PREFACE TO THE FIFTH EDITION

The author feels great pleasure in presenting the 5th edition of the book with a marked improvement over the previous one. The book has been thoroughly revised, enlarged and rewritten and so designed as to meet the needs of the students appearing for various competitive examinations conducted by different agencies like. NHPC, NTPC, ONGC, BEL, BHEL, HAL, CPWD, GATE, State Electricity Boards, Central and State Services for recruitment or admission to higher courses.

A large number of objective type questions have been added from the latest papers of U.P.S.C. I.E.S., GATE, Institution of Engineers (India), various Indian Universities and other examining bodies. An earnest effort has been made to provide a comprehensive coverage of the courses prescribed by most of the competition examination conducting and other examining bodies on the subject of Electrical Engineering.

The book, now, comprises 20 chapters divided into three Sections viz. "Electrical Engineering", "Electronics" and "Measurements, Instrumentation and Control." First section (Electrical Engineering) comprises 11 chapters namely "DC Basics and Network and Electromagnetic Theory", "AC Basics and Networks", "DC Machines", "AC Machines", "Electrical Engineering Materials", "Electrical Machine Design", "Electrical Installation and Wiring", "Electrical Power Generation & Economic Considerations", "Transmission and Distribution of Electric Power", "Switchgear and Protection" and "Electrical Energy Utilization and Electric Traction." Second section (Electronics) comprises of 6 chapters namely "Electronic Components and Devices", "Analog Electronics", "Industrial and Power Electronics", "Digital Electronics", "Microprocessors", and "Communication System". The third section (Measurements, Instrumentation and Control) consists of 3 chapters namely, "Electronic and Electrical Measurements and Measuring Instruments", "Electrical and Electronic Instrumentation", and "Control Systems".

The book contains more than 17,000 Objective Type Questions (about 2250 short answer type, 9,420 Multiple Choice Type, 650 Assertion/Reason Type, 430 Matching Type, 2,300 True/False Type and 2,200 Fill-in-the Blanks Type) designed to bring about the hidden aspects and make the maximum information available to the readers on various subjects/topics covered and also to test gains in knowledge, understanding and application aspect of learning.

It is earnestly hoped that with the extensive additions, revision, modifications and improvement, the present edition will prove very useful to the teachers in organising class tests and to the examiners and paper setters in framing of Question Papers with a vast variety of questions of choice either for written or oral examinations in no time. The book will also prove very useful to the students appearing in regular/competitive (written/oral) examinations.

Every care has been taken to eliminate misprints, omissions and errors but it is too much to expect that no inaccuracy/error/misprint has crept in and the author would be grateful to the readers fo. bringing to notice any of such errors/misprints/omissions they may come across while going through the book.

The author will like to thank the readers (both teachers and students) who sent their valuable suggestions that became the basis for the revision of the book.

The author shall feel satisfied if the book meets the needs of the students for whom it is meant. Suggestions and criticism for the further improvement of the book shall be welcomed.

The author will like to appreciate the sincere efforts and contribution made by his sons Rajeev Manglik and Rohit Manglik in presentation of the new edition in this form.

The author will like to thank all the scientists, engineers, authors and publishers whose works and text have been the source of enlightenment, inspiration and guidance in presenting this new edition.

Lastly, but not the least, the author is thankful to his publisher, Sanjeev Kumar Kataria for bringing out the book in such a short time and for pricing it moderately despite heavy cost of paper and printing.

PREFACE TO THE FIRST EDITION

The primary objective of presenting this book is to meet with the requirements of the students appearing for various competitive examinations conducted by various agencies like NHPC, NTPC, ONGC, BEL, BHEL, HAL, CPWD, GATE, State Electricity Boards, State and Central Services for recruitment or admission to higher courses. The book will be useful to the teachers in organising class tests and to the examiners and paper setters in framing of Question papers with a vast variety of questions of choice either for written or oral examinations in no time. The book will also prove very useful to the students appearing in different Electrical Engineering papers of AMIE Sec A and Sec B and facing interview boards.

A quick review of large range of topics right from Electrical Engineering Basics to Control Systems covered by Electrical Engineering is a pre-requisite for candidates appearing in competitive examinations conducted by various agencies for recruitment or admission to higher courses. Even to face interview boards for jobs recruitment to various public and private sector organisations, quick review of all the topics within a short period of time is essential for sure success. Most of the agencies conducting competitive examinations nowadays follow the pattern of objective evaluation. Even Institution of Engineers (India) and other examining bodies are adopting the pattern of objective evaluation (partly) for their regular examinations.

The book has been designed keeping in view the above mentioned requirements. The book comprises of 15 chapters covering a large range of topics covered by Electrical Engineering so as to make the students confident to face different competitive examinations/interview boards. The book contains about 12,000 Objective Type Questions (about 8000 Multiple Choice Type, 500 Assertion/Reason Type, 300 Matching Type, 2000 True/False Type and 1200 Fill in The Blanks Types) designed to bring about the hidden aspects and make the maximum information available to readers on various subjects/topics covered and also to test gains in knowledge, understanding and application aspect of learning. The language used is simple and lucid, to cater to the needs of average and below average students. While writing this book the difficulties and troubles which an average student faces and thirst of knowledge of an intelligent student have been kept in view. Most of the questions included in the book are from examination papers of AMIE Sec A and Sec B and UPSC (IES) or are of equivalent standard.

The author has made use of his long experience of teaching, setting of conventional as well as objective type question papers and conducting interviews in preparing this book.

Every care has been taken to eliminate misprints, omissions and errors but it is too much to expect that no inaccuracy/error/misprint has crept in and the author would be grateful to the readers for bringing to notice any of such errors/misprints/omissions they may come across while going through the book.

The author will like to appreciate the sincere efforts made by his son. **Mr. Rajeev Manglik** B.E. (Electrical) and **Er. (Smt) Shalini Manglik** in presentation of the book in this form.

Lastly, but not the least, the author is thankful to his publisher, **Sanjeev Kumar Kataria**, for bringing out the book in such a short time and for pricing it moderately despite heavy cost of paper and printing.

Chapters *Pages*

SECTION I
ELECTRICAL ENGINEERING 1–480

1. **DC Basics and Networks and Electromagnetic Theory** **3–65**
   - Short Answer Type Questions With Answers 3–9
   - Multiple Choice Type Questions 10–54
   - Assertion(A)/Reason(R) Type Questions 54–57
   - Matching Type Questions 57–60
   - True(T)/False(F) Type Questions 60–62
   - Fill in The Blanks Type Questions 62–65
2. **AC Basics and Networks** **66–108**
   - Short Answer Type Questions With Answers 66–68
   - Multiple Choice Type Questions 69–101
   - Assertion(A)/Reason(R) Type Questions 101–102
   - Matching Type Questions 102–104
   - True(T)/False(F) Type Questions 104–106
   - Fill in The Blanks Type Questions 106–108
3. **DC Machines** **109–151**
   - Short Answer Type Questions With Answers 109–116
   - Multiple Choice Type Questions 117–142
   - Assertion(A)/Reason(R) Type Questions 142–143
   - Matching Type Questions 143–144
   - True(T)/False(F) Type Questions 144–148
   - Fill in The Blanks Type Questions 148–151
4. **AC Machines** **152–252**
   - Short Answer Type Questions With Answers 152–164
   - Multiple Choice Type Questions 165–230
   - Assertion(A)/Reason(R) Type Questions 230–232
   - Matching Type Questions 233–238
   - True(T)/False(F) Type Questions 238–246
   - Fill in The Blanks Type Questions 246–252
5. **Electrical Engineering Materials** **253–280**
   - Short Answer Type Questions With Answers 253–257
   - Multiple Choice Type Questions 258–272
   - Assertion(A)/Reason(R) Type Questions 272–273
   - Matching Type Questions 274–278
   - True(T)/False(F) Type Questions 278–279
   - Fill in The Blanks Type Questions 280
6. **Electrical Machine Design** **281–298**
   - Short Answer Type Questions With Answers 281–283
   - Multiple Choice Type Questions 284–295
   - Assertion(A)/Reason(R) Type Questions 295–296
   - Matching Type Questions 296
   - True(T)/False(F) Type Questions 297
   - Fill in The Blanks Type Questions 297–298
7. **Electrical Installation and Wiring** **299–309**
   - Short Answer Type Questions With Answers 299–303
   - Multiple Choice Type Questions 304–307
   - Assertion(A)/Reason(R) Type Questions 307–308
   - Matching Type Questions 308
   - True(T)/False(F) Type Questions 309
   - Fill in The Blanks Type Questions 309
8. **Electrical Power Generation and Economic Considerations** **310–352**
   - Short Answer Type Questions With Answers 310–314
   - Multiple Choice Type Questions 315–342
   - Assertion(A)/Reason(R) Type Questions 342–343
   - Matching Type Questions 343–344
   - True(T)/False(F) Type Questions 345–349
   - Fill in The Blanks Type Questions 349–352
9. **Transmission and Distribution of Electrical Power** **353–386**
   - Short Answer Type Questions With Answers 353–357
   - Multiple Choice Type Questions 358–378
   - Assertion(A)/Reason(R) Type Questions 379–380
   - Matching Type Questions 380–381
   - True(T)/False(F) Type Questions 381–383
   - Fill in The Blanks Type Questions 384–386
10. **Switchgear and Protection** **387–442**
    - Short Answer Type Questions With Answers 387–397
    - Multiple Choice Type Questions 398–428
    - Assertion(A)/Reason(R) Type Questions 428–429
    - Matching Type Questions 429–432
    - True(T)/False(F) Type Questions 432–435
    - Fill in The Blanks Type Questions 436–442
11. **Electrical Energy Utilisation and Electric Traction** **443–480**
    - Short Answer Type Questions With Answers 443–447
    - Multiple Choice Type Questions 448–471
    - Assertion(A)/Reason(R) Type Questions 471–473
    - Matching Type Questions 473–475
    - True(T)/False(F) Type Questions 475–478
    - Fill in The Blanks Type Questions 478–480

SECTION II
ELECTRONICS 481–665

12. **Electronic Components and Devices** **483–520**
    - Short Answer Type Questions With Answers 483–489
    - Multiple Choice Type Questions 490–512
    - Assertion(A)/Reason(R) Type Questions 512–513

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Matching Type Questions 513–515
True(T)/False(F) Type Questions 515–517
Fill in The Blanks Type Questions 517–520

13. Analog Electronics 521–567
Short Answer Type Questions With Answers 521–529
Multiple Choice Type Questions 530–559
Assertion(A)/Reason(R) Type Questions 559–561
Matching Type Questions 561–563
True(T)/False(F) Type Questions 563–565
Fill in The Blanks Type Questions 565–567

14. Industrial and Power Electronics 568–605
Short Answer Type Questions With Answers 568–573
Multiple Choice Type Questions 574–599
Assertion(A)/Reason(R) Type Questions 599–600
Matching Type Questions 600–603
True(T)/False(F) Type Questions 603–604
Fill in The Blanks Type Questions 604–605

15. Digital Electronics 606–631
Short Answer Type Questions With Answers 606–609
Multiple Choice Type Questions 610–626
Assertion(A)/Reason(R) Type Questions 627
Matching Type Questions 627–629
True(T)/False(F) Type Questions 629
Fill in The Blanks Type Questions 629–631

16. Microprocessors 632–648
Short Answer Type Questions With Answers 632
Multiple Choice Type Questions 633–644
Assertion(A)/Reason(R) Type Questions 644–645
Matching Type Questions 645–646
True(T)/False(F) Type Questions 647
Fill in The Blanks Type Questions 647–648

17. Communication System 649–665
Short Answer Type Questions With Answers 649–650
Multiple Choice Type Questions 651–661
Assertion(A)/Reason(R) Type Questions 661–662
Matching Type Questions 662–663
True(T)/False(F) Type Questions 663–664
Fill in The Blanks Type Questions 664–665

SECTION III MEASUREMENTS, INSTRUMENTATION AND CONTROL 667–800

18. Electronic and Electrical Measurements and Instruments 669–730
Short Answer Type Questions With Answers 669–686
Multiple Choice Type Questions 687–716
Assertion(A)/Reason(R) Type Questions 716–718
Matching Type Questions 718–722
True(T)/False(F) Type Questions 723–724
Fill in The Blanks Type Questions 724–730

19. Electrical and Electronic Instrumentation 731–751
Short Answer Type Questions With Answers 731–735
Multiple Choice Type Questions 736–746
Assertion(A)/Reason(R) Type Questions 746–747
Matching Type Questions 747–748
True(T)/False(F) Type Questions 749
Fill in The Blanks Type Questions 749–751

20. Control Systems 752–800
Short Answer Type Questions With Answers 752–753
Multiple Choice Type Questions 754–790
Assertion(A)/Reason(R) Type Questions 791–792
Matching Type Questions 792–798
True(T)/False(F) Type Questions 798–799
Fill in The Blanks Type Questions 799–800

Model Test Papers 801–832

Reference Books 833

CHAPTER 1

DC Basics And Networks And Electromagnetic Theory

Short Answer Type Questions With Answers

Q. 1. Do conventional current and electron current flow in the same direction in an electric circuit ?

Ans. No, the direction of flow of electrons is opposite to that of conventional current.

Q. 2. What is drift current ?

Ans. The steady flow of electrons in one direction caused by the applied electric field constitutes electric current, called the drift current.

Q. 3. What are the limitations of Ohm's law ?

Ans. Ohm's law cannot be applied to the circuits consisting of (*i*) electronic tubes or transistors (because such elements are not bilateral) and (*ii*) nonlinear elements such as powdered iron, electric arc etc.

Q. 4. If the length of a wire of resistance R is uniformly stretched to n times its original value, what will be its new resistance ?

Ans. New resistance

$$= \text{Old resistance} \times \frac{\text{new length}}{\text{old length}} \times \frac{\text{old cross-section}}{\text{new cross-section}}$$

$$= R \times \frac{nl}{l} \times \frac{a}{a/n} = n^2 R$$

Q. 5. How does increase in temperature affect the resistance of (*i*) conductors and (*ii*) insulators ?

Ans. The resistance of the conductors (except of carbon) increases with the increase in temperature, therefore, on high temperature good conductors become bad conductors even.

The insulators lose their insulating power with the increase in temperature and some may even become good conductors if they are strongly heated.

Q. 6. What is meant by a potential divider ?

Ans. The potential divider is a high resistance connected across the supply mains and is used to provide a variable voltage from a constant supply voltage.

Q. 7. What is the principle of duality ? Does it hold good for series and parallel circuits ?

Ans. Two physical systems, or phenomena are called dual if they are described by equations of the same mathematical form. The principle of duality holds goods for series and parallel circuits.

Q. 8. Give the SI units of force, work, power and energy.

Ans. SI units of force, work, power and energy are newton, newton-metres (or joules), newton-metre per second (or joules per second) and newton-metres (or joules) respectively.

Q. 9. What is meant by 'node' ?

Ans. A junction or node is a point in a network where two or more branches meet.

Q. 10. Distinguish between mesh and loop of network.

[R.G.P.V. Bhopal June 2005]

Ans. A loop is a closed path in a network formed by a number of connected branches. Mesh is a loop that contains no other loop within it.

Q. 11. Distinguish between bilateral and unilateral elements with examples. **[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]**

Ans. An electric circuit, whose characteristics or properties are same in either direction (*e.g.* a distribution or transmission line), is called the *bilateral circuit.* The distribution or transmission line can be made to perform its function equally well in either direction.

An electric circuit, whose characteristics or properties change with the direction of its operation (*e.g.* a diode rectifier), is called the *unilateral circuit.* A diode rectifier cannot perform rectification in both directions.

Q. 12. Draw the directed or an oriented graph of the network given below (Fig. 1).

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

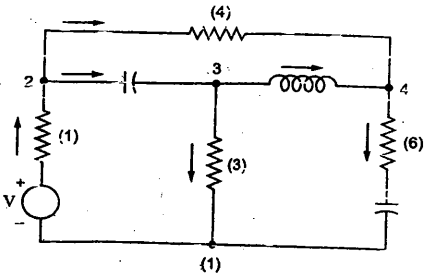

Fig. 1

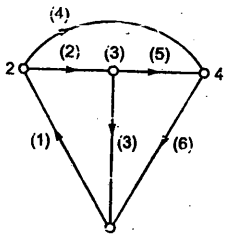

Fig. 2

Ans. The oriented graph of the given network is depicted above in Fig. 2.

Q. 13. For the given network shown in Fig. 3 draw four possible trees.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2005]

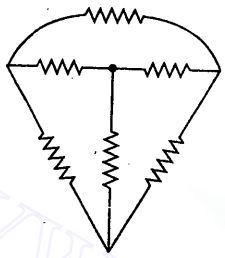

Fig. 3

Ans. For a given network, the four possible trees are:

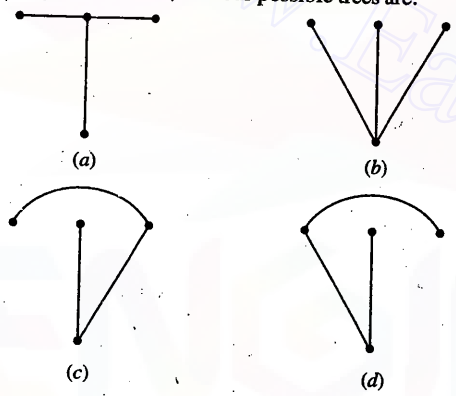

Fig. 4

Q. 14. What is meant by cut-set ?

Ans. By removing a set of branches, from a linear graph without affecting the nodes, two connected subgraphs are obtained and the original graph becomes unconnected. The removal of these branches which results in cutting the graph into two parts are known as the *cut-set*. A cut-set separates the nodes of a graph into two groups, each being in one of the two groups.

Q. 15. Write the steps to form fundamental cut-set matrix.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2005]

Ans. For fundamental cut-set matrix, the first column represents the tree branch voltages V_a, V_b ...

Each row represents the branch numbers such as *a*, *b*, *c* ...:

Rows are then filled by three entries +1, –1, or 0. The number of non-zero elements in a row is equal to the number of branches in the corresponding *f*-cut-set.

The column of cut-set matrix corresponds to a twig and has non-zero element.

For a graph having *b* branches and $(n + 1)$ nodes the cut-set matrix is of the order of $(n \times b)$.

Q. 16. Comment on the of methods of circuit analysis.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. The methods used for determination of response of a given network with given excitation are called the methods of circuit analysis. These methods are very helpful in reducing the amount of work involved in circuit analysis and therefore the methods using circuit reduction techniques and network theorems are very popular for circuit analysis.

Q. 17. State superposition theorem.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. In a network of linear impedances containing more than one source, the current which flows at any point is algebraic/phasor sum of all currents which would flow at that point if each source was considered separately and all other sources are replaced by their internal impedances.

Q. 18. Can we apply superposition theorem to an electric circuit with a nonlinear resistance.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]

Ans. No. Superposition theorem cannot be applied to an electric circuit with a nonlinear resistance.

Q. 19. What is the utility of superposition theorem ?

Ans. This theorem is applied when we are to determine the current in one particular branch of a network containing several voltage sources or current sources or both voltage sources and current sources.

Q. 20. What is the utility of Thevenin theorem ?

Ans. Thevenin's theorem is advantageous when we are to determine the current in a particular element of a linear bilateral network particularly when it is desired to find the current which flows through a resistor for its different values. It makes the solution of the complicated networks (particularly electronic networks) quite simple.

Q. 21. What is maximum power transfer theorem ?

Ans. A resistive load, served through a resistive network, will abstract maximum power when the load resistance value is the same as the resistance "viewed by the load as it looks back into the network".

Q. 22. Where does the Millman theorem find utility ?

Ans. In practice, cases frequently arise where a network has only two terminal points between which any number of parallel branches may be connected. Their calculations can be greatly simplified by the use of Millman's theorem, which is combination of Thevenin's and Norton's theorem. This theorem enables a number of voltage (or current) sources to be combined into a single voltage (or current) source.

Q. 23. Give the relationship between resistances connected in delta and equivalent star systems ?

Ans. The equivalent star resistance connected to a given terminal is equal to the product of the two delta resistances connected to the same terminal divided by the sum of the delta connected resistances.

Q. 24. Give the relationship between resistances connected in star and equivalent delta systems ?

Ans. The equivalent delta resistance between two terminals is the sum of the two star resistances connected to those terminals plus the product of the same divided by the third star resistance.

Q. 25. State Tellegen's theorem.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. According to this theorem the summation of instantaneous powers for the n-branches in an electric network is always zero. Alternatively this theorem may be narrated as

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

below :

If there are n elements in any network; $i_1, i_2, i_3 \ldots i_n$ are the respective instantaneous currents flowing through these elements satisfying Kirchhoff's current law and $v_1, v_2, v_3, \ldots v_n$ are the respective instantaneous voltages across these elements satisfying Kirchhoff's voltage law, then

$$\sum_{k=1}^{n} v_k \, i_k = 0$$

where v_k is the instantaneous voltage across k_{th} element and i_k is the instantaneous current flowing through this element.

This theorem is applicable to a very general class of lumped networks composed of elements that are linear or nonlinear, active or passive, time invariant or time variant.

Q. 26. What are driving point impedance and transfer impedance ?

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. The impedance found at a given port is known as the *driving point impedance.*

Transfer impedance is defined as the ratio of voltage transform at one port to the current transform at another port. It is usually denoted by $Z(s)$. Subscript 1, 2 is affixed to Z to denote the port number.

Q. 27. Distinguish between ABCD parameters and Z parameters of a two port network. **[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]**

Ans. **ABCD Parameters:** These parameters are used in the analysis of power transmission lines. The input and output ports are called the sending and receiving ends respectively.

Since in this case, output current I_2 is considered outward, therefore negative sign arises with I_2. In the matrix form

$$\begin{bmatrix} V_1 \\ I_1 \end{bmatrix} = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} V_2 \\ -I_2 \end{bmatrix}$$

The above matrix equation defines A, B, C, D parameters.

$$\text{So } V_1 = A V_2 + B (-I_2) = A V_2 - B I_2$$

$$\text{and } I_1 = C V_2 + D (-I_2) = C V_2 - D I_2$$

Z-Parameters: In this system of parameters the input and output voltages are expressed in terms of the input and output currents. The defining equations are

$$V_1 = Z_{11} I_1 + Z_{12} I_2$$

$$V_2 = Z_{21} I_1 + Z_{22} I_2$$

In the matrix form

$$\begin{bmatrix} V_1 \\ V_2 \end{bmatrix} = \begin{bmatrix} Z_{11} & Z_{12} \\ Z_{21} & Z_{22} \end{bmatrix} \begin{bmatrix} I_1 \\ I_2 \end{bmatrix}$$

Q. 28. Draw the pole zero diagram of the network function:

$$H(s) = \frac{(s+5)}{(s+3)(s^2+7s+14)}$$

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]

Ans. The network function

$$H(s) = \frac{s+5}{(s+3)(s^2+7s+14)}$$

$$s^2 + 7s + 14 = 0$$

$$s = \frac{-7 \pm \sqrt{7^2 - 4 \times 14}}{2} = \frac{-7 \pm \sqrt{-7}}{2} = -3.5 \pm j\, 1.323$$

Zero of the function $H(s)$ is at $s = -5$.

Poles are at $s = -3$, $(3.5 - j\,1.323)$ and $(3.5 + j\,1.323)$

The pole zero diagram is shown below in Fig. 5.

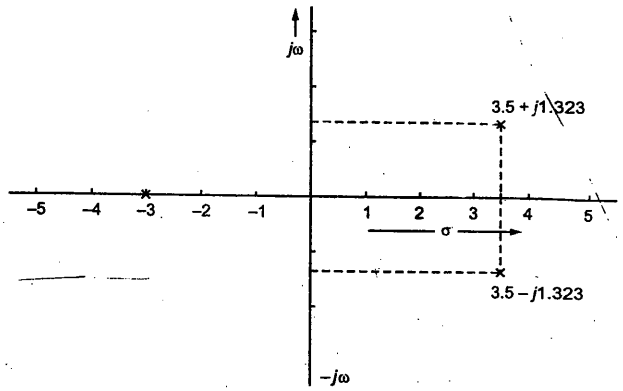

Fig. 5

Q. 29. What is difference between primary and secondary batteries ?

Ans. Batteries are either primary or secondary. Primary batteries can be used only once because the chemical reactions that supply the current are irreversible. Secondary batteries, sometimes called *storage batteries* or *accumulators*, can be used, recharged and reused. In these batteries, the chemical reactions that provide current from the battery are readily reversed when current is supplied to the battery.

Q. 30. Why terminal potential of a cell (or a battery) is always less than its emf ?

Ans. Terminal potential of a cell (or a battery) is always less than its emf because some of the emf developed is used in overcoming the internal resistance of the cell (or a battery) itself.

Q. 31. Lead acid battery can be charged where as primary cell cannot be charged. Why ?

Ans. Primary cells can be used only once because the chemical reactions that supply the electric current are irreversible but in lead acid battery, the chemical reactions that provide the current are readily reversed when current is supplied to the battery.

Q. 32. What is ECE ?

Ans. Electrochemical equivalent (ECE) of a substance is the amount deposited on passing an electric current of one ampere for one second through its solution.

Q. 33. In what form is energy stored in a secondary battery ?

Ans. Energy is stored in the form of electrical energy in a secondary battery.

Q. 34. Why Faure process is much suitable for manufacturing of negative plates rather than positive plates?

Ans. Faure process is much suitable for manufacturing of negative plates because negative active material (sponge lead) is quite tough (not hard and brittle as lead peroxide is) and moreover, it undergoes a comparatively negligible change in volume during charging and discharging processes.

Q. 35. Why in grouping of lead acid cells the negative group is made to have one plate more than positive group ?

Ans. The negative group of the plates contains one more plate than that of the positive group so that when interleaved both the end plates become the negative. This is done so that all the positive plates can work equally well on both sides. If a positive plate were used at one end, one of its sides would remain inactive,

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

when the other side expands, and thus the plate is likely to buckle.

Q. 36. Do we use ac or dc to charge a battery ?

Ans. For charging of a battery dc is essential.

Q. 37. Why should the lead acid cells not be allowed to stand completely discharged ?

Ans. Lead acid cells shall not be allowed to stand completely discharged because the lead sulphate formed on the plates crystallizes and the proper reforming of the plates becomes difficult.

Q. 38. Why the lead acid battery should not be allowed to discharge beyond 1.75 V ?

Ans. The lead acid battery should never be allowed to discharge beyond 1.75 V otherwise lead sulphate will be formed on the electrodes which is hard, insoluble and increases the internal resistance of the battery.

Q. 39. Why the state of charge of a nickel-iron cell cannot be determined by measuring the specific gravity of the electrolyte ?

Ans. The state of charge of a nickel-iron cell cannot be determined by the specific gravity of electrolyte as it does not change during charging and discharging.

Q. 40. A sphere of 200 mm radius contains electrical charge of density $\frac{2}{r \sin\theta}$ C/m^3. What is the total charge contained within the sphere. **[A.M.I.E. Sec B. Circuit and Field Theory Winter 2005]**

Ans. Total charge contained within the sphere,

$$Q = \sigma \times \frac{4}{3}\pi r^3$$

$$= \frac{2}{r \sin\theta} \times \frac{4}{3}\pi r^3$$

$$= \frac{8\pi r^2}{3 \sin\theta} = \frac{8\pi (200 \times 10^{-3})^2}{3 \sin\theta} = \frac{0.335}{\sin\theta} \text{ C}$$

Q. 41. Is electric field a vector quantity ?

Ans. Yes, electric field intensity is a vector quantity.

Q. 42. What is a polarization vector ?

Ans. The sum of dipole moments per unit volume in a dielectric material is called the polarization vector or dielectric polarization, **P**.

Q. 43. How is electric displacement in a dielectric material related to polarization ?

Ans. The electric displacement or electric induction is defined as that property of the field which is evidenced by its ability to induce charges on conductors placed in it and is expressed as

$$\text{Electric displacement } \mathbf{D} = \varepsilon_0 \mathbf{E} + \mathbf{P}$$

Q. 44. What do you mean by polarization of dielectric ?

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2005]

Ans. When a dielectric is subjected to an applied field, it contains a large number of dipoles-induced or permanent. The dielectric in such a state is said to be polarized or in a *state of polarization*. When the field is removed and the atoms or molecules return to their normal or unpolarized state the dipoles disappear.

Q. 45. Write any one condition to be satisfied for a linearly, polarized, uniform plane wave.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. For a linearly polarized uniform plane wave one of the condition is

At every point in space **E** and **H** are perpendicular to each other and to the direction of travel. Also the field varies harmonically with time at the same frequency.

Q. 46. What is relation between electric flux density and electric field intensity ?

Ans. Electric flux density, $D = \varepsilon_o \varepsilon_r E$.

Q. 47. What is electric susceptibility of a dielectric ? **[I.E.S. 1993]**

Ans. Electric susceptibility of a dielectric medium is defined as the ratio of bound charge density to free charge density and is represented by the symbol χ_e.

Q. 48. How is electric susceptibility related to a relative permittivity ?

Ans. Electric susceptibility $\chi_e = \varepsilon_r - 1$.

Q. 49. Define Gauss's law in electrostatics.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2005]

Ans. Gauss's law states that the total flux emerging from a closed surface S is equal to the total charge enclosed by the surface. Thus

$$\oint_S \mathbf{D} \cdot d\mathbf{S} = Q$$

where Q is total charge which is enclosed. The surface over which the integral is taken is called the *Gaussian surface*.

Q. 50. Write divergence theorem is point form.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. Divergence theorem is also called the Gauss's theorem.

This is one of the most useful theorems in the area of electric fields. According to this theorem, the total electric flux ψ emanating from a closed surface is equal to the total charge enclosed by the surface. Denoting the charges enclosed by the surface by Q_1, Q_2, ... Q_i ... Q_n where the Qs' may be positive and negative, this theorem may be expressed mathematically by means of a surface integral as follows

$$\psi = \iint \mathbf{D} \cdot d\mathbf{S} = \sum_{i=1}^{n} Q_i \qquad ...(i)$$

where **D** represents the flux density in coulombs/m^2 at the centre of the surface element represented by the outwardly directed vector $d\mathbf{S}$; the integration extends over the entire enclosed surface. If there is a continuous charge distribution of density σ instead of discrete charges, the sum on the RHS of Eq. (*i*) is replaced by the volume integral of σ, the integration extending over the entire volume enclosed by the surface under consideration. Thus Eq. (*i*) may be written as

$$\psi = \iint \mathbf{D} \cdot d\mathbf{S} = \iiint \sigma \, dV \qquad ...(ii)$$

Q. 51. Write Laplace's equation in three dimensional electrostatic problem. **[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]**

Ans. When the electrostatic potential V is expressed as a function of the three Cartesian coordinates, x, y, z, Laplace's equation takes the form

$$\nabla^2 V = \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2} = 0$$

or $\Delta^2 V = 0$ in Cartesian coordinates.

Q. 52. Write Laplace's and Poisson's equations.

[A.M.I.E. Sec B. Circuit and Field Theory Summary 2005]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. For Laplace's equation Refer to Answer of Q. 51.

Poisson's equation, in Cartesian coordinate system, is given as

$$\nabla^2 V = -\frac{\rho}{\varepsilon}$$

$$\text{or } \frac{\partial^2 V}{\partial x^2} + \frac{\partial^2 V}{\partial y^2} + \frac{\partial^2 V}{\partial z^2} = -\frac{\rho}{\varepsilon}$$

Q. 53. Give the mathematical statement of Helmholtz's theorem.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. According to Helmholtz's theorem a vector field is completely specified by its divergence and curl. Inversely, any vector field may be expressed as the sum of an irrotational vector and solenoidal vector fields.

Q. 54. How much work will be done in transferring a charge of Q coulombs over an equipotential surface ?

Ans. Zero.

Q. 55. Write the expression of $\nabla\nabla$ in spherical coordinate system.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. In spherical coordinate system

$$\nabla = a_r \frac{\partial}{\partial r} + a_\theta \frac{1}{r}\frac{\partial}{\partial \theta} + a_\phi \frac{1}{r \sin\theta}\frac{\partial}{\partial \phi}$$

$$\text{So } \nabla\nabla = a_r \frac{\partial \nabla}{\partial r} + a_\theta \frac{1}{r}\frac{\partial \Delta}{\partial \theta} + a_\phi \frac{1}{r \sin\theta}\frac{\partial \nabla}{\partial \phi}$$

Q. 56. What is Brewster angle ?

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. Brewster angle is the angle for which there is no reflection and the incident wave is vertically polarized. The condition for reflection can be obtained by equating reflection coefficient of the vertically polarized wave to zero.

Q. 57. Give the physical interpretation of the equation $\nabla \cdot \mathbf{D} = \rho$.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. $\nabla \cdot \mathbf{D} = \rho$ is the Gauss's law equation.

Its physical interpretation is that at every point in a medium divergence of electric displacement density is equal to the charge density.

Q. 58. What do you mean by solenoidal and irrotational fields ?

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. A vector field that has a zero divergence is called the *solenoidal field* and a vector field having a zero curl or rotational everywhere is called an *irrotational field.*

Q. 59. Define capacitance between two conductors.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. Capacitance between any two conductors is the charge required to be added to increase the potential by unit.

Mathematically, $C = \frac{Q}{V}$.

Q. 60. There are two concentric conducting spherical surfaces of radii a and b ($a < b$). The inner spherical surface carries a charge Q and the outer surface is grounded. What is the potential of the inner spherical surface ? **[GATE 1994]**

Ans. $V = \frac{Q}{4\pi\varepsilon_0 \varepsilon_r}\left(\frac{1}{a} - \frac{1}{b}\right)$ Volts.

Q. 61. What will be the capacitance of the capacitor given in Q. 60 ?

Ans. $C = 4\pi\varepsilon_0\varepsilon_r \frac{ab}{(b-a)}$ farads.

Q. 62. Why the voltage of a capacitor cannot change instantaneously ?

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. For a capacitor we have

$$i = C\frac{dv}{dt}$$

Thus a small change in voltage across a capacitor within zero time gives an infinite current through the capacitor, which is physically impossible. Hence voltage across a capacitor cannot change instantaneously.

Q. 63. Write the equation for the variation of current for a serics R-C circuit subjected to a step input voltage.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. The equation for variation of current for a series R-C circuit to a step input voltage is given by

$$i(t) = \frac{V}{R} e^{-t/CR}.$$

Q. 64. What is the value of permeability of free space ?

Ans. The permeability for free space is $4\pi \times 10^{-7}$ H/m.

Q. 65. What is meant by magnetic susceptibility ?

Ans. Magnetic susceptibility χ is defined as the ratio of intensity of magnetization M to the magnetizing force H

$$i.e. \quad \chi = \frac{M}{H}$$

Q. 66. What is basic law of magnetic field ?

Ans. The line integral of the vector H over the whole contour depends only on the algebraic sum of the currents intersecting the surfaces, and is equal to that sum *i.e.*

$$\oint H\,dl = \Sigma I$$

The above equation is known as *Ampere's circuital law* or sometimes referred to *Ampere's work law.*

Q. 67. State and explain Biot-Savart law.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. The quantitative expression for magnetic induction (or flux density) was derived experimentally by Biot and Savart. Taking the deflection of a compass needle as a measure of the intensity of magnetic field of a current, varying in magnitude and shape, the two scientists concluded that any current element projects into space a magnetic field, the magnetic flux density of which, dB, is directly proportional to the length of the element dl, the current I, and the sine of the angle θ between the direction of the current and the vector joining a given point of the field and the current element, and is inversely proportional to the square of the distance of the given point from the current element, r

$$i.e\ dB \propto \frac{I\,dl \sin\theta}{r^2},$$

$$\text{or } dB = K\frac{I\,dl\sin\theta}{r^2}$$

where K is a proportionality constant, which depends upon the magnetic properties of the medium and the system of units employed. In SI system of units $K = \frac{\mu_0 \mu_r}{4\pi}$.

$$\text{So } dB = \frac{\mu_0\mu_r}{4\pi} \cdot \frac{I\,dl\sin\theta}{r^2}$$

The above equation is referred to as the Biot-Savart law (sometimes referred to as Laplace's law) expressed in vector form

$$d\mathbf{B} = \frac{\mu_0\mu_r}{4\pi} \cdot \frac{I\,d\mathbf{l}\,\mathbf{1}_r}{r^2} \qquad ...(i)$$

Downloaded From : www.EasyEngineering.net

Downloaded from : www.EasyEngineering.net

The above relation gives the magnetic induction at any point due to direct current element. The direction of magnetic induction $d\mathbf{B}$ is perpendicular to the vectors $d\mathbf{l}$ and $\mathbf{1}_r$ and coincides with the direction in which right-handed screw advances when rotated from $d\mathbf{l}$ to $\mathbf{1}_r$. For a closed loop of which dl is a part

$$\mathbf{B} = \oint \frac{\mu_0 \mu_r}{4\pi} \frac{d\mathbf{l} \times \mathbf{1}_r}{r^2} \quad ...(ii)$$

where $\mathbf{B}$ is flux density at point P, in teslas, and μ_r is relative permeability of the medium

$$\mathbf{B} = \oint \frac{\mu_0 \mathrm{I}}{4\pi} \frac{d\mathbf{l} \times \mathbf{1}_r}{r^2} \text{ in air} \quad ...(ii)$$

Q. 68. Give the equation of Biot-Savart's law.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. Biot-Savart's law equation is

$$\mathbf{B} = \frac{\mu_0 \mu_r \mathrm{I}}{4\pi} \int \frac{dl \sin\theta}{r^2}$$

where $\mathbf{B}$ gives the flux density at any point by the differential element of length dl lying at a distance r and θ is the angle between the line connecting the element to the point where $\mathbf{B}$ is desired.

Q. 69. Write the four Maxwell's equations.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. Four Maxwell's equations in electromagnetic theory are:

$$\nabla \mathbf{D} = \rho \quad \text{(Gauss's law)}$$

$$\nabla \mathbf{B} = 0$$

$$\nabla \mathbf{H} = \mathbf{J} + \frac{\partial \mathbf{D}}{\partial t} \quad \text{(Ampere's law)}$$

$$\nabla \mathbf{E} = -\frac{\partial \mathbf{B}}{\partial t} \quad \text{(Faraday's induction law)}$$

Q. 70. Write integral form of Maxwell's equations.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2005]

Ans. The Maxwell's equations in integral form are:

$$\oint_C \mathbf{H} \cdot d\mathbf{l} = \int_S \left(\mathbf{J} + \frac{\partial D}{\partial t} \right) \cdot d\mathbf{S} \qquad \oint_S \mathbf{D} \cdot d\mathbf{S} = \int_V Q_V \, dV$$

$$\oint_C \mathbf{E} \cdot d\mathbf{l} = -\int_S \frac{\partial \mathbf{B}}{\partial t} \cdot d\mathbf{S} \qquad \oint_S \mathbf{B} \cdot d\mathbf{S} = 0$$

Q. 71. Find the line integral of $\mathbf{H}$ around each of the following closed paths.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

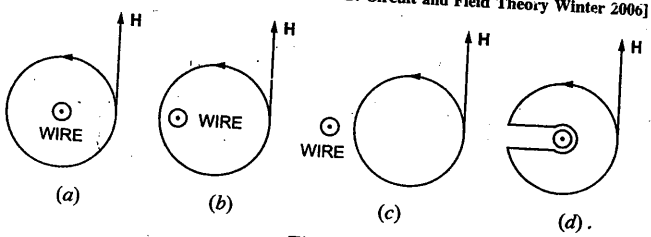

Fig. 6

Ans. Line integral of current around closed path is I.

Hence answers are (*a*) I, (*b*) I, (*c*) 0 (*d*) 0

Q. 72. Calculate the skin depth at 100 Hz in a material having $\mu_r = 1.0$ and $\sigma = 3.60 \times 10^7$ S/m.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]

Ans. Skin depth,

$$\delta = \sqrt{\frac{1}{\pi f \mu_0 \mu_r \sigma}} = \sqrt{\frac{1}{\pi \times 100 \times 4\pi \times 10^{-7} \times 1.0 \times 3.60 \times 10^7}}$$

$$= 8.4 \text{ mm} \quad \text{Ans.}$$

Q. 73. State and explain Poynting's theorem.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]

Ans. Poynting's theorem states that the vector product of electric intensity $\mathbf{E}$ and magnetic field intensity $\mathbf{H}$ at any point is a measure of the rate of energy flow per unit area at that point. The direction of flow is perpendicular to $\mathbf{E}$ and $\mathbf{H}$ in the direction of vector $\mathbf{E} \times \mathbf{H}$ *e.g.*, for a plane wave travelling in the Z-direction.

Mathematically $\rho = \mathbf{E} \times \mathbf{H}$

Q. 74. On what factors does the magnetic reluctance depend ?

Ans. The reluctance of the magnetic circuit is directly proportional to length l, inversely proportional to cross-sectional area and dependent on the nature of material of the magnetic circuit.

Q. 75. Is magnetic reluctance constant for all flux densities ?

Ans. No.

Q. 76. State the simple mathematical relation of Faraday's law of electromagnetic induction.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2006]

Ans. Faraday's law of electromagnetic induction is expressed, in mathematical form, as

$$e = -N \frac{d\phi}{dt}$$

where $N \frac{d\phi}{dt}$ is the product of number of turns and rate of change of linking flux and is termed as the rate of change of flux linkage.

Q. 77. Define Lenz's law.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2007]

Ans. The direction of emf induced in a conductor or coil is governed by Lenz's law which states that the direction of induced emf would be in such a direction that it would try to oppose the very cause for which it is due.

Q. 78. What is the difference between a statically induced emf and a dynamically induced emf ?

[PTU January 2000]

Ans. When flux linking with any coil or circuit changes, an emf is induced in the coil or circuit, called the *electromagnetically induced emf.*

EMF induced in a coil or circuit by increasing or decreasing magnitude of the linking flux (no relative motion between coil or circuit and magnetic field) is known as statically *induced emf.*

Q. 79. What is Fleming's right hand rule ?

Ans. According to Fleming's right hand rule if the thumb, fore-finger and middle finger of the right hand are held mutually perpendicular to each other, forefinger pointing into the direction of the field and thumb in the direction of motion of conductor then middle finger will point in the direction of the induced emf.

Q. 80. What is hysteresis loss ? On what factors does it depend ?

Ans. The energy expended in taking a specimen through a magnetic cycle is known as hysteresis loss.

Hysteresis loss per cubic metre per cycle of magnetization of a magnetic material depends upon (*i*) the maximum value of flux density and (*ii*) the magnetic quality of the material.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 81. What is the effect of self-induction in a dc circuit ?

Ans. The self induction opposes the change of current in a dc circuit.

Q. 82. For zero initial conditions, write the equation for current in a series R-L circuit for step response.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2005]

Ans. The equation for current in series R-L circuit for step response and for zero initial conditions is

$$i = \frac{V}{R}\left[1 - e^{-\frac{R}{L}t}\right]$$

Q. 83. What is meant by the 'time constant' of a series R-L circuit ?

Ans. The time constant τ of a series R-L circuit is defined as the time required for the current to rise to its final steady-state value if it continued rising at its initial rate of V/L amperes per second.

The time constant may also be defined as the time required for the current to reach 0.632 of its final steady-state value (*i.e.* 0.632 I_{max}).

Q. 84. What are the undesirable effects of eddy current and hysteresis loss ? **[R.G.P.V. Bhopal June 2002]**

Ans. Eddy current and hysteresis loss appears in the form of heat and so raises the temperature of that portion of magnetic circuit, in which they occur.

Q. 85. How can eddy current and hysteresis losses be minimised ?

Ans. Hysteresis loss can be minimised by choosing a core material with low hysteresis coefficient such as low carbon steel, silicon alloys, alloy steel.

Eddy current loss can be minimised by using thin laminations.

Q. 86. Mention some applications of eddy currents.

[R.G.P.V. Bhopal June 2002]

Ans. Use of eddy currents is made in (*i*) eddy current heating (*ii*) eddy current braking and (*iii*) to develop damping torque in measuring instruments.

Q. 87. What is Seebeck effect ?

Ans. The phenomenon of production of emf by a thermocouple when the two junctions are kept at different temperatures is known as Seeback effect.

Q. 88. State Peltier effect.

Ans. The evolution and absorption of heat energy at junctions of a thermocouple, when a current is passed through it, is called as Peltier effect.

Q. 89. State Thomson effect.

Ans. The absorption or evolution of heat energy, if a current is allowed to flow in a conductor having its different parts at different temperatures is known as Thomson effect.

Q. 90. What is thermocouple and thermoelectric emf ?

Ans. The combination of two dissimilar metals is known as thermocouple and the emf developed across the junction is called the thermoelectric emf.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers and write the letters in the answer sheet. If there is more than one correct answers, select the answer which should consist of the letters in any case, choose ONLY ONE response for each question.

1. The flow of electric current in a conductor is due to flow of
(a) electrons. (b) protons.
(c) electrons and ions. (d) charged particles.

2. An electric current is the
(a) random movement of electrons in a conductor.
(b) movement of free electrons predominately in one direction.
(c) pressure difference between two poles.
(d) the power that causes drift of electrons.

3. In gases the flow of current is due to
(a) electrons only. (b) positive and negative ions.
(c) electrons and positive ions.
(d) electrons, positive ions and negative ions.

4. The minimum requirements for causing flow of current are
(a) a voltage source, a resistor and a switch.
(b) a voltage source and a conductor.
(c) a power source and a bulb.
(d) a voltage source, a conductor, an ammeter and a switch.

5. Current velocity through a copper conductor is
(a) nearly 3×10^9 m/s.
(b) of the order of a few μ m/s.
(c) independent of current strength.
(d) the same as propagation velocity of electric energy.

6. The draft velocity of electrons is
(a) larger than speed of light.
(b) almost equal to speed of light.
(c) equal to speed of light.
(d) very small in comparison to speed of light.

7. Correct form of Ohm's law
(a) $I = VR$ (b) $V \propto I$ (c) $V = IR$
(d) above (b) and (c). [R.G.T.U. M.P. Basic E.E. June 2008]

8. The condition for the validity of Ohm's law is that the
(a) temperature should remain constant.
(b) current should be proportional to voltage.
(c) resistance must be wire wound type.
(d) all of the above.

9. Ohm's law is applicable to
(a) semiconductors. (b) vacuum tubes.
(c) electrolytes. (d) carbon resistors.
(e) arc lamps. (f) none of these.

10. Which of the following statements is correct regarding resistance ?
(a) The resistance of a conductor is the hindrance by which the conductor opposes the flow of current through it.
(b) The resistance of wire is independent of the temperature for most of the materials.
(c) The resistance of a wire does not depend upon its material.
(d) None of the above.

11. For a fixed supply voltage the current flowing through a conductor will increase when its
(a) area of x-section is reduced.
(b) length is reduced. (c) length is increased.
(d) length is increased and x-sectional area is reduced.

12. Two wires A and B of the same material and length l and $2l$ have radius r and $2r$ respectively. The ratio of their specific resistance will be
(a) 1 : 1 (b) 1 : 2 (c) 1 : 4 (d) 1 : 8
[U.P.S.C. I.E.S. E.E.-I, 1992]

13. The electrical conductivity of metals is typically of the order of (in $ohm^{-1}m^{-1}$)
(a) 10^7 (b) 10^5 (c) 10^{-4} (d) 10^{-6}
[U.P.S.C. I.E.S. E.E.-I, 1992]

14. Resistance of a copper wire always increases if
(a) temperature is reduced.
(b) temperature is increased.
(c) number of free electrons available become less.
(d) number of free electrons available become more.

15. Pure metals generally have
(a) high conductivity and low temperature coefficient.
(b) high conductivity and large temperature coefficient.
(c) low conductivity and zero temperature coefficient.
(d) low conductivity and high temperature coefficient.
[U.P.S.C. I.E.S. E.E.-I, 1992]

16. The temperature coefficient of resistance of a wire is 0.0008°C. If the resistance of the wire is 8 ohm at 0°C, what is the resistance at 100°C?
(a) 8.64 Ohm. (b) 8.08 Ohm.
(c) 7.92 Ohm. (d) 7.20 Ohm.
[U.P.S.C. I.E.S. E.E.-I, 2007]

17. If the length of a wire of resistance R is uniformly stretched to n times its original value, its new resistance is
(a) nR (b) R/n (c) n^2R (d) R/n^2
[GATE E.E. 1998]

18. Ohm's law in point form in field theory can be expressed as
(a) $V = RI$ (b) $J = \frac{E}{\sigma}$ (c) $J = \sigma E$ (d) $R = \rho \frac{l}{A}$
[U.P.S.C. I.E.S. E.E.-I, 2002]

19. Specific resistance of a conductor depends upon
(a) dimensions of the conductor.
(b) composition of conductor material.
(c) resistance of the conductor.
(d) both (a) and (b).

20. Which of the following materials possesses the least specific resistance ?
(a) Aluminium. (b) Copper.
(c) Silver. (d) Iron.

21. The insulation resistance of a cable of length 10 km is 1 MΩ. For a length of 100 km of same cable, the insulation resistance will be
(a) 1 MΩ (b) 10 MΩ (c) 0.1 MΩ (d) 0.01 MΩ
[GATE E.E. 1995]

Answers: **1.** (a), **2.** (b), **3.** (d), **4.** (b), **5.** (b), **6.** (d), **7.** (d), **8.** (a), **9.** (f), **10.** (a), **11.** (b), **12.** (a), **13.** (a), **14.** (b, c), **15.** (b), **16.** (a), **17.** (c), **18.** (c), **19.** (b), **20.** (c), **21.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

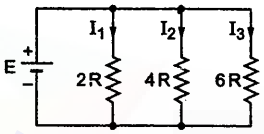
22. The hot resistance of the filament of a bulb is higher than the cold resistance because the temperature coefficient of the filament is
(a) negative. (b) infinite. (c) zero. (d) positive.
[U.P.S.C. I.E.S. E.E.-I, 2000]

23. The temperature coefficient of resistance of an insulator is
(a) positive and independent of temperature.
(b) negative and independent of temperature.
(c) negative and dependent on temperature.
(d) positive and dependent on temperature.
[U.P.S.C. I.E.S. E.E.-I, 1999]

24. Four resistances 80 Ω, 50 Ω, 25 Ω and R are connected in parallel. Current through 25 Ω resistance is 4 A. Total current of the supply is 10 A. The value of R will be
(a) 66.66 Ω (b) 40.25 Ω (c) 36.36 Ω (d) 76.56 Ω
[U.P.S.C. I.E.S. E.E.-I, 1999]

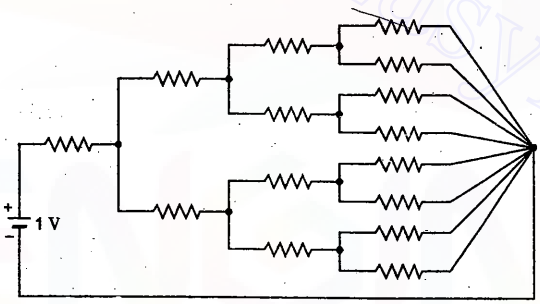
25. Three parallel resistive branches are connected across a dc supply. What will be the ratio of the branch currents $I_1 : I_2 : I_3$ if the branch resistances are in the ratio $R_1 : R_2 : R_3 :: 2 : 4 : 6$?
(a) 3 : 2 : 6 (b) 2 : 4 : 6 (c) 6 : 3 : 2 (d) 6 : 2 : 4
[U.P.S.C. I.E.S. E.E.-I, 2004]

26. Three parallel branches of resistors are connected across a dc source as shown in the figure. What is $I_1 : I_2 : I_3$?



(a) 3 : 2 : 6 (b) 2 : 4 : 6
(c) 6 : 3 : 2 (d) 6 : 2 : 4
[U.P.S.C. I.E.S. E.E.-I, 2011]

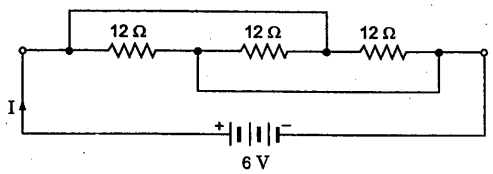
27. All the resistances in figure shown below are 1 Ω each. The value of current 'I' is



(a) $\frac{1}{15}$ A (b) $\frac{2}{15}$ A (c) $\frac{4}{15}$ (d) $\frac{8}{15}$ A
[GATE E.E. 1992]

28. Two resistors R_1 and R_2 give combined resistance of 4.5 Ω when in series and 1 Ω when in parallel, the resistances are
(a) 2 Ω and 2.5 Ω (b) 1 Ω and 3.5 Ω
(c) 1.5 Ω and 3 Ω (d) 4 Ω and 0.5 Ω
[A.M.I.E. Summer 1995]

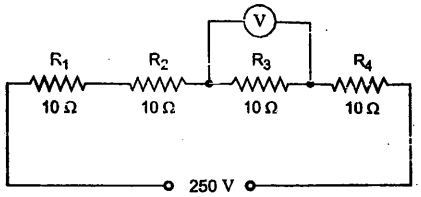
29. For the circuit shown below the equivalent resistance will be



(a) 36 Ω (b) 12 Ω (c) 4 Ω (d) 6 Ω

30. Twelve 1 Ω resistance are used as edges to form a cube. The resistance between two diagonally opposite corners of the cube is
(a) $\frac{5}{6}\Omega$ (b) 1 Ω (c) $\frac{6}{5}\Omega$ (d) $\frac{3}{2}\Omega$
[GATE E.C.E. 2003]

31.



If in above the figure, resistor R_3 becomes open circuited, the voltmeter will read
(a) zero (b) 62.5 V (c) 125 V (d) 250 V

32. How are 500 Ω resistors connected so as to give an effective resistance of 750 Ω ?
(a) Three resistors of 500 Ω each, in parallel.
(b) Three resistors of 500 Ω each, in series.
(c) Two resistors of 500 Ω each, in parallel.
(d) Two resistors of 500 Ω each, in parallel and the combination in series with another 500 Ω resistor.

33. Which of the following does not use heating effect of electric current ?
(a) Electric furnace. (b) Geyser.
(c) Electric iron. (d) Vacuum cleaner
(e) Electric oven. (f) Immersion heater.

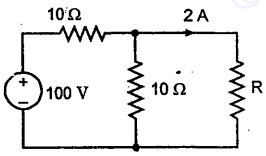
34. Which of the following is not equivalent to watts ?
(a) amperes × volts. (b) $(\text{amperes})^2 \times \text{ohm}$.
(c) amperes/volt. (d) joules per second.

35. Which of the following relation is not correct ?
(a) $P = \frac{V}{R^2}$ (b) $P = VI$
(c) $I = \sqrt{\frac{P}{R}}$ (d) $V = \sqrt{PR}$

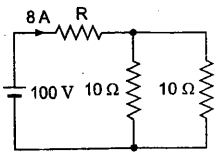
36. A network consists of linear resistors and ideal voltage source. If the value of the resistors are doubled, then voltage across each resistor is
(a) halved. (b) doubled.
(c) increased four lines. (d) not changed.
[G.G.S.I.P. Delhi Univ. Electrical Science May 2005]

37. Three resistances each of R Ω are corrected to form a triangle. The resistance between any two terminals will be
(a) R Ω (b) $\frac{3}{2}$R Ω (c) 3R Ω (d) $\frac{2}{3}$R Ω
[R.G.T.U. B.E.E. June, July 2006]

38. In given figure, the value of resistance R in Ω is
(a) 10
(b) 20
(c) 30
(d) 40 [GATE E.E. 2004]



39. In the figure given below the value of R is
(a) 2.5 Ω
(b) 5.0 Ω
(c) 7.5 Ω
(d) 10.0 Ω [GATE E.E. 2005]

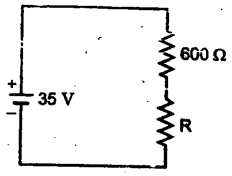


Answers: **22.** (d), **23.** (c), **24.** (c), **25.** (c), **26.** (c), **27.** (d), **28.** (c), **29.** (c), **30.** (a), **31.** (d), **32.** (d), **33.** (d), **34.** (c), **35.** (a), **36.** (d), **37.** (d), **38.** (b), **39.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

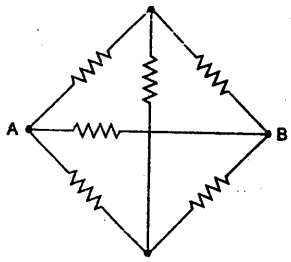
40. A 35 V source is connected to a series circuit of 600 Ω and R as shown. If a voltmeter of internal resistance 1.2 kΩ is connected across 600 Ω resistor, it reads 5 V. The value of R is



(a) 1.2 kΩ (b) 2.4 kΩ
(c) 3.6 kΩ (d) 7.2 kΩ

[U.P.S.C. I.E.S. E.E.-I, 1992]

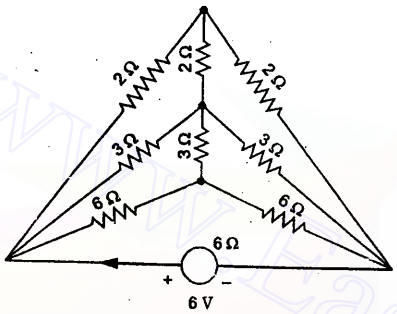
41. When all the resistances in the circuit are of 1 Ω each, the equivalent resistance across the points A and B will be



(a) 1 Ω
(b) 0.5 Ω
(c) 2 Ω
(d) 1.5 Ω

[U.P.S.C. I.E.S. E.E.-I, 1992]

42. Consider the following circuit. What is the value of current I in the circuit shown ?



(a) 1 A (b) 2 A (c) 3 A (d) 4 A

[U.P.S.C. I.E.S. E.E.-I, 2004]

43. When an electric current flows through a conductor, its temperature rises. This is because of
(a) mutual collisions between metal atoms.
(b) mutual collisions between conducting electrons.
(c) collisions between conduction electrons and atoms.
(d) release of conduction electrons from parent atoms.

44. Two heaters, rated at 1000 W, 250 V each are connected in series across a 250 V, 50 Hz ac mains. The total power drawn from the supply would be _____ W.
(a) 1,000 (b) 500 (c) 250 (d) 2,000

[Delhi University 1984]

45. Four 100 W bulbs are connected in parallel across 200 V supply line. If one bulb gets fused
(a) no bulb will light.
(b) all the four bulbs will light.
(c) rest of the three bulbs will light.
(d) none of the above.

46. A 200 W, 230 V lamp is connected across 115 V supply. The lamp will draw power
(a) slightly more than 50 W. (b) slightly less than 50 W.
(c) exactly 100 W. (d) exactly 50 W.

47. Two incandescent light bulbs of 40 W and 60 W rating are connected in series across the mains. Then
(a) the bulbs together consume 100 W.
(b) the bulbs together consume 50 W.
(c) the 60 W bulb glows brighter.
(d) the 40 W bulb glows brigher.

[GATE E.E. 2001]

48. How may 200 W/220 V incandescent lamps connected in series would consume the same total power as a singie 100 W/220 V incandescent lamp?
(a) not possible. (b) 4 (c) 3 (d) 2

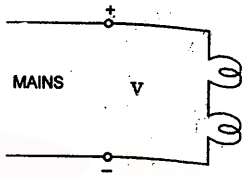
[GATE E.E. 2009]

49. A certain network consists of a large number of ideal linear resistances, one of which is designated as R and two constant ideal sources. The power consumed by R is P_1 when only the first source is active, and P_2 when only the second source is active. If both sources are active simultaneously then the power consumed by R is

(a) $P_1 \pm P_2$ (b) $\sqrt{P_1} \pm \sqrt{P_2}$
(c) $\left(\sqrt{P_1} \pm \sqrt{P_2}\right)^2$ (d) $(P_1 \pm P_2)^2$

[U.P.S.C. I.E.S. E.E.-I, 2003]

50. The incandescent bulbs rated respectively as P_1 and P_2 for operation at a specified main voltage are connected in series across the mains as shown in the figure. Then the total power supplied by the main to the two bulbs



(a) $\frac{P_1 P_2}{P_1 + P_2}$
(b) $\sqrt{P_1^2 + P_2^2}$
(c) $(P_1 + P_2)$
(d) $\sqrt{P_1 \times P_2}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

51. A 100 watt light bulb burns on an average of 10 hours a day for one week. The weekly consumption of energy will be _____ unit/s.
(a) 7 (b) 70 (c) 0.7 (d) 0.07

[Delhi Univ. July 1984]

52. Which of the following statements is incorrect ?
(a) Resistance is a passive element.
(b) Inductor is a passive element.
(c) Current source is a passive element.
(d) Voltage source is an active element.

53. The terminals across the source are _____ if a current source is to be neglected.
(a) open circuited (b) short circuited
(c) replaced by a capacitor
(d) replaced by a source resistance

54. Which of the following is an active element in a circuit?
(a) Current source. (b) Resistance.
(c) Inductance. (d) Capacitance.

55. Which of the following is not bilateral element?
(a) Constant current source. (b) Resistor.
(c) Inductor. (d) Capacitor.

56. The circuit having same properties in either direction is known as _____ circuit.
(a) bilateral (b) unilateral
(c) irreversible (d) reversible

57. The elements which are not capable of delivering energy by its own are known as
(a) unilateral elements. (b) nonlinear elements.
(c) passive elements. (d) active elements.

Answers: **40.** (b), **41.** (b), **42.** (c), **43.** (c), **44.** (b), **45.** (c), **46.** (a), **47.** (d), **48.** (d), **49.** (c), **50.** (a), **51.** (a), **52.** (c), **53.** (a), **54.** (a), **55.** (a), **56.** (a), **57.** (c),

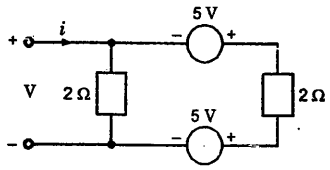
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

58. A network having one or more than one source of emf is known as _____ network.
(a) passive (b) active (c) linear (d) nonlinear

59. A circuit having neither any energy source nor emf source is called the _____ circuit.
(a) unilateral (b) bilateral
(c) passive (d) active

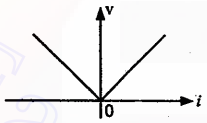
60. Consider the following circuit :
Which one of the following statements is correct ?



(a) Passive and linear. (b) Active and linear.
(c) Passive and nonlinear. (d) Active and nonlinear.
[U.P.S.C. I.E.S. E.E.-I, 2004]

61. A 3 V dc supply with an internal resistance of 2 Ω supplies a passive nonlinear resistance characterised by the relation $V_{NL} = I_{NL}^2$. The power dissipated in the nonlinear resistance is
(a) 1.0 W. (b) 1.5 W. (c) 2.5 W. (d) 3.0 W.
[GATE E.E. 2007]

62. The *v-i* characteristic of an element is shown in the figure given below. The element is
(a) nonlinear, active, nonbilateral.
(b) linear, active, nonbilateral.
(c) nonlinear, passive, nonbilateral.
(d) nonlinear, active, bilateral.



[U.P.S.C. I.E.S. E.E.-I, 2002]

63. A network has 4 nodes and 3 independent loops. What is the number of branches in the network?
(a) 5 (b) 6 (c) 7 (d) 8
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

64. If there are *b* branches and *n* nodes the number of equations will be
(a) $n-1$ (b) b (c) $b-n$ (d) $b-n+1$

65. An electric circuit with 10 branches and 7 nodes will have
(a) 3 loop equations. (b) 4 loop equations.
(c) 7 loop equations. (d) 10 loop equations.
[U.P.S.C. I.E.S. E.E.-I, 2001]

66. A network has 10 nodes and 17 branches. The number of different node pair voltage would be
(a) 7 (b) 9 (c) 45 (d) 10
[A.M.I.E. Sec B. Circuit Theory & Control Summer 2005]

67. If the number of branches in a network is 'B', the number of nodes is 'N' and the number of dependent loops is 'L' , then the number of independent node equations will be
(a) N + L – 1 (b) B – 1
(c) B – N (d) N – 1 [U.P.S.C. I.E.S. E.E.-I, 2000]

68. Consider the following statements on binary tree:
1. A tree with *n* nodes has $(n-1)$ edges.
2. A labelled and rooted binary tree can be uniquely constructed given its post-order and per-order traversal results.
3. The maximum number of nodes in a binary tree of height (depth) *h* is $(2^{h+1}-1)$.
4. A complete binary tree with *n* internal nodes has $(n+1)$ leaves.

Which of the statements given above are correct?
(a) 1, 2, 3, 4. (b) 1, 2 and 3 only.
(c) 1 and 3 only. (d) 2 and 4 only.
[U.P.S.C. I.E.S E.T.E.-II, 2007]

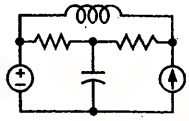
69. A connected network of N > 2 nodes has at most one branch directly connecting any pair of nodes. The graph of the network
(a) must have at least N branches for one or more closed paths to exist?
(b) can have an unlimited number of branches?
(c) can only have at most N branches?
(d) can have a minimum number of branches not decided by N?
[GATE E.E. 2001]

70. The graph of an electrical network has N nodes and B branches. The number of links, L, with respect to the choice of a tree, is given by
(a) B – N + 1 (b) B + N
(c) N – B + 1 (d) N – 2B – 1
[GATE E.E. 2002]

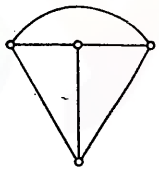
71. The number of possible ordered trees with 3 nodes A, B, C is
(a) 6 (b) 8 (c) 10 (d) 12
[U.P.S.C. I.E.S E.T.E.-II, 2008]

72. What is the number of chords of a connected graph G of *n* vertices and *e* edges?
(a) $n(n-1)/2$ (b) $n-1$
(c) $e-n-1$ (d) $e-n+1$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

73. The number of chords in the graph of the given circuit will be
(a) 3 (b) 4
(c) 5 (d) 6
[GATE E.E. 2008]



74. What is the total number of trees for the graph shown in figure?
(a) 4 (b) 8
(c) 12 (d) 16
[U.P.S.C. I.E.S. E.T.E.-I, 2006]



75. The determinant of the matrix

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ 100 & 1 & 0 & 0 \\ 100 & 200 & 1 & 0 \\ 100 & 200 & 300 & 1 \end{bmatrix}$$ is

(a) 100 (b) 200 (c) 1 (d) 300
[GATE E.E. 2002]

76. Consider the following statements with regard to a complete incidence matrix:
1. The sum of the entries in any column is zero.
2. The rank of the matrix is $n-1$ where *n* is the number of nodes.
3. The determinant of the matrix of a closed loop is zero.

Which of the statements given above are correct?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

77. The incidence matrix A of a connected graph is given below:

Nodes \ Branches	1	2	3	4	5	6
1	1	0	0	–1	0	–1
2	0	0	0	1	–1	0
3	0	1	1	0	1	1
4	–1	–1	–1	0	0	0

Answers: **58.** (b), **59.** (c), **60.** (b), **61.** (a), **62.** (a), **63.** (b), **64.** (d), **65.** (b), **66.** (c), **67.** (d), **68.** (d), **69.** (a), **70.** (a), **71.** (d), **72.** (d), **73.** (a), **74.** (d), **75.** (c), **76.** (d), **77.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The following statements are associated with the above matrix:
1. Branches 2, 3 are in series.
2. Branches 4, 5 are in series.
3. Voltages of branches 4, 5 and 6 form an independent set.

Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

78. The matrix A given below is the node incidence matrix of a network. The columns correspond to branches of the network while the rows correspond to nodes. Let $V[v_1 v_2 \dots v_6]^T$ denote the vector of branch voltages while $I = [i_1 i_2 \dots i_6]^T$ that of branch currents. The vector $E = [e_1 e_2 e_3 e_4]^T$ denotes the vector of node voltages relative to a common ground.

$$\begin{bmatrix} 1 & 1 & 1 & 0 & 0 & 0 \\ 0 & -1 & 0 & -1 & 1 & 0 \\ -1 & 0 & 0 & 0 & -1 & -1 \\ 0 & 0 & -1 & 1 & 0 & 1 \end{bmatrix}$$

Which of the following statements is true?
(a) The equations $V_1 - V_2 + V_3 = 0$, $V_3 + V_4 - V_5 = 0$ are KVL equations for the network for some loops.
(b) The equations $V_1 - V_3 - V_6 = 0$, $V_4 + V_5 - V_6 = 0$ are KVL equations for the netwrok for some loops.
(c) $E = AV$.
(d) $AV = 0$ are KVL equations for the network. [GATE E.E. 2007]

79. For a voltage source
(a) terminal voltage is equal to the source emf.
(b) terminal voltage cannot exceed source emf.
(c) terminal voltage is always lower than source emf.
(d) terminal voltage is higher than the source emf.

80. Constant voltage source is
(a) active and bilateral. (b) passive and bilateral
(c) active and unilateral. (d) passive and unilateral.

81. Ideal voltage source have
(a) zero internal resistance. (b) infinite internal resistance.
(c) low value of current. (d) large value of emf..
[R.G.T.U. Basic E.E. Dec., 2006]

82. An ideal voltage source should have
(a) large emf. (b) small emf.
(c) zero resistance. (d) none of these.
[G.B.T.U. Even Semester 2010-11]

83. Ideal current source have
(a) zero internal resistance. (b) infinite internal resistance.
(c) low value of voltage. (d) large value of current.
[R.G.T.U. Basic E.E. Nov./Dec. 2007]

84. A practical current source is represented by
(a) a resistance in series with an ideal current source.
(b) a resistance in parallel with an ideal current source.
(c) a resistance in parallel with an ideal voltage source.
(d) none of the above. [GATE E.E. 1997]

85. A dependent source
(a) may be a current source or a voltage source
(b) is always a voltage source
(c) is always a current source
(d) neither a current source nor a voltage source
[R.G.T.U. Basic E.E. December 2006]

86. A constant current source supplies a current of 300 mA to a load of 1 kΩ. When the load is changed to 100 Ω, the load current will be
(a) 3 A (b) 300 mA (c) 30 mA (d) 100 mA

87. A voltage source having an open-circuit voltage of 100 V and internal resistance of 50 Ω is equivalent to a current source
(a) 2 A in parallel with 50 Ω. (b) 2 A with 50 Ω in series.
(c) 0.5 A in parallel with 50 Ω. (d) 2 A in parallel with 100 Ω.
[U.P.S.C. I.E.S E.E.-II, 1995]

88. To neglect a voltage source, the terminals across the source are
(a) open-circuited. (b) short-circuited.
(c) replaced by some resistance. (d) replaced by inductor.
[A.M.I.E. Sec B. Circuit Theory & Control Winter 2006]

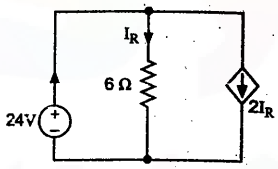
89. For determining the polarity of the voltage drop across a resistor, it is necessary to know the
(a) value of resistor. (b) value of current.
(c) direction of current flowing through the resistor.
(d) value of emf in the circuit.

90. Kirchhoff's laws are valid for
(a) linear circuits only.
(b) passive time invariant circuits.
(c) nonlinear circuits only.
(d) both linear and nonlinear circuits.
[A.M.I.E. Elec. Science Summer 1994]

91. Kirchhoff's laws are not applicable to circuits with
(a) distributed parameters. (b) lumped parameters.
(c) passive elements. (d) nonlinear resistances.

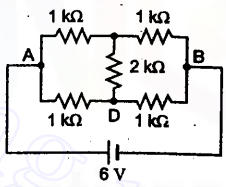
92. Kirchhoff's voltage law is concerned with
(a) IR drop. (b) battery emf.
(c) junction voltage. (d) both (a) and (b).
[R.G.T.U. Basic E.E. December 2006]

93. Consider the circuit given below. What is the power delivered by the 24 V source?
(a) 96 W
(b) 114 W
(c) 192 W
(d) 288 W

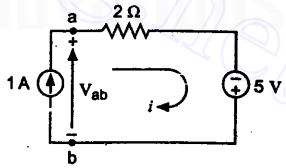


[U.P.S.C. I.E.S. E.E.-I, 2007]

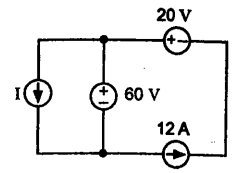
94. The current through the 2 kΩ resistance in the circuit shown is
(a) 0 mA
(b) 1 mA
(c) 2 mA
(d) 6 mA
[GATE E.E. 2009]



95. Assuming ideal elements in the circuit shown below, the voltage V_{ab} will be
(a) −3 V (b) 0 V
(c) 3 V (d) 5 V
[GATE E.E. 2008]



96. In the interconnection of ideal sources shown in the figure, it is known that the 60 V source is absorbing power. Which of the following can be the value of the current source I ?
(a) 10 A (b) 13 A
(c) 15 A (d) 18 A



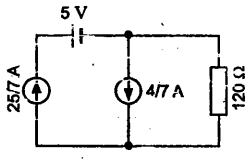
[GATE E.C.E. 2009]

Answers: **78.** (b), **79.** (b), **80.** (c), **81.** (a), **82.** (c), **83.** (b), **84.** (b), **85.** (a), **86.** (b), **87.** (a), **88.** (b), **89.** (c), **90.** (d), **91.** (a), **92.** (d), **93.** (d), **94.** (a), **95.** (a), **96.** (a),

Downloaded From : www.EasyEngineering.net

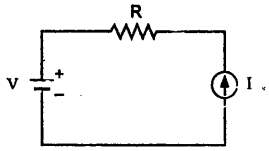
Downloaded From : www.EasyEngineering.net

97. The current through 120 ohm resistor in the circuit shown in the figure is



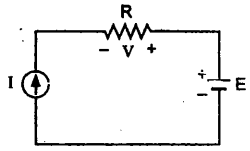
(a) 1 A (b) 2 A
(c) 3 A (d) 4 A
[U.P.S.C. I.E.S. E.E.-I, 2002]

98. For the network shown in the figure, what is the voltage across the current source I?



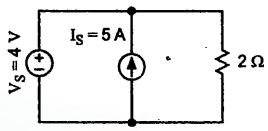
(a) V – RI
(b) V + RI
(c) Zero. (d) RI – V
[U.P.S.C. I.E.S. E.E.-I, 2008]

99. For the circuit shown, what is the voltage V if the source voltage is reduced by 50%?



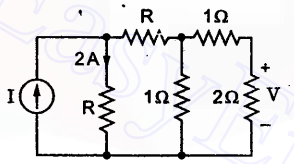
(a) IR + E
(b) E – IR
(c) 2IR – (E/2)
(d) (E/2) – IR
[U.P.S.C. I.E.S. E.E.-I, 2008]

100. For the circuit shown, find out the current flowing through the 2 Ω resistance. Also identify the changes to be made to double the current through the 2 Ω resistance.



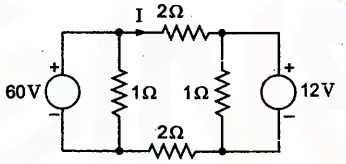
(a) (5 A; Put $V_s = 20$ V) (b) (2 A; Put $V_s = 8$ V)
(c) (5 A; Put $I_s = 10$ A) (d) (7 A; Put $I_s = 12$ A)
[GATE E.E., 2009]

101. What is the value of I for the below shown circuit, if V = 2 volts?



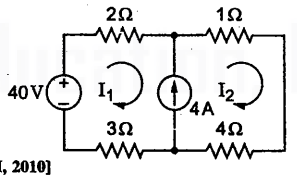
(a) 2 A
(b) 4 A
(c) 6 A
(d) 8 A [U.P.S.C. I.E.S. E.E.-I, 2009]

102. For the circuit shown, the value of current, I is



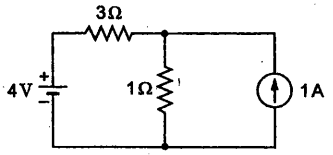
(a) 2 A
(b) 3 A
(c) 6 A
(d) 12 A
[U.P.S.C. I.E.S. E.E.-I, 2010]

103. The currents I_1 and I_2 in the below circuit are respectively



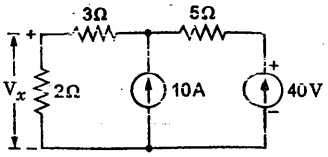
(a) 4 A; 4 A
(b) 3 A; 5 A
(c) 2 A; 6 A
(d) 6 A; 2 A [U.P.S.C. I.E.S. E.E.-I, 2010]

104. For the circuit shown, the voltage across the 1 ohm resistor is given by



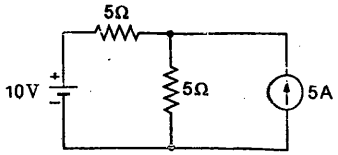
(a) $\frac{7}{4}$ V (b) $\frac{5}{4}$ V
(c) $\frac{7}{3}$ V (d) $\frac{2}{3}$ V
[U.P.S.C. I.E.S. E.E.-I, 2010]

105. The voltage V_x across the 2 Ω resistance in the circuit is



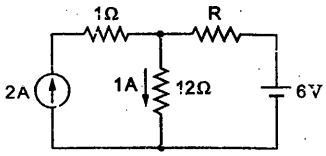
(a) 16 V
(b) 60 V
(c) 18 V
(d) 10 V
[U.P.S.C. I.E.S. E.E.-I, 2011]

106. What is the voltage across the current source for the below shown circuit?



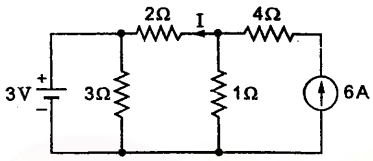
(a) 5.0 V
(b) 7.5 V
(c) 12.5 V
(d) 17.5 V
[U.P.S.C. I.E.S. E.E.-I, 2009]

107. If the 12 Ω resistor draws a current of 1 A as shown in the figure, the value of resistance R is



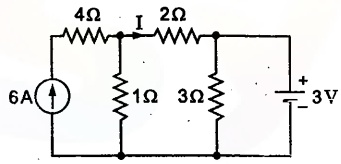
(a) 4 Ω (b) 6 Ω
(c) 8 Ω (d) 18 Ω
[GATE E.E. 2010]

108. For the circuit as shown in the figure, what is the value of I?



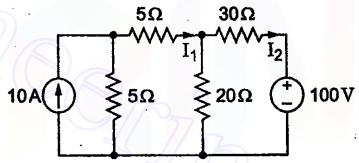
(a) 4 A
(b) 3 A
(c) 2 A
(d) 1 A
[U.P.S.C. I.E.S. E.E.-I, 2009]

109. For the circuit shown in the figure, I is



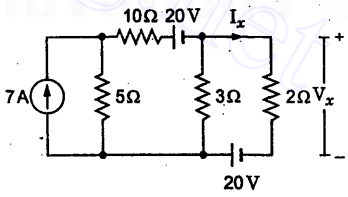
(a) 0 A
(b) 1 A
(c) 2 A
(d) 3 A
[U.P.S.C. I.E.S. E.E.-I, 2010]

110. The currents I_1 and I_2 in the below circuit are respectively



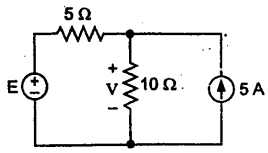
(a) 1.818 A; – 0.4545 A (b) 2.451 A; – 1.568 A
(c) 0.4545 A; – 1.818 A (d) 1.56 A; – 2.45 A
[U.P.S.C. I.E.S. E.E.-I, 2010]

111. The current I_x and voltage V_x in the below circuit are, respectively



(a) 5 A; 10 V
(b) 10 A; 20 V
(c) 6 A; 12 V
(d) 4 A; 8 V
[U.P.S.C. I.E.S. E.E.-I, 2010]

112. If the voltage V across 10 Ω resistance is 10 V, what is the voltage E of the voltage source in the circuit shown?



(a) –50 V (b) –10 V
(c) 10 V (d) 50 V
[U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **97.** (c), **98.** (b), **99.** (d), **100.** (b), **101.** (c), **102.** (d), **103.** (c), **104.** (a), **105.** (c), **106.** (d), **107.** (b), **108.** (d), **109.** (b), **110.** (c), **111.** (a), **112.** (b),

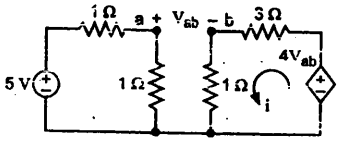
113. In the circuit shown in the figure, the value of the current will be given by



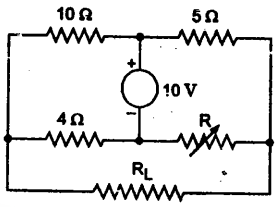
(a) 0.31 A.
(b) 1.25 A.
(c) 1.75 A. (d) 2.5 A.

[GATE E.E., 2008]

114. When a resistor R is connected to a current source, it consumes a power of 18 W. When the same R is connected to a voltage source having the same magnitude as the current source, the power absorbed by R is 4.5 W. The magnitude of the current source and the value of R are

(a) $\sqrt{18}$ A and 1 Ω (b) 3 A and 2 Ω
(c) 1 A and 18 Ω (d) 6 A and 0.5 Ω [GATE E.E. 1999]

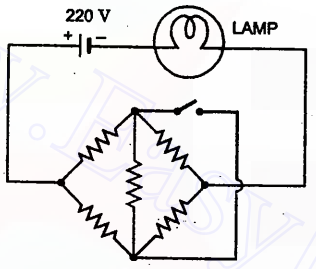
115. For the circuit shown below, the value of R is adjusted, so as to make the current in R_L equal to zero. What is the value of R ?



(a) 1 Ω
(b) 2 Ω
(c) 3 Ω
(d) 4 Ω

[U.P.S.C. I.E.S. E.E.-I, 2005]

116. All the resistances in the circuit given below are of R ohms each. The switch is initially open. What happens to the lamp's intensity when the switch is closed ?



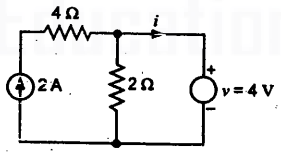
(a) Increases.
(b) Decreases.
(c) Remains the same.
(d) Answer depends on the value of R.

[GATE E.E. 1992]

117. Superposition theorem is not applicable for
(a) voltage calculations. (b) bilateral elements.
(c) power calculations. (d) passive elements.
[U.P.S.C. I.E.S. E.E.-I, 2002]

118. Which of the following theorems is applicable for both linear and nonlinear circuits ?
(a) Superposition. (b) Thevenin's.
(c) Norton's. (d) None of these.
[A.M.I.E. Elec. Science Summer 1994]

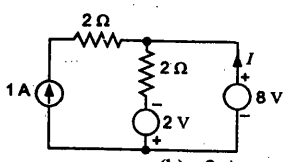
119. In the circuit shown in figure, what will be the value of current *i* through the voltage source when v = 4 V?



(a) 1 A (b) 2 A
(c) 0 A (d) 3 A

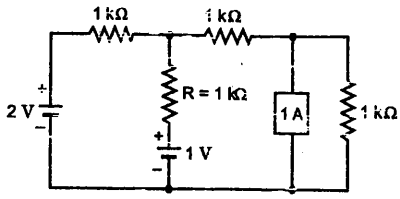
[R.G.T.U. Basic E.E. June 2007]

120. In the circuit shown, what is the value of the current I?



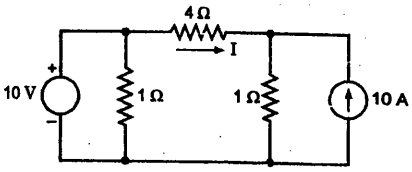
(a) 1 A (b) 2 A
(c) 3 A (d) 4 A [U.P.S.C. I.E.S. E.E.-I, 2008]

121. The current in resistor R shown in figure will be



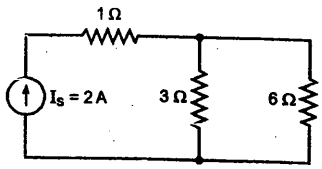
(a) 0.2 A (b) 0.4 A (c) 0.6 A (d) 0.8 A
[U.P.S.C. I.E.S. E.E.-I, 1992]

122. In the network shown below, what is the current I in the direction shown ?



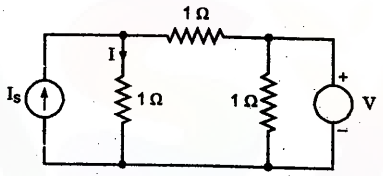
(a) 0 A
(b) 1/3 A
(c) 5/6 A (d) 4 A
[U.P.S.C. I.E.S. E.E.-I, 2006]

123. In the given circuit, what is the voltage across the current source I_S ?



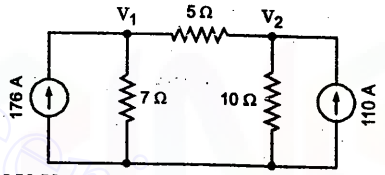
(a) 0 V
(b) 2 V
(c) 3 V
(d) 6 V
[U.P.S.C. I.E.S. E.E.-I, 2005]

124. In the given circuit, I = 1 A for I_S = 0. What is the value of I for I_S = 2 A ?



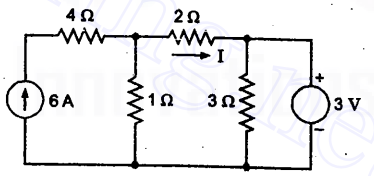
(a) 7 A
(b) 4 A
(c) 3 A (d) 2 A
[U.P.S.C. I.E.S. E.E.-I, 2005]

125. In the circuit shown below, what is the voltage across 5 Ω resistor ?



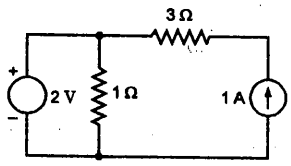
(a) −30 V
(b) 30 V
(c) 1250 V (d) −1250 V
[U.P.S.C. I.E.S. E.E.-I, 2006]

126. For the circuit shown in the given figure the current I is given by



(a) 3 A
(b) 2 A
(c) 1 A
(d) zero
[U.P.S.C. I.E.S. E.E.-I, 2001]

127. For the circuit given in the figure the power delivered by the 2 V source is given by



(a) 4 W (b) 2 W (c) −2 W (d) −4 W
[U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **113.** (b), **114.** (b), **115.** (b), **116.** (c), **117.** (c), **118.** (d), **119.** (c), **120.** (d), **121.** (a), **122.** (a), **123.** (d), **124.** (d), **125.** (b), **126.** (c), **127.** (b),

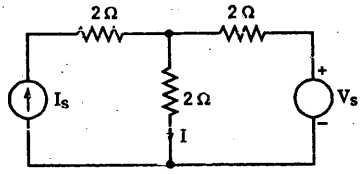
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

128. A 10 V battery with an internal resistance of 1 Ω is connected across a non-linear load whose *v-i* characteristic is given by

$$7i = v^2 + 2v$$

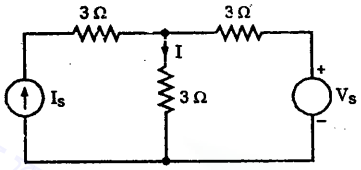
The current delivered by the battery is
(a) 2.5 A
(b) 5 A
(c) 6 A
(d) 7 A



[U.P.S.C. I.E.S. E.E.-I, 1998]

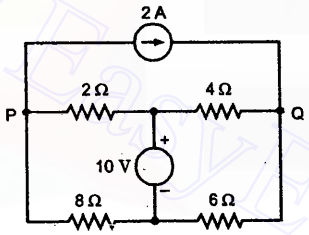
129. In the circuit shown in the figure, the value of V_S is 0, when I = 4 A. The value of I when V_S = 16 V, is
(a) 6 A
(b) 8 A
(c) 10 A (d) 12 A [U.P.S.C. I.E.S. E.E.-I, 2003]

130. Consider the following circuit :

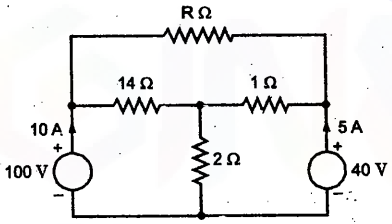


In this above circuit, when V_S = 3 V, I = 4 A, what is the value of I when V_S = 12 V ?
(a) 5.5 A (b) 10 A (c) 15 A (d) 20 A
[U.P.S.C. I.E.S. E.E.-I, 2004]

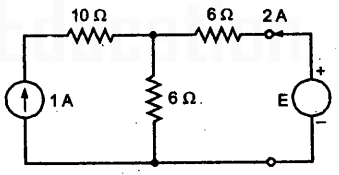
131. In given figure, the potential difference between points P and Q is
(a) 12 V
(b) 10 V
(c) –6 V
(d) 8 V
[GATE E.E. 2003]



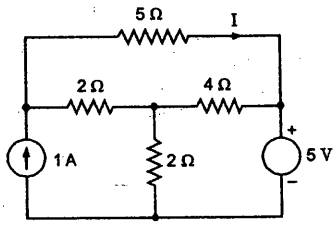
132. In the given figure, the value of R is
(a) 10 Ω
(b) 18 Ω
(c) 24 Ω
(d) 12 Ω
[GATE E.E. 2003]



133. In the given figure, the value of the source voltage is
(a) 12 V
(b) 24 V
(c) 30 V
(d) 44 V [GATE E.E. 2004]

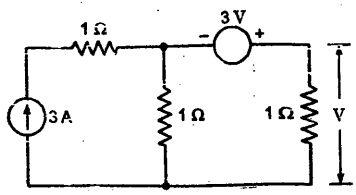


134. Consider the following circuit : What is the value of current I in the 5 Ω resistor in the circuit given in the figure ?
(a) 0 A
(b) 2 A
(c) 3 A
(d) 4 A



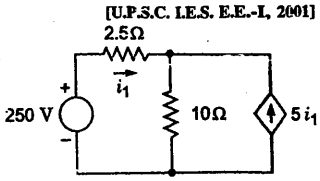
[U.P.S.C. I.E.S. E.E.-I, 2004]

135. The value of V in the circuit shown in the given figure is
(a) 1 V
(b) 2 V
(c) 3 V
(d) 4 V



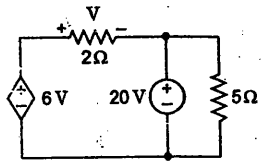
[U.P.S.C. I.E.S. E.E.-I, 2001]

136. In the circuit shown, the current i_1 is
(a) 4 A
(b) 2 A
(c) 4.76 A
(d) 20 A



[U.P.S.C. I.E.S. E.E.-I, 2011]

137. What is the current through the 2 Ω resistance for the circuit as shown below?
(a) 5 A
(b) 4 A
(c) 3 A
(d) 2 A



[U.P.S.C. I.E.S. E.E.-I, 2009]

138. Maxwell's loop current method of solving electrical networks
(a) uses branch currents.
(b) utilizes Kirchhoff's voltage law.
(c) is confined to single-loop circuits.
(d) is a network reduction method. [R.G.T.U. Basic E.E. June 2007]

139. Superposition theorem is applicable for:
(a) Linear circuits only. (b) Non-linear circuits only.
(c) Linear and non-linear circuits both.
(d) None of these. [G.B.T.U. E.E. Even Semester, 2010-11]

140. Nodal analysis is based on
(a) KCL. (b) KVL. (c) both.
(d) law of conservation of energy.
[R.G.T.U. Basic E.E. Nov./Dec. 2009]

141. In nodal analysis, if there are N nodes in the circuit, then how many equations will be written to solve the network?
(a) N – 1. (b) N + 1. (c) N. (d) N – 2.
[R.G.T.U. Basic E.E. June/July 2006, Jan./Feb. 2007]

142. Point out the wrong statement. In the node voltage technique of solving networks, choice of a reference node does not
(a) affect the operation of the circuit.
(b) change the voltage across any element.
(c) alter the pd between any pair of nodes.
(d) affect the voltages of various nodes.
[R.G.T.U. Basic E.E. June 2007]

143. Consider the following statements on mesh and nodal analysis:
1. Networks that contain many series-connected elements, voltage sources or meshes having common current sources (super meshes) are more suitable for mesh analysis than for nodal analysis.
2. Networks with parallel connected elements, current sources or nodes connected by voltage sources are more suitable for nodal analysis than mesh analysis.
3. A circuit with fewer nodes than meshes is better analysed using mesh analysis, while a circuit with fewer meshes, than nodes is better analyzed using nodal analysis.

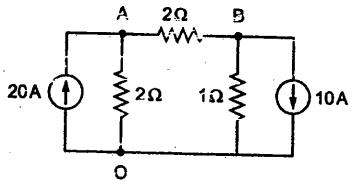
Which of the statements given above are correct?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3. [U.P.S.C. I.E.S. E.E.-I, 2007]

Answers: **128.** (b), **129.** (b), **130.** (a), **131.** (c), **132.** (d), **133.** (c), **134.** (a), **135.** (c), **136.** (a), **137.** (d), **138.** (b), **139.** (a), **140.** (a), **141.** (a), **142.** (a), **143.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

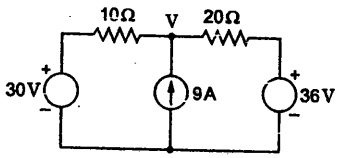
144. Find the voltage of the node A with respect to 'O' for the circuit as shown below.



(a) 40 V
(b) 20 V
(c) 50 V
(d) 60 V

[U.P.S.C. I.E.S. E.E.-I, 2009]

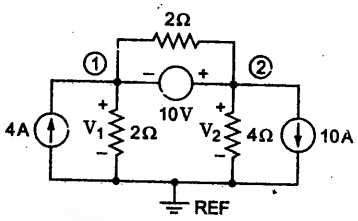
145. The node voltage V in the circuit is



(a) 6 V
(b) 30 V
(c) 36 V
(d) 92 V

[U.P.S.C. I.E.S. E.E.-I, 2011]

146. When KCL is applied at the super node in the above circuit, the current equation in terms of node voltages V_1 and V_2 is



(a) $-6 = \frac{V_1}{2} + \frac{V_2}{4}$

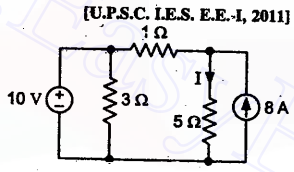
(b) $4 = \frac{V_1 - V_2}{2} + \frac{V_1 - V_2}{20}$

(c) $4 = \frac{V_1}{2} + \frac{V_1 - V_2}{20}$

(d) $4 = \frac{V_1}{2} + \frac{V_2}{4}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

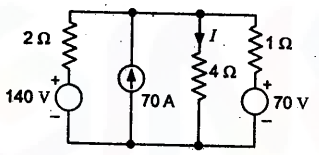
147. For the circuit shown in the figure, what is the value I?



(a) 10 A
(b) 6 A
(c) 3.7 A
(d) 3 A

[U.P.S.C. I.E.S. E.E.-I, 2007]

148. What is the value of the current I in the circuit shown?



(a) 20 A
(b) 25 A
(c) 30 A
(d) 36 A

[U.P.S.C. I.E.S. E.E.-I, 2008]

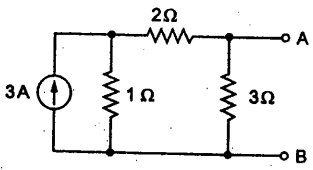
149. While Thevenizing a circuit between two terminals, V_{TH} is equal to

(a) short-circuit terminal voltage.
(b) open-circuit terminal voltage.
(c) net voltage available in the circuit.
(d) emf of the battery nearest to the terminals.

150. While determining R_{TH} of a circuit

(a) voltage and current sources should be left as they are.
(b) all sources should be replaced by their source resistances.
(c) all independent current and voltage sources are short-circuited.
(d) none of the above.

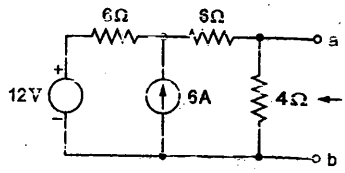
151. The Thevenin's equivalent of the circuit shown in the figure is



(a) 0.75 V, 1.5 Ω
(b) 1.5 V, 1.5 Ω
(c) 1.5 V, 0.75 Ω
(d) 5.0 V, 1.5 Ω

[U.P.S.C. I.E.S. E.E.-I, 2010]

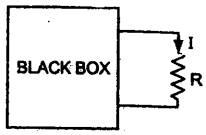
152. Thevenin equivalent circuit to the left of the terminals *a* and *b* in the circuit, has equivalent voltage source V_{th} and equivalent resistance R_{th}, respectively, as



(a) 12 V and 16 Ω
(b) 20 V and 4 Ω
(c) 12 V and 12 Ω
(d) 12 V and 3 Ω

[U.P.S.C. I.E.S. E.E.-I, 2011]

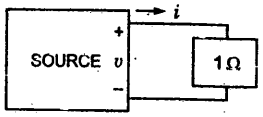
153. For the circuit shown, the black box contains resistors and independent sources only. The current I is 3 A and 1.5 A for R = 0 and 2 Ω, respectively. For R = 1 Ω, what is the current?



(a) 1 A (b) 2 A (c) 3 A (d) 4 A

[U.P.S.C. I.E.S. E.E.-I, 2008]

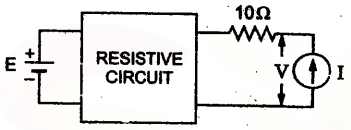
154. As shown in the figure, a 1 Ω resistance is connected across a source that has a load line $v + i = 100$. The current through the resistance is



(a) 25 A
(b) 50 A
(c) 100 A
(d) 200 A

[GATE E.E., 2010]

155. For the circuit as shown in the figure, if E = E_1 and I is removed, then V = 5 volts. If E = 0 and I = 1 A, then V = 5 volts. For E = E_1 and I replaced by resistor of 5 Ω, what is the value of V in volts?



(a) 5.0
(b) 2.5
(c) 7.5
(d) 3.5

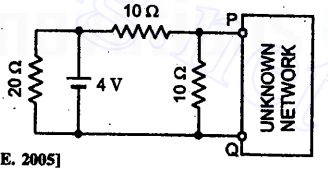
[U.P.S.C. I.E.S. E.E.-I, 2009]

156. In the given circuit, if V = 3 volts for E = 1 volt, I = 0; and V = 2 volts for I = 2 A and E = 0. When E = 1 volt and I is replaced by a resistor of 2 ohm, then what is the value of V?

(a) 2 volts
(b) 4 volts
(c) 6 volts
(d) 8 volts

[U.P.S.C. I.E.S. E.E.-I, 2009]

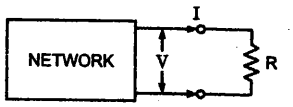
157. In the given figure, the Thevenin's equivalent pair (voltage, impedance), as seen at the terminals P-Q is given by



(a) (2 V, 5 Ω)
(b) (2 V, 7.5 Ω)
(c) (4 V, 5 Ω)
(d) (4 V, 7.5 Ω)

[GATE E.E. 2005]

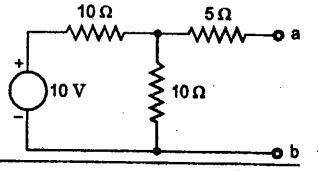
158. For the network shown in figure, when I = 0, V = 20 V and when R = 0, I = 10 A. If now R = 3 Ω what is the value of the current I ?



(a) 6.67 A (b) 6.0 A (c) 4.0 A (d) 10.0 A

[U.P.S.C. I.E.S. E.E.-I, 2006]

159. For the circuit given in the figure, the Thevenin's voltage and resistance as seen at "*a b*" are respectively



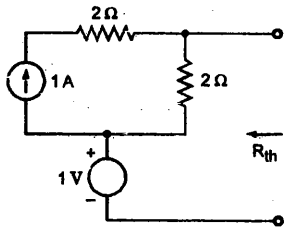
Answers: **144.** (b), **145.** (d), **146.** (a), **147.** (d), **148.** (c), **149.** (b), **150.** (b), **151.** (b), **152.** (d), **153.** (b), **154.** (b), **155.** (b), **156.** (a), **157.** (a), **158.** (c), **159.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

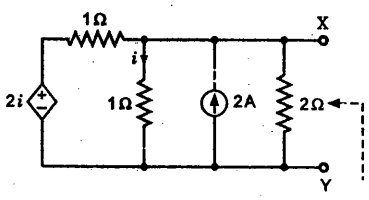
(a) 5 V, 10 Ω
(b) 10 V, 10 Ω
(c) 5 V, 5 Ω
(d) 54 V, 15 Ω [G.G.S.I.P. Delhi Univ. Electrical Science 2005]

160. The Thevenin's equivalent resistance R_{th} for the given network is



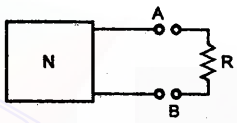
(a) 1 Ω
(b) 2 Ω
(c) 4 Ω
(d) infinity
[U.P.S.C. I.E.S. E.E.-I, 2001]

161. For the circuit shown in the figure, the Thevenin voltage and resistance looking into X-Y are



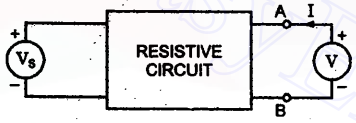
(a) $\frac{4}{3}$ V, 2 Ω
(b) 4 V, $\frac{2}{3}$ Ω
(c) $\frac{4}{3}$ V, $\frac{2}{3}$ Ω
(d) 4 V, 2 Ω [GATE E.C.E. 2007]

162. Norton equivalent to the network N to the left of AB is a current source $I_N = 4$ A from B to A, $R_N = 2$ Ω. The current through R when it is connected across AB = 2 A. What is the value of resistance R ?



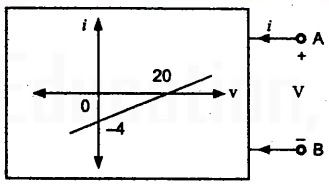
(a) 1 Ω (b) 2 Ω (c) 3 Ω (d) 4 Ω
[U.P.S.C. I.E.S. E.E.-I, 2006]

163. For the network shown in the figure, if $V_S = 1$ V and V = 0, then I = – 5 A and if $V_S = 0$, and V = 1, then



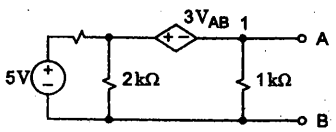
$I = \frac{1}{2}$ A. The value of I_{SC} and R_i of the Norton's equivalent across AB would be respectively
(a) – 5 A and 2 Ω. (b) 10 A and 0.5 A.
(c) 5 A and 2 Ω. (d) 2.5 A and 5 Ω.
[U.P.S.C. I.E.S. E.E.-I, 1998]

164. The resistance seen from the terminals A and B of the device whose characteristic is shown in the figure is



(a) – 5 Ω.
(b) $-\frac{1}{5}\Omega$.
(c) $\frac{1}{5}$. (d) 5 Ω. [U.P.S.C. I.E.S. E.E.-I, 2002]

Statement for Linked Answer Questions 165-166



165. For the circuit given above, the Thevenin's resistance across the terminals A and B is
(a) 0.5 kΩ (b) 0.2 kΩ
(c) 1 kΩ (d) 0.11 kΩ [GATE E.E. 2009]

166. For the circuit given above, the Thevenin's voltage across the terminals A and P is
(a) 1.25 V (b) 0.25 V
(c) 1 V (d) 0.5 V [GATE E.E. 2009]

167. Which of the following statements is/are correct ?
(a) Norton's equivalent resistance is the same as Thevenin's equivalent resistance R_{TH}.
(b) Norton's equivalent is the current equivalent of the network.
(c) The load is connected in parallel to the Norton's equivalent resistance and Norton's equivalent current source.
(d) all of the above.

168. The Norton's equivalent of circuit shown in Fig. 1 is drawn in the circuit shown in Fig. II. The values of I_{SC} and R_{eq} in Fig. 2 are respectively

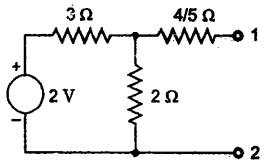


Fig. 1

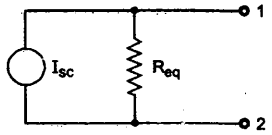

Fig. 2

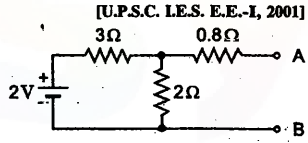
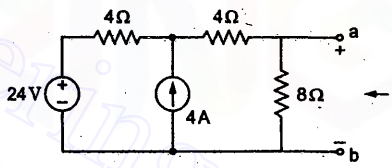
(a) $\frac{5}{2}$ A and 2 Ω (b) $\frac{2}{5}$ A and 1 Ω
(c) $\frac{4}{5}$ A and $\frac{12}{5}$ Ω (d) $\frac{2}{5}$ A and 2 Ω
[U.P.S.C. I.E.S. E.E.-I, 2001]

169. The Norton equivalent between A and B for the circuit is



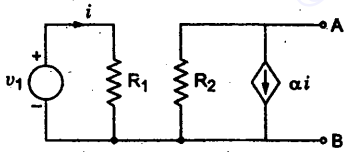
(a) 2 A and 2.5 Ω
(b) 0.5 A and 1 Ω
(c) 1 A and 2 Ω
(d) 0.4 A and 2 Ω
[U.P.S.C. I.E.S. E.E.-I, 2011]

170. Applying Norton's Theorem, the Norton's equivalent circuit to the left of the terminals *a* and *b* in the below circuit is having equivalent current source (I_N) and equivalent resistance (R_N) as



(a) $I_N = 5$ A; $R_N = 4$ Ω (b) $I_N = 4$ A; $R_N = 6$ Ω
(c) $I_N = 9$ A; $R_N = 1.6$ Ω (d) $I_N = 4$ A; $R_N = 3$ Ω
[U.P.S.C. I.E.S. E.E.-I, 2010]

171. For the circuit as shown, what are the values of the Norton's equivalent current and conductance between AB terminals?



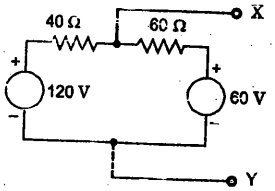
(a) $-\alpha\frac{v_1}{R_1}$ and $G = \frac{1}{R_2}$ (b) $\alpha\frac{v_1}{R_2}$ and $G = \frac{1}{R_1}$
(c) $\alpha\frac{v_1}{R_1}$ and $G = \frac{1}{R_2}$ (d) $-\alpha\frac{v_1}{R_1}$ and $G = -\frac{1}{R_1}$
[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **160.** (b), **161.** (d), **162.** (b), **163.** (c), **164.** (d), **165.** (b), **166.** (d), **167.** (d), **168.** (d), **169.** (d), **170.** (a), **171.** (a),

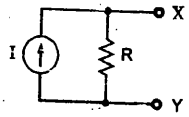
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

172. Consider the circuits A and B. For what values respectively of I and R, the circuit B is equivalent to circuit A ?



(Circuit A)



(Circuit B)

(a) 3 A, 40 Ω
(b) 4 A, 24 Ω
(c) 1 A, 100 Ω
(d) 2 A, 100 Ω

[U.P.S.C. I.E.S. E.E.-I, 2004]

173. A voltage source with an internal resistance R_S, supplies power to a load R_L. The power delivered to the load varies with R_L as

(a) 
(b) 
(c)

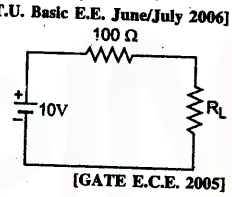
(d) 
[U.P.S.C. I.E.S. E.E. I, 1994]

174. When the power transferred to the load is maximum, the efficiency of power transfer is

(a) 25%. (b) 75%. (c) 50%. (d) 100%.

[R.G.T.U. Basic E.E. June/July 2006]

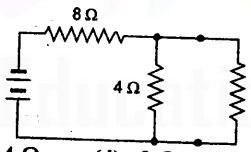
175. The maximum power that can be transferred to the load resistor R_L from the voltage source in the figure is



(a) 1 W. (b) 10 W.
(c) 0.25 W. (d) 0.5 W.

[GATE E.C.E. 2005]

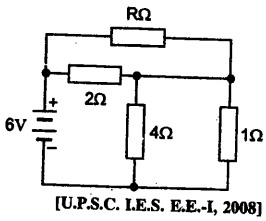
176. Consider the following circuit: What should be the value of resistance R in the circuit shown if it has to absorb the maximum power from the source ?



(a) 8/3 Ω (b) 3/8 Ω (c) 4 Ω (d) 8 Ω

[U.P.S.C. I.E.S. E.E.-I, 2004]

177. In the circuit shown, when is the power absorbed by the 1 Ω resistor maximum?



(a) R = 0.
(b) R = 2 Ω.
(c) R = 4 Ω.
(d) R = ∞.

[U.P.S.C. I.E.S. E.E.-I, 2008]

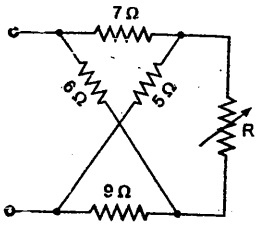
178. A human nerve cell has an open-circuit voltage of 80 mV and it can deliver a current of 5 nA through a 6 M ohm load. What is the maximum power available from the cell?

(a) 0.16 nW (b) 16 mW
(c) 1.6 W (d) 16 pW [U.P.S.C. I.E.S. E.E.-I, 2009]

179. A load is connected to an active network. At the terminals to which the load is connected, $R_{th} = 10\ \Omega$ and $V_{th} = 60$ V. Then maximum power supplied to the load is

(a) 360 W (b) 90 W
(c) 60 W (d) 10 W [U.P.S.C. I.E.S. E.E.-I, 2010]

180. In the lattice network, find the value of R for the maximum power transfer to the load.



(a) 5 Ω
(b) 6.5 Ω
(c) 8 Ω
(d) 9 Ω

[U.P.S.C. I.E.S. E.E.-I, 1992]

181. The *v-i* characteristic as seen from the terminal pair (A, B) of the network of Fig. 1 is shown in Fig. 2. If a variable resistance R_L is connected across the terminal pair (A, B), the maximum power that can be supplied to R_L would be

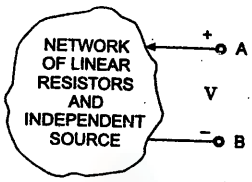


Fig. 1

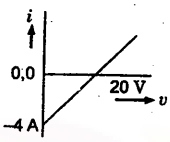

Fig. 2

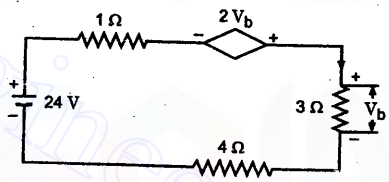
(a) 80 W. (b) 40 W. (c) 20 W.
(d) indeterminate unless the actual network is given.

[GATE E.E. 1991]

182. The current in the given circuit with a dependent voltage source is

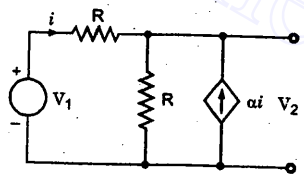


(a) 10 A (b) 12 A (c) 14 A (d) 16 A

[U.P.S.C. I.E.S. E.E.-I, 2001]

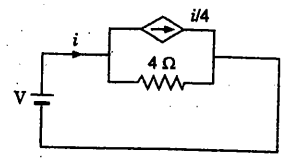
183. Consider the circuit as shown in the figure, which has a current dependent current source. The value $\frac{V_2}{V_1}$ is

(a) 1
(b) 2
(c) $\frac{i+\alpha}{2+\alpha}$
(d) $\frac{\alpha}{2+\alpha}$



[U.P.S.C. I.E.S. E.E.-I, 2003]

184. In the network shown in the figure, the effective resistance faced by the voltage source is



(a) 4 Ω
(b) 3 Ω
(c) 2 Ω
(d) 1 Ω

[U.P.S.C. I.E.S. E.E.-I, 1998]

Answers: **172.** (b), **173.** (c), **174.** (c), **175.** (c), **176.** (a), **177.** (c), **178.** (a), **179.** (b), **180.** (b), **181.** (a), **182.** (b), **183.** (c), **184.** (b),

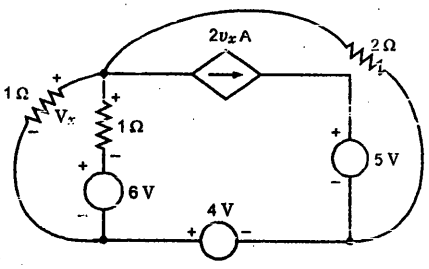
185. In the network shown in the given figure, the value of v_x would be



(a) $\frac{-8}{9}$ V (b) $\frac{8}{9}$ V (c) $\frac{16}{9}$ V (d) $\frac{-16}{9}$ V

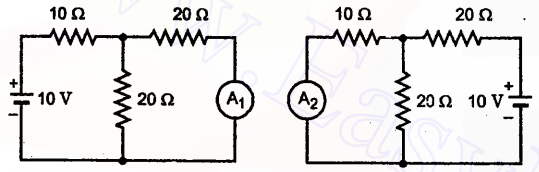
[U.P.S.C. I.E.S. E.E.-I, 1999]

186. For a linear network containing generators and impedances, the ratio of the voltage to the current produced in other loop is the same as the ratio of voltage and current obtained if the positions of the voltage source and the ammeter measuring the current are interchanged. The network theorem is known as

(a) Millman's theorem. (b) Norton's theorem.
(c) Tellegen's theorem. (d) Reciprocity theorem.

[A.M.I.E. Sec B. Circuit & Field Theory Winter 1993]

187. Consider the two circuits I and II shown in the given figures Which of the following statements regarding the current flowing through the ammeters A_1 and A_2 is correct ?



Circuit I Circuit II

(a) The currents in A_1 and A_2 are of the same value and equal 0.25 A.
(b) The currents in A_1 and A_2 are respectively 0.25 A and 2.5 A.
(c) The current in both the ammeters is of the same value and equals 2.5 A.
(d) The currents in A_1 and A_2 are respectively 2.5 A and 0.25 A.

[U.P.S.C. I.E.S. E.E.-I, 1996]

188. In a balanced Wheatstone bridge, if the positions of detector and source are interchanged, the bridge will still remain balanced. This inference can be drawn from

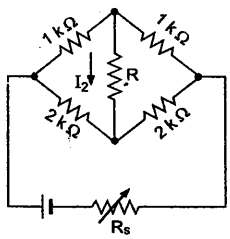
(a) reciprocity theorem. (b) duality theorem.
(c) compensation theorem. (d) equivalence theorem.

[U.P.S.C. I.E.S. E.E.-I, 1999]

189. A bridge is shown in the given figure. If the resistance R_S is increased from 2 kΩ to 2.5 kΩ, the current I_2 will

(a) increase. (b) decrease.
(c) not change.
(d) increase or decrease depending on the polarity of E.

[U.P.S.C. I.E.S. E.E.-I, 1999]



190. Which of the following theorems can be applied to any network-linear or nonlinear, active or passive, time-variant or time-invariant?

(a) Thevenin theorem. (b) Norton theorem.
(c) Tellegen theorem. (d) Superposition theorem.

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

191. The common voltage across parallel branches with different voltage sources can be computed from the relation

$$V = \frac{\frac{V_1}{R_1} + \frac{V_2}{R_2} + \frac{V_3}{R_3}}{1/R_1 + 1/R_2 + 1/R_3}$$

The above statement is associated with _____ theorem.

(a) Thevenin's (b) Millman's
(c) Norton (d) reciprocity

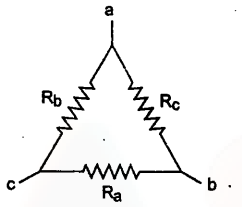
192. The theorem that enables a number of voltage (or current) sources to be combined directly into a single voltage (or current) source is the _____ theorem.

(a) compensation (b) reciprocity
(c) Millman's (d) Maxwell's

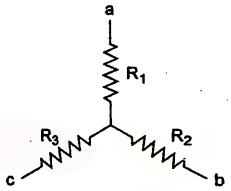
193. Millman's theorem yields equivalent

(a) impedance or resistance. (b) current source.
(c) voltage source. (d) voltage or current source.

194. In given figure R_a, R_b and R_c are 20 Ω, 10 Ω and 10 Ω respectively. The resistances R_1, R_2 and R_3 in ohms of an equivalent star-connection are



(a)



(b)

(a) 2.5, 5, 5 (b) 5, 2.5, 5 (c) 5, 5, 2.5 (d) 2.5, 5, 2.5

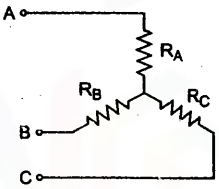
[GATE E.E. 2004]

195. The following are the results of tests conducted on the above star-connected load:

The resistance between A and B with C open : 12 Ω

The resistance between B and C with A open : 22 Ω

The resistance between C and A with B open : 18 Ω

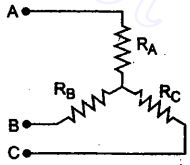


The individual resistances of R_A, R_B and R_C are, respectively,

(a) 8 Ω, 14 Ω and 4 Ω (b) 10 Ω, 2 Ω and 8 Ω
(c) 4 Ω, 8 Ω and 14 Ω (d) 6 Ω, 6 Ω and 8 Ω

[U.P.S.C. I.E.S. E.E.-I, 2011]

196. Consider the star network shown in figure. The resistance between terminals A and B with C open is 6 Ω, between terminals B and C with A open is 11 Ω, and between terminals C and A with B open is 9 Ω. Then



(a) $R_A = 4\ \Omega, R_B = 2\ \Omega, R_C = 5\ \Omega$.
(b) $R_A = 2\ \Omega, R_B = 4\ \Omega, R_C = 7\ \Omega$.
(c) $R_A = 3\ \Omega, R_B = 3\ \Omega, R_C = 4\ \Omega$.
(d) $R_A = 5\ \Omega, R_B = 1\ \Omega, R_C = 10\ \Omega$.

[GATE E.E., 2001]

197. A two-port device is defined by the following pair of equations:

$$i_1 = 2v_1 + v_2 \quad \text{and} \quad i_2 = v_1 + v_2.$$

Its impedance parameters (z_{11}, z_{12}, z_{21}, z_{22}) are given by

(a) $\begin{bmatrix} 2 & 1 \\ 1 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & -1 \\ -1 & 2 \end{bmatrix}$ (c) $\begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}$ (d) $\begin{bmatrix} 2 & -1 \\ -1 & 1 \end{bmatrix}$

[GATE E.E. 2000]

Answers: **185.** (b), **186.** (d), **187.** (a), **188.** (a), **189.** (c), **190.** (c), **191.** (b), **192.** (c), **193.** (d), **194.** (a), **195.** (c), **196.** (b), **197.** (b),

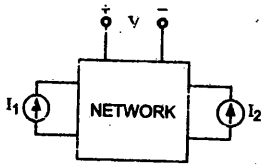
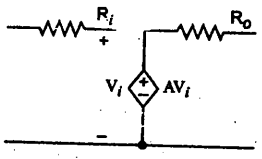
198. The linear network as shown has only resistors. If $I_1 = 8$ A and $I_2 = 12$ A; V is found to be 80 V. V = 0 when $I_1 = -8$ A and $I_2 = 4$ A. Then the value of V when $I_1 = I_2 = 10$ A, is



(a) 25 V. (b) 50 V. (c) 75 V. (d) 100 V.

[U.P.S.C. I.E.S. E.E.-I, 2003]

199. The parameters of the circuit shown in the figure are $R_i = 1\ M\Omega$, $R_0 = 10\ \Omega$, $A = 10^6$ V/V. If $V_i = 1\ \mu V$, the output voltage, input impedance and output impedance respectively are



(a) 1 V, ∞, 10 Ω. (b) 1 V, 0, 10 Ω.
(c) 1 V, 0, ∞. (d) 10 V, ∞, 10 Ω.

[GATE E.E. 2006]

200. Consider the following statements:

The transfer impedances at a 2-port network remain constant when the position of excitation and response are interchanged if the network

1. is linear.
2. contains bilateral elements.
3. has high impedance.
4. is resonant.

Which of the above statements is/are correct?

(a) 1 and 2 only (b) 1, 3 and 4 only
(c) 2 only (d) 1, 2, 3 and 4

[U.P.S.C. I.E.S. E.E.-I, 2010]

201. A two-port network is defined by the relation:

$$I_1 = 5V_1 + 3V_2$$
$$I_2 = 2V_1 - 7V_2$$

The value of Z_{12} is

(a) 3 (b) −3
(c) $\frac{3}{41}$ (d) $\frac{2}{31}$ [U.P.S.C. I.E.S. E.E.-I, 2010]

202. A two-port network is described by the following equations:

$$V_1 = 50\,I_1 + 20\,I_2$$
$$V_2 = 30\,I_1 + 10\,I_2$$

Then, which one of the following is not correct?

(a) $Z_{12} = 20$ (b) $Y_{12} = 0.2$
(c) $h_{12} = 2.0$ (d) A = 25

[U.P.S.C. I.E.S. E.E.-I, 2010]

203. A 2-port network is defined by the relation:

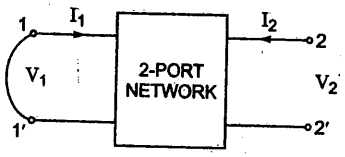
$$V_1 = \frac{3}{4}I_1 - \frac{1}{4}I_2, \quad V_2 = -\frac{1}{2}I_1 + \frac{1}{2}I_2.$$

Then y_{12} is

(a) $\frac{1}{2}$ ℧ (b) $-\frac{1}{2}$ ℧
(c) 1 ℧ (d) −1 ℧

[U.P.S.C. I.E.S. E.E.-I, 2011]

204. When port-1 of a two-port network is short circuited, $I_1 = 4\,I_2$ and $V_2 = 0.5\,I_2$, then which of the following is true?



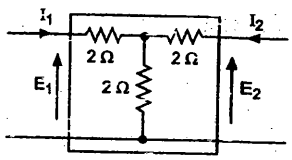
(a) $Y_{11} = 4$ mho (b) $Y_{12} = 8$ mho
(c) $Y_{21} = 16$ mho (d) $Y_{22} = 0.25$ mho

[U.P.S.C. I.E.S. E.E.-I, 2011]

205. A two-port network, shown in the figure, is described by the following equations

$I_1 = Y_{11}E_1 + Y_{12}E_2$
$I_2 = Y_{21}E_1 + Y_{22}E_2$

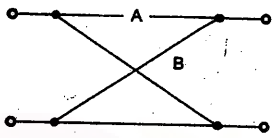
The admittance parameters, Y_{11}, Y_{12}, Y_{21} and Y_{22} for the network shown are



(a) 0.5 mho, 1 mho, 2 mho and 1 mho respectively.
(b) $\frac{1}{3}$ mho, $-\frac{1}{6}$ mho, $-\frac{1}{6}$ mho and $\frac{1}{3}$ mho respectively.
(c) 0.5 mho, 0.5 mho, 1.5 mho and 2 mho respectively.
(d) $-\frac{2}{5}$ mho, $-\frac{3}{7}$ mho, $\frac{3}{7}$ mho and $\frac{2}{5}$ mho respectively.

[GATE E.E. 2002]

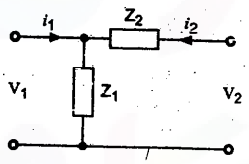
206. The lattice circuit has the following impedances $Z_A = 3 + 4j$, $Z_B = 3 - j4$. Then the Z-parameters would be



(a) $\begin{pmatrix} 3+j4 & 0 \\ 0 & 3+j4 \end{pmatrix}$.
(b) $\begin{pmatrix} 3 & -j4 \\ -j4 & 3 \end{pmatrix}$.
(c) $\begin{pmatrix} 3-j4 & 3 \\ 3 & 3+j4 \end{pmatrix}$. (d) $\begin{pmatrix} -j4 & 3 \\ 3 & +j4 \end{pmatrix}$.

[U.P.S.C. I.E.S. E.E.-I, 2003]

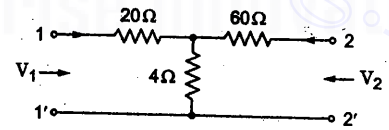
207. For the two-port network shown in the figure the Z-matrix is given by



(a) $\begin{bmatrix} Z_1 & Z_1+Z_2 \\ Z_1+Z_2 & Z_2 \end{bmatrix}$.
(b) $\begin{bmatrix} Z_1 & Z_1 \\ Z_1+Z_2 & Z_2 \end{bmatrix}$.
(c) $\begin{bmatrix} Z_1 & Z_2 \\ Z_2 & Z_1+Z_2 \end{bmatrix}$. (d) $\begin{bmatrix} Z_1 & Z_1 \\ Z_1 & Z_1+Z_2 \end{bmatrix}$.

[GATE E.E. 2005]

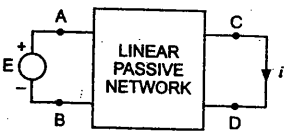
208. For the two-port network, the impedance parameter matrix $[Z] = \begin{bmatrix} Z_{11} & Z_{12} \\ Z_{21} & Z_{22} \end{bmatrix}$ is



(a) $\begin{bmatrix} 60\,\Omega & 100\,\Omega \\ 40\,\Omega & 60\,\Omega \end{bmatrix}$ (b) $\begin{bmatrix} 40\,\Omega & 100\,\Omega \\ 60\,\Omega & 40\,\Omega \end{bmatrix}$
(c) $\begin{bmatrix} 60\,\Omega & 40\,\Omega \\ 40\,\Omega & 100\,\Omega \end{bmatrix}$ (d) $\begin{bmatrix} 40\,\Omega & 100\,\Omega \\ 100\,\Omega & 60\,\Omega \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

209. For the circuit shown in the given figure, when the voltage E is 10 V, the current i is 1 A. If the applied voltage across



Answers: **198.** (c), **199.** (a), **200.** (a), **201.** (c), **202.** (d), **203.** (c), **204.** (b), **205.** (b), **206.** (b), **207.** (d), **208.** (c), **209.** (c),

Downloaded From : www.EasyEngineering.net

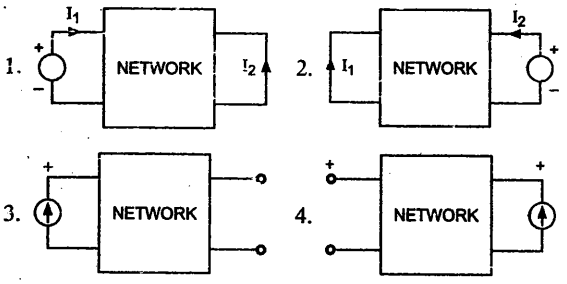
terminal C-D is 100 V, the short circuit current flowing through the terminal A-B will be
(a) 0.1 A (b) 1 A (c) 10 A (d) 100 A
[U.P.S.C. I.E.S. E.E.-I, 2001]

210. Consider the following two-port network configurations:

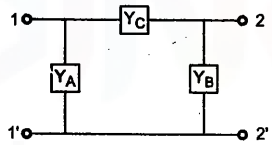


Which of these configurations relate to the definition of short-circuit admittance parameters.
(a) 1 and 2. (b) 1 and 4. (c) 2 and 3. (d) 2 and 4.
[U.P.S.C. I.E.S. E.E.-I 2000]

211. In a passive two-port network, the open-circuit impedance matrix is $\begin{bmatrix} 10\,\Omega & 2\,\Omega \\ 2\,\Omega & 2\,\Omega \end{bmatrix}$. If the input port is interchanged with the output port, then the open-circuit impedance matrix will be
(a) $\begin{bmatrix} 10\,\Omega & 2\,\Omega \\ 5\,\Omega & 2\,\Omega \end{bmatrix}$ (b) $\begin{bmatrix} 5\,\Omega & 2\,\Omega \\ 2\,\Omega & 10\,\Omega \end{bmatrix}$
(c) $\begin{bmatrix} 5\,\Omega & 10\,\Omega \\ 2\,\Omega & 2\,\Omega \end{bmatrix}$ (d) $\begin{bmatrix} 2\,\Omega & 5\,\Omega \\ 10\,\Omega & 2\,\Omega \end{bmatrix}$
[U.P.S.C. I.E.S. E.E.-I, 1999]

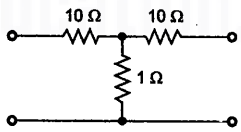
212. The Z matrix of a 2-port network as given by $\begin{bmatrix} 0.9 & 0.2 \\ 0.2 & 0.6 \end{bmatrix}$. The element Y_{22} of the corresponding Y matrix of the same network is given by
(a) 1.2 (b) 0.4 (c) −0.4 (d) 1.8
[GATE E.E. 2004]

213. For the two-port network as shown below, Y_{12} is equal to
(a) $Y_A + Y_B$
(b) $Y_C + \left(\frac{Y_A Y_B}{Y_A + Y_B}\right)$
(c) $-Y_C$
(d) Y_C



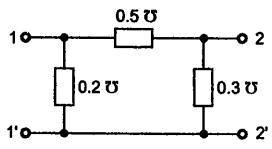
[U.P.S.C. I.E.S. E.E.-I, 2003]

214. Two identical T-sections, such as one shown below are connected in series. What is the y_{11} of the combination?
(a) 11/240 ℧.
(b) 22/240 ℧.
(c) 11/360 ℧.
(d) 22/120 ℧.



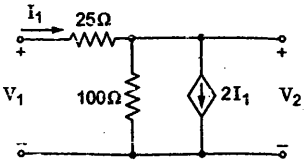
[U.P.S.C. I.E.S. E.E.-I, 2004]

215. Which one of the following gives the correct short circuit parameter matrix Y for the network shown?
(a) $\begin{bmatrix} 0.7 & -0.5 \\ -0.5 & 0.8 \end{bmatrix}$.
(b) $\begin{bmatrix} 0.7 & 0.5 \\ -0.5 & 0.8 \end{bmatrix}$.
(c) $\begin{bmatrix} 0.8 & -0.5 \\ -0.5 & 0.7 \end{bmatrix}$.
(d) $\begin{bmatrix} 0.7 & -0.5 \\ 0.5 & 0.8 \end{bmatrix}$.



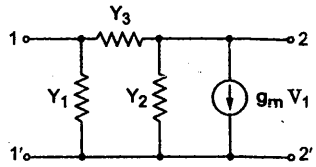
[U.P.S.C. I.E.S. E.E.-I, 2005]

216. The Y-parameters of the network shown below are
(a) $\begin{bmatrix} -0.04 & 0.04 \\ -0.04 & 0.03 \end{bmatrix}$
(b) $\begin{bmatrix} 0.04 & -0.04 \\ 0.04 & -0.03 \end{bmatrix}$
(c) $\begin{bmatrix} 0.04 & -0.03 \\ -0.04 & 0.03 \end{bmatrix}$
(d) $\begin{bmatrix} -0.04 & 0.03 \\ 0.04 & 0.03 \end{bmatrix}$



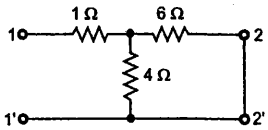
[U.P.S.C. I.E.S. E.E.-I, 2010]

217. For the 2-port network as shown, what is the value of Y_{21} parameter?
(a) $Y_1 + Y_3$
(b) $g_m - Y_2$
(c) $g_m - Y_3$
(d) $Y_1 + Y_2 + g_m$



[U.P.S.C. I.E.S. E.E.-I, 2009]

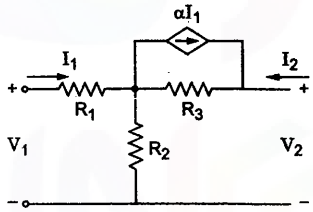
218. For the 2-port network shown in the figure, what is the value of the parameter h_{21}?
(a) 1.5 (b) −0.4
(c) 0.6 (d) −0.5



[U.P.S.C. I.E.S. E.E.-I, 2005]

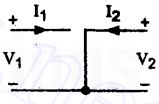
219. The h parameters h_{11} and h_{22} are related to z and y parameters as
(a) $h_{11} = z_{11}$ and $h_{22} = 1/z_{22}$.
(b) $h_{11} = z_{11}$ and $h_{22} = y_{22}$.
(c) $h_{11} = 1/y_{11}$ and $h_{22} = 1/z_{22}$.
(d) $h_{11} = 1/y_{11}$ and $h_{22} = y_{22}$.
[U.P.S.C. I.E.S. E.E.-I, 2001]

220. Consider the two-port network as shown. The hybrid parameter h_{12} is
(a) $-\frac{(\alpha R_3 + R_2)}{R_2 + R_3}$
(b) $\frac{(1-\alpha)R_3}{R_2 + R_3}$
(c) $\frac{(1-\alpha)R_2}{R_2 + R_3}$
(d) $\frac{R_2}{R_2 + R_3}$



[U.P.S.C. I.E.S. E.E.-I, 2011]

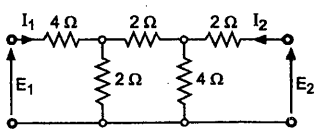
221. The parameter type and the matrix representation of the relevant two port parameters that describe the circuit shown are



(a) z parameters, $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$. (b) h parameters, $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$.
(c) g parameters, $\begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix}$. (d) z parameters, $\begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$.
[GATE E.E. 2006]

222. The h parameters for a two-port network are defined by

$$\begin{bmatrix} E_1 \\ I_2 \end{bmatrix} = \begin{bmatrix} h_{11} & h_{12} \\ h_{21} & h_{22} \end{bmatrix} \begin{bmatrix} I_1 \\ E_2 \end{bmatrix}$$



For the two-port network shown in figure, the value of h_{12} is given by
(a) 0.125 (b) 0.167 (c) 0.625 (d) 0.25
[GATE E.E. 2003]

Answers: **210.** (a), **211.** (b), **212.** (d), **213.** (c), **214.** (a), **215.** (a), **216.** (b), **217.** (c), **218.** (b), **219.** (c), **220.** (d), **221.** (c), **222.** (d),

223. A reciprocal two-port network is symmetrical if
(a) $\Delta_A = 1$ (b) $A = C$ (c) $z_{11} = z_{22}$ (d) $\Delta_y = 1$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

224. The short-circuit test of a 2-port network is shown in Fig. 1. The voltage across the terminals AA in the network shown in Fig. 2 will be

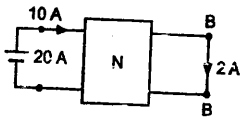

Fig. 1

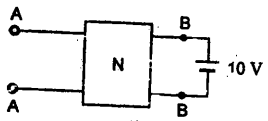

Fig. 2

(a) 20 V (b) 10 V (c) 5 V (d) 2 V
[U.P.S.C. I.E.S. E.E.-I, 1999]

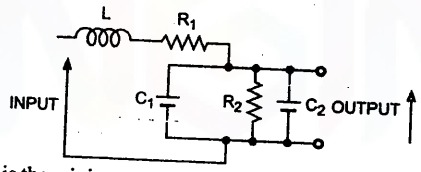
225. Which of the following are the conditions for a two port passive network to be a reciprocal one?
1. $z_{12} = z_{21}$ 2. $y_{12} = y_{21}$ 3. $h_{12} = -h_{21}$
Select the correct condition from the code given below:
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

226. For a two-port network to be reciprocal, it is necessary that
(a) $z_{11} = z_{22}$ and $y_{21} = y_{12}$.
(b) $z_{11} = z_{22}$ and $AD - BC = 0$.
(c) $h_{21} = h_{12}$ and $AD - BC = 0$.
(d) $y_{12} = y_{21}$ and $h_{21} = -h_{12}$. [U.P.S.C. I.E.S. E.E.-I, 1998]

227. A, B, C and D represent the transmission parameters of a two-port network. When is the network reciprocal?
(a) $AB - CD = 1$. (b) $AD - BC = 1$.
(c) $AB - CD = 0$. (d) $AD - BC = 0$.
[U.P.S.C. I.E.S. E.E.-I, 2008]

228. A passive 2-port network is in a steady-state. Compared to its input, the steady state output can never offer
(a) higher voltage. (b) lower impedance.
(c) greater power. (d) better regulation.
[GATE E.E. 2001]

229. Consider the following network:



What is the minimum number of states of the network given above in order to determine the complete output of the network overall future time for a given input?
(a) 0 (b) 1 (c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 2004]

230. Two two-port networks with transmission parameters A_1, B_1, C_1, D_1 and A_2, B_2, C_2, D_2 respectively are cascaded. The transmission parameter matrix of the cascaded network will be
(a) $\begin{bmatrix} A_1 & B_1 \\ C_1 & D_1 \end{bmatrix} + \begin{bmatrix} A_2 & B_2 \\ C_2 & D_2 \end{bmatrix}$. (b) $\begin{bmatrix} A_1 & B_1 \\ C_1 & D_1 \end{bmatrix} \begin{bmatrix} A_2 & B_2 \\ C_2 & D_2 \end{bmatrix}$.
(c) $\begin{bmatrix} A_1A_2 & B_1B_2 \\ C_1C_2 & D_1D_2 \end{bmatrix}$.
(d) $\begin{bmatrix} (A_1A_2 + C_1C_2) & (A_1A_2 - B_1D_2) \\ (C_1A_2 - D_1C_2) & (C_1C_2 + D_1D_2) \end{bmatrix}$.
[U.P.S.C. I.E.S. E.E.-I, 1998]

231. For a π network with admittances Y_A and Y_B are shunt arms and Y_C as the series arm, the values of y_{11}, y_{12} and y_{22} will be respectively
(a) $(Y_A + Y_C), Y_B, Y_C$. (b) $(Y_A + Y_C), -Y_C, (Y_B + Y_C)$.
(c) $Y_A, (Y_B + Y_C), -Y_B$. (d) $Y_A, -Y_C, Y_B$.
[A.M.I.E. Sec B. Circuit Theory & Control Winter 2007]

232. For a two-port symmetrical bilateral network, if $A = 3$ and $B = 1\ \Omega$, the value of parameter C will be
(a) 4 s (b) 5 s (c) 8 s (d) 16 s
[U.P.S.C. I.E.S. E.E.-I, 2000]

233. Pole of a network is a frequency at which
(a) network function becomes zero.
(b) network function becomes infinite.
(c) network function becomes unity.
(d) none of these.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

234. A pole of driving point admittance function implies
(a) zero current for a finite value of driving voltage.
(b) zero voltage for a finite value of driving current.
(c) an open circuit condition.
(d) none of (a), (b) and (c) mentioned in the question.
[U.P.S.C. I.E.S. E.E.-I, 2001]

235. The lowest and the highest critical frequencies of an R–L driving-point impedance are, respectively
(a) a zero, a pole. (b) a pole, a pole.
(c) a zero, a zero. (d) a pole, a pole.
[U.P.S.C. E.T.E.-I, 2008]

236. The first and the last critical frequencies (singularities) of a driving point impedance function of a passive network having two kinds of elements, are a pole and a zero respectively. The above property will be satisfied by
(a) RL network only. (b) RC network only.
(c) LC network only (d) RC as well as RL networks
[GATE E.C.E. 2006]

237. The first and last critical frequency of an RC-driving point impedance function must respectively be
(a) a zero and a pole. (b) a zero and a zero.
(c) a pole and a pole. (d) a pole and a zero.
[GATE E.C.E. 2005]

238. The poles and zeroes of an all-pass network are located in which part of the s-plane?
(a) Poles and zeroes are in the right half s-plane.
(b) Poles and zeroes are in the left half s-plane.
(c) Poles in right half and zeroes in left half of s-plane.
(d) Poles in the left half and zeroes in right half of s-plane.
[U.P.S.C. I.E.S. E.E.-I, 2009]

239. The poles and zeroes of a driving point impedance function, $z(s)$ are as

Poles 0, −2
Zeroes −1, −3
and $z(\infty) = 4$

then what is $z(s)$?

(a) $\dfrac{(s^2 + 2s)}{(2s^2 + 8s + 3)}$ (b) $\dfrac{(2s^2 + 4s)}{(s^2 + 4s + 3)}$

(c) $\dfrac{(s^2 + 4s + 3)}{(s^2 + 2s)}$ (d) $\dfrac{(s^2 + 16s + 12)}{(s^2 + 2s)}$
[U.P.S.C. I.E.S. E.E.-I, 2010]

Answers: **223.** (c), **224.** (d), **225.** (d), **226.** (d), **227.** (b), **228.** (c), **229.** (c), **230.** (b), **231.** (b), **232.** (c), **233.** (b), **234.** (b), **235.** (a), **236.** (b), **237.** (d), **238.** (d), **239.** (d),

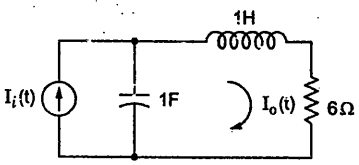
240. Why is the network function,

$N(s) = \dfrac{s^3+3s}{s^4+4s^2+4}$ not positive real?

(a) The highest degree of numerator and denominator polynomials differ by one.
(b) The terms of the lowest degree in the numerator and denominator polynomials differ in degree by one.
(c) The poles and zeroes have zero real parts.
(d) It has multiple poles on the imaginary axis.

[U.P.S.C. I.E.S. E.E.-I, 2009]

241. For the below circuit, the current gain function $\dfrac{I_o(s)}{I_i(s)}$ has poles and zeros as



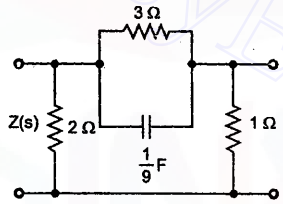
(a) No zeros, $P_1 = -3+2\sqrt{2}$, $P_2 = -3-2\sqrt{2}$.
(b) $Z_1 = 0; Z_2 = 2$, $P_1 = -3+2\sqrt{2}$, $P_2 = +3-2\sqrt{2}$.
(c) No zeroes, $P_1 = 1$, $P_2 = 1$.
(d) $Z_1 = 1; Z_2 = 1$, $P_1 = 3+j2\sqrt{2}$, $P_2 = 3+j2\sqrt{2}$.

[U.P.S.C. I.E.S. E.E.-I, 2011]

242. For an RC driving-point impedance function $Z_{RC}(s)$
(a) $Z_{RC}(0) \geq Z_{RC}(\infty)$. (b) $Z_{RC}(0) = Z_{RC}(\infty)$ only.
(c) $Z_{RC}(0) \leq Z_{RC}(\infty)$. (d) $Z_{RC}(0) > Z_{RC}(\infty)$ only.

[U.P.S.C. I.E.S. E.T.E.-I 2008]

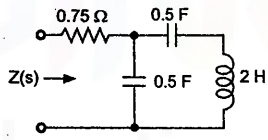
243. What are the poles and zeroes of Z(s) of the given network?



(a) $s = -12, s = -6$.
(b) $s = -6, s = -12$.
(c) $s = -3, s = -6$.
(d) $s = -2, s = -4$.

[U.P.S.C. I.E.S E.E.-I, 2005]

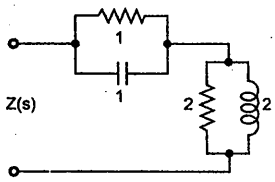
244. The driving point function of the circuit shown in the given figure when $s \to 0$ and $s \to \infty$, (the elements are normalised will respectively be



(a) $\dfrac{1}{s}$ and $\dfrac{2}{s}$. (b) $\dfrac{1}{s}$ and 0.75.
(c) 0.75 and $\dfrac{2}{s}$. (d) $\dfrac{2}{s}$ and 0.75.

[U.P.S.C. I.E.S. E.E.-I, 2001]

245. For the circuit shown, the poles of the driving-point impedance function are at which one of the following locations?



(a) A pole at $s = -2$.
(b) A pole at $s = -1$.
(c) A double pole at $s = -1$.
(d) Poles at $s = -1$ and $s = -2$.

[U.P.S.C. I.E.S. E.E.-I, 2005]

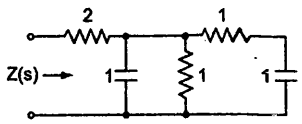
246. If an RC driving point impedance function, Z(s) has equal number of poles and zeros at finite locations, then
(a) $Z(0) \leq Z(\infty)$ (b) $Z(0) \geq Z(\infty)$
(c) $Z(0) < Z(\infty)$ (d) $Z(0) > Z(\infty)$

[U.P.S.C. I.E.S. E.E.-I, 2011]

247. The driving point impedance function, $Z(s) = \dfrac{s^2+2s+2}{s^2+s+1}$, may be realized by
(a) R-C network (b) R-L network
(c) L-C network (d) None of the above networks.

[U.P.S.C. I.E.S. E.E.-I, 2011]

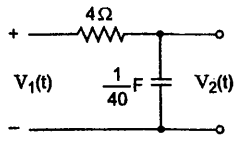
248. The network realization of RC impedance function, Z(s)



$= \dfrac{(\alpha s^2+7s+3)}{s^2+3s+\beta}$ is as shown above. What are the values of α and β?
(a) 1 and 2 (b) 2 and 1
(c) 2 and 3 (d) 3 and 2

[U.P.S.C. I.E.S. E.E.-I, 2009]

249. Consider the following with respect to the given circuit:



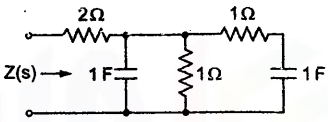
1. The transfer function of the circuit is $\dfrac{10}{s+10}$.
2. If $V_1(t) = 20$, $V_2(t) = 20\,(1 - e^{-10t})$.
3. If $V_1(t) = 20 \sin 10t$,

$$V_2(s) = \frac{2{,}000}{(s+10)(s^2+100)}$$

Which of these is/are correct?
(a) 1 only. (b) 1 and 2.
(c) 1, 2 and 3. (d) 2 only.

[U.P.S.C. I.E.S. E.E.-I, 2009]

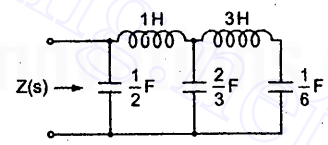
250. For the driving point impedance function, Z(s)



$= \dfrac{as^2+7s+3}{s^2+3s+b}$, the circuit realization is shown in the figure. The values of 'a' and 'b' respectively are
(a) 4 and 5. (b) 2 and 5.
(c) 2 and 1. (d) 2 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2010]

251. For the circuit shown, the values of Z(s) as $s \to 0$ and $s \to \infty$ are respectively given by



(a) $\dfrac{2}{s}, s$ (b) $\dfrac{6}{8s}, \dfrac{2}{s}$
(c) $\dfrac{8s}{6}, \dfrac{s}{2}$ (d) $4s\,4\,\dfrac{6}{s}, \dfrac{2}{s}$

[U.P.S.C. I.E.S. E.E.-I, 2010]

252. For the following driving point impedance functions, which of the following statement is true?

$$Z_1(s) = \frac{s+2}{s^2+3s+5}$$

$$Z_2(s) = \frac{s+2}{s^2+5}$$

Answers: **240.** (d), **241.** (a), **242.** (d), **243.** (b), **244.** (c), **245.** (b), **246.** (d), **247.** (d), **248.** (b), **249.** (c), **250.** (c), **251.** (a), **252.** (d).

Downloaded From : www.EasyEngineering.net

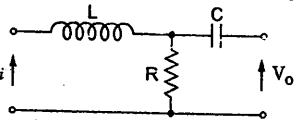
$$Z_3(s) = \frac{s+3}{s^2+2s+1}$$

$$Z_4(s) = \frac{(s+2)(s+4)}{(s+1)(s+3)}$$

(a) Z_1 is not positive real. (b) Z_2 is positive real.
(c) Z_3 is positive real. (d) Z_4 is positive real.

[U.P.S.C. I.E.S. E.E.-I, 2010]

253. The transfer function $\frac{V_o(s)}{V_i(s)}$ of the 2-port network is



(a) $\frac{1}{1+s\frac{L}{R}}$ (b) $\frac{1+sCR}{sC(R+sL)}$

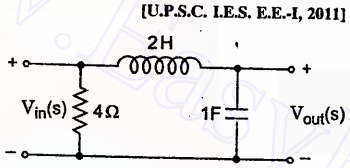
(c) $\frac{\frac{1}{sC}}{R+sL}$ (d) $\frac{s}{s+\frac{R}{L}}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

254. For the driving point impedance function of a circuit, $Z(s) = \frac{s+\alpha}{s+\beta}$, α and β real. Then voltage will lead the current if α and β are
(a) positive and $\alpha > \beta$. (b) positive and $\alpha < \beta$.
(c) positive and real negative, respectively.
(d) negative and real positive, respectively.

[U.P.S.C. I.E.S. E.E.-I, 2011]

255. The voltage transfer function of the network is



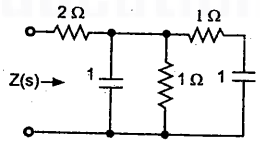
(a) $\frac{1}{1+2s}$
(b) $1+4s$
(c) $6-s$
(d) $\frac{1}{1+2s^2}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

256. A network function has a zero at $S=-1$ and poles at $S=-1\pm j1$, the multiplier being unity. If the input is a unit step function, then what is the steady state response?
(a) $2\angle 0°$ (b) $1\angle -45°$ (c) $3\angle 90°$ (d) $0.5\angle 0°$

[U.P.S.C. I.E.S. E.E.-I, 2005]

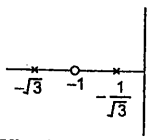
257. The realization of the driving point impedance function $Z(s) = (\alpha s^2 + 7s + 3)/(s^2 + 3s + \beta)$ is shown in the circuit given below. What are, respectively the values of α and β?



(a) 5, 2
(b) 2, 5
(c) 2, 3
(d) 2, 1

[U.P.S.C. I.E.S. E.E.-I, 2004]

258. The pole zero diagram of an impedance $Z(s)$ is shown in the figure. K = 1, × ⇒ pole, O ⇒ zero. Poles (×) are at $\frac{-1}{\sqrt{3}}$ and $-\sqrt{3}$ and zero (0) is at $s=-1$. For a signal $I = \cos t$, the steady state response across $Z(s)$ is $V = V_m \cos(t+\theta)$. What is the value of θ?



(a) $-45°$ (b) $45°$ (c) $-90°$ (d) $90°$

[U.P.S.C. I.E.S. E.E.-I, 2007]

259. The current behaviour in a circuit is expressed by: $i(t) = 2e^{-t} - e^{-5t}$ for $t \geq 0$. Which one of the following figures shows the pole-zero pattern of $I(s)$?

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2005]

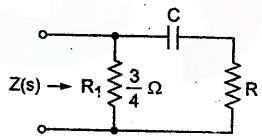
260. The system matrix of a continuous time system is given by $A = \begin{bmatrix} 0 & 1 \\ -3 & -5 \end{bmatrix}$. Then the characteristic equation is
(a) $s^2 + 5s + 3 = 0$ (b) $s^2 - 3s - 5 = 0$
(c) $s^2 + 3s + 5 = 0$ (d) $s^2 + s + 2 = 0$

[U.P.S.C. I.E.S. E.E.-I, 2010]

261. A network function $Z(s) = \frac{V(s)}{I(s)}$ has a single pole at $s = -\frac{1}{\sqrt{3}}$ and a single zero $s = -\sqrt{3}$. If the excitation $v(t) = \sin t$, then what is the angle of lead or lag of the current?
(a) Lead the voltage by 30°. (b) Lag the voltage by 30°.
(c) Lead the voltage by 90°. (d) Lag the voltage by 90°.

[U.P.S.C. I.E.S. E.E.-I, 2009]

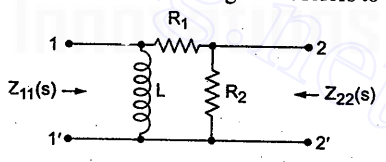
262. For the given circuit, the two natural frequencies of the driving-point impedance $Z(s)$ are given by $s+1=0$ and $s+4=0$. It is not known, which is for open circuit and which is for short circuit. The $Z(s)$ is given by



(a) $\frac{3}{16}\frac{(s+4)}{(s+1)}$ (b) $\frac{3}{4}\frac{(s+4)}{(s+1)}$
(c) $3\frac{(s+1)}{(s+4)}$ (d) $\frac{1}{3}\frac{(s+4)}{(s+1)}$

[U.P.S.C. I.E.S. E.E.-I, 2010]

263. For the circuit shown below, the natural frequencies at port 2 are given by $s+2=0$ and $s+5=0$, without knowing which refers to open circuit and which to short circuit. Then the impedances Z_{11} and Z_{22} are given respectively by



(a) $K_1\frac{s+5}{s+2}, K_2\frac{s+2}{s+5}$ (b) $K_1\frac{s+2}{s+5}, K_2\frac{s+5}{s+2}$
(c) $K_1\frac{s}{s+2}, K_2\frac{s+2}{s+5}$ (d) $K_1\frac{s+2}{s+5}, K_2\frac{s+2}{s+5}$

[U.P.S.C. I.E.S. E.E.-I, 2010]

264. For the following shown network, the function $G(s)\ \frac{V_o(s)}{V_i(s)}$ is $\frac{4s}{s^2+4s+20}$ when R is 2 ohm. What is the value of L and C?

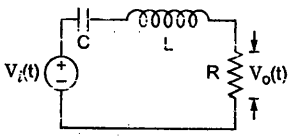
Answers: **253.** (a), **254.** (b), **255.** (d), **256.** (d), **257.** (d), **258.** (a), **259.** (c), **260.** (a), **261.** (a), **262.** (a), **263.** (c), **264.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 0.3 H and 1 F
(b) 0.4 H and 0.5 F
(c) 0.5 H and 0.1 F
(d) 0.5 H and 0.01 F

[U.P.S.C. I.E.S. E.E.-I, 2009]



265. Consider the following driving point immittance functions:

1. $z(s) = \dfrac{Ks(s^2+6)}{(s^2+2)(s^2+4)}$

2. $z(s) = \dfrac{(s^5+3s^3+5s)}{(3s^4+6s^2)}$

3. $z(s) = \dfrac{K(s^2+4)(s^2+9)}{(s^2+2)(s^2+6)}$

4. $z(s) = \dfrac{K(s^2+4)(s^2+9)}{s(s^2+6)}$

Which of these are LC immittance functions?

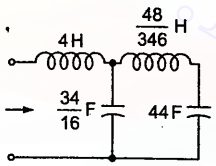
(a) 1 and 2. (b) 3 and 4.
(c) 2 and 3. (d) 4 only.

[U.P.S.C. I.E.S. E.E.-I, 2009]

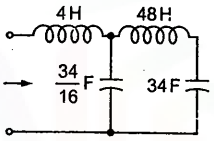
266. Which one of the following networks represents the Cauer's II[nd] form for the given driving point impedance function

$$Z(s) = \frac{12s^4+10s^2+1}{6s^3+4s}\ ?$$

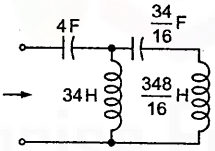
(a)



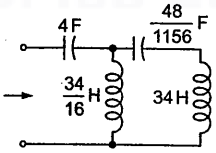
(b)



(c)



(d)



[U.P.S.C. I.E.S. E.E.-I, 2011]

267. Capacity of a dry cell, is
(a) more when it supplies current continuously.
(b) more when it supplies current intermittently.
(c) not affected by the type of discharge.
(d) none of the above.

268. The emf of primary cell depends upon the
(a) physical dimensions of a cell.
(b) nature of electrolyte.
(c) nature of electrode. (d) both (b) and (c).

269. Internal resistance of primary cell varies
(a) inversely with the distance between electrodes.
(b) inversely with the surface area of electrodes.
(c) directly with the distance between electrodes.
(d) with the nature of electrodes.
(e) all of the above except (a).

270. Five cells are connected in series in a row and then four such rows are connected in parallel to feed the current to a resistive load of 1.25 Ω. Each cell has an emf of 1.5 V with an internal resistance of 0.2 Ω. The current through the load will be
(a) 3.33 A (b) 23.33 A (c) 5 A (d) 1 A

[U.P.S.C. I.E.S. E.E.-I, 1999]

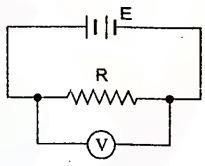
271. A 24 V battery of internal resistance $r = 4\ \Omega$ connected to a variable resistance R. The rate of heat dissipation in the resistor is maximum when the current drawn from the battery is I. The current drawn from the battery will be $\frac{I}{2}$ when R is equal to
(a) 8 Ω (b) 12 Ω (c) 16 Ω (d) 20 Ω

[U.P.S.C. I.E.S. E.E. I, 1992]

272. A battery is connected to a resistance causing a current of 0.5 A in the circuit. The current drops to 0.4 A when an additional resistance of 5 Ω is connected in series. The current will drop to 0.2 A when the resistance is further increased by
(a) 10 Ω (b) 15 Ω (c) 25 Ω (d) 40 Ω

[U.P.S.C. I.E.S. E.E. I, 1992]

273. If the battery has zero internal resistance and external resistance R is gradually reduced in the circuit shown in the figure, the voltmeter reading will
(a) decrease. (b) increase.
(c) remain constant.



274. In the circuit shown above if the battery has some definite internal resistance and R is gradually reduced voltmeter reading will
(a) increase. (b) decrease. (c) remain unchanged.

275. Cells are connected in parallel in order to increase the
(a) life of the cells. (b) efficiency.
(c) current capacity. (d) voltage rating.

276. For a group of cells when internal resistance of the group is equal to external load resistance, the group will deliver maximum
(a) voltage. (b) current. (c) ampere-hours. (d) efficiency.

277. The arrangement of 12 cells, each of internal resistance 1.5 Ω, to give maximum current in external load resistance of 2 Ω will be
(a) all 12 cells in series. (b) all 12 cells in parallel.
(c) 4 cells in series with 3 rows in parallel.
(d) 3 cells in series with 4 rows in parallel.

278. Standard cell
(a) will have precise and accurate constant voltage when current drawn from it is few microamperes only.
(b) will have precise and accurate constant voltage when few milliamperes are drawn from it.
(c) will continue to have constant voltage irrespective of loading conditions.
(d) can supply voltages up to 10 V. [U.P.S.C. I.E.S. E.E.-I, 2003]

279. During electroplating the weight of a substance deposited depends upon
(a) shape of the article. (b) quantity of electricity.
(c) room temperature. (d) all of the above.

Answers: **265.** (d), **266.** (d), **267.** (b), **268.** (d), **269.** (e), **270.** (c), **271.** (b), **272.** (c), **273.** (c), **274.** (b), **275.** (c), **276.** (b), **277.** (c), **278.** (a), **279.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

280. During electrodeposition, the amounts of different substances liberated by same quantity of electricity are proportional to
(a) atomic weights. (b) valency.
(c) chemical equivalents. (d) atomic numbers.

281. Pickling is
(a) protection of surface from rusting.
(b) a layer coating for preventing surface deterioration.
(c) removal of scale, grease etc. from the surface.
(d) none of the above.

282. Oil and grease can be removed from a surface with the help of
(a) soaps. (b) hot alkaline solutions.
(c) solvents such as gasoline or carbon tetrachloride.
(d) any of the above.

283. Rust, scales and oxides can be removed from a surface with the help of
(a) various acids. (b) alkali and salt solution.
(c) mechanical abrasion. (d) electrolytic cleaning.
(e) any of the above.

284. For achieving uniform thickness of deposit on irregular surface
(a) anode and cathode are kept farther apart.
(b) anode and cathode are kept closer.
(c) high current densities are used.
(d) electrolyte is agitated constantly.

285. Addition of which of the following substances in electrolyte promotes smooth deposition?
(a) Albumen. (b) Glucose.
(c) Phenol. (d) Any of these.

286. Which of the following substances on adding in electrolyte helps in producing bright finish?
(a) Glycerine. (b) Dextrol.
(c) Phenol. (d) Any of these.

287. In a lead acid battery, the level of the electrolyte should be
(a) equal to that of the plates. (b) below the level of plates.
(c) above the level of plates. (d) none of the above.

288. Which of the following statements is incorrect about lead acid batteries ?
(a) The electrolyte in weak sulphuric acid.
(b) When fully charged both of the plates become lead-per-oxide.
(c) The number of plates is always odd.
(d) The number of negative plates is one more than the number of positive plates.

289. Which of the following statements is correct about lead acid batteries ?
(a) It delivers current as soon as its components are put together.
(b) Density of electrolyte increases while delivering current
(c) It does not deliver current on putting its components together until it is supplied electrical energy from an external source.
(d) It has lead as positive plates.

290. During discharging of lead acid cells, the terminal voltage decreases with the decrease in
(a) temperature. (b) discharge rate.
(c) state of charge. (d) none of these.

291. In a battery, cover is placed over the elements and sealed at the top of the battery container. This is done in order to
(a) exclude dirt and foreign matter from the electrolyte.
(b) reduce evaporation of water from electrolyte.
(c) both (a) and (b). (d) none of the above

292. For keeping the lead acid battery terminals free from corrosion it is advisable to
(a) keep electrolyte level low. (b) apply petroleum jelly.
(c) charge the battery at frequent intervals.

293. In a lead acid battery, separators are provided to
(a) reduce internal resistance.
(b) facilitate flow of the current.
(c) avoid internal short circuits.
(d) increase the energy efficiency.

294. In a lead acid battery, fillers are provided to
(a) facilitate flow of gasses. (b) prevent flow of gasses.
(c) recover acid losses through vapours.
(d) reduce tendency for polarisation.

295. Which of the following tests is performed for ascertaining whether the battery plates are defective or not ?
(a) Specific gravity test. (b) High discharge test.
(c) Cadmium test. (d) None of the above.

296. Vent plug is provided in each lead acid cell to
(a) pour water or electrolyte when needed.
(b) check the electrolyte level.
(c) allow escape out of gases during charging.
(d) all of the above.

297. Common impurity in a battery electrolyte is
(a) dust particles. (b) iron.
(c) lead crystals. (d) sodium chloride.

298. In lead acid batteries, sedimentation occurs due to
(a) idleness for a longer period.
(b) overcharging at slow rate.
(c) overcharging at high rate.
(d) slow charging at low rate.

299. In a lead acid battery, excessive formation of lead sulphate occurs due to
(a) idleness of battery for a long time.
(b) low level of electrolyte.
(c) persistent undercharging.
(d) all of the above.

300. Sulphated cells are indicated by the
(a) low specific gravity. (b) low voltage on discharge.
(c) low capacity. (d) all of the above.

301. Charging of a sulphated battery at high rate causes
(a) warping of plates.
(b) boiling of electrolyte owing to gassing.
(c) damage to separators, cell caps, covers and battery case due to excessive temperature.
(d) all of the above.

302. Short circuiting of a cell may be caused by
(a) buckling of plates.
(b) breakdown of one or more separators.
(c) excessive accumulation of sediments at the bottom of the cell.
(d) lead particles forming circuits between positive and negative plates.
(e) any of the above.

303. Short circuiting of a cell results in
(a) reduced gassing during charging.
(b) abnormal high temperature.
(c) low specific gravity of the electrolyte.
(d) all of the above.

Answers: **280.** (c), **281.** (c), **282.** (d), **283.** (e), **284.** (a), **285.** (d), **286.** (d), **287.** (c), **288.** (b), **289.** (c), **290.** (b), **291.** (c), **292.** (b), **293.** (c), **294.** (a), **295.** (c), **296.** (d), **297.** (b), **298.** (c), **299.** (d), **300.** (d), **301.** (d), **302.** (e), **303.** (d),

304. Overcharging of a lead acid battery would cause
(a) excessive gassing. (b) loss of active material.
(c) increase in temperature resulting in buckling of plates.
(d) all of the above.

305. In comparison to constant current charging method, the constant voltage charging method of charging a lead acid battery has the advantage(s) of
(a) increasing capacity of the battery.
(b) reducing charging time.
(c) avoiding of excessive gassing.
(d) both (b) and (c).

306. Battery charging equipment should be installed
(a) in well ventilated, clean and dry place.
(b) as near as practical to the battery under charge.
(c) both (a) and (b). (d) wherever convenient.

307. The condition of a fully charged lead acid battery cannot be ascertained by
(a) gassing. (b) voltage. (c) colour of the electrodes.
(d) specific gravity of the electrolyte.
(e) colour of the electrolyte.

308. The emf of a lead battery
(a) increases with the increase in specific gravity of the electrolyte.
(b) slightly increases with the increase in temperature.
(c) decreases with the increase in temperature.
(d) both (a) and (b).

309. If the specific gravity of the electrolyte in a lead acid cell increases beyond 1.23 there will be
(a) loss of life. (b) loss of capacity.
(c) increase in internal resistance.
(d) corrosion of the grids of the plate.

310. The energy capacity of a storage battery is rated in
(a) kWh. (b) kW.
(c) ampere hours. (d) joules.
[U.P.S.C. I.E.S. E.E.-I, 2003]

311. The capacity of a lead acid battery does not depend upon
(a) charge rate. (b) discharge rate.
(c) temperature. (d) density of electrolyte.
(e) quantity of active material.
(f) plate surface area.

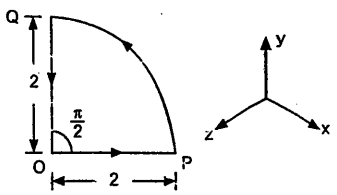
312. The capacity of a lead acid battery is adversely affected by increase in
(a) discharge rate. (b) charge rate.
(c) temperature. (d) specific gravity of the electrolyte.

313. During charging and discharging of an Edison cell
(a) electrolyte does not take part in chemical reaction.
(b) emf remains the same.
(c) corrosive fumes are produced.
(d) nickel hydroxide remains unsplit.

314. Nickel-cadmium accumulators in comparison to nickel-iron accumulators have the advantages of
(a) being lighter in weight and cheaper in cost.
(b) low internal resistance and longer life.
(c) higher emf and higher efficiency.
(d) all of the above.

315. A floating battery is one
(a) which is charged and discharged simultaneously.
(b) in which battery voltage is equal to charger voltage.
(c) which supplies current intermittently and also during idle period gets charged.
(d) none of the above.

316. If $\bar{A} = \hat{a}_r + \hat{a}_\phi + \hat{a}_z$, the value of $\oint \bar{A} \cdot \overline{dl}$ around the closed circular quadrants shown in the given figure is



(a) π
(b) $\frac{\pi}{2} + 4$
(c) $\pi + 4$ (d) $\frac{\pi}{2} + 2$
[U.P.S.C. I.E.S. E.E.-I, 2001]

317. The electric field intensity $\vec{E}$ at a point P is given by $10\hat{i} + 10\hat{j} + 10\hat{k}$ where $\hat{i}, \hat{j}$ and $\hat{k}$ are unit vectors in x, y and z directions respectively. If α, β, γ are respectively the angles the $\vec{E}$ vector makes with x, y and z axes respectively, they are given by which of the following?
(a) $\alpha = \beta = \gamma = 30°$ (b) $\alpha = \beta = \gamma = 60°$
(c) $\alpha = \beta = \gamma = \cos^{-1}\frac{1}{\sqrt{3}}$ (d) $\alpha = \beta = \gamma = \cos^{-1}\frac{1}{3}$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

318. Consider the following statements for an electrostatic field:
1. Its curl is zero.
2. It is negative of gradient of scalar potential ϕ.
3. It is conservative.
Which of the statements given above are correct?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2008]

319. The line integral of the vector potential $\vec{A}$ around the boundary of a source S represents which one of the following?
(a) Flux through the surface S.
(b) Flux density in the surface S.
(c) Magnetic field intensity.
(d) Current density.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

320. The operator 'del' (∇) is a
(a) vector space function. (b) vector time function.
(c) scalar space function. (d) scalar time function.
[U.P.S.C. I.E.S. E.E.-I, 1999]

321. Given a vector field $\vec{F}$, the divergence theorem states that
(a) $\int_s \vec{F} \cdot d\vec{S} = \int_v \vec{\nabla} \cdot \vec{F} dV$ (b) $\int_s \vec{F} \cdot d\vec{S} = \int_v \vec{\nabla} \times \vec{F} dV$
(c) $\int_s \vec{F} \times d\vec{S} = \int_v \vec{\nabla} \cdot \vec{F} dV$ (d) $\int_s \vec{F} \times d\vec{S} = \int_v \vec{\nabla} \cdot \vec{F} dV$
[GATE E.E., 2002]

322. Divergence of the vector field
$V(x, y, z) = -(x \cos xy + y)i + (y \cos xy)j + (\sin z^2 + x^2 + y^2)k$ is
(a) $2z \cos z^2$ (b) $\sin xy + 2z \cos z^2$
(c) $x \sin xy - \cos z$ (d) none of these
[GATE E.E., 2007]

323. If a vector field $\vec{V}$ is related to another vector field $\vec{A}$ through $\vec{V} = \nabla \times \vec{A}$, which of the following is true?
Note: C and S_C refer to any closed contour and any surface whose boundary is C.

Answers: **304.** (d), **305.** (d), **306.** (c), **307.** (e), **308.** (d), **309.** (c), **310.** (c), **311.** (a), **312.** (a), **313.** (a), **314.** (b), **315.** (c), **316.** (a), **317.** (c), **318.** (d), **319.** (b), **320.** (a), **321.** (a), **322.** (a), **323.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $\oint_C \bar{V}\cdot\bar{dl} = \int_{S_C}\int \bar{A}\cdot\bar{dS}$ (b) $\oint_C \bar{A}\cdot\bar{dl} = \int_{S_C}\int \bar{V}\cdot\bar{dS}$

(c) $\oint_C \nabla\times\bar{V}\cdot\bar{dl} = \int_{S_C}\int \nabla\times\bar{A}\cdot\bar{dS}$

(d) $\oint_C \nabla\times\bar{A}\cdot\bar{dl} = \int_{S_C}\int \bar{V}\cdot\bar{dS}$ [GATE E.C.E., 2009]

324. Which of the following equations is correct?
(a) $a_x \times a_x = |a_x|^2$ (b) $(a_x \times a_y) + (a_y \times a_x) = 0$
(c) $a_x \times (a_y \times a_z) = a_x \times (a_z \times a_y)$
(d) $a_r \cdot a_\theta \div a_\theta \cdot a_r = 0$ [U.P.S.C. E.E.-I, 2002]

325. The electrons revolve around the nucleus with high velocity. The force which acts against the centrifugal force and keeps the electrons in their orbits is
(a) electrostatic force of attraction.
(b) adhesive force.
(c) electromagnetic force of attraction.
(d) none of the above.

326. The electric field of a uniform plane wave is given by:

$\bar{E} = 10 \sin(3\pi \times 10^8 t - \pi Z)\, \bar{a}_X + 10 \cos(3\pi \times 10^8 t - \pi Z)\, \bar{a}_Y$ Vm^{-1}

What is the corresponding magnetic field $\bar{H}$?

(a) $\frac{10}{377}\sin(3\pi\times10^8 t - \pi Z)\,\bar{a}_Y + \frac{10}{377}\cos(3\pi\times10^8 t - \pi Z)(-\bar{a}_X)$ Am^{-1}

(b) $\frac{10}{377}\sin(3\pi\times10^8 t - \pi Z)(-\bar{a}_Y) + \frac{10}{377}\cos(3\pi\times10^8 t - \pi Z)(-\bar{a}_X)$ Am^{-1}

(c) $\frac{10}{377}\sin(3\pi\times10^8 t - \pi Z)\,\bar{a}_Y + \frac{10}{377}\cos(3\pi\times10^8 t - \pi Z)(\bar{a}_X)$ Am^{-1}

(d) $\frac{10}{377}\sin(3\pi\times10^8 t - \pi Z)(\bar{a}_Y) + \frac{10}{377}\cos(3\pi\times10^8 t - \pi Z)(\bar{a}_X)$ Am^{-1}

[U.P.S.C. I.E.S. E.E.-I, 2009]

327. Consider the following statements in connection with boundary relations of electric field:
1. In a single medium electric field is continuous.
2. The tangential components are the same on both sides of a boundary between two dielectrics.
3. The tangential electric field at the boundary of a dielectric and a current carrying conductor with finite conductivity is zero.
4. Normal component of the flux density is continuous across the charge-free boundary between two dielectrics.

Which of the above statements is/are correct?
(a) 1 only. (b) 1, 2 and 3.
(c) 1, 2 and 4. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-I, 2009]

328. Point charges of $Q_1 = 2$ *n*C and $Q_2 = 3$ *n*C are located at a distance apart. With regard to this situation, which one of the following statements is **not** correct?
(a) The force on the 3 *n*C charge is repulsive.
(b) A charge of –5 *n*C placed midway between Q_1 and Q_2 will experience no force.
(c) The forces Q_1 and Q_2 are same in magnitude.
(d) The forces on Q_1 and Q_2 will depend on the medium in which they are placed. [U.P.S.C. I.E.S. E.E.-I, 2010]

329. A capacitor is made with a polymeric dielectric having an ε_r of 2.26 and a dielectric breakdown strength of 50 kV/cm. The permittivity of free space is 8.85 pF/m. If the rectangular plates of the capacitor have a width of 20 cm and a length of 40 cm, then the maximum electric charge in the capacitor is
(a) 2 μC (b) 4 μC
(c) 8 μC (d) 10 μC [GATE E.E., 2011]

330. A lossy capacitor C_x, rated operation at 5 kV, 50 Hz is represented by an equivalent circuit with an ideal capacitor C_p is parallel with a resistor R_p. The value of C_p is found to be 0.102 μF and the value of $R_p = 1.25$ MΩ. Then the power loss and tan δ of the lossy capacitor operating at the rated voltage, respectively, are
(a) 10 W and 0.0002 (b) 10 W and 0.0025
(c) 20 W and 0.025 (d) 20 W and 0.04 [GATE E.E., 2011]

331. The normal components of electric flux density across a dielectric-dielectric boundary
(a) Are discontinuous (b) Are continuous
(c) Depend on the magnitude of the surface charge density
(d) Depend on electric field intensity [U.P.S.C. I.E.S. E.E.-I, 2011]

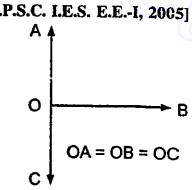
332. The electric field intensity phasor of an EM wave in free space is $E = 10\, e^{-j4y}\, a_x$ V/m. The angular frequency ω, in radiation per second, is
(a) $4 \times 3 \times 10^8$ (b) $4y \times 3 \times 10^8$
(c) $t \times 3 \times 10^8$ (d) $10 \times 3 \times 10^8$
[U.P.S.C. I.E.S. E.E.-I, 2011]

333. When a plane wave propagates in a dielectric medium
(a) The average electric energy and the average magnetic energy densities are not equal.
(b) The average electric energy and the average magnetic energy densities are equal.
(c) The net average energy density is finite.
(d) The average electric energy density is not dependent on the average magnetic energy density. [U.P.S.C. I.E.S. E.E.-I, 2011]

334. Coulomb's law for the force between electric charges most closely resembles with
(a) Newton's law of motion.
(b) Law of conservation of energy.
(c) Gauss's theorem.
(d) Newton's law of gravitation.
[A.M.I.E. Elec. Science Summer 1995]

335. If the electric field established by three point charges Q, 2Q and 3Q exert a force 3F on 3Q and 2F on 2Q, then what is the force exerted on the point charge Q ?
(a) F (b) –F (c) 5 F (d) –5F
[U.P.S.C. I.E.S. E.E.-I, 2005]

336. In the given figure, A, B and C are equal charges, when a unit charge moves from 'C' to '0' the force on the charge when it reaches at 0,



(a) will be zero.
(b) a pull in the direction of A.
(c) a pull in the direction of B.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-I, 1992]

337. Which one of the following statements does not state that electrostatic field is conservative?
(a) The Curl of $\bar{E}$ is identically zero.
(b) The potential difference between two points is zero.

Answers: **324.** (b), **325.** (a), **326.** (a), **327.** (c), **328.** (b), **329.** (c), **330.** (c), **331.** (c), **332.** (a), **333.** (b), **334.** (d), **335.** (d), **336.** (d), **337.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) The electrostatic field is a gradient of a scalar potential.
(d) The work done in a closed path inside the field is zero.
[U.P.S.C. I.E.S. E.E.-I, 2006]

338. Consider the following statements regarding an electrostatic field:
1. It is irrotational.
2. It is solenoidal.
3. It is static only from a macroscopic view point.
4. Work done in moving a charge in the field from one point to another is independent of the path of movement.

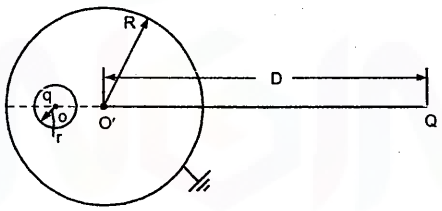
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) Only 2 and 4. (d) 1, 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

339. Across the surface of a charged conductor, the electric
(a) field is continuous. (b) potential is discontinuous.
(c) field is discontinuous. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-I, 1992]

340. Unit of electric intensity is
(a) joules/coulomb. (b) newton/coulomb.
(c) volt/meter. (d) both (b) and (c).
[R.G.T.U. Basic E.E. June 2007]

341. A charge of 1 Coulomb is placed near a grounded conducting plate at a distance of 1 m. What is the force between them?
(a) $\frac{1}{4\pi\varepsilon_0}$ N (b) $\frac{1}{8\pi\varepsilon_0}$ N
(c) $\frac{1}{16\pi\varepsilon_0}$ N (d) $4\pi\varepsilon_0$ N
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

342. A charge $+q$ is placed at the centre of a spherical cavity in a grounded conducting sphere as shown in the figure. Another charge + Q is placed outside on the line joining O and O′. The force acting on the charge $+q$ will be



(a) $\frac{qQ}{4\pi\varepsilon_0(D+d)^2}$ (b) $\frac{qQ}{4\pi\varepsilon_0 D^2}$ (c) zero.
(d) dependent on the charge density distribution on the conductors and will not have closed from expression.
[U.P.S.C. I.E.S. E.E.-I, 1998]

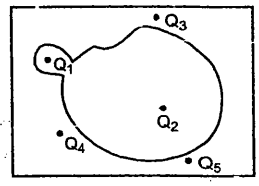
343. The force $\bar{f}$ per unit area on the surface of a conductor, with surface charge density σ in the presence of an electric field is ($\bar{a}_n$ is unit outward normal to the conductor surface)
(a) $\bar{f} = \frac{\sigma^2}{2\epsilon_0}\bar{a}_n$ (b) $\bar{f} = \frac{\sigma^2}{\epsilon_0}\bar{a}_n$
(c) $\bar{f} = \epsilon_0\sigma^2\,\bar{a}_n$ (d) $\bar{f} = 0$ [U.P.S.C. I.E.S. E.E.-I, 1998]

344. The electric field $\vec{E}$ (in volts/metre) at the point (1, 1, 0) due to a point charge of +1 μC located at (–1, 1, 1) (coordinates in metres) is
(a) $\frac{10^{-6}}{20\sqrt{5}\pi\varepsilon_0}(2i-k)$ (b) $\frac{10^{-6}}{20\pi\varepsilon_0}(2i-k)$
(c) $\frac{-10^{-6}}{20\sqrt{5}\pi\varepsilon_0}(2i-k)$ (d) $\frac{-10^{-6}}{20\pi\varepsilon_0}(2i-k)$
[GATE E.E. 2001]

345. The surface integral of the electrical field intensity is the
(a) net flux emanating from the surface.
(b) electric charge. (c) charge density.
(d) flux density.

346. "The total electric flux through any closed surface surrounding charges is equal to the amount of charges enclosed."
The above statement is based on
(a) Maxwell's law. (b) Ampere's law.
(c) Gauss's law. (d) Coulomb's law.

347. The net flux of electric field emanating from the surface 'S' with location of point charges as shown in the given figure is



(a) $\frac{Q_1+Q_2}{\varepsilon_0}$
(b) $\frac{Q_1+Q_2+Q_3+Q_4+Q_5}{\varepsilon_0}$
(c) $\frac{Q_1+Q_4+Q_5}{\varepsilon_0}$
(d) $\varepsilon_0(Q_1+Q_2)$
[U.P.S.C. I.E.S. E.E.-I, 2000]

348. What is the value of total electric flux coming out of a closed surface?
(a) Zero.
(b) Equal to volume charge density.
(c) Equal to the total charge enclosed by the surface.
(d) Equal to the surface charge density. [U.P.S.C. I.E.S. E.E.-I, 2004]

349. Two point charges Q_1 = 10 μC and Q_2 = 20 μC are placed at coordinates (1, 1, 0) and (–1, –1, 0) respectively. The total electric flux passing through a plane z = 20 will be
(a) 7.5 μC (b) 13.5 μC (c) 15.0 μC (d) 22.5 μC
[GATE E.E. 2008]

350. Inside a hollow conducting sphere
(a) electric field is zero.
(b) electric field is a non-zero constant.
(c) electric field changes with the magnitude of the charge given to the conductor.
(d) electric field changes with distance from the centre of the sphere. [GATE E.E. 1996]

351. The electric field inside a perfectly conducting media is
(a) infinite. (b) zero.
(c) dependent upon the value of the charge.
(d) none of the above.

352. An infinite number of charges, each equal to 'Q' are placed along the axis at $x = 1, x = 2, x = 3$.... and so on. The electric field at the point $x = 0$ due to these charges will be
(a) Q (b) 2Q/3 (c) 4Q/3 (d) 4Q/5

353. In above question, the electric field at point $x = 0$, when the alternate charges are of opposite nature, will be
(a) 4Q/3 (b) 4Q/5 (c) 1.5 Q (d) 3Q

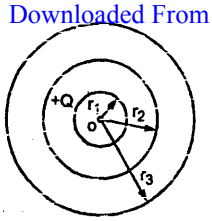
354. The electric field intensity at a point situated at a distance d from a straight charged conductor is proportional to
(a) d (b) d^2 (c) $1/d$ (d) $1/d^2$

Answers: **338.** (d), **339.** (c), **340.** (d), **341.** (c), **342.** (c), **343.** (b), **344.** (a), **345.** (a), **346.** (c), **347.** (d), **348.** (c), **349.** (c), **350.** (a), **351.** (b), **352.** (c), **353.** (b), **354.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

355. A small isolated conducting sphere of radius r_1 is charged with + Q coulombs. Surrounding this sphere and concentric with it is a conduction spherical cell, which possesses no net charge. The inner radius of the shell is r_2 and outer radius r_3. All non-conducting space is air. The electric field distribution from 0 to r_1 will be



(a) same. (b) zero. (c) increase. (d) decrease.

356. In Q 355 the electric field from r_1 to r_2 will be
(a) zero. (b) same.
(c) decreasing. (d) increasing.

357. In Q 355, the electric field from r_2 to r_3 will be
(a) zero. (b) same.
(c) decreasing. (d) increasing.

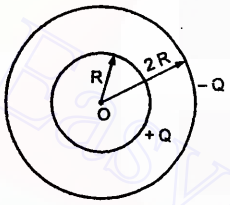
358. Two positive charges, Q coulombs each are placed at points (0, 0, 0) and (2, 2, 0) while two negative charges, Q coulombs each in magnitude, are placed at points (0, 2, 0) and (2, 0, 0) The electric field intensity at the point (1, 1, 0) is

(a) zero. (b) $\frac{Q}{8\pi\epsilon_0}$

(c) $\frac{Q}{4\pi\epsilon_0}$ (d) $\frac{Q}{16\pi\epsilon_0}$

[U.P.S.C. I.E.S. E.E. I, 1992]

359. Two concentric spherical shells carry equal and opposite uniformly distributed charges over their surfaces as shown in the figure. Electric field on the surface of the inner shell will be



(a) zero
(b) $Q/4\pi\epsilon_0R^2$
(c) $Q/8\pi\epsilon_0R^2$ (d) $Q/16\pi\epsilon_0R^2$

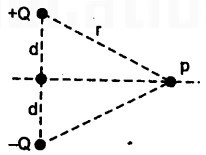
[U.P.S.C. I.E.S. E.E.-I, 1993]

360. A solid sphere made of insulating material has a radius R and has a total charge Q distributed uniformly in its volume. What is the magnitude of the electric field intensity, E at a distance $r(0 < r < R)$ inside the sphere?

(a) $\frac{1}{4\pi\epsilon_0}\frac{Qr}{R^3}$ (b) $\frac{3}{4\pi\epsilon_0}\frac{Qr}{R^3}$

(c) $\frac{1}{4\pi\epsilon_0}\frac{Q}{r^2}$ (d) $\frac{1}{4\pi\epsilon_0}\frac{QR}{r^3}$ [GATE E.E. 2007]

361. Consider the following diagram:



Which of the following statements is correct?

The electric field E at a point *p* due to the presence of dipole as shown in the diagram (considering distance $r \gg$ distance d) is proportional to

(a) $1/r$ (b) $1/r^2$ (c) $1/r^3$ (d) $1/r^4$

[U.P.S.C. I.E.S. E.E.-I, 2004]

362. Plane $z = 10$ m carries surface charge density 20 nC/m^2. What is the electric field at the origin?

(a) $-10\,\hat{a}_z$ V/m (b) $-18\pi\,\hat{a}_z$ V/m

(c) $72\pi\,\hat{a}_z$ V/m (d) $-360\pi\,\hat{a}_z$ V/m

[U.P.S.C. I.E.S. E.E.-I, 2004]

363. The electrostatic field on the surface of a conductor at a certain point is $0.3\,\hat{a}_x + 0.4\,\hat{a}_y$. If the normal to the surface of the conductor at that point makes an angle θ with respect to x-axis, the value of $\cos\theta$ will be

(a) 0.8 (b) 0.75 (c) 0.6 (d) 0.5

[U.P.S.C. I.E.S. E.E.-I, 2000]

364. An infinite plane sheet of uniform surface charge density σ C/m^2 is lying in the x-y plane. The electric field $\bar{E}$ at a point P(0, 0, z) above the sheet ($z > 0$) would be (ϵ_0 is the free space permittivity)

(a) $\bar{E} = \frac{\sigma}{2\epsilon_0}\hat{a}_z$ (b) $\bar{E} = \frac{\sigma}{\epsilon_0}\hat{a}_z$

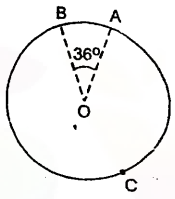
(c) $\bar{E} = \frac{\hat{a}_z\sigma}{4\pi\epsilon_0 z^2}$ (d) $\bar{E} = \frac{\sigma^2}{4\pi\epsilon_0 z^2}\hat{a}_z$

[U.P.S.C. I.E.S. E.E.-I, 2000]

365. Of two concentric long conduction cylinders, the inner one is kept at a constant positive potential $+V_0$ and the outer one is grounded. What is the electric field in the space between the cylinders?
(a) Uniform and directed radially outwards.
(b) Uniform and directed radially inwards.
(c) Non-uniform and directed radially outwards.
(d) Non-uniform and directed parallel to the axis of the cylinders.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

366. If the 36° arc AB of a circle shown in the given figure is uniformly charged leaving the arc BCA uncharged, the electric field at the centre 'O' is $\bar{E}$. If the arc BCA is given the same linear charge density and the arc AB left uncharged, then the electric field at the centre 'O' will be



(a) $\bar{E}$ (b) $-\bar{E}$ (c) $9\bar{E}$ (d) $-9\bar{E}$

[U.P.S.C. I.E.S. E.E.-I, 2000]

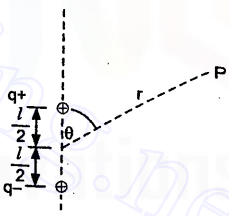
367. Consider the arrangement of two equal and opposite charges of magnitude q separated by an infinitesimal distance l as shown in the figure given above. If $\hat{a}_r$ is the unit vector in the direction r and $\hat{a}_\theta$ is the unit vector in the direction, θ, the electric field at the point P is

(a) $\frac{-2ql\cos\theta}{4\pi\epsilon r^3}\bar{a}_r - \frac{ql\sin\theta}{4\pi\epsilon r^3}\bar{a}_\theta$

(b) $\frac{-2ql\cos\theta}{4\pi\epsilon r^3}\bar{a}_r + \frac{ql\sin\theta}{4\pi\epsilon r^3}\bar{a}_\theta$

(c) $\frac{2ql\cos\theta}{4\pi\epsilon r^3}\bar{a}_r + \frac{ql\sin\theta}{4\pi\epsilon r^3}\bar{a}_\theta$

(d) $\frac{2ql\cos\theta}{4\pi\epsilon r^3}\bar{a}_r - \frac{ql\sin\theta}{4\pi\epsilon r^3}\bar{a}_\theta$



[U.P.S.C. I.E.S. E.E.-I, 2002]

368. Tangential component of the electric field on a perfect conductor will be
(a) infinite. (b) zero.
(c) same as the normals field component and 90° out of phase.
(d) same as the normal component but 180° out of phase.

[U.P.S.C. I.E.S. E.E.-I, 1998]

369. For the volume charge density ρ_v, the divergence of the electric field intensity will be equal to

(a) $\frac{\rho_v}{\epsilon_0}$ (b) $\epsilon_0^2\rho_v$ (c) $\epsilon_0\rho_v$ (d) $\frac{\rho_v}{\epsilon_0^2}$

[U.P.S.C. I.E.S. E.E.-I, 1999]

Answers: **355.** (b), **356.** (c), **357.** (a), **358.** (a), **359.** (b), **360.** (a), **361.** (c), **362.** (d), **363.** (c), **364.** (a), **365.** (c), **366.** (c), **367.** (c), **368.** (b), **369.** (a),

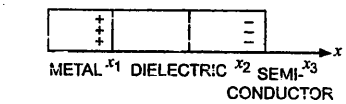
370. The charge distribution in a metal-dielectric-semiconductor specimen is shown in the figure. The negative charge density decreases linearly in the semiconductor as shown. The electric field distribution is as shown in

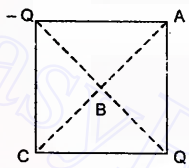


(a)

(b) 
(c) 
(d) 
[GATE E.E., 2005]

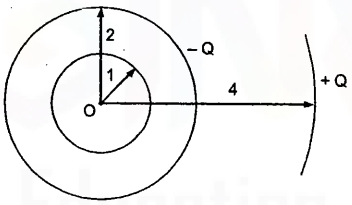
371. The electric potential due to an electric dipole of length l at a point distance r away from it will be doubled if the
(a) length l of the dipole is doubled.
(b) r is doubled.
(c) r is halved. (d) l is halved.
[U.P.S.C. I.E.S. E.E.-I, 1992]

372. Two point charges Q and –Q are located on two opposite corners of a square as shown in the figure. If the potential at the corner A is taken as 1 V, then the potential at B, the centre of the square will be



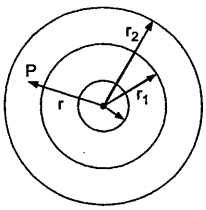
(a) zero (b) $\frac{1}{\sqrt{2}}$ V (c) 1 V
(d) $\sqrt{2}$ V
[U.P.S.C. I.E.S. E.E.-I, 1993]

373. An infinite number of concentric rings carry a charge Q each alternately positive and negative. Their radii are 1, 2, 4, 8... metres in geometric progression as shown. The potential at the centre of the rings will be



(a) zero (b) $Q/12\pi\varepsilon_0$ (c) $Q/8\pi\varepsilon_0$ (d) $Q/6\pi\varepsilon_0$
[U.P.S.C. I.E.S. E.E.-I, 1992]

374. A spherical conductor of radius a with charge 'q' is placed concentrically inside an uncharged and earthed spherical conducting shell of inner and outer radii r_1 and r_2 respectively. Taking potential to be zero at infinity, the potential at any point P with in the shell ($r_1 < r < r_2$) will be

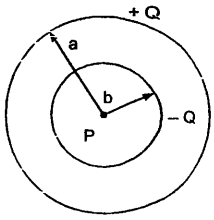


(a) $\frac{q}{4\pi\varepsilon_0 r}$ (b) $\frac{q}{4\pi\varepsilon_0 a}$
(c) $\frac{q}{4\pi\varepsilon_0 r_2}$ (d) $\frac{q}{4\pi\varepsilon_0 r_1}$ [GATE E.E. 1995]

375. A charge is uniformly distributed throughout the sphere of radius a. Taking the potential at infinity as zero, the potential at $r = b < a$ is

(a) $-\int_{\infty}^{b} \frac{Qr}{4\pi\varepsilon_0 a^3}\,dr$ (b) $-\int_{\infty}^{b} \frac{Q}{4\pi\varepsilon_0 r^2}\,dr$
(c) $-\int_{\infty}^{a} \frac{Q}{4\pi\varepsilon_0 r^2}\,dr - \int_{a}^{b} \frac{Qr}{4\pi\varepsilon_0 a^3}\,dr$ (d) $-\int_{\infty}^{a} \frac{Q}{4\pi\varepsilon_0 r^2}\,dr$
[U.P.S.C. I.E.S. E.E.-I, 2003]

376. Two concentric metallic spheres of radii 'a' and 'b' carry charges + Q and – Q respectively as shown in the given figure. Potential at the centre 'P' will be



(a) zero
(b) $\frac{Q}{4\pi\varepsilon_0 b}$
(c) $\frac{-Q}{4\pi\varepsilon_0 b}$ (d) $\frac{-Q}{4\pi\varepsilon_0}\left(\frac{1}{a}-\frac{1}{b}\right)$
[U.P.S.C. I.E.S. E.E.-I, 1997]

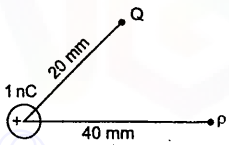
377. The potential inside a charged hollow sphere is
(a) zero. (b) same as that on the surface.
(c) less than that on the surface.
(d) none of the above.

378. Two spheres of radii r_1 and r_2 are connected by a conducting wire. Each of the spheres has been given a charge Q. Now
(a) larger sphere will have greater potential.
(b) larger sphere will have smaller potential.
(c) both of the spheres will have same potential.
(d) smaller sphere will have zero potential.

379. Potential of a sphere is given as

(a) $\frac{Q}{4\pi\epsilon_0 r}$ (b) $\frac{Q}{\pi\epsilon_0 r}$
(c) $\frac{Q}{4\pi\epsilon_0 r^2}$ (d) $\frac{Q^2}{4\pi\epsilon_0 r^2}$

380. A point charge of +1 nC is placed in a space with permittivity of 8.85×10^{-12} F/m as shown in figure. The potential difference V_{PQ} between two points P and Q at distances of 40 mm and 20 mm respectively from the point charge is



(a) 0.22 kV (b) –225 V
(c) –2.24 kV (d) 15 V [GATE E.E., 2003]

381. Given the potential function in free space to be $V(x) = (50x^2 + 50y^2 + 50z^2)$ volts, the magnitude (in volts/metre) and the direction of the electric field at a point (1, –1, 1), where the dimensions are in metres, are

(a) 100; $(i + j + k)$ (b) $100/\sqrt{3}$; $(i - j + k)$
(c) $100\sqrt{3}$; $[(-i - j - k)/\sqrt{3}]$ (d) $100\sqrt{3}$; $[(-i - j + k)/\sqrt{3}]$
[GATE E.E. 2001]

382. The region $z \le 0$ is a dielectric of relative permittivity 2 while the region $z \ge 0$ is a dielectric of relative permittivity 5. If the electric field intensity in region $z \le 0$ is $\bar{E} = 10\,\hat{a}_z$ kV/m, the potential difference between (0, 0, -10^{-3}) m and (0, 0, 10^{-3}) m will be
(a) zero. (b) 70 V. (c) 20 V. (d) 14 V.
[U.P.S.C. I.E.S. E.E.-I, 2000]

Answers: **370.** (a), **371.** (a), **372.** (c), **373.** (d), **374.** (a), **375.** (c), **376.** (d), **377.** (b), **378.** (c), **379.** (a), **380.** (b), **381.** (c), **382.** (d),

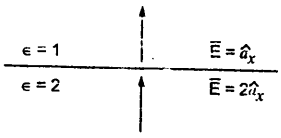
383. The electric field across a dielectric-air interface is shown in the given figure. The surface charge density on the interface is



(a) $-4\epsilon_0$ (b) $-3\epsilon_0$
(c) $-2\epsilon_0$ (d) $-\epsilon_0$

[U.P.S.C. I.E.S. E.E.-I, 2001]

384. Three media are characterised by
1. $\varepsilon_r = 8, \mu_r = 2, \sigma = 0$ (b) $\varepsilon_r = 1, \mu_r = 9, \sigma = 0$
3. $\varepsilon_r = 4, \mu_r = 4, \sigma = 0$

ε_r is relative permittivity, μ_r is relative permeability and σ is conductivity. The values of the intrinsic impedances of the media 1, 2 and 3 respectively are
(a) 188 Ω, 377 Ω and 1131 Ω (b) 377 Ω, 1131 Ω and 188 Ω
(c) 188 Ω, 1131 Ω and 377 Ω (d) 1131 Ω, 188 Ω and 377 Ω

[U.P.S.C. I.E.S E.E.-I 2001]

385. Sphere of radius a with a uniform charge density σ_V C/m^3 shall have electric flux density at $r = a$, equal to

(a) $\frac{a}{3}\sigma_V \hat{i}_r$ C/m^2 (b) $\frac{1}{3}\sigma_V \hat{i}_r$ C/m^2

(c) $a\sigma_V \hat{i}_r$ C/m^2 (d) $\frac{a}{4}\sigma_V \hat{i}_r$ C/m^2

[U.P.S.C. I.E.S. E.E.-I, 2006]

386. The charge on an isolated conductor resides
(a) at the conductor surface.
(b) inside the conductor.
(c) partly at the surface and partly inside the conductor.
(d) none of the above.

387. Two copper spheres A (hollow) and B (solid) are of same diameter and are charged to the same potential.
(a) A will hold more charge in comparison to that of B.
(b) A will hold less charge in comparison to that of B.
(c) Both of the spheres will hold the same charge.
(d) None of the sphere will hold any charge.

388. In a charge-free space, the Poisson's equation results in which one of the following?
(a) Continuity equation. (b) Maxwell's equation.
(c) Laplace equation. (d) None of the above.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

389. If E = 0 at all points on a closed surface,
1. the electric flux through the surface is zero.
2. the total charge enclosed by the surface is zero.
3. the charge resides on the surface.
(a) 1 and 2 only are correct. (b) 2 and 3 only are correct.
(c) 1 and 3 only are correct. (d) 1, 2 and 3 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1992]

390. Which one of the following is the correct statement?
Equipotential lines and field lines
(a) are parallel. (b) are anti-parallel.
(c) are orthogonal. (d) bear no definite relationship.

[U.P.S.C. I.E.S. E.E.-I, 2008]

391. Equipotential surfaces about a pair of equal and opposite linear charges exist in what form?
(a) Concentric spheres. (b) Concentric cylinders.
(c) Non-concentric cylinders.
(d) Planes.

[U.P.S.C. I.E.S. E.E.-I, 2006]

392. Equipotential surfaces about a point charge are in which one of the following forms?
(a) Spheres. (b) Planes.
(c) Cylinders. (d) Cubes.

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

393. A potential field is given by $V = 3x^2y - yz$. Which of the following is NOT true?
(a) At the point (1, 0, –1), V and the electric field $\bar{E}$ vanish.
(b) $x^2y = 1$ is an equipotential line in the xy-plane.
(c) The equipotential surface V = –8 passes through the point P(2, –1, 4).
(d) A unit normal to the equipotential surface V = –8 at P is $(-0.83\hat{x} + 0.55\hat{y} + 0.07\hat{z})$.

[U.P.S.C. I.E.S. E.E.-I, 2002]

394. Cosider the following statements:
In electrostatics equipotential surface is defined as surface where
1. Electric field intensity is normal everywhere.
2. Electric field intensity is tangential everywhere.
3. No work is done in moving a charge over it.
4. No charge is present.
Of these statements
(a) 1 alone is correct. (b) 3 and 4 are correct.
(c) 1 and 3 are correct. (d) 2 and 4 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1998]

395. Which of the following statement(s) is/are valid in case of conductors in electrostatic fields?
(a) The surface of a conductor is an equipotential surface.
(b) The electric field intensity inside a conductor is zero.
(c) The electric field intensity at the surface of a conductor is everywhere directed normal to that surface.
(d) All of the above.

396. If $\bar{E}$ is the electric field intensity, $\nabla(\nabla \times \bar{E})$ is equal to
(a) $\bar{E}$ (b) $|\bar{E}|$
(c) null vector. (d) zero. [GATE E.E. 2005]

397. For electrostatic fields in charge free atmosphere, which one of the following is correct?
(a) $\nabla \times \vec{E} = 0$ and $\nabla \cdot \vec{E} = 0$ (b) $\nabla \times \vec{E} \neq 0$ but $\nabla \cdot \vec{E} = 0$
(c) $\nabla \times \vec{E} = 0$ but $\nabla \cdot \vec{E} \neq 0$ (d) $\nabla \times \vec{E} \neq 0$ but $\nabla \cdot \vec{E} \neq 0$

[U.P.S.C. I.E.S. E.E.-I, 2005]

398. Which one of the following pairs is NOT correctly matched?
(a) Gauss's Theorem: $\oint_s \bar{D} \cdot d\bar{s} = \int_v \nabla \cdot \bar{D} dv$
(b) Gauss's Law: $\oint \bar{D} \cdot d\bar{s} = \int_v \rho dv$
(c) Coulomb's Law: $V = -\frac{d\phi_m}{dt}$
(d) Stroke's Theorem: $\oint_t \bar{\xi} \cdot d\bar{l} = \int_s (\nabla \times \bar{\xi}) \cdot d\bar{s}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

399. In free space, if $\rho = 0$, the Poisson's equation becomes
(a) Maxwell's divergence equation $\nabla \cdot \bar{B} = 0$.
(b) Laplacian equation $\nabla^2 V = 0$.
(c) Kirchhoff's voltage equation $\Sigma V = 0$.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-I, 2006]

400. Where is the Laplace's equation valid?
(a) Only in free space. (b) Only in conductors.
(c) Only in charge free dielectric regions.
(d) Only in cavities bounded on all sides by conducting walls.

[U.P.S.C. I.E.S. E.E.-I, 2006]

401. Which one of the following is the Poisson's equation for a linear and isotropic but inhomogeneous medium?

Answers: **383.** (b), **384.** (c), **385.** (a), **386.** (a), **387.** (c), **388.** (c), **389.** (d), **390.** (c), **391.** (d), **392.** (a), **393.** (d), **394.** (c), **395.** (d), **396.** (d), **397.** (a), **398.** (c), **399.** (b), **400.** (a), **401.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From www.EasyEngineering.net

(a) $\nabla^2 V = -\rho/\epsilon$ (b) $\bar{\nabla}(\epsilon\bar{\nabla}V) = -\rho$

(c) $\bar{\nabla}\cdot\bar{\nabla}(\epsilon V) = -\rho$ (d) $\nabla^2 V = -\rho/\epsilon$

[U.P.S.C. I.E.S. E.E.-I, 2005]

402. Which one of the following statements is correct?
(a) Both Laplace's and Poisson's equations are nonlinear equations.
(b) Laplace's equation is nonlinear but Poisson's equation is linear.
(c) Laplace's equation is linear but Poisson's equation is non-linear.
(d) Both Laplace's and Poisson's equations are linear.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

403. Consider the following statements relating to Laplace's equation:
1. Solution of Laplace's equation with two different approved methods will lead to different answers.
2. Every physical problem satisfying Laplace's equation must contain at least two conducting boundaries.
3. Every field (if $\rho_v = 0$) satisfies Laplace's equation.
4. Every conceivable configuration of electrodes or conductors produces a field for which $\nabla^2 V = 0$

Which of these statements are correct?
(a) 1, 3 and 4. (b) 3 and 4.
(c) 1 and 2. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2003]

404. Two conducting shells of radii r_1 and $r_2 (r_1 > r_2)$ each with a charge 'Q' are placed for apart in uniform external electric field. The space surrounding each shell is filled with the same dielectric material. In this situation, the
(a) shells will not experience any force?
(b) shells will experience identical forces?
(c) shells with radius r_1 will experience a greater force?
(d) shell with radius r_2 will experience a greater force?
[U.P.S.C. I.E.S. E.E.-I, 1998]

405. The torque on a dipole consisting of 1 μC charge at $(0, 0, 10^{-3})$ m and −1 μC of charge at $(0, 0, -10^{-3})$ m in an electric field $\bar{E} = 10^3(2\hat{a}_x - \hat{a}_y - 2\hat{a}_z)$ V/m. The value of torque would be
(a) $2 \times 10^{-6}(\hat{a}_x + 2\hat{a}_y)$ N-m
(b) $10^{-6}(\hat{a}_x + 2\hat{a}_y)$ N-m (c) -4×10^{-6} N-m
(d) $-2 \times 10^{-6}(\hat{a}_x + 2\hat{a}_y)$ N-m [U.P.S.C. I.E.S. E.E.-I, 1998]

406. A medium behaves like dielectric when the
(a) displacement current is just equal to the conduction current.
(b) displacement current is less than the conduction current.
(c) displacement current is much greater than the conduction current.
(d) displacement current is almost negligible.
[U.P.S.C. I.E.S. E.E.-I, 2002]

407. The relation between the breakdown voltage V and the thickness t of the dielectric is given as $V = At^{2/3}$ where A is a constant which depends on the nature and thickness of the medium. This statement is known as
(a) Coulomb's law. (b) Baur's law.
(c) Gauss's law. (d) none of these.

408. During dielectric breakdown of a capacitor
(a) permanent conduction path is established between capacitor plates.
(b) electrons are scattered.
(c) electrons cease to move from one plate to another.
(d) none of the above.

409. Dielectric strength of a material depends on
(a) temperature. (b) thickness.
(c) moisture content. (d) all of these.

410. Dielectric strength of a medium
(a) increases with the increase in temperature.
(b) decreases with the increase in thickness.
(c) increases with moisture content.
(d) is not affected by the moisture content.

411. Polarization of dielectric materials results in
(a) production of eddy currents.
(b) creation of dielectric dipoles.
(c) release of protons. (d) absorption of electrons.

412. Fields are said to be circularly polarized if their magnitudes are
(a) Equal and they are in phase.
(b) Equal and they differ in phase by ± 90°.
(c) Unequal and they differ in phase by ±90°.
(d) Unequal and they are in phase. [U.P.S.C. I.E.S. E.E.-I, 2007]

413. The equation $\bar{E} = \bar{a}_x E \sin(\omega t - \beta z) + \bar{a}_y E \sin(\omega t - \beta z)$ represents
(a) a left circularly polarised wave.
(b) a right circularly polarised wave.
(c) a linearly polarised wave.
(d) an elliptically polarised wave. [U.P.S.C. I.E.S. E.E.-I, 1999]

414. The electric field intensity between the plates of a parallel plate condenser is E. Now if a dielectric of medium of dielectric constant ε is introduced between the plates, the electric field intensity will become
(a) ϵE (b) E/ϵ (c) $\sqrt{\epsilon E}$ (d) $\sqrt{E/\epsilon}$

415. The unit of polarization is the same as that of
(a) electric flux density D. (b) electric intensity E.
(c) charge. (d) dielectric flux.

416. Which of the following equation(s) is/are correct ?
(a) $\bar{J} = \sigma\bar{E}$ (b) $\nabla\bar{V} = \bar{E}$
(c) $\bar{D} = \epsilon\bar{E}$ (d) all of these.

417. The relation between electric polarization and susceptibility indicates that the electric polarization is
(a) independent of susceptibility.
(b) inversely proportional to susceptibility.
(c) proportional to square root of susceptibility.
(d) proportional to susceptibility. [U.P.S.C. I.E.S. E.E.-I, 1994]

418. The polarization of a dielectric material is given by
(a) $P = \varepsilon_r E$ (b) $P = (\varepsilon_r - 1) E$
(c) $P = E\,\varepsilon_0(\varepsilon_r - 1)$ (d) $P = (\varepsilon_r - 1)\,\varepsilon_0$
[U.P.S.C.I.E.S. E.E.-I, 1994]

419. A flat slab of dielectric, $\varepsilon_r = 5$ is placed normal to a uniform field with a flux density D = 1 Coulomb/m^2. The slab is uniformly polarized. What is the polarization P of the slab in Coulomb/m^2?
(a) 0.8 (b) 1.2 (c) 4 (d) 6
[U.P.S.C. I.E.S. E.E.-I, 2004]

420. A plane slab of dielectric having dielectric constant 5, placed normal to a uniform field with a flux density of 2 C/m^2 is uniformly polarized. The polarization of the slab is
(a) 0.4 C/m^2 (b) 1.6 C/m^2
(c) 2.0 C/m^2 (d) 6.4 C/m^2
[U.P.S.C. I.E.S. E.E.-I, 2003]

Answers: **402.** (d), **403.** (b), **404.** (b), **405.** (a), **406.** (d), **407.** (b), **408.** (a), **409.** (d), **410.** (b), **411.** (b), **412.** (b), **413.** (c), **414.** (b), **415.** (a), **416.** (d), **417.** (d), **418.** (c), **419.** (a), **420.** (b),

421. The electric field of a uniform plane wave is given by

$$\bar{E} = 10 \sin(\omega t - \pi z)\hat{a}_x + 10 \cos(\omega t - \pi z)\hat{a}_y \frac{V}{m}$$

The polarization of the wave is

(a) Circular. (b) Elliptical. (c) Linear. (d) Undefined.

[U.P.S.C. I.E.S. E.E.-I, 2003]

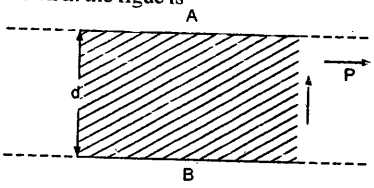
422. The potential difference between the faces A and B of uniformly polarized infinite slab shown in the figue is

(a) $\frac{Pd}{\varepsilon_0(\varepsilon_r - 1)}$

(b) $\frac{Pd}{\varepsilon_0 \varepsilon_r}$

(c) $\frac{Pd}{\varepsilon_0}$

(d) $Pd\frac{(\varepsilon_r + 1)}{\varepsilon_0}$



[U.P.S.C. I.E.S. E.E.-I, 1993]

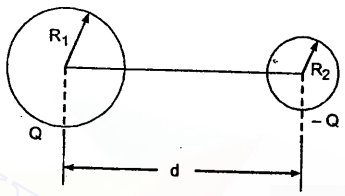
423. Two circular rings carry equal and opposite charges as shown in the given figure. The dipole moment of the charge distribution is

(a) $Q\frac{R_2}{R_1}d$

(b) $\frac{R_1}{R_2}d$

(c) $Q\frac{R_1^2 - R_2^2}{d}$

(d) Qd



[U.P.S.C. I.E.S. E.E.-I, 1994]

424. Two electrons moving parallel to each other at the same velocity will

(a) attract each other if they move in the same direction.
(b) repel each other more strongly when moving in the same direction than when moving in opposite direction.
(c) repel each other less strongly when moving in same direction.
(d) repel each other with the same force when moving in the same or opposite direction. [U.P.S.C. I.E.S. E.E.-I, 1992]

425. In a multilayer dielectric material on either side of a boundary,

(a) the normal component of electrical displacement is same.
(b) the normal component of electrical field is same.
(c) the tangential component of electrical displacement is necessarily zero.
(d) the tangential component of electrical field is necessarily zero.

[U.P.S.C. I.E.S. E.E.-I, 1994]

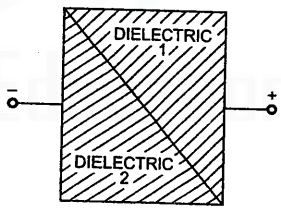
426. Which one is correct at dielectric 1-dielectric 2 boundary ?

(a) $E_1 = E_2$

(b) $E_{t1} = E_{t2}$

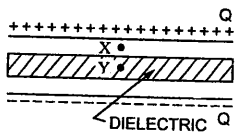
(c) $D_{n1}\, D_{n2} = E_{t1}\, E_{t2}$

(d) None of the above.



427. In a parallel plate capacitor shown in figure given below, the polarisation factor at points X and Y respectively will be

(a) zero, zero.
(b) non-zero, non-zero.
(c) zero, non-zero. (d) non-zero, zero.



428. Which one of the following statements is correct?
On a conducting surface boundary, electric field lines are

(a) always tangential.
(b) always normal.
(c) neither tangential nor normal.
(d) at an angle depending on the field intensity.

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

429. Consider the following statements associated with boundary conditions between two media:

1. Normal component of B is continuous at the surface of discontinuity.
2. Normal component of D may or may not be continuous.

Which of the statements given above is/are correct?

(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

430. The relation between electric intensity E, voltage applied V and the distance d between the plates of a parallel plate condenser is

(a) $E = \frac{V}{d}$ (b) $E = V \times d$

(c) $E = \frac{V}{d^2}$ (d) $E = V \times d^2$

[U.P.S.C. I.E.S. E.E.-I, 2002]

431. Joule/coulomb is the unit of

(a) electric field potential. (b) potential.
(c) charge. (d) none of the above.

[U.P.S.C. I.E.S. E.E.-I, 1992]

432. The capacitance of an insulated conducting shpere of radius R in vacuum is

(a) $2\pi\varepsilon_0 R$ (b) $4\pi\varepsilon_0 R$ (c) $4\pi\varepsilon_0 R^2$ (d) $4\pi\varepsilon_0/R$

[U.P.S.C. I.E.S. E.E.-I, 2008]

433. Consider the following statements associated with parallel plate capacitor :

1. Capacitance is proportional to area.
2. Capacitance is inversely proportional to distance of separation of plates.
3. The dielectric material is in a state of compression.

Of these statements

(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 1 and 3 are correct. (d) 2 and 3 are correct.

[U.P.S.C. I.E.S. E.E. I, 1995]

434. In a parallel plate capacitor, a dielectric slab is introduced. Then the

(a) pd between the plates will decrease.
(b) electric intensity will decrease.
(c) capacitance will increase. (d) all of the above.

435. In a parallel capacitor of capacitance C and electric field E if a mica slab ($\in_r = 6$) is introduced to fill capacitor completely then the new capacitance and electric field will be

(a) 6 C and 6 E. (b) C/6 and 6 E.
(c) 6 C and E/6. (d) C/6 and E/6.

436. The ratio of charge stored by two metallic spheres raised to the same potential is 6. The ratio of the surface areas of the sphere is

(a) 6 (b) 1/6 (c) 36 (d) $1/\sqrt{6}$

[U.P.S.C. I.E.S. E.E.-I, 1992]

437. Which one of the following gives the approximate value of the capacitance between two spheres, whose separation is very much larger than their radii R.

(a) $\frac{2\pi}{\varepsilon_0 R}$ (b) $2\pi\varepsilon_0 R$ (c) $\frac{2\pi\varepsilon_0}{R}$ (d) $\frac{4\pi\varepsilon_0}{R}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **421.** (a), **422.** (a), **423.** (d), **424.** (a), **425.** (d), **426.** (b), **427.** (c), **428.** (b), **429.** (c), **430.** (a), **431.** (b), **432.** (b), **433.** (a), **434.** (d), **435.** (c), **436.** (c), **437.** (b),

438. A capacitor is made up of two concentric spherical shells. The radii of the inner and outer shells are R_1 and R_2 respectively and ε is the permittivity of the medium between the shells. The capacitance of the capacitor is given by

(a) $\frac{1}{4\pi\varepsilon}\left(\frac{1}{R_1}-\frac{1}{R_2}\right)$ (b) $\frac{1}{4\pi\varepsilon}\left(\frac{1}{R_1}+\frac{1}{R_2}\right)$

(c) $4\pi\varepsilon\frac{R_1R_2}{R_1+R_2}$ (d) $4\pi\varepsilon\frac{R_1R_2}{R_1-R_2}$

[U.P.S.C. I.E.S. E.E.-I, 1998]

439. A parallel plate capacitor has capacitance of 10 μF. If the linear dimensions of the plates are doubled and the separation between them is also doubled the value of the capacitor would be

(a) 10 μF (b) 20 μF (c) 5 μF (d) 40 μF

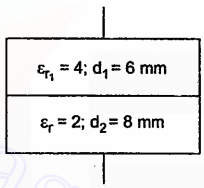
[A.M.I.E. Elec. Science Winter 1994]

440. A parallel plate air capacitor has plates of 1,500 cm^2 separated by 5 mm. If a layer of dielectric 2 mm thick and relative permittivity 3 is now introduced between the plates, then the new separation in mm between the plates, so that the capacitance value is unchanged, will be

(a) 7.00 (b) 6.33 (c) 5.67 (d) 5.00

[U.P.S.C. I.E.S. E.E.-I, 1994]

441. A parallel plate capacitor is shown in the figure. It is made up of two square metal plates of 400 mm side. The 14 mm space between the plates is filled with two layers of dielectrics of $\varepsilon_r = 4$, 6 mm thick and $\varepsilon_r = 2$, 8 mm thick. Neglecting fringing of fields at the edges the capacitance is

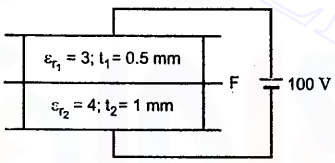


$\varepsilon_0 = 8.85 \times 10^{-12}$ F/m

(a) 1298 pF. (b) 944 pF.
(c) 354 pF. (d) 257 pF.

[GATE E.E. 2004]

442. A composite parallel plate capacitor is made up of two different dielectric materials with different thicknesses (t_1 and t_2) as shown in figure. The two different dielectric materials are separated by a conducting foil F. The voltage of the conducting foil is



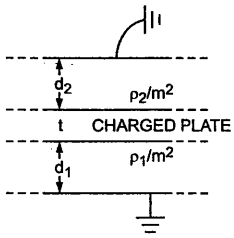
(a) 52 V (b) 60 V (c) 67 V (d) 33 V

[GATE E.E. 2003]

443. A capacitor consists of two metal plates each 500 × 500 mm^2 and spaced 6 mm apart. The space between the metal plates is filled with a glass plate of 4 mm, thickness and a layer of paper of 2 mm thickness. The relative primittivities of the glass and paper are 8 and 2 respectively. Neglecting the fringing effect, the capacitance will be (Given that $\varepsilon_0 = 8.85 \times 10^{-12}$ F/m)

(a) 983.3 pF (b) 1475 pF
(c) 637.5 pF (d) 9956.25 pF [GATE E.E. 2008]

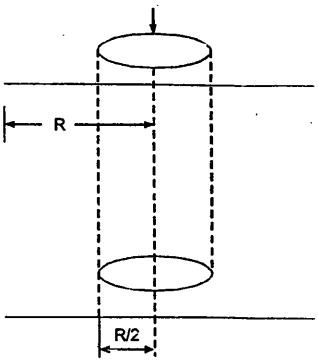
444. When an infinite charged conducting plate is placed between two infinite conducting grounded surfaces as shown in the figure given below, what would be the ratio of the surface charge densities ρ_1 and ρ_2 on the two sides of the plate?



(a) $\left(\frac{d_1+t}{d_2+t}\right)$ (b) $\left(\frac{d_2+t}{d_1+t}\right)$

(c) $\frac{d_1}{d_2}$ (d) $\frac{d_2}{d_1}$ [U.P.S.C. I.E.S. E.E.-I, 2007]

445. A parallel plate capacitor consists of two circular plates each of radius R. At a certain instant, the capacitor carries a current i. A closed cylindrical surface is drawn centrally as shown in the figure. The conduction current leaving the closed surface is



(a) zero.
(b) i
(c) $i/2$
(d) $3i/4$

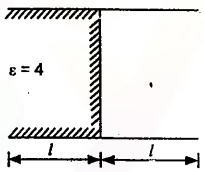
[U.P.S.C. I.E.S. E.E.-I, 1993]

446. When air pocket is trapped inside a dielectric of relative permittivity '5', for a given applied voltage across the dielectric, the ratio of stress in the air pocket to that in the dielectric is equal to

(a) $\frac{1}{5}$ (b) 5 (c) 1 + 5 (d) 5 – 1

[U.P.S.C. I.E.S. E.E.-I, 2001]

447. A parallel plate air capacitor carries a charge Q at its maximum withstand voltage V. If the capacitor is half filled with an insulating slab of dielectric constant 4 as shown in the figure, what are the maximum withstand voltage and the charge on the capacitor at this voltage, respectively?



(a) 2.5 V, Q (b) 4 V, 2.5 Q
(c) V, 2.5 Q (d) V/4, Q

[U.P.S.C. I.E.S. E.E.-I, 2007]

448. A parallel plate capacitor has a homogeneous dielectric slab of area 4 cm^2 and thickness 1 cm with $\varepsilon_r = 4$. If a cubic air void of 1 mm^3 is developed in the volume of the dielectric slab, then

(a) the average voltage stress in the dielectric material will increase and discharge free rating of the capacitor will increase.
(b) the average voltage stress in the dielectric material will increase and discharge free rating of the capacitor will decrease.
(c) the average voltage stress in the dielectric material will decrease and discharge free rating of the capacitor will decrease.
(d) the average voltage stress in the dielectric material will decrease and discharge free rating of the capacitor will increase. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

449. In two parallel conducting plates, each of area A and having charge density ρ_s, the force of attraction between them will be

(a) $\frac{1}{2\epsilon}\rho_s^2A^3$ (b) $\frac{1}{2}\frac{E^2}{\epsilon}A$

(c) $\frac{1}{2\epsilon}\rho_s^2$ (d) $\frac{1}{2}\rho_s^2$

450. When the plate area of a parallel plate capacitor is increased keeping the capacitor voltage constant, the force between the plates

Answers: **438.** (d), **439.** (b), **440.** (b), **441.** (d), **442.** (b), **443.** (b), **444.** (c), **445.** (a), **446.** (b), **447.** (c), **448.** (b), **449.** (a), **450.** (a),

Downloaded From : www.EasyEngineering.net

 Downloaded From : www.EasyEngineering.net

(a) increases. (b) decreases.
(c) remains constant.
(d) may increase or decrease depending on metal making up the plates. [GATE E.E. 1999]

451. A parallel plate capacitor with air as dielectric is charged and then disconnected from the supply. The force between the plates is F. If the capacitor is now immersed in a liquid dielectric of dielectric constant ε, then the force between the plates will be
(a) $\varepsilon^2 F$ (b) εF (c) F (d) F/ε
[U.P.S.C. I.E.S. E.E.-I, 1997]

452. If V, W, q stand for voltage, energy and charge, then V can be expressed as
(a) $V = \frac{dq}{dw}$ (b) $V = \frac{dw}{dq}$
(c) $dV = \frac{dw}{dq}$ (d) $dV = \frac{dq}{dw}$ [GATE E.E. 1996]

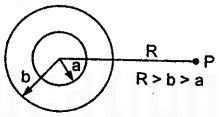
453. The dissipation factor of good dielectric is of the order of
(a) 0.0002 (b) 0.002 (c) 0.02 (d) 0.1

454. A solid specimen of dielectric has relative permittivity $\varepsilon_r = 4.2$ and loss angle $\tan\delta = 0.001$ at 50 Hz frequency. If it is subjected to an electrical stress of 50 kV/cm, what is the heat generated in the specimen due to dielectric loss?
(a) 291 W/cm^3 (b) 5.82 mW/cm^3
(c) 19.5 W/cm^3 (d) 0.291 mW/cm^3
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

455. Energy density in a static electric field is given by
(a) $W = \frac{1}{2} Q V$ (b) $W = \frac{1}{2} C V^2$
(c) $W = \frac{1}{2} D E$ (d) $W = \frac{1}{2} \in E^2 V$

456. The electric energy density is 'W' at a point in free space where the electric field is $\hat{a}_x E$. If the electric field is $\hat{a}_x E - \hat{a}_y E$, in a dielectric of relative permittivity 4, then the electric energy density at that point will be
(a) zero (b) 2 W (c) 4 W (d) 8 W
[U.P.S.C. I.E.S. E.E.-I, 2000]

457. A spherical balloon of radius a is charged. The energy density in the electric field at a point P shown in the figure given below is w. If the balloon is inflated to a radius b without altering its charge, what is the energy density at P?
(a) $w\left(\frac{b}{a}\right)^3$ (b) $w\left(\frac{b}{a}\right)^2$
(c) $w\left(\frac{b}{a}\right)$ (d) w



[U.P.S.C. I.E.S. E.E.-I, 2007]

458. A parallel plate capacitor has an electrode area of 100 mm^2, with a spacing of 0·1 mm between the electrodes. The dielectric between the plates is air with a permittivity of $8{\cdot}85 \times 10^{-12}$ F/m. The charge on the capacitor is 100 V. The stored energy in the capacitor is
(a) 8·85 pJ (b) 440 pJ (c) 22·1 nJ (d) 44·3 nJ
[GATE E.E. 2003]

459. A parallel plate capacitor of 5 pF capacitance has a charge of 0.1 μC on its plates. What is the energy stored in the capacitor?
(a) 1 mJ (b) 1 μJ
(c) 1 nJ (d) 1 pJ [U.P.S.C. I.E.S. E.T.E.-I, 2006]

460. W_1 is the electrostatic energy stored in a system of three equal point charges arranged in a line with 0.5 m separation between them. If W_2 is the energy stored with 1 m separation between them, then which one of the following is correct?
(a) $W_1 = 0.5\, W_2$ (b) $W_1 = W_2$
(c) $W_1 = 2\, W_2$ (d) $W_1 = 4\, W_2$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

461. Point charges of – 10 nC and 10 nC are located in free space at (–1, 0, 0) m and (1, 0, 0) m respectively. What is the energy stored in the field?
(a) zero. (b) 450 nJ (c) –450 nJ (d) –900 nJ
[U.P.S.C. I.E.S. E.E.-I, 2007]

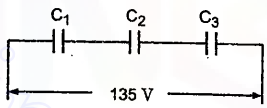
462. The capacitance of a cylindrical capacitor is given as
(a) $\frac{\epsilon_0 \epsilon_r}{\log_e \frac{D}{d}}$ F/m (b) $\frac{2\pi \epsilon_0 \epsilon_r}{\log_e \frac{D}{d}}$ F/m
(c) $\frac{2\pi \epsilon_0 \epsilon_r}{\log_{10} \frac{D}{d}}$ F/m (d) $\frac{2\pi}{\epsilon_0 \epsilon_r \log_e \frac{D}{d}}$ F/m

463. In a cable capacitor, voltage gradient is maximum at the surface of the
(a) sheath. (b) conductor.
(c) dielectric. (d) earth.

464. Six capacitors of different capacitances C_1, C_2, C_3, C_4, C_5 and C_6 are connected in series. $C_1 > C_2 > C_3 > C_4 > C_5 > C_6$. What is the total capacitance almost equal to ?
(a) C_1 (b) C_3 (c) C_4 (d) C_6
[U.P.S.C. I.E.S. E.E.-I, 2006]

465. Two capacitors each having capacitance C and breakdown voltage V are joined in series. The capacitance and breakdown voltage of the combination will be
(a) 2 C and 2 V (b) $\frac{C}{2}$ and $\frac{V}{2}$
(c) 2 C and $\frac{V}{2}$ (d) $\frac{C}{2}$ and 2 V
[A.M.I.E. Elec. Science Summer 1994]

466. If the charge on each of the capacitors in the given figure is 4,500 μC, what is the total capacitance in (μF), assuming that the voltage distribution across C_1, C_2 and C_3 is in the ratio of 2:3:4 ?
(a) 325
(b) 11.1
(c) 22.2
(d) 33.3

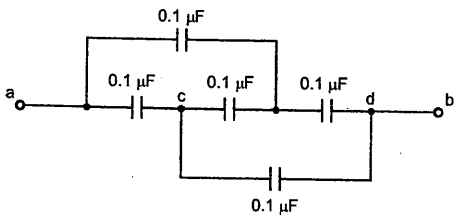


[U.P.S.C. I.E.S. E.E.-I, 1994]

467. Three capacitors each of breakdown voltage 500 V are connected in parallel. The breakdown rating of the combination will be
(a) 500 V (b) 707 V (c) 1,000 V (d) 2,500 V
[A.M.I.E. Elec. Science Summer 1995]

468. The number of 2 μF, 400 V capacitors needed to obtain a capacitance value of 1.5 μF rated for 1,600 V is
(a) 12 (b) 8 (c) 6 (d) 4
[U.P.S.C. I.E.S. E.E.-I, 1994]

469. The equivalent capacitance across ab will be



Answers: **451.** (d), **452.** (b), **453.** (a), **454.** (d), **455.** (c), **456.** (b), **457.** (d), **458.** (d), **459.** (a), **460.** (c), **461.** (a), **462.** (b), **463.** (b), **464.** (d), **465.** (d), **466.** (d), **467.** (a), **468.** (a), **469.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 0.2 μF (b) 0.1 μF (c) 0.5 μF (d) zero
[U.P.S.C. I.E.S. E.E.-I, 1992]

470. The condensors of 20 μF and 40 μF capacitance are connected in series across a 90 V supply. After charging, they are removed from the supply and are connected in parallel with positive terminals connected together and similarly the negative terminals. Then the voltage across them will be
(a) 90 V (b) 60 V (c) 40 V (d) 20 V
[U.P.S.C. I.E.S. E.E.-I, 1995]

471. A 5 A current enters a right circular cylinder of 5 cm radius. What is the linear surface current density at the end surface?
(a) $(50/\pi)$ A/m (b) $(100/\pi)$ A/m
(c) $(1000/\pi)$ A/m (d) $(2000/\pi)$ A/m
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

472. In free space $\vec{E}(z, t) = 50\cos(\omega t - \beta z)\,\vec{a}_x$ V/m and $\vec{H}(z, t) = \frac{5}{12\pi}\cos(\omega t - \beta z)\,\vec{a}_y$ A/m. The average power crossing a circular area of radius $\sqrt{24}$ m in plane z = constant is
(a) 200 W (b) 250 W (c) 300 W (d) 350 W
[U.P.S.C. I.E.S. E.E.-I, 2002]

473. A copper wire carries a conduction current of 1.0 A at 50 Hz. For copper wire $\varepsilon = \varepsilon_0$, $\mu = \mu_0$, $\sigma = 5.8 \times 10$ mho/m. What is the displacement current in the wire?
(a) 2.8×10 A (b) 4.8×10^{-11} A
(c) 1 A
(d) It cannot be calculated with the given data.
[U.P.S.C. I.E.S. E.E.-I, 2006]

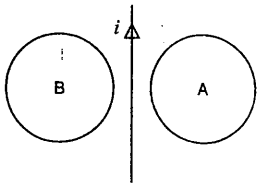
474. If the electric field $\vec{E} = 0.1\,te^{-t}\,\vec{a}_x$ and $\epsilon = 4\,\epsilon_0$, then the displacement current crossing an area of 0.1 m^2 at $t = 0$ will be
(a) zero. (b) $0.04\,\epsilon_0$ (c) $0.4\,\epsilon_0$ (d) $4\,\epsilon_0$
[U.P.S.C. I.E.S. E.E.-I, 1998]

475. For linear isotropic materials, both $\vec{E}$ and $\vec{H}$ have the time dependence $e^{j\omega t}$ and regions of interest are free of charges. The value of $\vec{\nabla} \times \vec{H}$ is given by
(a) $\sigma\vec{E}$ (b) $j\omega\varepsilon\vec{E}$
(c) $\sigma\vec{E} + j\omega\varepsilon\vec{E}$ (d) $\sigma\vec{E} - j\omega\varepsilon\vec{E}$
[U.P.S.C. I.E.S. E.E.-I, 2002]

476. Two extensive homogeneous isotropic dielectrics meet on a plane $z = 0$. For $z \geq 0$, $\varepsilon_{r_1} = 4$ and $z \leq 0$, $\varepsilon_{r_2} = 2$. A uniform electric field exists at $z \geq 0$ as $\vec{E}_1 = 5\hat{a}_x - 2\hat{a}_y + 3\hat{a}_z$ kV/m. What is the value of $\vec{E}_2$ in the region $z \leq 0$?
(a) $3\hat{a}_z$ (b) $5\hat{a}_x - 2\hat{a}_y$
(c) $6\hat{a}_z$ (d) $\hat{a}_x - \hat{a}_y$
[U.P.S.C. I.E.S. E.E.-I, 2004]

477. If a very flexible wire is laid out in the shape of a hairpin with its two ends secured, what shape will the wire tend to assume if a current is passed through it?
(a) Parabolic. (b) Straight line.
(c) Circle. (d) Ellipse.
[U.P.S.C. I.E.S. E.E.-I 2007]

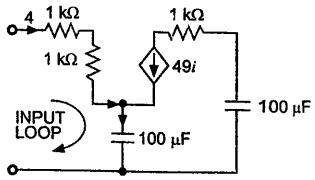
478. A straight current carrying conductor and two conducting loops A and B are shown in the figure. What are the induced currents in the two loops?



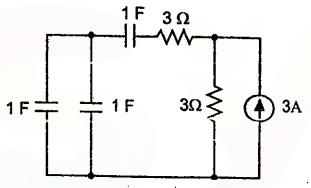
(a) Anticlockwise in A and clockwise in B.
(b) Clockwise in A and anticlockwise in B.
(c) Clockwise both in A and B.
(d) Anticlockwise both in A and B. [U.P.S.C. I.E.S. E.E.-I, 2007]

479. Which of the following statements associated with capacitors is wrong?
(a) A capacitor resists an abrupt change in the voltage across it in a manner analogous to the way a spring resists abrupt change in its displacement.
(b) A capacitor resists an abrupt change in the current flowing through it.
(c) It is impossible to change the voltage across a capacitor even if the current through the capacitor by a finite amount in zero time, for this requires infinite current through the capacitor.
(d) A finite amount of energy can be stored in a capacitor even if the current through the capacitor is zero, such as when the voltage across it is a constant.

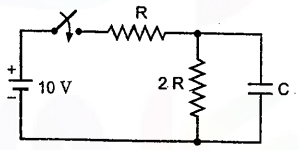
480. The equivalent capacitance of the input loop of the circuit shown is
(a) 2 μF
(b) 100 μF
(c) 200 μF
(d) 4 μF [GATE E.E. 2009]



481. The time constant for the given circuit will be
(a) 1/9 s
(b) 1/4 s
(c) 4 s
(d) 9 s [GATE E.E. 2008]

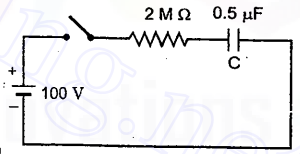


482. The time constant of the network shown in figure is
(a) 2 RC
(b) 3 RC
(c) RC/2
(d) 2 RC/3

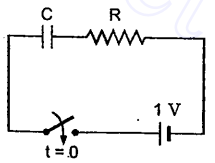


[GATE E.E. 1992]
[**Hint** : Resistance faced by C with the source shorted is 2 R/3]

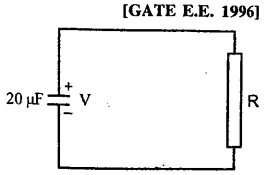
483. The voltage across R after $t = 0$ and $t = 10$ seconds will be
(a) 100 V, 63.2 V
(b) 0 V, 63.2 V
(c) 100 V, 36.8 V
(d) 0 V, 36.8 V
[U.P.S.C. I.E.S. E.E. I-1992]



484. In the series R-C circuit shown in the figure, the voltage across C starts increasing when the dc source is switched on. The rate of increase of voltage across C at the instant just after the switch is closed (*i.e.* at $t = 0^+$), will be
(a) zero. (b) infinity. (c) RC. (d) 1/RC.
[GATE E.E. 1996]



485. For the circuit shown in the given figure, if $C = 20\ \mu F$, $v(0^-) = -50$ V and $\frac{dv(0^-)}{dt} = 500$ V/s, then R



Answers: **470.** (c), **471.** (a), **472.** (b), **473.** (b), **474.** (b), **475.** (c), **476.** (c), **477.** (b), **478.** (a), **479.** (b), **480.** (a), **481.** (c), **482.** (d), **483.** (c), **484.** (d), **485.** (c),

Downloaded From : www.EasyEngineering.net

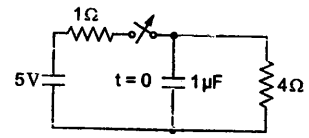
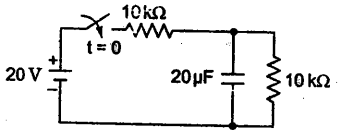
(a) 2 kΩ (b) 3 kΩ (c) 5 kΩ (d) 10 kΩ
[U.P.S.C I.E.C E.E.-I, 2002]

486. The switch in the circuit has been closed for a long time. It is opened at $t = 0$. At $t = 0^+$, the current through the 1 μF capacitor is



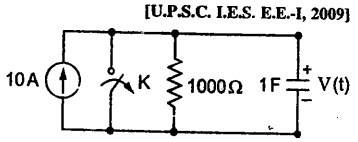
(a) 0 A (b) 1 A
(c) 1.25 A (d) 5 A
[GATE E.E., 2010]

487. The switch of the given circuit was open for long, and at $t = 0$ it is closed. What is the final steady state voltage across the capacitor and the time constant of the circuit?



(a) 0 V and 0.1 sec. (b) 20 V and 0.2 sec.
(c) 10 V and 0.2 sec. (d) 10 V and 0.1 sec.
[U.P.S.C. I.E.S. E.E.-I, 2009]

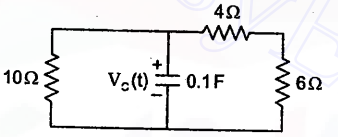
488. In the given network, the switch K is opened at $t = 0$. Then $\frac{dV}{dt}$ at $t = 0^+$ is



(a) 1,000 V/sec (b) 100 V/sec
(c) 10 V/sec (d) 1 V/sec
[U.P.S.C. I.E.S. E.E.-I, 2011]

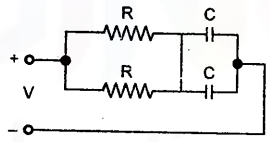
489. If the initial voltage across the capacitor of 2 farad is V(0) = 1, the voltage and charge on the capacitor at $t = 3$ sec after connecting a current source $I_s = 2$ A at $t = 0$ are respectively
(a) 2 V, 4 coulomb. (b) −2 V, 4 coulomb.
(c) 4 V, 8 coulomb. (d) 8 V, 4 coulomb.
[U.P.S.C. I.E.S. E.E.-I, 2010]

490. In the circuit, if $V_c(0) = 25$ V, the expression for $V_c(t)$ for $t > 0$ is



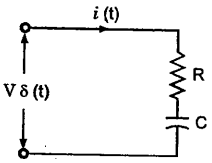
(a) $V_c(t) = 20\, e^{-0.4t}$ V
(b) $V_c(t) = 25\, e^{-0.4t}$ V
(c) $V_c(t) = 20\, e^{-2.5t}$ V
(d) $V_c(t) = 25\, e^{-2t}$ V
[U.P.S.C. I.E.S. E.E.-I, 2011]

491. The time constant of the network shown in the figure is



(a) CR (b) 2CR
(c) $\frac{CR}{4}$ (d) $\frac{CR}{2}$
[U.P.S.C. I.E.S. E.E.-I, 1998]

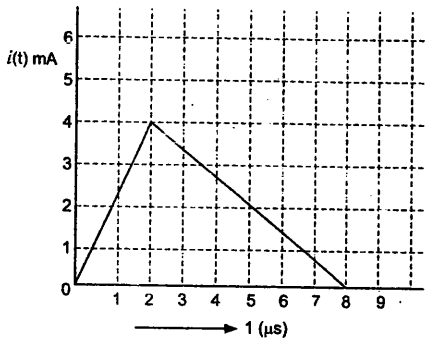
492. In the circuit shown in the given figure, the response current $i(t)$ is



(a) $\frac{V}{R}\exp\left(\frac{-t}{CR}\right)$
(b) $\frac{V}{R}\delta(t)$
(c) $\frac{V}{R}\left[\delta(t) - \frac{1}{RC}\exp\left(\frac{-1}{RC}\right)\right]$
(d) $\frac{V}{R}\left[\delta(t) - \exp\left(\frac{-1}{RC}\right)\right]$
[U.P.S.C. I.E.S. E.E.-I, 1999]

Statement for Linked Answer Questions 493–494

The current $i(t)$ sketched in the figure flows through an initially uncharged 0.3 nF capacitor.



493. The charge stored in the capacitor at $t = 5$ μs, will be
(a) 8 nC (b) 10 nC (c) 13 nC (d) 16 nC
[GATE E.E. 2008]

494. The capacitor charged up to 5 ms, as per the current profile given in the figure, is connected across an inductor of 0.6 mH. Then the value of voltage across the capacitor after 1 μs will approximately be
(a) 18.8 V (b) 23.5 V (c) −23.5 V (d) −30.6 V
[GATE E.E. 2008]

495. Potential difference across a capacitor of capacitance 20 μF is increased uniformly from 0 to 240 V in 1 second. The charging current will be
(a) 12 mA (b) 4.8 mA (c) 1.2 mA (d) 9.6 mA

496. An ideal voltage source will charge an ideal capacitor
(a) in infinite time. (b) exponentially.
(c) instantaneously. (d) none of the above.
[GATE E.E. 1997]

497. For preventing the generation of static charge on rubber or flat leather
(a) surface is moistened.
(b) conductive dressing is done.
(c) oil compound dressing is done.
(d) any of the above.

498. For removing static charge from machinery the
(a) machinery is insulated.
(b) insulated cabins are constructed.
(c) framework is earthed.
(d) any of the above.

499. If the dielectric of a capacitor is replaced by a conducting material the
(a) capacitor will get heated up owing to eddy currents.
(b) plates will get short circuited.
(c) capacitor can store infinite charge.
(d) capacitance will become very high.

500. While testing a capacitor with ohmmeter, if the capacitor shows charging but the final resistance reading is appreciably less than normal the capacitor is
(a) leaky. (b) open circuited.
(c) short circuited. (d) satisfactory.

501. If an ohmmeter reading immediately goes practically to zero and stays there while checking a capacitor, the capacitor is
(a) leaky. (b) short circuited.
(c) open circuited. (d) satisfactory.

Answers: **486.** (b), **487.** (d), **488.** (c), **489.** (c), **490.** (d), **491.** (a), **492.** (a), **493.** (c), **494.** (d), **495.** (b), **496.** (c), **497.** (b), **498.** (c), **499.** (b), **500.** (a), **501.** (b),

502. While checking a good 0.05 μF capacitor by ohmmeter, its reading will
(a) show high resistance momentarily and then a very low resistance.
(b) show low resistance momentarily and back off to a very high resistance.
(c) show a reading of 80 Ω.
(d) none of the above.

503. A permeable substance is one
(a) through which the magnetic lines of force can pass very easily.
(b) which is a strong magnet.
(c) which is a bad conductor. (d) none of the above.

504. The magnetic materials exhibit the property of magnetisation due to
(a) spin of nucleus. (b) spin of electrons.
(c) orbital motion of electrons. (d) all of the above.

505. Consider the following statements: In the case of diamagnetic materials, the magnetic susceptibility is
1. positive. 2. negative.
3. independent of temperature.
4. inversely proportional to temperature. Of these statements
(a) 1 and 3 are correct. (b) 2 and 3 are correct.
(c) 1 and 4 are correct. (d) 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

506. Which of the following statement(s) is/are correct ?
1. Ferromagnetic substances have very large negative values of susceptibility.
2. Diamagnetic substances have very small negative values of suceptibility.
3. Paramagnetic substances have very small positive values of susceptibility.
4. The permeability of diamagnetic substances is slightly greater than unity.
Select the correct answer using the codes given below:
(a) 1 and 4. (b) 2 and 3. (c) 3 and 4. (d) 4 alone.
[U.P.S.C. I.E.S E.E.-I, 1994]

507. The magnetic susceptibility of a paramagnetic material is
(a) less than zero. (b) less than one but positive.
(c) greater than one. (d) equal to zero.
[U.P.S.C. I.E.S. E.E.-I, 1997]

508. Iron is a
(a) ferromagnetic. (b) ferrimagnetic.
(c) paramagentic. (d) antiferromagnetic material.
[A.M.I.E. Sec B. E.E. Materials Winter 1994]

509. Air exhibits
(a) ferromagnetic. (b) paramagnetism.
(c) antiferromagnetism. (d) ferromagnetism.
[A.M.I.E. Sec B. E.E. Materials Winter 1994]

510. Soft magnetic materials have
(a) high permeability and low coercive force.
(b) low permeability and high coercive force.
(c) high residual magnetism. (d) low resistivity.

511. Soft magnetic material is
(a) tungsten steel. (b) Alcomax.
(c) bismuth. (d) iron.
[A.M.I.E. Sec B. E.E. Materials Summer 1993]

512. Remanent magnetism is one which
(a) is left in the iron piece after the removal of the magnetic field.
(b) is produced by the superconductor coils.
(c) is produced by electric current.
(d) is produced by induction.

513. The bar magnet has
(a) monopole moment. (b) dipole moment.
(c) both (a) and (b). (d) none of these.

514. A keeper is used for
(a) restoring of lost flux. (b) amplification of flux.
(c) providing a closed path for the magnetic flux.
(d) changing the direction of magnetic lines of force.

515. When a piece of iron is placed in a magnetic field,
(a) there will be no effect on the magnetic field.
(b) the magnetic lines of force will bend away from their usual paths in order to go away from the piece.
(c) the magnetic lines of force will bend away from their usual paths so as to pass through the piece.
(d) none of the above.

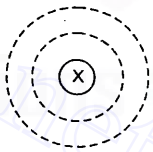
516. Which of the following statements associated with magnetic field is correct ?
(a) The electric current always produces a magnetic field.
(b) The electric current produces magnetic field only in presence of a coil.
(c) The electric current produces magnetic field only in presence of an iron core.
(d) Only large currents produce a magnetic field.

517. A conducting sheet lying in x-y plane has J_x as current density in X-direction, then magnetic flux at the surface is
(a) zero. (b) ∞ (c) $H_y = n J_x$ (d) $H_x = J_x$
where n is the normal vector to the surface.

518. Magnetic flux density emerging out of a closed surface is
(a) infinite. (b) zero.
(c) dependent upon the magnetic movement inside the closed surface.
(d) none of the above.

519. Which of the following is a vector quantity ?
(a) Magnetic potential. (b) Susceptibility.
(c) Magnetic field intensity. (d) Magnetic flux density.

520. The direction of magnetic flux in a current carrying conductor shown in figure below is
(a) upwards
(b) downwards.
(c) clockwise.
(d) counterclockwise.



521. Which of the following is derived from Ampere's law ?
(a) $\oint \mathbf{B} \cdot ds = 0$ (b) $\oint \mathbf{D} \cdot ds = \int \rho dV$
(c) $\oint \mathbf{H} \cdot ds = \int \left(\frac{d\mathrm{D}}{dt} + \mathrm{J} \right) \cdot da$
(d) none of the above.

522. $\nabla \mathbf{B}$ is based on
(a) Gauss's law. (b) Lenz's law.
(c) Ampere's law. (d) continuity equation.
[U.P.S.C. I.E.S. E.E.-I, 2006]

Answers: **502.** (b), **503.** (a), **504.** (d), **505.** (b), **506.** (b), **507.** (b), **508.** (a), **509.** (b), **510.** (a), **511.** (d), **512.** (a), **513.** (b), **514.** (c), **515.** (c), **516.** (a), **517.** (c), **518.** (b), **519.** (c), **520.** (c), **521.** (c), **522.** (a),

523. An electromagnetic field is said to be conservative when

(a) $\nabla^2 E = \mu\varepsilon \frac{\partial^2 E}{\partial t^2}$ (b) $\nabla^2 H = \mu\varepsilon \frac{\partial^2 H}{\partial t^2}$

(c) Curl of the field is zero. (d) Divergence of the field is zero.

[U.P.S.C. I.E.S. E.E.-I, 2003]

524. Which of the following is zero as applied to electromagnetic fields?

(a) grad div $\vec{A}$. (b) div grad V.

(c) div curl $\vec{A}$. (d) curl curl $\vec{A}$.

[U.P.S.C. I.E.S. E.E.-I, 2006]

525. Maxwell equation $\bar{\nabla} \times \bar{E} = -\frac{\partial \bar{B}}{\partial t}$ is represented in integral form as

(a) $\oint \bar{E} \cdot d\bar{l} = -\frac{\partial}{\partial t} \oint \bar{B} \cdot d\bar{l}$ (b) $\oint \bar{E} \cdot d\bar{l} = -\frac{\partial}{\partial t} \int_s \bar{B} \cdot d\bar{s}$

(c) $\oint \bar{E} \times d\bar{l} = \frac{\partial}{\partial t} \oint \bar{B} \cdot d\bar{l}$ (d) $\oint \bar{E} \times d\bar{l} = \frac{\partial}{\partial t} \int_s \bar{B} \cdot d\bar{s}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

526. Which of the following equations is/are not Maxwell's equations(s)?

1. $\nabla \cdot \bar{J} = -\frac{\partial \rho v}{\partial t}$ 2. $\nabla \cdot \bar{D} = \rho v$

3. $\nabla \cdot \bar{E} = -\frac{\partial \bar{B}}{\partial t}$ 4. $\oint \bar{H} \cdot d\bar{l} = \int_s \left(\sigma \bar{E} + \varepsilon \frac{\partial \bar{E}}{\partial t}\right) \cdot d\bar{s}$

Select the correct answer using the codes given below:

(a) 2 and 4. (b) 1 alone. (c) 1 and 3. (d) 1 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2002]

527. What is the generalized Maxwell's equation $\nabla \times \bar{H} = \bar{J}e + \frac{\partial \bar{D}}{\partial t}$ for free space?

(a) $\nabla \times \bar{H} = 0$ (b) $\nabla \times \bar{H} = \bar{J}e$

(c) $\nabla \times \bar{H} = \frac{\partial \bar{D}}{\partial t}$ (d) $\nabla \times \bar{H} = \bar{D}$

[U.P.S.C. I.E.S. E.E.-I, 2009]

528. Which one of the following is *not* a Maxwell's equation?

(a) $\nabla \times H = (\sigma + j\omega\varepsilon) E$ (b) $F = Q(E + v \times B)$

(c) $\oint_C H.ds = \int_s J.ds + \int_s \frac{\partial D}{\partial t}.ds$

(d) $\oint_s B.ds = 0$

[U.P.S.C. I.E.S. E.E.-I, 2009]

529. Consider the following three equations

1. $\nabla \times \bar{E} = -\frac{\partial \bar{B}}{\partial t}$ 2. $\nabla \times \bar{H} = \bar{J} + \frac{\partial \bar{D}}{\partial t}$ 3. $\nabla \times \bar{B} = 0$

Which of the above appear in Maxwell's equations?

(a) 1, 2 and 3. (b) 1 and 2 only.

(c) 2 and 3 only. (d) 1 and 3 only.

[U.P.S.C. I.E.S. E.E.-I, 2008]

530. Which one of the following equations is not Maxwell's equation for a static electromagnetic field in a linear homogeneous medium?

(a) $\nabla \cdot \bar{B} = 0$ (b) $\nabla \cdot \bar{D} = \bar{0}$

(c) $\oint_c \bar{B} \cdot d\bar{l} = \mu_0 I$ (d) $\nabla^2 \bar{A} = \mu_0 \bar{J}$

[U.P.S.C. I.E.S. E.E.-I, 2007]

531. Which one of the following is not the valid expression for magnetostatic field vector $\bar{B}$?

(a) $\bar{B} = \nabla \cdot \bar{A}$ (b) $\bar{B} = \nabla \times \bar{A}$

(c) $\nabla \cdot \bar{B} = \bar{J}$ (d) $\nabla \cdot \bar{B} = \mu_0 \bar{J}$

[U.P.S.C. I.E.S. E.E.-I, 2005]

532. The following equation is *not* valid for magnetostatic field in inhomogeneous magnetic materials:

(a) $\nabla \cdot B = 0$ (b) $\nabla \cdot H = 0$

(c) $\nabla \times A = B$ (A is magnetic vector potential)

(d) $\nabla \times H = J$

[U.P.S.C. I.E.S. E.E.-I, 2011]

533. If the static magnetic flux density is $\bar{B}$, then

(a) $\nabla \times \bar{B} = 0$ (b) $\nabla \cdot \bar{B} = 0$

(c) $\nabla \cdot \bar{B} = \bar{J}$ (d) $\nabla \cdot \bar{B} = 0$

[U.P.S.C. I.E.S. E.E.-I, 2005]

534. If a vector field $\bar{B}$ is solenoidal, which of these is true?

(a) $\oint \bar{B} \cdot d\bar{l} = 0$ (b) $\oint_s \bar{B} \cdot d\bar{s} = 0$

(c) $\nabla \times \bar{B} = 0$ (d) $\nabla \cdot \bar{B} \neq 0$

[U.P.S.C. I.E.S. E.E.-I, 2002]

535. Image theory is applicable to problems involving

(a) electrostatic field only.

(b) magnetostatic field only.

(c) both electrostatic and magnetostatic fields.

(d) neither electrostatic nor magnetostatic field.

[U.P.S.C. I.E.S. E.E.-I, 2006]

536. Interface of two regions of two magnetic materials is current-free. The region 1, for which relative permeability $\mu_{r_1} = 2$ is defined by $z < 0$, and region 2, $z > 0$ has $\mu_{r_2} = 1$.

If $\bar{B}a_1 = 1.2\bar{a}_x + 0.8\bar{a}_y + 0.4\bar{a}_z$ I; then $\bar{H}_1$ is

(a) $\frac{1}{\mu_0}[0.6\bar{a}_x + 0.4\bar{a}_y + 0.4\bar{a}_z]$ A/m

(b) $\frac{1}{\mu_0}[1.2\bar{a}_x + 0.8\bar{a}_y + 0.8\bar{a}_z]$ A/m

(c) $\frac{1}{\mu_0}[1.2\bar{a}_x + 0.4\bar{a}_y + 0.4\bar{a}_z]$ A/m

(d) $\frac{1}{\mu_0}[0.6\bar{a}_x + 0.4\bar{a}_y + 0.8\bar{a}_z]$ A/m [U.P.S.C. I.E.S. E.E.-I, 2003]

537. Which one of the following formulae is NOT correct for the boundary between two magnetic materials?

(a) $B_{n1} = B_{n2}$ (b) $B_2 = \sqrt{B_{n2} + B_{t2}}$

(c) $H_1 = H_{n1} + H_{t1}$

(d) $\hat{a}_{n21} \times (\bar{H}_1 - \bar{H}_2) = \bar{K}$, where $\hat{a}_{n21}$ is a unit vector normal to the interface and directed from region 2 to region 1.

[U.P.S.C. I.E.S. E.E.-I, 2003]

538. The force on a charge moving with velocity v under the influence of electric and magnetic fields is given by which one of the following?

(a) $q(\vec{E} + \vec{B} \times \vec{v})$ (b) $q(\vec{E} + \vec{v} \times \vec{B})$

(c) $q(\vec{H} + \vec{v} \times \vec{E})$ (d) $q(\vec{E} + \vec{v} \times \vec{B})$

[U.P.S.C. I.E.S. E.E.-I, 2008]

539. Which of the following statements holds of the divergence of electric and magnetic flux densities?

Answers: **523.** (c), **524.** (c), **525.** (b), **526.** (c), **527.** (c), **528.** (b), **529.** (a), **530.** (d), **531.** (a), **532.** (b), **533.** (b), **534.** (b), **535.** (a), **536.** (a), **537.** (b), **538.** (d), **539.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Both are zero.
(b) These are zero for static densities but non-zero for time varying densities.
(c) It is zero for the electric flux density.
(d) It is zero for the magnetic flux density. [GATE E.E. 2006]

540. In Curie law for paramagnetic materials, how is the susceptibility χ related to absolute temperature T?
(a) $\chi \propto T$ (b) $\chi \propto 1/T$ (c) $\chi \propto T^2$ (d) $\chi \propto 1/T^2$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

541. Plane defined by $z = 0$ carry surface current density $2\hat{a}_x$ A/m. The magnetic intensity 'H_y' in the two regions $-\infty < z < 0$ and $0 < z < \infty$ are respectively
(a) $\hat{a}_y$ and $-\hat{a}_y$ (b) $-\hat{a}_y$ and $\hat{a}_y$
(c) $\hat{a}_x$ and $-\hat{a}_x$ (d) $-\hat{a}_x$ and $\hat{a}_x$
[U.P.S.C. I.E.S. E.E.-I, 2001]

542. Magnetic field intensity is $\bar{H} = 3\bar{a}_X + 7y\bar{a}_Y + 2x\bar{a}_Z$ A/m. What is the current density $\bar{J}$ A/m^2?
(a) $-2\bar{a}_Y$ (b) $-7\bar{a}_Z$
(c) $3\bar{a}_X$ (d) $12\bar{a}_Y$ [U.P.S.C. I.E.S. E.E.-I, 2009]

543. In free space $\bar{H}$ field is given as
$\bar{H}(Z, t) = -\frac{1}{6\pi}\cos(\omega t + \beta Z)\bar{a}_y$. $\bar{E}(Z, t)$ is
(a) $20\cos(\omega t + \beta Z)\bar{a}_x$ (b) $20\cos(\omega t + \beta Z)\bar{a}_z$
(c) $20\sin(\omega t + \beta Z)\bar{a}_y$ (d) $20\sin(\omega t + \beta Z)\bar{a}_x$
[U.P.S.C. I.E.S. E.E.-I, 2011]

544. Magnetic current is composed of which of the following?
(a) Only conduction component.
(b) Only displacement component.
(c) Both conduction and displacement components.
(d) Neither conduction component nor displacement component.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

545. If the vector $\bar{B} = x^2\hat{a}_x - xy\hat{a}_y - Kxz\hat{a}_z$ represents a magnetic field, the value of the constant K must be
(a) 0 (b) 1 (c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 2000]

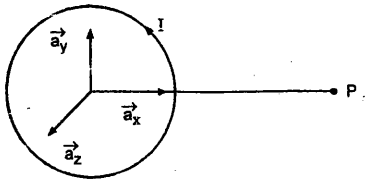
546. For a current element Idl, situated at an arbitrary point, the magnetic vector potential A equals (R is the distance of the observation point from the centre of the current element)
(a) $\mu Idl/(4\pi R)$ (b) $\mu Idl/(4\pi R^2)$
(c) $\mu Idl/(4\pi R)$ (d) $\mu Idl/(2\pi R)$
[U.P.S.C. I.E.S. E.E.-I, 1998]

547. The magnetic vector potential A obeys which equations?
1. $\bar{B} = \nabla \times \bar{A}$ 2. $\nabla^2\bar{A} = -\mu_0\bar{j}$ 3. $\bar{A} = \int \frac{\mu_0 Id\bar{l}}{4\pi R}$
Select the correct answer using the code given below:
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2008]

548. If $\bar{A}$ and $\bar{J}$ are the vector potential and current density vectors associated with coil, then $\int \bar{A}\cdot\bar{J}\,dv$ has the units of
(a) flux-linkage. (b) power.
(c) energy. (d) inductance.
[U.P.S.C. I.E.S. E.E.-I, 2002]

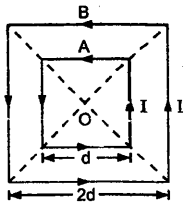
549. What is the value of the magnetic vector potential due to an infinitesimally small current element, evaluated at infinite distance from it?
(a) Infinity. (b) Unity. (c) Zero.
(d) Any number between zero and infinity depending on the strength of the current element. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

550. A circular current-carrying loop and a field point are shown in the figure. The vector magnetic potential at P is in the direction of



(a) $\bar{a}_x$ (b) $\bar{a}_y$ (c) $\bar{a}_z$ (d) $(\bar{a}_x - \bar{a}_y)\sqrt{2}$
[U.P.S.C. I.E.S. E.E.-I, 1993]

551. If two concentric square loops A and B shown in the given figure carry equal currents in the same sense, then the magnetic field at 'O' due to the two loops A and B will be in the ratio



(a) $1:\sqrt{2}$ (b) $1:1$
(c) $\sqrt{2}:1$ (d) $2:1$
[U.P.S.C. I.E.S. E.E.-I, 1992, 1997]

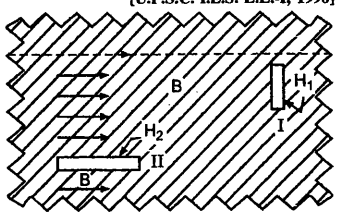
552. A current I flows through a circular coil of one turn of radius R in the counterclockwise direction. The magnetic
1. field at the centre is inversely proportional to R.
2. moment of the coil is directly proportional to R^2.
3. field at the centre is directly proportional to R^2.
Of these, correct statements are
(a) 1 & 2 only. (b) 2 & 3 only.
(c) 1 & 3 only. (d) 1, 2 & 3.
[U.P.S.C. I.E.S. E.E.-I, 1992]

553. What is the magnetic field due to an infinite linear current carrying conductor ?
(a) $H = \frac{\mu I}{2\pi r}$ A/m (b) $H = \frac{I}{2\pi r}$ A/m
(c) $H = \frac{\mu I}{2r}$ A/m (d) $H = \frac{I}{r}$ A/m
[U.P.S.C. I.E.S. E.E.-I, 2006]

554. The magnitude of the magnetic flux density 'B' at a distance 'R' from an infinitely long straight current filament is
(a) $\frac{\mu_0 I}{2R}$ (b) $\frac{\mu_0 I}{2\pi R}$ (c) $\frac{\mu_0 I}{4\pi R}$ (d) $\frac{\mu_0 I}{8\pi R}$
[U.P.S.C. I.E.S. E.E.-I, 1999]

555. An infinite number of concentric circular loops carry a current 'I' each but alternately in opposite directions. The radii of the loops are R, 2R, 4R ... in geometric progression. The magnetic flux density at the centre of the loops will be
(a) zero (b) $\frac{\mu_0 I}{3R}$ (c) $\frac{\mu_0 I}{4R}$ (d) $\frac{\mu_0 I}{6R}$
[U.P.S.C. I.E.S. E.E.-I, 1998]

556. The flux density B in a ferromagnetic medium of large extent and permeability μ is as shown in the given figure. Two cavities, cavity I shaped like a thin disc and cavity II long and needle like are cut. The ratio of H_1 to H_2 for air filled cavities is



(a) zero (b) 1 (c) ∞ (d) μ/μ_0
[U.P.S.C. I.E.S. E.E.-I, 1994]

Answers: **540.** (b), **541.** (a), **542.** (a), **543.** (a), **544.** (c), **545.** (b), **546.** (c), **547.** (d), **548.** (c), **549.** (c), **550.** (b), **551.** (d), **552.** (a), **553.** (b), **554.** (b), **555.** (b), **556.** (a),

Downloaded From : www.EasyEngineering.net

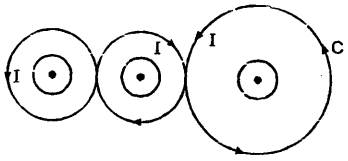
557. Three current carrying conductors are shown in the figure. The value of $|\Phi B.dl|$ around the closed curve C is



(a) $4\mu_0 I$ (b) $3\mu_0 I$ (c) $2\mu_0 I$ (d) $\mu_0 I$

[U.P.S.C. I.E.S. E.E.-I, 1993]

558. A filamentary current of 10 πA flows in the negative z-direction. The magnetic field at (0, 5, 0) is

(a) $\hat{a}_x$ A/m (b) $\hat{a}_y$ A/m

(c) $\hat{a}_z$ A/m (d) $(\hat{a}_x + \hat{a}_y)$ A/m

[U.P.S.C. I.E.S. E.E.-I, 2000]

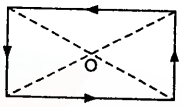
559. Plane $y = 0$ carries a uniform current density $30\hat{k}$ mA/m. At (1, 20, –2), what is the magnetic field intensity?

(a) $-15\hat{i}$ mA/m (b) $15\hat{i}$ mA/m

(c) $18.85\hat{j}$ mA/m (d) $25\hat{i}$ mA/m

[U.P.S.C. I.E.S. E.E.-I, 2006]

560. A rectangular loop carrying a current is shown in the given figure. The magnetic potential $\bar{A}$ at the centre 'O' satisfies the conditions

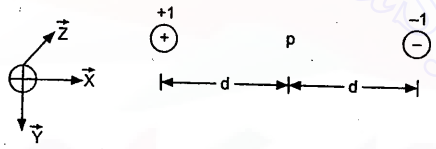


(a) $\bar{A} = 0$ and $\nabla \times \bar{A} \neq 0$ (b) $\bar{A} \neq 0$ and $\nabla \times \bar{A} = 0$

(c) $\bar{A} = 0$ and $\nabla \times \bar{A} = 0$ (d) $\bar{A} \neq 0$ and $\nabla \times \bar{A} \neq 0$

[U.P.S.C. I.E.S. E.E.-I, 2000]

561. Two conductors carrying forward and return current of +I and –I as shown in figure. The magnetic field intensity $\bar{H}$ at point P is



(a) $\frac{I}{\pi d}\bar{y}$ (b) $\frac{I}{\pi d}\bar{x}$ (c) $\frac{I}{2\pi d}\bar{y}$ (d) $\frac{I}{2\pi d}\bar{x}$

[GATE E.E. 2003]

562. A long straight wire carriers a current I = 10 A. At what distance is the magnetic field H = 1 Am^{-1}?

(a) 1.19 m (b) 1.39 m (c) 1.59 m (d) 1.79 m

[U.P.S.C. I.E.S. E.E.-I, 2008]

563. A long straight wire carries a current I = 1A. At what distance is the magnetic field 1 Am^{-1}?

(a) 1.59 m (b) 0.159 m

(c) 0.0159 m (d) 0.00159 m

[U.P.S.C. I.E.S. E.E.-I, 2009]

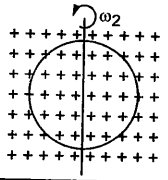
564. How much current must flow in a loop of radius 1 m to produce a magnetic field of 1 mAm^{-1}?

(a) 1.0 mA (b) 1.5 mA

(c) 2.0 mA (d) 2.5 mA

[U.P.S.C. I.E.S. E.E.-I, 2009]

565. A circular loop placed perpendicular uniform sinusoidal magnetic field frequency ω_1 is revolved about an axis through its diameter at an angular velocity ω_2 rad/sec ($\omega_2 < \omega_1$) as shown in the figure. What are the frequencies for the emf induced in the loop?



(a) ω_1 and ω_2 (b) ω_1, $\omega_1 + \omega_2$ and ω_2

(c) ω_2, $\omega_1 - \omega_2$ and ω_2 (d) $\omega_1 - \omega_2$ and $\omega_1 + \omega_2$

[U.P.S.C. I.E.S. E.E.-I, 2009]

566. A solid cylindrical conductor of radius 'R' carrying a current 'I' has a uniform current density. The magnetic field intensity '$\bar{H}$' inside the conductor at the radial distance 'r' ($r < R$) is

(a) Zero (b) $\frac{1}{2\pi r}$ (c) $\frac{Ir}{2\pi R^2}$ (d) $\frac{IR^2}{2\pi r^3}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

567. An infinitely long straight conductor located along Z-axis carries a current I in the +ve Z-direction. The magnetic field at any point P in the X-Y plane is in which direction?

(a) In the positive Z-direction.

(b) In the negative Z-direction.

(c) In the direction perpendicular to the radial line OP (in X-Y plane) joining the origin O to the point P.

(d) Along the radial line OP. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

568. What is the force experienced per unit length by a conductor carrying 5 A current in positive Z direction and placed in a magnetic field $\vec{B} = (3\bar{a}_x + 4\bar{a}_y)$?

(a) $15\bar{a}_x + 20\bar{a}_y$ N/m (b) $-20\bar{a}_x + 15\bar{a}_y$ N/m

(c) $20\bar{a}_x - 15\bar{a}_y$ N/m (d) $-20\bar{a}_x - 205\bar{a}_y$ N/m

[U.P.S.C. I.E.S. E.E.-I, 2004]

569. A conductor 2 metre long lies along the Z-axis with a current of 10 A in $\hat{a}_z$ direction. If the magnetic field is $\bar{B} = 0.05\hat{a}_X$ T, then force on the conductor is

(a) $4.0\,\hat{a}_Y$ N (b) $1.0\,\hat{a}_Z$ N

(c) $1.0\,\hat{a}_Y$ N (d) $3.0\,\hat{a}_Z$ N

[U.P.S.C. I.E.S. E.E.-I, 2010]

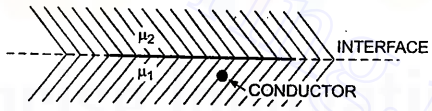
570. What is the force on a unit charge moving with velocity $\bar{v}$ in presence of electric field $\vec{E}$ and magnetic field $\vec{B}$?

(a) $\vec{E} - \bar{v} \cdot \vec{B}$ (b) $\vec{E} + \bar{v} \cdot \vec{B}$

(c) $\vec{E} + \vec{B} \cdot \bar{v}$ (d) $\vec{E} + \bar{v} \times \vec{B}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

571. An infinitely long conductor carrying a current is embedded in a semi-infinite medium of permeability μ_1 as shown in the given figure. For $\mu_1 > \mu_2$, the conductor will experience



(a) no force.

(b) a force that moves it away from the interface.

(c) a force towards the interface.

(d) a force parallel to the interface. [U.P.S.C. I.E.S. E.E.-I, 1994]

572. The magnitude of force acting on a current carrying conductor placed in a magnetic field is independent of

(a) flux density. (b) length of conductor.

(c) cross-sectional area of conductor.

(d) current flowing through the conductor.

573. If a current carrying conductor is placed in a magnetic field, the mechanical force experienced on the conductor is determined by

(a) simple product. (b) dot product.

(c) cross product. (d) any of these.

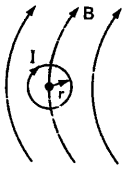
Answers: **557.** (d), **558.** (d), **559.** (a), **560.** (d), **561.** (a), **562.** (c), **563.** (b), **564.** (c), **565.** (a), **566.** (c), **567.** (c), **568.** (b), **569.** (c), **570.** (d), **571.** (b), **572.** (c), **573.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

574. The force experienced by a current carrying conductor lying parallel to a magnetic field is
(a) zero. (b) BIl.
(c) $BIl \sin\theta$ (d) $BIl \cos\theta$

575. The force experienced by the closed loop of wire carrying current I placed in a uniform magnetic field of flux density as shown in the figure given below will be equal to



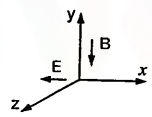
(a) zero. (b) $\mu_0 Ir$
(c) $\frac{BI}{2\pi r}$ (d) $2\pi rBI$

576. A straight conductor of length l moving with a velocity v in the presence of a magnetic field of flux density B directed at an angle θ with the direction of v experiences a force. Which of the following statement(s) is/are true for the magnitude of the force ?
1. It is independent of θ. 2. It is proportional to l^2
3. It is proportional to B. 4. It is independent of v.
Select the correct answer from the codes given below.
Codes:
(a) 1, 2 and 3. (b) 4 alone.
(c) 3 alone. (d) 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 1994]

577. An electric field is parallel but opposite to a magnetic field. Electrons with some initial velocity enter the region of the fields at an angle θ along the direction of the electric field. The electron path will be
(a) straight. (b) helical. (c) circular. (d) elliptical.

578. Consider the following statements about the effective length of half wave dipole (Elevation angle θ is measured form the dipole axis):
1. Effective length is a function of θ.
2. Effective length is maximum for $\theta = \pi/2$.
3. Maximum effective length is larger than physical length.
4. Effective length is the same for the antenna in transmitting and receiving modes.
Which of the statements given above are correct?
(a) 1, 2 and 4. (b) 2, 3, and 4
(c) 1, 2 and 3 (d) 1, 3 and 4
[U.P.S.C I.E.C E.E.-I, 2004]

579. A magnetic field **B** and electric field **E** are perpendicular to each other as shown in figure given below. The path of the electrons which start at rest from origin O will be



(a) straight. (b) circular. (c) helical.
(d) cycloidal.

580. Consider the following:
Lorentz force $\vec{F} = e(\vec{v} \times \vec{B})$, where e, $\vec{v}$ and $\vec{B}$ are respectively the charge of the particle, velocity of the particle and flux density of uniform magnetic field.
Which one of the following statements is not correct?
(a) Acceleration is normal to the plane containing the particle path and $\vec{B}$.
(b) If the direction of the particle path is normal to $\vec{B}$, the acceleration is maximum.
(c) If the particle is at rest, the field will deflect the particle.
(d) If the particle path is in the same direction of $\vec{B}$, there will be no acceleration.
[U.P.S.C. I.E.S. E.E. 2007]

581. The unit of flux density is
(a) Tesla. (b) A/mm^2 (c) N/m^2 (d) Wb/m
[R.G.T.U. M.P. E.E. June/July 2006]

582. The property of a material which opposes the production of magnetic flux in it is known as
(a) mmf. (b) reluctance.
(c) permeance. (d) permittivity.
[A.M.I.E. Elec. Science Summer 1995]

583. A coil wound over an iron ring carries certain current and establishes flux in the ring. If the area of x-section of the ring is doubled, the flux density in the core
(a) is double of the previous value.
(b) is half of the previous value.
(c) is same as the previous value.
(d) is not possible to predict. [A.M.I.E. Elec. Science Winter 1993]

584. The conductance of electrical circuit is analogous in magnetic circuit by
(a) flux. (b) reluctance.
(c) permeance. (d) relative permeability.
[R.G.T.U. M.P. B.E.E. Jan./Feb. 2006]

585. Reluctance offered by the magnetic circuit depends upon
(a) nature of magnetic material.
(b) length of magnetic flux path.
(c) cross-sectional area of the material.
(d) all of the above. [R.G.T.U. B.E.E. Nov/Dec. 2007]

586. A cast steel electromagnet has an air gap length of 0.3 cm. Find the ampere-turns for the air gap to produce a flux density of 0.7 Wb/m^2 in the air gap.
(a) 2,100 AT (b) 1,671 AT
(c) 1,447 AT (d) 167 AT
[R.G.T.U. B.E.E. June/July 2006]

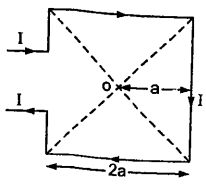
587. The magnetic field intensity (in A/m) at the centre of a circular coil of diameter 1 m and carrying a current of 2 A is
(a) 8 (b) 4 (c) 3 (d) 2
[U.P.S.C. I.E.S. E.E.-I, 1994]

588. The field at any point on the axis of a current carrying coil will be
(a) perpendicular to the axis. (b) parallel to the axis.
(c) at an angle of 45° with the axis.
(d) zero. [U.P.S.C. I.E.S. E.E.-I 1994]

589. An air gap is usually inserted in magnetic circuits so as to
(a) prevent saturation. (b) increase in mmf.
(c) increase in flux. (d) increase in inductance.

590. A small saw-cut is made in a permanent magnet of toroidal shape. Which of the following are true for H_0, if H_0 is the magnetic field in the air gap and H_i is that inside the magnet ?
1. $H_0 < H_i$ 2. $H_0 > H_i$
3. H_0 is in the same direction as H_i
4. H_0 and H_i are in opposite directions. Select the answer using the codes given below
Codes:
(a) 1 and 3 (b) 1 and 4 (c) 2 and 3 (d) 2 and 4
[U.P.S.C. I.E.S. E.E. I, 1993]

591. Magnetising force at the centre of a square, each arm of 2 a metre length, shown below is given as



(a) $\frac{\sqrt{2}\,I}{\pi a}$ A/m
(b) $\frac{I}{\pi a}$ A/m
(c) $\frac{\pi I}{I}$ A/m (d) $\frac{\sqrt{2}\pi I}{a^2}$ A/m

Answers: **574.** (a), **575.** (a), **576.** (c), **577.** (b), **578.** (d), **579.** (d), **580.** (c), **581.** (a), **582.** (b), **583.** (c), **584.** (c), **585.** (d), **586.** (b), **587.** (d), **588.** (b), **589.** (a), **590.** (c), **591.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

592. Which of the following statements is correct?
(a) The magnetic flux inside the exciting coil is the same as on its outer surface.
(b) The magnetic flux inside an exciting coil is zero.
(c) The magnetic flux inside the exciting coil is greater than that on its outside surface.
(d) The magnetic flux inside the exciting coil is lower than that on the outside surface.

593. If the two conductors carry current in opposite directions there will be
(a) a force of attraction between the two conductors.
(b) a force of repulsion between the two conductors.
(c) no force between them. (d) none of the above.

594. A straight conductor of circular x-section carries a current. Which one of the following statements is true in this regard ?
(a) No force acts on the conductor at any point.
(b) An axial force acts on the conductor tending to increase its length.
(c) A radial force acts towards the axis tending to reduce its cross-section.
(d) A radial force acts away from the axis tending to increase its cross-section. [U.P.S.C. I.E.S. E.E.-I, 1994]

595. Consider the following statements:
The force per unit length between two stationary parallel wires carrying (steady) currents
1. is inversely proportional to the separation of wires.
2. is proportional to the magnitude of each current.
3. satisfies Newton's third law.
Of these statements
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 1 and 3 are correct. (d) 1, 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1994]

596. Two parallel wires separated by a distance d are carrying a current I in the same direction. The magnetic field along a line running parallel to these wires and midway between them
(a) depends upon I. (b) is zero.
(c) depends upon d.
(d) depends upon the permeability of medium between the wires.
[GATE E.E. 1999]

597. Linkage flux per unit current is called
(a) capacitance. (b) resistance.
(c) inductance. (d) capacitive reactance.
[R.G.T.U. B.E.E. June 2008]

598. A magnetic circuit requires 800 AT to produce a certain quantity of flux in magnetic circuit. If its excitation coil has 100 turns and 5 Ω resistance, the voltage to be applied in exciting coil is
(a) 60 V (b) 40 V (c) 80 V (d) 8 V
[R.G.T.U. M.P. B.E.E. Jan./Feb. 2006]

599. $\Delta \times E = \frac{d\bar{B}}{dt}$ is derived from
(a) Ampere's law. (b) Faraday's law.
(c) Gauss's law. (d) none of these.

600. Which of the following is correct ?
(a) $\mathbf{B} = \mu_0 \mathbf{H} + \mathbf{M}$ (b) $\mathbf{B} = \mu_0 \mathbf{M} + \mathbf{H}$
(c) $\mathbf{B} = \mu_0 (\mathbf{H} + \mathbf{M})$ (d) $\mathbf{B} = \frac{\mathbf{M}}{\mu_0}$

601. According to Faraday's law of electromagnetic induction an emf is induced in a conductor whenever it
(a) lies in a magnetic field.
(b) lies perpendicular to the magnetic field.
(c) cuts the magnetic flux.
(d) moves parallel to the direction of magnetic field.

602. The magnitude of induced emf in a conductor depends upon the
(a) amount of flux cut. (b) amount of flux linkage.
(c) rate of change of flux linkage.
(d) flux density of their magnetic field.

603. The laws of electromagnetic induction (Faraday's and Lenz's laws) are summarized in the following equation :
(a) $e = LR$ (b) $e = L\frac{di}{dt}$
(c) $e = -\frac{d\psi}{dt}$ (d) none of the above
[GATE E.E. 1998]

604. "In all cases of electromagnetic induction, an induced voltage will cause a current to flow in a closed circuit in such a direction that the magnetic field which is caused by that current will oppose the change that produces the current", is the original statement of
(a) Lenz's law.
(b) Faraday's law of magnetic induction.
(c) Fleming's law of induction.
(d) Ampere's law. [U.P.S.C. I.E.S. E.E. II, 1995]

605. Which law is synonymous to the occurrence of diamagnetism?
(a) Ampere's law. (b) Maxwell's law.
(c) Coulomb's law. (d) Lenz's law.
[U.P.S.C. I.E.S. E.E.-I, 1992]

606. There is a constant homogeneous magnetic field pointing in a vertical direction. A metallic wire in the form of a square is rotated about a horizontal axis passing through the middle points of its opposite arms. The emf generated in the square is
(a) zero. (b) finite and constant.
(c) oscillatory. (d) varying with time t as t^2.
[U.P.S.C. I.E.S. E.E.-I, 1992]

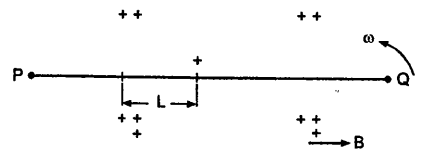
607. The emf induced in a coil due to relative motion of a magnet is independent of
(a) coil resistance. (b) magnet motion.
(c) number of coil turns. (d) pole strength of the magnet.

608. If a copper conductor is moved across a magnetic field
(a) the wire will become magnetic.
(b) a voltage will be induced in the wire.
(c) a current will be induced in the wire.
(d) nothing will happen.

609. When a single turn coil rotates in a uniform magnetic field, at a uniform speed the induced emf will be
(a) alternating. (b) steady.
(c) pulsating. (d) none of these.

610. The principle of dynamically induced emf is utilised in a
(a) choke. (b) transformer.
(c) generator. (d) thermocouple.

611. A conducting rod revolves about its mid point O at uniform angular speed ω in a uniform magnetic field B normal to its plane of revolution as shown in the figure. The electric pd between the ends P and Q of the rod would be



(a) zero (b) $B\omega^2 L/2$ (c) $-B\omega^2 L/2$ (d) $2B\omega^2 L$
[U.P.S.C. I.E.S. E.E.-I, 1993]

Answers: **592.** (a), **593.** (b), **594.** (c), **595.** (d), **596.** (b), **597.** (c), **598.** (b), **599.** (b), **600.** (c), **601.** (c), **602.** (c), **603.** (c), **604.** (a), **605.** (d), **606.** (c), **607.** (a), **608.** (b), **609.** (a), **610.** (c), **611.** (a),

Downloaded From : www.EasyEngineering.net

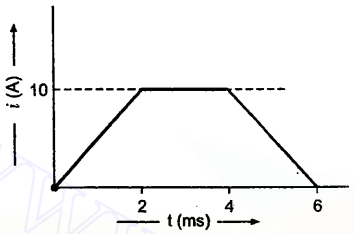
612. The unit(s) of inductance is/are
(a) Henry. (b) volt-second/A.
(c) Wb/A. (d) all of these.

613. Inductance has the dimensions of
(a) flux/current. (b) flux/length.
(c) (voltage)^2/current. (d) none of these.

614. If in an iron cored coil the iron core is removed so as to make the air-cored coil, the inductance of the coil will be
(a) more. (b) less. (c) the same. (d) none of these.

615. Lower the self inductance of a coil
(a) more will be the weber-turns.
(b) more will be the emf induced.
(c) lesser the flux produced by it.
(d) smaller the delay in establishing steady current through it.

616. A current shown in the given figure passes through a pure inductance of 3 mH. The instantaneous power, in watts, during $0 < t < 2$ ms is



(a) 25,000 t (b) 50,000 t (c) 75,000 t (d) 1,00,000 t
[U.P.S.C. I.E.S. E.E.-I, 1996]

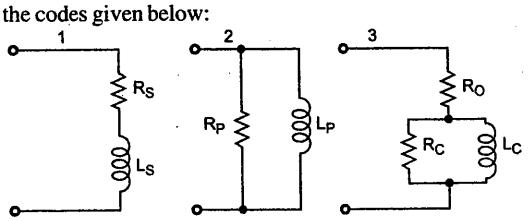
617. An open coil has
(a) zero resistance and zero inductance.
(b) infinite resistance and infinite inductance.
(c) infinite resistance and zero inductance.
(d) zero resistance and infinite inductance.

618. The inductance of a long solenoid of length 1,000 mm wound uniformly with 3000 turns on a cylindrical paper tube of 60 mm diameter is
(a) 3·2 μH (b) 3·2 mH (c) 32 mH (d) 3·2 H
[GATE E.E. 2004]

619. The inductance of a single layer solenoid of 10 turns is 5 μH. Which one of the following is the correct value of inductance when the number of turns is 20 and the length is doubled?
(a) 10 μH (b) 20 μH (c) 40 μH (d) 5 μH
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

620. A coil of 300 turns is wound on a non-magnetic core having a mean circumference of 300 mm and a cross-sectional area of 300 mm^2. The inductance of the coils corresponding to a magnetizing current of 3 A will be
(Given that $\mu_0 = 4\pi \times 10^{-7}$ H/m)
(a) 37.68 μH (b) 113.04 μH
(c) 3.768 μH (d) 1.1304 μH [GATE E.E. 2008]

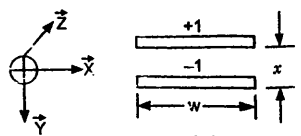
621. Which of the following is/are the equivalent circuits of an iron-cored coil, valid at one frequency? Select the correct answer using the codes given below:



(a) 1 alone. (b) 2 alone. (c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2004]

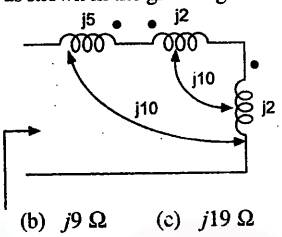
622. Mutual inductance between two magnetically coupled coils depends on the
(a) permeability of the core material.
(b) number of turns of the coils.
(c) cross-sectional area of their common core.
(d) all of the above.

623. Two infinite strips of width w m in x direction as shown in figure, are carrying forward and return currents of +I and –I in the z direction. The strips are separated by a distance of x m. The inductance per unit length of the configuration is measured to be L H/m. If the distance of separation between the strips is now reduced to $x/2$ m, the inductance per unit length of the configuration is



(a) 2L H/m (b) L/4 H/m (c) L/2 H/m (d) 4L H/m
[GATE E.E. 2003]

624. Impedance Z as shown in the given figure is



(a) $j29\ \Omega$ (b) $j9\ \Omega$ (c) $j19\ \Omega$ (d) $j39\ \Omega$
[GATE E.C.E. 2005]

625. The mutual inductance between two coupled coils is 10 mH. If the turns in one coil are doubled and that in the other are halved, then the mutual inductance will be
(a) 5 mH (b) 10 mH (c) 14 mH (d) 20 mH
[U.P.S.C. I.E.S. E.E.-I, 1999]

626. Given two coupled inductors L_1 and L_2, their mutual inductance M satisfies
(a) $M = \sqrt{L_1^2 + L_2}$ (b) $M > \dfrac{L_1 + L_2}{2}$
(c) $M > \sqrt{L_1 L_2}$ (d) $M \le \sqrt{L_1 L_2}$
[GATE E.E. 2001]

627. When two coils having self inductances of L_1 and L_2 are coupled through a mutual inductance M, the coefficient of coupling, K is given by
(a) $K = \dfrac{M}{\sqrt{2 L_1 L_2}}$ (b) $K = \dfrac{M}{\sqrt{L_1 L_2}}$
(c) $K = \dfrac{2M}{\sqrt{L_1 L_2}}$ (d) $K = \dfrac{L_1 L_2}{M}$
[U.P.S.C. I.E.C. E.E.-I, 1993]

628. The overall inductance of two coils connected in series, with mutual inductance aiding self inductance is L_1; with mutual inductance opposing self-inductance the overall inductance is L_2. The mutual inductance M is given by
(a) $L_1 + L_2$ (b) $L_1 - L_2$
(c) $\dfrac{1}{4}(L_1 - L_2)$ (d) $\dfrac{1}{2}(L_1 + L_2)$
[U.P.S.C. I.E.S. E.E.-I, 1993]

629. Two coupled coils connected in series have an equivalent inductance of 16 mH or 8 mH depending on the interconnection. Then the mutual inductance M between the coils is
(a) 12 mH (b) $8\sqrt{2}$ mH (c) 4 mH (d) 2 mH
[U.P.S.C. I.E. S. E.E.-I, 1994]

Answers: **612.** (d), **613.** (a), **614.** (b), **615.** (d), **616.** (c), **617.** (c), **618.** (c), **619.** (a), **620.** (b), **621.** (a), **622.** (d), **623.** (c), **624.** (b), **625.** (b), **626.** (d), **627.** (b), **628.** (c), **629.** (d),

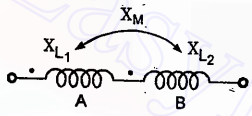
630. The coils having self-inductance of 10 mH and 15 mH and effective inductance of 40 mH, when connected in series aiding. What will be the equivalent inductance if we connect them in series opposing?
(a) 20 mH (b) 10 mH (c) 5 mH (d) zero
[U.P.S.C. I.E.S. E.E.-I, 1995]

631. The coupling between two magnetically coupled coils is said to be ideal if the coefficient of coupling is
(a) zero (b) 0.1 (c) 1 (d) 2
[U.P.S.C. I.E.S. E.E.-I, 1996]

632. Two inductive coils with self inductance L_1 and L_2 are magnetically coupled in series opposing and in parallel aiding respectively. The mutual inductance between the coils in the two cases are respectively
(a) $L_1 + L_2 + 2M, \dfrac{L_1L_2 - M^2}{L_1 + L_2 - 2M}$
(b) $L_1 + L_2 - 2M, \dfrac{L_1L_2 - M^2}{L_1 + L_2 + 2M}$
(c) $L_1 + L_2 - 2M, \dfrac{L_1L_2 - M^2}{L_1 + L_2 - 2M}$
(d) $L_1 + L_2 + 2M, \dfrac{L_1L_2 - M^2}{L_1 + L_2 + 2M}$
[U.P.S.C. I.E.S. E.E.-I, 1995]

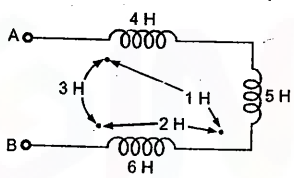
633. Two coupled coils with $L_1 = L_2 = 0.6$ H have a coupling coefficient of K = 0.8. The turn ratio $\dfrac{N_1}{N_2}$ is
(a) 4 (b) 2 (c) 1 (d) 0.5
[U.P.S.C. I.E.S. E.E. I, 1994]

634. The equivalent inductance of two coils A and B connected as in the given figure is given by



(a) $X_{L1} + X_{L2} - 2X_M$
(b) $X_{L1} + X_{L2} + X_M$
(c) $X_{L1} + X_{L2} - X_M$
(d) $X_{L1} + X_{L2} + 2X_M$
[U.P.S.C. I.E.S. E.E.-I, 2000]

635. The effective inductance of the circuit across the terminals A, B in the figure shown below is



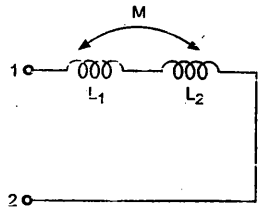
(a) 9 H (b) 21 H
(c) 11 H (d) 6 H
[GATE E.E. 1998]

636. In case all the flux from the current in coil 1 links with coil 2, the coefficient of coupling will be
(a) 2.0 (b) 1.0 (c) 0.5 (d) zero
[R.G.T.U. Basic E.E. Jan./Feb. 2007]

637. Two coils are coupled in such a way that the mutual inductance between them is 16 mH, if the inductances of the coils are 20 mH and 80 mH respectively, the coefficient of coupling is
(a) 0.01 (b) 0.4 (c) 0.1 (d) 0.0025
[U.P.S.C. I.E.S. E.E.-I, 2008]

638. Two identical coils of negligible resistance, when connected in series across a 50 Hz fixed voltage source, draw a current of 10 A. When the terminals of one of the coils are reversed, the current drawn is 8 A. The coefficient of coupling between the two coils is
(a) 1/100 (b) 1/9 (c) 4/10 (d) 8./10
[U.P.S.C. I.E.S. E.E.-I, 1998]

639. The equivalent inductance measured between the terminals 1 and 2 for the circuit shown in the figure is



(a) $L_1 + L_2 + M$ (b) $L_1 + L_2 - M$
(c) $L_1 + L_2 + 2M$ (d) $L_1 + L_2 - 2M$
[GATE E.C.E. 2004]

640. The inductance matrix of a system of two mutually coupled inductors shown in Fig. 1 is given by

$$L = \begin{bmatrix} 5 & -4 \\ -4 & 7 \end{bmatrix}$$

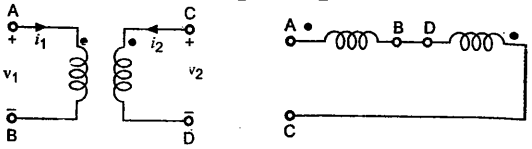


Fig. 1 Fig. 2

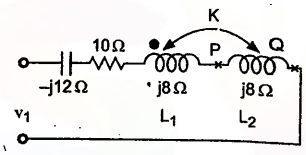
When the inductors are connected in Fig. 2, the equivalent inductance of the system is
(a) 20 H (b) 4 H (c) 16 H (d) 8 H
[U.P.S.C. I.E.S. E.E.-I, 2002]

641. In the circuit shown in figure it is found that the input ac voltage (v_i) and current i are in phase. The coupling coefficient is $K = \dfrac{M}{\sqrt{L_1L_2}}$, where M is



the mutual inductance between the two coils. The value of K and the dot polarity of the coil P-Q are
(a) K = 0.25 and dot at P. (b) K = 0.5 and dot at P.
(c) K = 0.25 and dot at Q. (d) K = 0.5 and dot at Q.
[GATE E.E. 2002]

642. A circular loop of radius increasing at a rate of 2 m/s. The loop is placed perpendicular to a constant magnetic field of 0·1 Wb/m^2. When the radius of the loop is 2 m, the emf induced in the loop will be
(a) 0·8 πV (b) 0·4 πV (c) 0·2 πV (d) zero.
[U.P.S.C. I.E.S. E.E.-I, 1997]

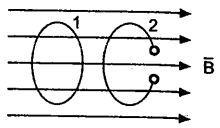
Statement for Linked Answer Questions 643 and 644

An inductor designed with 400 turns coil wound on an iron core 16 cm^2 cross-sectional area and with a cut of an air gap length of 1 mm. The coil is connected to a 230 V, 50 Hz ac supply. Neglect coil resistance, core loss, iron reluctance and leakage inductance, ($\mu_0 = 4\pi \times 10^{-7}$ H/m).

643. The current in the inductor is
(a) 18.08 A (b) 9.04 A (c) 4.56 A (d) 2.28 A
[GATE E.E. 2007]

644. The average force on the core to reduce the air gap will be
(a) 832.29 N (b) 1666.22 N
(c) 3332.47 N (d) 6664.84 N [GATE E.E. 2007]

645. Two conducting coils 1 and 2 (identical except that 2 is split) are placed in a uniform magnetic field which decreases at a constant rate as in figure. If the



Answers: **630.** (b), **631.** (c), **632.** (c), **633.** (c), **634.** (d), **635.** (c), **636.** (b), **637.** (b), **638.** (b), **639.** (d), **640.** (a), **641.** (c), **642.** (b), **643.** (d), **644.** (a), **645.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

planes of the coils are perpendicular to the field lines, the following statements are made:
1. an emf is induced in the split coil 2.
2. emfs are induced in both coils.
3. equal Joule heating occurs in both coils.
4. Joule heating does not occur in any coil.

Which of the above statements is/are true?
(a) 1 and 4. (b) 2 and 4. (c) 3 only. (d) 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2002]

646. When a closed conducting loop 'C' is moving with a constant velocity 'V' through a non-uniform time-varying magnetic field 'B', the voltage induced in the loop is given by

(a) $e = -\int_S \frac{\partial \bar{B}}{\partial t} \cdot d\bar{s}$ (b) $e = \int_C (\bar{V} \times \bar{B}) \cdot d\bar{l}$

(c) $e = \int_C (\bar{B} \times \bar{V}) \cdot d\bar{l}$ (d) $e = -\int_S \frac{\partial \bar{B}}{\partial t} \cdot d\bar{s} + \int_C (\bar{V} + \bar{B}) \cdot d\bar{l}$

[U.P.S.C. I.E.S. E.F.-I, 1998]

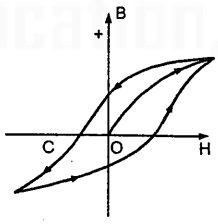
647. A circular loop is rotating about the y-axis as a diameter in a magnetic field $\bar{B} = B_0 \sin \omega t \, \hat{a}_x$ Wb/m^2. The induced emf in the loop is
(a) due to transformer emf only.
(b) due to motional emf only.
(c) due to a combination of transformer and motional emf.
(d) zero.
[U.P.S.C. I.E.S. E.E.-I, 2001]

648. Two conducting thin coils X and Y (identical except for a thin cut in coil Y) are placed in a uniform magnetic field which is decreasing at a constant rate. If the plane of the coils is perpendicular to the field lines, which of the following statement is correct? As a result, emf is inducted in
(a) both the coils. (b) coil Y only.
(c) coil X only. (d) none of the two coils.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

649. Materials subjected to rapid reversals of magnetism should have
(a) high permeability and low hysteresis loss.
(b) large B-H loop area.
(c) large coercivity and high retentivity.
(d) low permeability and large coercivity.

650. The magnetic field required to reduce the residual magnetisation to zero is called
(a) retentivity. (b) coercivity.
(c) hysteresis. (d) saturation magnetisation.
[U.P.S.C. I.E.S. E.E.-I, 2005]

651. The coercive force in a ferromagnetic material is related to the
(a) area enclosed by the B-H loop.
(b) intercept on the negative H axis of the B-H loop.
(c) intercept on the positive B axis of the B-H loop.
(d) maximum value of B on the B-H loop. [U.P.S.C. I.E.S. E.E.-I, 1993]



652. Which of the following statements should be true if one compares the hysteresis loops of hard and soft magnetic materials?
1. Hysteresis loss of hard magnetic material will be less than that of soft material.
2. Coercivity of hard material will be greater than that of soft material.
3. Retentivity of two materials will always be equal.

Select the correct answer using the codes given below
Codes:
(a) 1 alone (b) 2 alone (c) 2 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 1995]

653. The shape of B-H curve for air gap is
(a) parabola. (b) sinusoidal.
(c) ellipse. (d) straight line.
[R.G.T.U. Basic E.E. June 2008]

654. Iron loss is known as
(a) hysteresis loss. (b) eddy current loss.
(c) above (a) and (b). (d) none of the above.
[R.G.T.U. Basic E.E. June 2008]

655. In a magnetic material, hysteresis loss takes place primarily due to
(a) flux density lagging behind magnetising force.
(b) molecular friction.
(c) its high retentivity.
(d) rapid reversal of its magnetisation.
[R.G.T.U. Basic E.E. June 2007]

656. The area of hysteresis loop is a measure of
(a) magnetic flux. (b) permeance.
(c) mmf per cycle. (d) energy loss per cycle.
[R.G.T.U. Basic E.E. Nov./Dec. 2007]

657. Hysteresis loss least depends on
(a) volume of material. (b) frequency.
(c) Steinmetz coefficient of material.
(d) ambient temperature. [R.G.T.U. Basic E.E. Jan./Feb. 2007]

658. The hysteresis loss is caused by
(a) structural non-homogeneity.
(b) work required for magnetising the material.
(c) potential work function.
(d) none of the above.

659. In order to minimise loss due to hysteresis the magnetic material should have
(a) high retentivity. (b) high resistivity.
(c) small B-H loop area. (d) large coercive force.
(e) high hysteresis coefficient.

660. The hysteresis loop of a magnetic material has an area of 5 cm^2 with the scales given as 1 cm = 2 AT and 1 cm = 50 mWb. At 50 Hz, the total hysteresis loss is
(a) 15 W (b) 20 W (c) 25 W (d) 50 W
[GATE E.E. 2001]

661. Which of the following inductors will have the least eddy current losses?
(a) air-cored. (b) iron cored.
(c) wooden cored. (d) laminated iron cored.
[R.G.T.U. Basic E.E. Nov./Dec. 2007]

662. Magnetostriction is a phenomenon whereby the magnetisation of a ferromagnetic material leads to a change in
(a) relative permeability. (b) physical dimensions.
(c) spontaneous magnetisation.
(d) magnetic susceptibility. [U.P.S.C. I.E.S. Elec. Engineereing-I, 1997]

663. Magnetostriction is a phenomenon of
(a) generation of electricity in ferromagnetic materials.
(b) generation of magnetism in conductors.
(c) change in permeability of ferromagnetic materials during magnetisation.
(d) change in physical dimensions of ferromagnetic materials during magnetisation. [U.P.S.C. I.E.S. E.E.-I, 2005]

Answers: **646.** (d), **647.** (c), **648.** (a), **649.** (a), **650.** (b), **651.** (b), **652.** (b), **653.** (d), **654.** (c), **655.** (d), **656.** (d), **657.** (d), **658.** (b), **659.** (c), **660.** (c), **661.** (a), **662.** (b), **663.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

664. What does the equation $\frac{1}{2}\bar{J}\cdot\bar{A}$ represent?
(a) Electric energy density. (b) magnetic energy density.
(c) Power density. (d) radiation resistance.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

665. Energy density in a static magnetic field is
(a) $W_m = \frac{1}{2}LI$ (b) $W_m = \mu H^2$
(c) $W_m = \frac{1}{2}\mu H^2$ (d) $\frac{1}{2}\mu^2 H$

666. Energy stored by a coil is doubled when its current is increased by
(a) 100 per cent. (b) 41.4 per cent.
(c) 50 per cent. (d) 35 per cent.
[R.G.T.U. Basic E.E. June 2007]

667. A coil of 1,000 turns is wound on a core. A current of 1 A flowing through the coil creates a core flux 1 m Wb. The energy stored in the magnetic field is
(a) 0.25 J. (b) 0.5 J. (c) 1 J. (d) 2 J.
[U.P.S.C. I.E.S. E.E.-II, 2003; 2005]

668. The energy stored in the magnetic field of a solenoid 30 cm long and 3 cm diameter wound with 1,000 turns of wire carrying current of 10 A is
(a) 0.015 J (b) 0.15 J (c) 0.5 J (d) 1.15 J
[GATE E.E. 1996]

669. Which of the following statements associated with inductors is wrong ?
(a) An inductor is a sort of short circuit to dc.
(b) An inductor is a sort of open circuit to dc.
(c) An inductor never dissipates energy but only stores it.
(d) A finite amount of energy can be stored in an inductor even if voltage across it is zero, such as when the current through it is constant.

670. The magnetic field strength of an air-cored coil can be increased by
(a) increasing the number of turns on the coil.
(b) increasing the current strength.
(c) increasing the core x-sectional area.
(d) inserting a soft iron core into the coil.
(e) any of the above methods.

671. The electromagnet is made of
(a) soft iron core. (b) steel core.
(c) soft iron core wrapped in a coil of fine wire with current flowing through it.
(d) any of the above methods.

672. Core of an electromagnet should have
(a) low coercivity. (b) high susceptibility.
(c) both (a) and (b). (d) none of these.

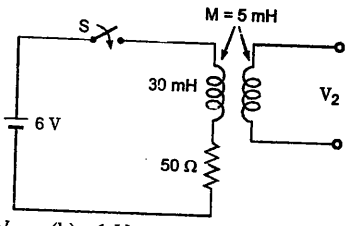
673. When a battery of E volts is suddenly applied across an ideal inductance of L henry, the current through inductance will be
(a) zero. (b) infinity instantaneously.
(c) increasing linearly at the rate of $\frac{E}{L}$ ampere/s.
(d) $\frac{E}{L}(1 - e^{-t/T})$.
[A.M.I.E. Elec. Science Winter 1994]

674. A coil with a certain number of turns has a specified time constant. If the number of turns is doubled, its time consant would
(a) remain unaffected. (b) become doubled.
(c) become four fold. (d) get halved.
[U.P.S.C. I.E.S. E.E.-I, 1993]

675. At a certain current, the energy stored in an iron-cored coil is 1,000 J and its copper loss is 2,000 W. The time constant (in seconds) of the coil is
(a) 0.25 (b) 0.5 (c) 1.0 (d) 2.0
[U.P.S.C. I.E.S. E.E.-I, 1994]

676. A series R-L circuit with R = 100 ohm; L = 50 H, is supplied to a dc source of 100 V. The time taken for the current to rise 70% of its steady-state value is
(a) 0.3 s (b) 0.6 s (c) 2.4 s
(d) 70% of time required to reach steady state.
[U.P.S.C. I.E.S. Elec. Engg-I, 1993]

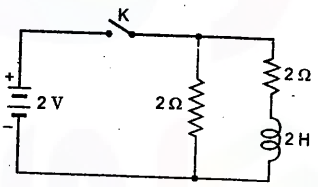
677. In the circuit shown in the given figure, the switch S is closed at $t = 0$. The induced voltage V_2 will have a maximum value of



(a) 0.6 V (b) 1 V (c) 3.78 V (d) 6 V
[U.P.S.C. I.E.S. E.E.-I, 1994]

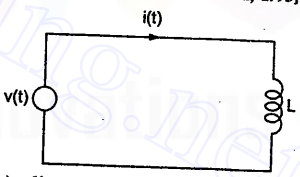
678. Two coils having equal resistances but different inductances are connected in series. The time constant of the series combination is the
(a) sum of the time constant of the individual coils.
(b) average of the time constants of the individual coils.
(c) geometric mean of the time constants of the individual coils.
(d) product of the time constants of the individual coils.
[U.P.S.C. I.E.S. E.E.-I, 1993]

679. In the network shown in the figure, the circuit was initially in the steady-state condition with the switch K closed. At the instant when the switch is opened, the rate of decay of current through the inductance will be



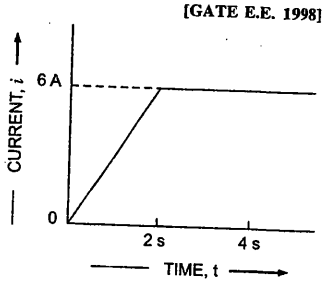
(a) zero. (b) 0.5 A/s (c) 1 A/s (d) 2 A/s
[U.P.S.C. I.E.S. E.E.-I, 1993]

680. In the circuit shown in the figure, it is desired to have a constant direct current $i(t)$ through the ideal inductor L. The nature of the voltage source $v(t)$ must be



(a) constant voltage. (b) linearly increasing voltage.
(c) an ideal impulse. (d) expontially increasing voltage.
[GATE E.E. 1998]

681. Figure shows the waveform of the current passing through an inductor of resistance 1 Ω and inductance 2 H. The energy absorbed by the inductor in the first four seconds is



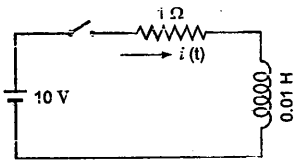
(a) 144 J
(b) 98 J
(c) 132 J
(d) 168 J
[GATE E.E. 2003]

Answers: **664.** (b), **665.** (c), **666.** (b), **667.** (b), **668.** (b), **669.** (b), **670.** (e), **671.** (c), **672.** (c), **673.** (c), **674.** (b), **675.** (c), **676.** (b), **677.** (b), **678.** (b), **679.** (d), **680.** (c), **681.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

682. After closing the switch at $t = 0$, the current $i(t)$ at any instant in network shown in the given figure will be



(a) $10 + 10^{100t}$
(b) $10 - 10^{100t}$
(c) $10 + 10^{-100t}$
(d) $10 - 10^{-100t}$

[U.P.S.C. I.E.S. E.E.-I, 1997]

683. A voltage waveform $v(t) = 12t^3$ is applied across a 1 H inductor for $t \geq 0$, with initial current through it being zero. The current through the inductor for $t \geq 0$ is given by
(a) $12t$ (b) $24t$ (c) $12t^3$ (d) $4t^3$

[GATE E.E. 2000]

684. The v-i characteristic as seen from the terminal-pair (A, B) of the network shown Fig. 1 is shown in Fig. 2. If an inductance of value 6 mH is connected across the terminal pair (A, B), the time constant of the system will be

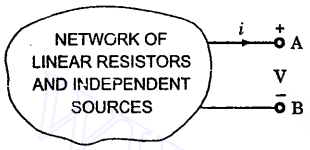


Fig. 1

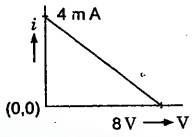

Fig. 2

(a) 3 μs (b) 12 s (c) 32 s
(d) unknown, unless the actual network is specified

[GATE E.E. 1996]

685. The cores in electrical machines are generally made of laminations with a view to reduce
(a) the eddy current loss. (b) the hysteresis loss.
(c) the copper loss.
(d) eddy current, hysteresis and copper losses.

[U.P.S.C. I.E.S. E.E.-I, 1994]

686. The instantaneous electric field of a plane wave propagating in z-direction is $\bar{E}(t) = [\hat{a}_x E_1 \cos \omega t - \hat{a}_y E_2 \sin \omega t] e^{-jkz}$. This wave is
(a) Linearly polarised. (b) Elliptically polarised.
(c) Right hand circularly polarised.
(d) Left hand circularly polarised. [U.P.S.C. I.E.S. E.E.-I, 2005]

687. A uniform plane wave is propagating in a material for which $\varepsilon = 4\,\varepsilon_0$, $\mu = 7\,\mu_0$ and $\sigma = 0$. The skin depth for the material is
(a) zero. (b) infinity.
(c) 28 m (d) 14 m [U.P.S.C. I.E.S. E.E.-I, 2010]

688. If $\bar{E} = (\hat{x} + j\hat{y}) e^{-j\beta z}$, then the wave is said to be which one of the following?
(a) Right circularly polarised.
(b) Right elliptically polarised.
(c) Left circuilarly polarised.
(d) Left elliptically polarised. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

689. What will be the reflected wave for an elliptically polarized wave incident on the interface of a die-electric at the Brewester angle?
(a) Elliptically polarised. (b) Linearly polarised.
(c) Right circularly polarised.
(d) Left circularly polarised. [U.P.S.C. I.E.S. E.E.-I, 2004]

690. Consider the following statements connection with electromagnetic waves:
1. Conducting medium behaves like an open circuit to the electromagnetic field.
2. At radio and microwave frequencies the relaxation time is much less than the period.
3. In loss-less dielectric the relaxation time is infinite.
4. Intrinsic impedance of a perfect dielectric medium is a pure resistance.

Which of the above statements is correct?
(a) 1 only. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2009]

691. Which one of the following is the correct electromagnetic wave equation in terms of vector potential $\vec{A}$?

(a) $\nabla^2 \vec{A} - \frac{\partial^2 \vec{A}}{\partial t^2} = -\vec{J}$ (b) $\nabla^2 \vec{A} - \frac{\mu}{\varepsilon} \frac{\partial^2 \vec{A}}{\partial t^2} = -\mu \vec{J}$

(c) $\nabla^2 \vec{A} - \frac{\partial^2 \vec{A}}{\partial t^2} = -\mu \vec{J}$ (d) $\nabla^2 \vec{A} - \mu\varepsilon \frac{\partial^2 \vec{A}}{\partial t^2} = -\mu \vec{J}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

692. In free space $\bar{H}(z, t) = 0.10 \cos (4 \times 10^7 t - \beta z)\alpha_x$ A/m. The expression for $\bar{E}(z, t)$ is
(a) $\bar{E}(z, t) = 37.7 \cos(4 \times 10^7 t - \beta z)\alpha_y$.
(b) $\bar{E}(z, t) = 2.65 \times 10 \cos(4 \times 10^7 t - \beta z)\alpha_z$.
(c) $\bar{E}(z, t) = 37.7 \cos(4 \times 10^7 t - \beta z)\alpha_x$.
(d) $\bar{E}(z, t) = -37.7 \cos(4 \times 10^7 t - \beta z)\alpha_y$.

[U.P.S.C. I.E.S. E.E.-I, 2002]

693. In free space

$$\bar{E}(Z, t) = 60\pi \cos(\omega t - \beta Z)\, \bar{a}_X \text{ V/m.}$$

The average power crossing a circular area of π square metres in the plane Z = constant is
(a) 16 π watts/m^2 (b) 15 π watts/m^2
(c) 14 π watts/m^2 (d) 13 π watts/m^2

[U.P.S.C. I.E.S. E.E.-I, 2010]

694. In free space

$$\bar{E}(Z, t) = 120\,\pi \cos(\pi t - \beta Z)\, \bar{a}_x \text{ Vm}^{-1}.$$

What is the average power in Wm^{-2}?
(a) $30\pi \bar{a}_Z$ (b) $60\pi \bar{a}_Z$
(c) $90\pi \bar{a}_Z$ (d) $120\pi \bar{a}_Z$

[U.P.S.C. I.E.S. E.E.-I, 2009]

695. A plane wave travelling in air is incident on a conducting medium. Which one of the following is correct?
The magnetic field intensity
(a) becomes approximately half.
(b) gets approximately doubled.
(c) remains unchanged. (d) cannot be determined.

[U.P.S.C. I.E.S. E.E.-I, 2008]

696. Consider the following stetements
For a uniform plane electromagnetic wave
1. The direction of energy flow is the same as the direction of propagation of the wave.
2. Electric and magnetic fields are in time quadrature.
3. Electric and magnetic fields are in space quadrature

Of these statements
(a) 2 alone is correct. (b) 1 and 2 are correct.
(c) 1 and 3 are correct. (d) 3 alone is correct.

[U.P.S.C. I.E.S. E.E.-I, 1998]

Answers: **682.** (d), **683.** (d), **684.** (a), **685.** (a), **686.** (b), **687.** (b), **688.** (c), **689.** (b), **690.** (d), **691.** (d), **692.** (d), **693.** (b), **694.** (b), **695.** (c), **696.** (c),

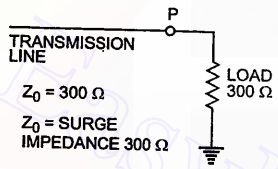
697. Which one of the following statements is correct?
The wavelength of a wave propagating in a waveguide is:
(a) smaller than the free space wavelength.
(b) greater than the free space wavelength.
(c) directly proportional to the group velcocity.
(d) inversely proportional to the phase velcoity.
[U.P.S.C. I.E.S. E.E.-I, 2004]

698. Why is delay distortion in coaxial cables caused?
(a) The dielectric constant (ε_r) of the dielectric filling the coaxial cable varies with frequency.
(b) The amplitude of the signal on the cable varies with frequency.
(c) The velocity of electromagnetic waves propagating on the cable varies with frequency.
(d) Because of both the factors given at (a) and (c) above..
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

699. What causes electromagnetic wave polarization?
(a) Refraction. (b) Reflection.
(c) Longitudinal nature of electromagnetic wave.
(d) Transverse nature of electromagnetic wave.
[U.P.S.C. I.E.S. E.E.-I, 2008]

700. Which of the following is a vector quantity?
(a) Standing wave ratio only.
(b) Reflection coefficient only.
(c) Gain.
(d) Standing wave ratio and reflection coefficient.
[U.P.S.C. I.E.S. E.E.-I, 2008]

701. The reflection coefficient for the transmission line shown in figure at P is
(a) +1
(b) –1
(c) 0
(d) 0.5



[GATE E.E. 1998]

702. What is the value of Standing Wave Ratio (SWR) in free space for transmission coefficient $\Gamma = -\frac{1}{3}$?
(a) $\frac{2}{3}$ (b) 0.5 (c) 4.0 (d) 2.0
[U.P.S.C. I.E.S. E.E.-I, 2005]

703. If the maximum and minimum voltages on a transmission line are 4 V and 2 V, respectively, for a typical load, VSWR is
(a) 1.0 (b) 0.5
(c) 2.0 (d) 8.0 [U.P.S.C. I.E.S. E.E.-I, 2011]

704. If reflection coefficient for voltage be 0.6, the voltage standing wave ratio (VSWR) is
(a) 0.66 (b) 4
(c) 1.5 (d) 2 [U.P.S.C. I.E.S. E.E.-I, 2010]

705. A signal of 10 V is applied to a 50 ohm coaxial transmission line, terminated in a 100 ohm load. The voltage reflection coefficient is
(a) $\frac{1}{4}$ (b) $\frac{1}{3}$
(c) $\frac{1}{2}$ (d) 1 [U.P.S.C. I.E.S. E.E.-I, 2010]

706. $\bar{H} = 0.5 \exp[-0.1x] \sin(10^6 t - 2x)\, \hat{a}_z \left(\frac{A}{m}\right)$, which one of the following statements is NOT correct?
(a) Wave is linearly polarized along $\hat{a}_z$.
(b) The velocity of the wave is 5×10^5 m/s.
(c) The complex propagation constant is $(0.1 - j^2)$.
(d) The wave is travelling along $\hat{a}_x$. [U.P.S.C. I.E.S. E.E.-I, 2003]

707. A plane *em* wave $(\bar{E}_i, \bar{H}_i)$ travelling in a perfect dielectric medium of surge impedance 'Z' strikes normally an infinite perfect dielectric medium of surge impedance 2Z. If the refracted *em* wave is $(\bar{E}_r, \bar{H}_r)$, the ratios of $\frac{E_i}{E_r}$ and $\frac{H_i}{H_r}$ are respectively
(a) 3 and –3 (b) 3/2 and 1/3
(c) 3/4 and 3/2 (d) 3/4/ and 2/3
[U.P.S.C. I.E.S. E.E.-I, 2001]

708. If the electric field component of a wave is $E = \cos(6 \times 10^8 \pi t + 50z)\, a_x$ V/m, then the wave
(a) propagates in $-x$ direction
(b) amplitude is $\sqrt{2}$ V/m .
(c) is not travelling in free space.
(d) propagates in $+z$ direction. [U.P.S.C. I.E.S., E.E.-I, 1999]

709. If a plane electromagnetic wave travelling in the direction $\vec{\beta} = \vec{\alpha}_x\beta_x + \vec{\alpha}_y\beta_y + \vec{\alpha}_z\beta_z$ has electric field $E = A\cos(\omega t - \vec{\beta} \cdot \vec{r})$, then the phase velocities $v_x : v_y : v_z$ is equal to
(a) $\frac{1}{\beta_x^2} : \frac{1}{\beta_y^2} : \frac{1}{\beta_z^2}$ (b) $\beta_x^2 : \beta_y^2 : \beta_z^2$
(c) $\frac{1}{\beta_x} : \frac{1}{\beta_y} : \frac{1}{\beta_z}$ (d) $\beta_x : \beta_y : \beta_z$
[U.P.S.C. I.E.S. E.E.-I, 1999]

710. An electromagnetic field is radiated from
(a) a stationary point charge.
(b) a capacitor with a dc voltage.
(c) a conductor carrying a dc current.
(d) an oscillating dipole. [GATE E.E. 1999]

711. The E field of a plane electromagnetic wave travelling in a non-magnetic non-conducting medium is given by $\bar{E} = \hat{a}_x 5\cos(10^9 t + 30Z)$. What is the dielectric constant of the medium?
(a) 30 (b) 10 (c) 9 (d) 81
[U.P.S.C. I.E.S. E.E.-I, 2005]

712. What is the phase velocity of plane wave in a good conductor?
(a) $\sqrt{\pi f \mu\sigma}$ (b) $\sqrt{\frac{\pi f\sigma}{\mu\sigma}}$ (c) $\sqrt{\frac{\pi f}{\mu\sigma}}$ (d) $2\sqrt{\frac{\pi f}{\mu\sigma}}$
[U.P.S.C. I.E.S. E.E.-I, 2005]

713. Which one of the following is the correct expression for torque on a loop in magnetic field $\bar{B}$? (Here $\bar{M}$ is the loop moment)
(a) $\bar{T} = \nabla \cdot \bar{B}$ (b) $\bar{T} = \bar{M} \cdot \bar{B}$
(c) $\bar{T} = \bar{M} \times \bar{B}$ (d) $\bar{T} = \bar{B} \cdot \bar{M}$
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

714. Which one of the following modes has the highest cut-off wavelength in a rectangular waveguide?
(a) TE_{10} (b) TE_{01} (c) TM_{01} (d) TM_{11}
[U.P.S.C. I.E.S. E.E.-I, 2008]

715. How is the attenuation factor in parallel plate guides represented?
(a) α = power lost/power transmitted.
(b) α = 2 × power lost/power transmitted.
(c) α = power lost per units length/(2 × power transmitted).
(d) α = power lost/(power lost + power transmitted).
[U.P.S.C. I.E.S. E.E.-I, 2007]

Answers: **697.** (a), **698.** (d), **699.** (d), **700.** (b), **701.** (c), **702.** (b), **703.** (c), **704.** (b), **705.** (b), **706.** (c), **707.** (a), **708.** (d), **709.** (c), **710.** (d), **711.** (d), **712.** (d), **713.** (c), **714.** (a), **715.** (b),

Downloaded From : www.EasyEngineering.net

716. What does the expression $\frac{1}{2}\vec{J}\cdot\vec{A}$ represent?
(a) Power density. (b) Radiation resistance.
(c) Magnetic energy density. (d) Electric energy density.
[U.P.S.C. I.E.S. E.E.-I, 2009]

717. In the wave equation, $\Delta^2\vec{E} = \mu\epsilon\frac{\partial^2\vec{E}}{\partial t^2} + \mu\sigma\frac{\partial\vec{E}}{\partial t}$ which term is responsible for attenuation of the wave?
(a) $\nabla^2\vec{E}$ (b) $\mu\epsilon\frac{\partial^2\vec{E}}{\partial t^2}$
(c) $\mu\sigma\frac{\partial^2\vec{E}}{\partial t}$ (d) all of the above three.
[U.P.S.C. I.E.S., E.E.-I, 2005]

718. For a conducting medium with conductivity σ, permeability μ, and permittivity ε, then, the skin depth for an electromagnetic signal at an angular frequency ω is proportional to
(a) σ (b) $\frac{1}{\omega}$ (c) $\frac{1}{\sqrt{\sigma}}$ (d) $\frac{1}{\mu}$
[U.P.S.C. I.E.S. E.E.-I, 2003]

719. For a perfect conductor, the field strength at a distance equal to the skin depth is X% of the field strength at its surface. The value of 'X%' is
(a) Zero (b) 50% (c) 36% (d) 26%
[U.P.S.C. I.E.S. E.E.-I, 2001]

720. In a lossless medium the intrinsic impedance $\eta = 60\pi$ and $\mu_r = 1$. What is the value of the dielectric constant ϵ_r?
(a) 2 (b) 1 (c) 4 (d) 8
[U.P.S.C. I.E.S. E.E.-I, 2004]

721. With the increase in frequency of an electromagnetic wave in free space, how do the velocity V_c and characteristic impedance Z_c change?
(a) V_c increases and Z_c decreases.
(b) V_c decreases and Z_c increases.
(c) Both V_c and Z_c increase.
(d) Both V_c and Z_c remain unchanged. [U.P.S.C. I.E.S. E.E.-I, 2005]

722. Depth of penetration δ is equal to $\frac{\lambda}{2\pi}$ for
(a) Good insulator. (b) Good conductor.
(c) Lossy medium. (d) Low values of λ.
[U.P.S.C. I.E.S. E.E.-I, 2011]

723. A higher directivity is specified by
(a) High gain high bandwidth.
(b) Low gain high bandwidth.
(c) High gain low bandwidth.
(d) Low gain low bandwidth. [U.P.S.C. I.E.S. E.E.-I, 2011]

724. Screw projecting into the waveguide is
(a) Capacitive discontinuity. (b) Inductive discontinuity.
(c) May be capacitive or inductive depending upon the position inside the guide.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-I, 2011]

725. Consider the following statements:
1. In conducting medium the field attenuates exponentially with increasing depth.
2. Conducting medium behaves like an open circuit to the electromagnetic field.
3. In lossless dielectric relaxation time is infinite.
4. In charge-free region, the Poisson's equation becomes Laplace's equation.
Which of the above statements are correct.
(a) 1, 2 and 3 only. (b) 1, 3 and 4 only.
(c) 2, 3 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

726. Consider the following statements in connection with cylindrical waveguides:
1. At low frequency the propagation constant is real and wave does not propagate.
2. At intermediate frequency the propagation constant is zero and wave cuts off.
3. At high frequency the propagation constant is imaginary and wave propagates.
4. At transition condition the cut-off frequency is inversely proportional to the eigen values of the Bessel function for the respective TE_{nr} mode.
Which of the above statements is/are correct?
(a) 1, 2 and 3. (b) 2 only.
(c) 2 and 3 only. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2009]

727. The intrinsic impedance of free space is
(a) 377 Ω (b) $\sqrt{\mu_0\epsilon_0}$ (c) $j\sqrt{\frac{\epsilon_0}{\mu_0}}$ (d) $\sqrt{\frac{\epsilon_0}{\mu_0}}$
[U.P.S.C. I.E.S. E.E.-I, 1999]

728. Which one of the following statements is correct?
For a lossless dielectric medium, the phase constant for a travelling wave, β is proportional to:
(a) ϵ_r (b) $\sqrt{\epsilon_r}$ (c) $\frac{1}{\epsilon_r}$ (d) $\frac{1}{\sqrt{\epsilon_r}}$
[U.P.S.C. I.E.S. E.E.-I, 2004]

729. Which of the following pairs of parameters and expressions is/are correctly matched?
1. Characteristic impedance — $\frac{\bar{E}}{\bar{H}}\sqrt{\epsilon_r}$
2. Power flow density — $\bar{V}\times\bar{H}$
3. Displacement current in non-conducting medium — $\bar{E}\times\bar{H}$
Select the correct answer using the codes given below:
Codes:
(a) 1 alone. (b) 2 and 3. (c) 1 and 3. (d) 1 and 2.
[U.P.S.C. I.E.S. E.E.-I, 1998]

730. The unit of the Poynting vector is
(a) power. (b) power density.
(c) energy. (d) energy density.
[U.P.S.C. I.E.S. E.E.-I, 1999]

731. Poynting vector is a measure of which one of the following?
(a) Maximum power flow through a surface surrounding the source.
(b) Average power flow through the surface.
(c) Instantaneous power flow through the surface.
(d) Power dissipated by the surface.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

732. What is the Poynting's vector on the surface of a long straight conductor of radius *b* and conductivity σ which carries current I in the *z*-direction?

Answers: **716.** (c), **717.** (c), **718.** (c), **719.** (c), **720.** (c), **721.** (d), **722.** (b), **723.** (c), **724.** (c), **725.** (d), **726.** (a), **727.** (a), **728.** (b), **729.** (a), **730.** (b), **731.** (b), **732.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $-\frac{I^2}{2\sigma\pi^2 b^3}\hat{i}_r$ (b) $\frac{I^2}{2\sigma\pi^2 b^2}\hat{i}_r$

(c) $\frac{I^2}{\sigma\pi b^2}\hat{i}_z$ (d) $\frac{I}{2\pi b}\hat{i}_\phi$

[U.P.S.C. I.E.S. E.E.-I, 2006]

733. According to Poynting theorem, the vector $\bar{E} \times \bar{H}$ is a measure of which one of the following?
(a) Stored energy density of the electric field.
(b) Stored energy density of the magnetic field.
(c) Power dissipated per unit volume.
(d) Rate of energy flow per unit area.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

734. Consider the following statements
1. Poisson's equation finds application in vacuum tube and gaseous discharge problems.
2. Gauss's law is useful for determining field and potential distribution about bodies having unsymmetrical geometry.
3. For the propagation of electromagnetic waves, the time varying electric fields must support time varying magnetic fields.
4. The unit of Poynting's vector is W/m^2.

Which of the statements given above are correct?
(a) 1, 2 and 3. (b) 1, 3 and 4.
(c) 2, 3 and 4. (d) 1, 2 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2005]

735. EMF of a thermocouple depends upon the
(a) nature of material of metals.
(b) difference of temperatures of two junctions.
(c) both (a) and (b).
(d) none of the above.

736. The absorption or evolution of heat energy, if a current is allowed to flow in a conductor having its different parts at different temperatures is known as _____ effect.
(a) Seebeck (b) Thomson (c) Peltier (d) Joule's

737. The temperature of hot junction of a thermocouple at which the thermo-emf is maximum is known as
(a) neutral temperature. (b) temperature of inversion.
(c) neither (a) nor (b).

738. Neutral temperature of a thermocouple
(a) is constant for a given thermocouple.
(b) depends upon the nature of the metals of the couple.
(c) is independent of temperature of cold junction of the couple.
(d) all of the above.

739. Thermoelectric power at neutral temperature is
(a) maximum. (b) minimum
(c) zero. (d) unpredictable.

740. _____ coefficient is numerically equal to the difference of potential per °C.
(a) Peltier (b) Thomson (c) Joule's (d) None of these

741. Thermocouple is based on
(a) Seebeck effect. (b) Thomson.
(c) Joule's. (d) None of these.

[A.M.I.E.Sec. B. E.E. Materials Winter 1994]

742. The emf is measured for a junction temperature difference of 20°C by thermocouples made from materials A, B and C. The pair A-B gives an emf of 165 μV, with the end of A being positive. The pair B-C gives 100 μV, with the end of C being positive. The pair A-C will give
(a) 265 μV with the end of A being positive.
(b) 265 μV with the end of C being positive.
(c) 65 μV with the end of A being positive.
(d) 65 μV with the end of C being positive.

[U.P.S.C. I.E.S. E.E.-I, 1999]

Answers: **733.** (d), **734.** (b), **735.** (c), **736.** (b), **737.** (a), **738.** (d), **739.** (c), **740.** (b), **741.** (a), **742.** (c).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): The direction of flow of conventional current is taken opposite to that of electrons.
(R): Electrons have negative charge.

2. (A): The hot resistance of the bulb's filament is higher than its cold resistance.
(R): The resistivity of bulb's filament is high.

3. (A): Two wires of same length with different x-sectional areas are connected in series. The heat produced by the current is more in the thicker wire.
(R): The thicker wire has low resistance.

4. (A): The Kirchhoff's current law states that the sum of currents entering at any node is equal to the sum of currents leaving that node.
(R): The Kirchhoff's current law is based on the law of conservation of charge. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

5. (A): If Thevenin's equivalent of a circuit is known, its Norton's equivalent is also known.
(R): Norton's equivalent is reciprocal of Thevenin's equivalent.
[U.P.S.C. I.E.S. E.E.-I, 2004]

6. (A): Norton's theorem is applied to a network for which no equivalent Thevenin's network exists.

Answers: **1.** (a), **2.** (b), **3.** (d), **4.** (a), **5.** (c), **6.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): Norton's theorem enables one to calculate quickly current and voltage in a particular branch of interest in a complicated network. [U.P.S.C. I.E.S. E.E.-I, 2001]

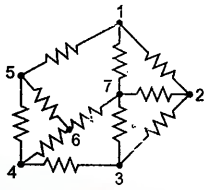
7. (A): Node-voltage analysis of networks is a method that uses Kirchhoff's current law to obtain a set of simultaneous equations that, when solved, will provide information concerning the magnitudes and phase angles of the voltages across each branch.

(R): The ideal generator maintains constant voltage amplitude and waveshape regardless of the amount of current it supplies to the circuit. [U.P.S.C. I.E.S. E.E.-I, 2002]

8. (A): A network consisting of 'n' nodes and 'e' elements can be completely analysed from $(e - n + 1)$ mesh equations or $(n - 1)$ node equations.

(R): The number of mesh equations plus number of node equations is equal to the number of elements in the network. [U.P.S.C. I.E.S. E.E.-I, 1998]

9. (A): In the circuit shown in the figure, five current equations are required to calculate the independent branch currents and *four* voltage equations are required to determine the independent branch voltages.



(R): The number of current equations is $b - n + 1$ and the number of voltage equations is $n - 1$ where b is the number of branches and n is the number of nodes for a circuit. [U.P.S.C. I.E.S. E.E.-I, 2000]

10. (A): All networks made up of passive, linear time invariant elements are reciprocal.

(R): Passivity and time invariance of elements do not guarantee reciprocity of the network. [U.P.S.C. I.E.S. E.E.-I, 2002]

11. (A): A four terminal passive linear network will always have an equivalent T-network.

(R): The Thevenin's theorem is applicable in cases of transfer functions also. [U.P.S.C. I.E.S. E.E.-I, 2007]

12. (A): A driving-point function should have its poles and zeros to the left of s-plane.

(R): Only a positive real function can be realized in network form. [U.P.S.C. I.E.S. E.E.-I, 2000]

13. (A): A capacitor has one pole at s = infinity and one zero at $s = 0$, where $s = j\omega$, ω is the angular frequency.

(R): The driving point impedance of a capacitor is $\frac{1}{sC}$. [U.P.S.C. E.E.-I, 2009]

14. (A): During charging of a lead acid cell the electrolyte becomes stronger.

(R): During charging sulphuric acid is formed.

15. (A): Lead acid battery container is made up of glass, lead lined wood, ebonite, hard rubber of bituminous compound ceramic materials or moulded plastics.

(R): Containers of lead acid batteries should be acid resistant.

16. (A): For preparing electrolyte for lead acid battery, acid is poured into water (water is never poured into the acid).

(R): Pouring of water into the acid while preparing electrolyte for lead acid battery will result in explosion.

17. (A): In a lead acid battery, the level of electrolyte must be maintained at least 10 or 15 mm above the plates.

(R): If the plates of a lead-acid battery are exposed to air, its capacity and life will reduce and exposed portion of plates will be converted into lead sulphate.

18. (A): Nickel-cadmium accumulators are superior to nickel-iron accumulators.

(R): Nickel cadmium accumulators have higher voltage per cell, less weight and low cost in comparison to those of nickel-iron accumulators.

19. (A): Nickel iron accumulators are particularly suitable for severe services such as propulsion of industrial trucks and mine locomotives.

(R): Nickel iron accumulators have low running cost and need very less maintenance.

20. (A): Nickel-iron cell, in comparison to a lead acid cell, has higher efficiency.

(R): Nickel iron cell has low emf.

21. (A): The electric field around a positive charge is outward.

(R): Gauss law states that the differential of the normal component of the outward electric flux density over a closed surface yields the positive charge enclosed. [U.P.S.C. I.E.S. E.E.-I, 2011]

22. (A): The static magnetic field has zero divergence and non-zero curl.

(R): The static magnetic field satisfies the flux law. [U.P.S.C. I.E.S. E.E.-I, 1998]

23. (A): Electric field cannot exist inside a perfect conductor.

(R): For a perfect conductor $\sigma = \infty$ and there is no voltage drop inside the conductor. [U.P.S.C. I.E.S. E.E.-I, 1999]

24. (A): State electric field and equipotential lines are orthogonal.

(R): $\int \bar{E} \cdot d\bar{l} = 0$. [U.P.S.C. I.E.S. E.E.-I, 1998]

25. (A): Displacement current can have only ac components.

(R): It is generated by a change in electric flux. [U.P.S.C. I.E.S. E.E.-I, 2003]

26. (A): When there is no charge in the interior of a conductor the electric field intensity is infinite.

(R): As per Gauss's law the total outward electric flux through any closed surface constituted inside the conductor must vanish. [U.P.S.C. I.E.S. E.E.-I, 2001]

27. Given that $\nabla \times \bar{H} = \bar{J} + \frac{\partial \bar{D}}{\partial t}$.

(A): In the equation, the additional term $\frac{\partial \bar{D}}{\partial t}$ is necessary.

(R): The equation will be consistent with the principle of conservation of charge. [U.P.S.C. I.E.S. E.E.-I, 2001]

28. (A): Potential everywhere on a conducting surface of infinite extent is zero.

(R): Displacement density on a conducting surface is normal to the surface. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

29. (A): When an alternating field is applied to a dielectric, the relative permittivity is a complex quantity.

(R): The imaginary part of the relative permittivity is responsible for dielectric loss. [U.P.S.C. I.E.S. E.E.-I, 2002]

30. (A): A unit current impulse applied to a capacitor of 'C' farads instantly inserts $\frac{1}{2C}$ joules of energy in it.

(R): A unit current impulse has infinite current for zero duration and encloses a charge of one coulomb in it. [U.P.S.C. I.E.S. E.E.-I, 2001]

Answers: **7.** (b), **8.** (a), **9.** (d), **10.** (d), **11.** (b), **12.** (b), **13.** (d), **14.** (a), **15.** (a), **16.** (c), **17.** (a), **18.** (c), **19.** (b), **20.** (d), **21.** (c), **22.** (b), **23.** (a), **24.** (a), **25.** (a), **26.** (d), **27.** (a), **28.** (b), **29.** (a), **30.** (a),

Downloaded From : www.EasyEngineering.net

31. (A): The test charge may have any value while defining electric field intensity.
(R): The test charge should not disturb the field being measured.
[U.P.S.C. I.E.S. E.E.-I, 2003]

32. (A): A capacitor can store charge.
(R): The plates of the condenser are conductive.

33. (A): Storing of electrical energy in dielectric materials is analogous to stretching of a spring.
(R): The storage takes place by a shift in the relative positions of the internal positive and negative charges against the normal molecular and atomic forces.
[U.P.S.C. I.E.S. E.E. I, 1994]

34. (A): Iron, cobalt and nickel are ferromagnetic.
(R): Spin of electrons in third band is responsible for ferromagnetism.

35. (A): Diamagnetic effect is present in all the materials.
(R): The applied magnetic field alters the orbital motion of the constituent electrons of the materials.
[U.P.S.C. I.E.S. E.E.-I, 1993]

36. (A): Alnico (aluminium-nickel-iron-cobalt) alloys are the most important of hard magnetic materials.
(R): Alnico magnet alloys have the lowest energy per unit of volume of any permanent magnet matetrials available commercially.

37. (A): Soft magnetic materials cannot be used for the construction of cores for the electrical machines.
(R): Soft magnetic materials have relatively small and narrow hysteresis loop.

38. (A): Hard magnetic materials are used for making permanent magnets.
(R): Hard magnetic materials have relatively small and narrow hysteresis loop.

39. (A): Hard magnetic materials are used for making cores of electrical machines.
(R): Hard magnetic materials after magnetization store a considerable amount of magnetic energy, and retain it for a long time.

40. (A): Magnetic leakage is considered undersirable in electric machines.
(R): Power efficiency of electric machines is lowered due to magnetic leakage.

41. (A): It is usually difficult to magnetise steel.
(R): Steel has high specific gravity.

42. (A): Wrought iron and cast steel are most suitable for permanent magnets.
(R): Wrought iron and cast steel have high magnetic permeability and good retentivity.

43. (A): Hard steel is most suitable for transformer core and armatures.
(R): Hard steel has high retentivity power and large coercive force.

44. (A) Silicon alloys and permalloy are most suitable for core of electromagnets.
(R): Silicon alloys and permalloy have very high permeability and low hysteresis loss.

45. (A): Time varying electric field produces magnetic fields.
(R): Time varying magnetic field produces electric fields.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

46. (A): $\oint_S \bar{B}\cdot\vec{ds} = 0$ where
$\bar{B}$ = magnetic flux density
$\vec{ds}$ = vector with direction normal to surface element ds.
(R): Tubes of magnetic flux have no sources or sinks.
[U.P.S.C. I.E.S. E.E.-I, 2002]

47. (A): Magnetic current consists of entirely a displacement component and no conduction component.
(R): Magnetic flux lines are always continuous.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

48. (A): In a current-carrying cylindrical conductor, the magnetic field intensity within the conductor increases linearly with radial distance.
(R): The enclosed current increases as the square of the radial distance while the perimeter increases only as the radial distance.
[U.P.S.C. I.E.S. E.E.-I, 1999]

49. (A): The scalar magnetic potential is evidently the quantity whose equipotential surfaces will form curvilinear squares with the stream lines of H.
(R): The scalar magnetic potential satisfies Laplace's equation where J = 0
[U.P.S.C. I.E.S. E.E.-I, 2003]

50. (A): The relationship between Magnetic Vector potential $\bar{A}$ and the Current density $\bar{J}$ in free space is $\bar{\nabla}\times(\bar{\nabla}\times\bar{A}) = \mu_0\bar{J}$. For a magnetic field in free space due to a dc or slowly varying current is $\nabla^2\bar{A} = -\mu_0\bar{J}$.
(R): For magnetic field due to dc or slowly varying current $\bar{\nabla}\cdot\bar{A} = 0$.
[U.P.S.C. I.E.S. E.E.-I, 2001]

51. (A): Knowing magnetic vector potential $\vec{A}$ at a point, the flux density $\vec{B}$ at that point can be obtained.
(R): $\vec{\nabla}\cdot\vec{A} = 0$.
[U.P.S.C. I.E.S. E.E.-I, 2009]

52. (A): For steady current in an arbitrary conductor, the current density is solenoidal.
(R): The reciprocal of the resistance is the conductivity.
[U.P.S.C. I.E.S. E.E.-I, 2003]

53. (A): A uniform plane wave is a transverse electromagnetic wave.
(R): A uniform plane wave can physically exist and represent finite energy.
[U.P.S.C. I.E.S. E.E.-I, 2003]

54. (A): The velocity of electromagnetic waves is same as velocity of light.
(R): Electrons also travel with the same velocity as photons.
[U.P.S.C. I.E.S. E.E.-I, 2007]

55. (A): Electromagnetic waves propagate being guided by plate perfect conductor surface.
(R): Tangential component of electric field intensity and normal component of magnetic field intensity are zero on a perfect conductor surface.
[U.P.S.C. I.E.S. E.E.-I, 2011]

56. (A): The amplitude of electric field is $(1/e^2)$ (V/m) after the wave has travelled a distance of 20 cm in the conductor.
(R): Skin depth is the distance in which the wave amplitude decays to $(1/e)$ of its value at the surface.
[U.P.S.C. I.E.S. E.E.-I, 2002]

57. (A): The B-H product is a measure of the energy required for demagnetization.
(R): Energy is required for domain boundary movements.
[U.P.S.C. I.E.S. E.E. I, 1992]

Answers: **31.** (d), **32.** (b), **33.** (a), **34.** (c), **35.** (d), **36.** (c), **37.** (d), **38.** (c), **39.** (d), **40.** (c), **41.** (b), **42.** (d), **43.** (d), **44.** (d), **45.** (b), **46.** (a), **47.** (a), **48.** (a), **49.** (b), **50.** (a), **51.** (b), **52.** (c), **53.** (c), **54.** (a), **55.** (a), **56.** (a), **57.** (a),

Downloaded From : www.EasyEngineering.net

58. (A) It is impossible to change the current through an inductor by finite amount in zero time.
(R): The current through an inductor can be changed by finite amount in zero time only when an infinite voltage is applied across it.

59. (A): A laminated iron core has reduced iron losses.
(R): The laminations are insulated from each other and results in high resistance to eddy currents.

60. (A): A ferrite core has less eddy current loss than iron core.
(R): Ferrites have high resistance.

61. (A): The current in a constant inductive system does not change instantaneously.
(R): In constant inductive system the flux linkage is conserved initially. [U.P.S.C. I.E.S. E.E.-I, 2001]

62. (A): A thin sheet of conducting material can act as a low-pass filter for electromagnetic waves.
(R): The depth of penetration is inversely proportional to the square root of the frequency. [U.P.S.C. I.E.S. E.E.-I, 2010, 2011]

Answers: **58.** (a), **59.** (a), **60.** (a), **61.** (c), **62.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Materials)	List 2 (Range of resistivity)
A. Conductive materials	1. 10^{0} to 10^{2} Ω-m
B. Semiconductor materials	2. 10^{-8} to 10^{-6} Ω-m
C. Insulating materials	3. 10^{12} to 10^{18} Ω-m
	4. 10^{20} to 10^{30} Ω-m

Codes:	A	B	C
(a)	2	1	3
(b)	2	1	4
(c)	1	2	3
(d)	1	2	4

2.

List 1 (Materials)	List 2 (Resistivity)
A. Copper	1. 1.6×10^{-8} Ω-m
B. Silver	2. 1.78×10^{-8} Ω-m
C. Carbon	3. 2.8×10^{-8} Ω-m
D. Aluminium	4. 1.1×10^{-4} Ω-m

Codes:	A	B	C	D
(a)	2	1	3	4
(b)	1	2	3	4
(c)	2	1	4	3
(d)	1	2	4	3

3.

List 1 (Materials)	List 2 (Temperature coefficient of resistance)
A. Aluminium	1. Zero
B. Manganin	2. Positive
C. Carbon	3. Negative

Codes :	A	B	C
(a)	1	2	3
(b)	2	3	1
(c)	3	1	2
(d)	2	1	3

4.

List 1 (Materials)	List 2 (Temperature coefficient of resistance)
A. Brass	1. Negative
B. Manganin	2. Zero
C. Electrolytes	3. Positive

Codes :	A	B	C
(a)	3	2	1
(b)	1	2	3
(c)	2	3	1
(d)	3	1	2

5.

List 1 (Parameters)	List 2 (Units)
A. h_{11}	1. Dimensionless
B. h_{12}	2. Ohms
C. h_{22}	3. Siemens

Codes:	A	B	C
(a)	1	2	3
(b)	1	3	2
(c)	2	1	3
(d)	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 1998]

6.

List 1 (Network parameters)	List 2 (Dimensions)
A. h_{11}	1. Impedance
B. h_{12}	2. Admittance
C. h_{22}	3. Current ratio
D. h_{21}	4. Voltage ratio

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	2	3	1	4
(c)	1	3	2	4
(d)	1	4	2	3

[U.P.S.C. I.E.S. E.E.-I, 2008]

7.

List 1 (Loop Concept)	List 2 (Junction Concept)
A. Mesh	1. Number of nodes
B. Outside mesh	2. Node voltage
C. Mesh current	3. Reference node
D. Number of meshes	4. Node

Codes:	A	B	C	D
(a)	3	4	1	2
(b)	3	4	2	1
(c)	4	3	2	1
(d)	4	3	1	2

[U.P.S.C. I.E.S. E.E.-I, 1998]

8.

List 1 (Theorem/Law)	List 2 (Property)
A. Norton's theorem.	1. Effects of independent sources in a linear circuit are additive.

Answers: **1.** (a), **2.** (c), **3.** (d), **4.** (a), **5.** (c), **6.** (d), **7.** (c), **8.** (b),

Downloaded From : www.EasyEngineering.net

B. Superposition theorem.
C. Thevenin's theorem.
D. Kirchhoff's current law.

2. Law of non-accumulation of charge holds good at nodes.
3. Current source with shunt resistor.
4. Voltage source with series resistor.

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	3	1	4	2
(c)	2	1	4	3
(d)	3	4	1	2

9. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

List 1
(Property of Network)
A. Linearity.
B. Structure.
C. Equivalent Circuit.
D. Bilateral.

List 2
(Relevant Theorem)
1. Superposition Theorem.
2. Norton's Theorem.
3. Tellegen's Theorem.
4. Reciprocity Theorem.
5. Millman's Theorem.

Codes:	A	B	C	D
(a)	2	5	1	3
(b)	1	3	2	4
(c)	2	3	1	4
(d)	1	5	2	3

10. [U.P.S.C. I.E.S. E.E.-I, 2005]

List I
A. Equivalent circuit.
B. Linearity.
C. Bilateral.
D. Structure.

List II
1. Superposition.
2. Norton's.
3. Tellegen's.
4. Reciprocity.

Codes:	A	B	C	D
(a)	3	1	4	2
(b)	2	1	4	3
(c)	3	4	1	2
(d)	2	4	1	3

11. [U.P.S.C. I.E.S. E.E.-II, 2011]

List 1
(Name of cell/accumulator)
A. Dry cells.
B. Lead acid accumulators.
C. Ni-iron accumulators.
D. Silver-zinc batteries.

List 2
(Applications)
1. Submarine propulsion.
2. Aircraft.
3. Telephone exchanges.
4. Transistors.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	4	3	2	1
(c)	2	3	4	1
(d)	3	4	1	2

12. [U.P.S.C. I.E.S. E.E.-II, 2011]

List I
A. Work.
B. Electric field strength.
C. Magnetic flux.
D. Magnetic field strength.

List II
1. Ampere per meter.
2. Weber.
3. Volt per meter.
4. Joule.

Code:	A	B	C	D
(a)	4	3	2	1
(b)	1	3	2	4
(c)	4	2	3	1
(d)	1	2	3	4

13. [U.P.S.C. I.E.S. E.E.-I, 1998]

List 1
A. $\bar{\nabla}\cdot\bar{D}=\rho$
B. $\bar{\nabla}\cdot\bar{J}=\frac{\partial\rho}{\partial t}$
C. $\bar{\nabla}\times\bar{H}=\bar{J}_c$
D. $\bar{\nabla}\times\bar{E}=-\frac{\partial\bar{B}}{\partial t}$

List 2
1. Ampere's Law.
2. Gauss's Law.
3. Faraday's Law.
4. Continuity equation.

Codes:	A	B	C	D
(a)	4	2	1	3
(b)	2	4	1	3
(c)	4	2	3	1
(d)	2	4	3	1

14. [U.P.S.C. I.E.S. E.E.-I, 1998]

List 1
(Material)
A. Copper.
B. Vacuum.
C. Aluminium.
D. Nickel.

List 2
(Relative permeability)
1. 600
2. 1.00002
3. 1.000008
4. 0.999991

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	4	3	1	2
(d)	4	3	2	1

15. [U.P.S.C. I.E.S. E.E-I, 1992]

List 1
(Material/Medium)
A. Ferromagnetic.
B. Paramagnetic.
C. Diamagnetic.
D. Free space.

List 2
(Relative permeability)
1. Slightly more than unity.
2. Unity.
3. Slightly less than unity.
4. Very high (from several hundreds to several thousands).

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	4	1	3	2
(c)	2	3	4	1
(d)	3	4	1	2

16. A cylindrical rod of magnetic material fits tightly when it is inserted into a long solenoid, half way through. The nature of the force on the rod and the type of material of the rod are listed below. Match list 1 and list 2 and select the correct answer using codes given below the lists:

List 1
(Material)
A. Diamagnetic
B. Paramagnetic
C. Ferromagnetic

List 2
(Force)
1. Nil
2. Repulsive
3. Attractive

Codes:	A	B	C
(a)	2	1	3
(b)	1	3	3
(c)	2	3	3
(d)	3	2	2

17. [U.P.S.C. I.E.S. E.E.-I, 1994]

List 1
(Materials)
A. Nickel, cobalt, iron, steel etc.
B. Aluminium, tin, platinum, magnesium etc.
C. Silver, copper, sulphur, lead, zinc, etc.

List 2
(Class of materials)
1. Diamagnetic.
2. Ferromagnetic.
3. Paramagnetic.

Codes:	A	B	C
(a)	1	2	3
(b)	3	2	1
(c)	2	1	3
(d)	2	3	1

Answers: **9.** (b), **10.** (b), **11.** (b), **12.** (a), **13.** (b), **14.** (d), **15.** (b), **16.** (a), **17.** (d),

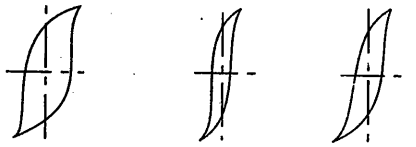
18.

List 1 (Materials)	List 2 (Applications)
A. Alnico alloys.	1. Transformer cores.
B. Wrought iron or cast steel.	2. Electromagnets.
C. Silicon alloy and permalloy.	3. Permanent magnets.

Codes:	A	B	C
(a)	3	2	1
(b)	1	2	3
(c)	2	3	1
(d)	3	1	2

19.

List 1 (Materials)	List 2 (Hysteresis loop)
A. Hard steel.	
B. Wrought iron and cast steel.	
C. Alloyed sheet steel.	



Codes:	A	B	C
(a)	1	2	3
(b)	2	1	3
(c)	2	3	1
(d)	3	2	1

20.

List 1 (Materials)	List 2 (Properties)
A. Hard steel.	1. High permeability and low hysteresis loss.
B. Wrought iron and cast steel.	2. High retentivity power and large coercive force.
C. Alloyed sheet steel.	3. High magnetic per meability and good retentivity.

Codes:	A	B	C
(a)	1	2	3
(b)	3	1	2
(c)	2	3	1
(d)	3	2	1

21.

List 1	List 2
A. Continuity equation	1. $\nabla \times \bar{H} = \bar{J} + \frac{\partial \bar{D}}{\partial t}$
B. Ampere's law	2. $\bar{J} = \frac{\partial \bar{D}}{\partial t}$
C. Displacement current	3. $\nabla \times \bar{E} = -\frac{\partial \bar{B}}{\partial t}$
D. Faraday's law	4. $\nabla \cdot \bar{J} = -\frac{\partial \rho_V}{\partial t}$

Codes:	A	B	C	D

26.

List 1 (Electromagnetic Law)	List 2 (Differential Form)
A. Ampere's law	1. $\nabla \cdot \vec{D} = \rho_v$
B. Faraday's law	2. $\nabla \cdot \vec{J} = -\frac{\partial h}{\partial t}$
C. Gauss law	3. $\nabla \times \vec{H} = \vec{J} + \frac{\partial \vec{D}}{\partial t}$
D. Current continuity equation	4. $\nabla \times \vec{E} = -\frac{\partial \vec{B}}{\partial t}$

Answers: **18.** (a), **19.** (a), **20.** (c), **21.** (b), **22.** (c), **23.** (b), **24.** (b), **25.** (a), **26.** (b),

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	3	4	1	2
(c)	1	4	3	2
(d)	3	2	1	4

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

27. A plane wave whose electric field is given by $\vec{E} = 100 \cos(\omega t - 6\pi x)\hat{z}$ passes normally from a material 'A' having $\varepsilon_r = 4, \mu_r = 1$ and $\sigma = 0$ to a material 'B' having $\varepsilon_r = 9, \mu_r = 4$ and $\sigma = 0$. Match items in List 1 with those in the List 2 and select the correct answer using the codes given below the lists:

List 1	List 2
A. Intrinsic impedance of medium 'B'.	1. 6π
B. Reflection Coefficient.	2. 80π
C. Transmission Coefficient.	3. $\frac{1}{7}$
D. Phase shift constant of medium 'A'.	4. $\frac{8}{7}$

Codes:	A	B	C	D
(a)	4	1	2	3
(b)	2	3	4	1
(c)	4	3	2	1
(d)	2	1	4	3

[U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **27.** (b).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. One ampere means the flow of one coulomb each second.
2. Ampere-second could be the unit of charge.
3. 1 coulomb charge is equal to 6.25×10^{18} electrons.
4. The charge Q flow through a conductor carrying current of I amperes for t seconds is equal to I/t coulombs.
5. Voltage applied across a circuit, acts as a force.
6. Volt is a form of potential energy.
7. The ratio of voltage and electric current in a closed circuit remain constant.
8. A linear resistor is one which obeys Ampere's law.
9. The lower the resistivity, greater the resistance.
10. Specific resistance is measured in Ω/m^3
11. The reciprocal of resistivity of a material is called its conductivity.
12. The resistance of wires varies inversely as length.
13. The resistance of a conductor increases at its x-sectional area decreases.
14. The substances having a large number of free electrons and offering low resistance are called the insulators.
15. With the rise in temperature the insulating property of an insulator gains.
16. The specific resistance of copper increases with the increase in temperature.
17. The values of temperature coefficient of resistance of a given conductor are the same at different temperatures.
18. Power rating of a resistor largely depends on the physical size of the resistor.
19. The voltage drop across each resistor is same in case of a series circuit.
20. The heating effect of electric current is always desirable.
21. Two heater coils of same material are connected in parallel across the supply. Coil A has diameter and length double that of coil B. Coil B will produce more heat.
22. Resistance of a tungsten filament lamp decreases with the increase in supply voltage.
23. If two lamps of 100 W and 40 W are connected in series across 230 V ac supply, 100 W lamp will glow brighter.
24. When a resistance element of a heater gets fused, we remove a portion of it and reconnect it to the same supply. The power drawn by the heater will decrease.
25. An ideal voltage source should have zero internal resistance.
[R.G.T.U. M.P., December-2016]
26. Any practical voltage source can be converted into a practical current source and vice versa.
27. Constant voltage source is active and bilateral.
28. Two ideal voltage sources of unequal output voltages cannot be placed in parallel.
29. A resistance is connected to a practical source. The current through this resistance can be determined only by representing the source as a current source.
30. Solution of an electric circuit will give the same result whether the source is treated as a voltage source or a current source.
31. In a practical voltage source, the source impedance is very large in comparison to load resistance.
32. For a graph with n nodes, every Tree has $(n-1)$ branches.
33. The response of a circuit is time-variant if given signal $x(t)$ and response $y(t)$ when the signal is $x(t-T)$ the response is $y(t-T)$.
34. The number of possible ordered trees with three nodes ABC is 6.
35. A network has 4 nodes and 3 independent loops. The number of branches in the network will be 5.
36. Principle of homogeneity shows linear circuit.
[Mahamaya Technical Univ. Second Semester 2010-2011]
37. According to Kirchhoff's voltage law, at any junction of an electrical network, the sum of incoming currents is equal to sum of outgoing currents.
[R.G.T.U. M.P., December-2010]
38. Superposition theorem is not applicable to a network containing time varying resistors.
[GATE E.E. 1994]

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (F), **5.** (T), **6.** (T), **7.** (T), **8.** (F), **9.** (F), **10.** (F), **11.** (T), **12.** (F), **13.** (T), **14.** (F), **15.** (F), **16.** (T), **17.** (F), **18.** (T), **19.** (F), **20.** (F), **21.** (F), **22.** (F), **23.** (F), **24.** (F), **25.** (T), **26.** (T), **27.** (F), **28.** (T), **29.** (F), **30.** (T), **31.** (F), **32.** (T), **33.** (T), **34.** (F), **35.** (F), **36.** (T), **37.** (F), **38.** (T),

39. Thevenin's theorem is quite useful when the current in one branch of a network is to be determined or when the current in an added branch is to be determined.
40. There is no relation between Thevenin's theorem and Norton's theorem.
41. Norton's equivalent resistance is the same as Thevenin's equivalent resistance.
42. The load is connected in parallel to the Norton's equivalent resistance and Norton's equivalent current source.
43. Maximum power transfer theorem is particularly useful for analysing communication networks.
44. For maximum transfer of power, internal resistance of the source should be equal to the resistance of the load.
45. In reciprocity theorem voltage and current remain same in all parts of the networks.
46. Tellegen's theorem is applicable to both linear and nonlinear networks.
47. Millman's theorem yields equivalent voltage or current source.
48. Three equal resistances are connected in star. If this star is converted into equivalent delta, the resistances of both the networks will be equal.
49. The h parameters h_{11} and h_{22} are related to z and y parameters as $h_{11} = z_{11}$ and $h_{22} = \frac{1}{z_{22}}$.
50. A reciprocal two port network is symmetrical of $z_{11} = z_{22}$.
51. A, B, C and D represent the transmission parameters of a two-port network. The network will be reciprocal if AD – BC = 0.
52. Electric battery is a device that generates emf by chemical action.
53. In a primary cell chemical action is reversible.
54. The depolarizer in a carbon zinc cell converts the hydrogen produced into water.
55. The cell, which is commonly used as standard cell is mercury cadmium cell.
56. The internal resistance of a cell is assumed to remain constant irrespective of the load current delivered by the cell.
57. The internal voltage drop of a voltage source is independent of load current supplied.
58. The law that finds application in electrolysis is Faraday law.
59. For all substances the ratio of electrochemical equivalent to chemical equivalent is the same and is equal to 0.01036.
60. During charging of a lead acid cell the specific gravity of a cell decreases.
61. Faure or pasted plates are lighter in weight and cheaper in cost than formed or plante plates.
62. The grids of positive plates are lighter than those of negative plates.
63. There is always one more positive plate than the negative plates in lead-acid batteries.
64. In a lead acid battery the positive terminal is of comparatively larger diameter than that of negative terminal.
65. To prevent local action in a battery, only distilled water is used in electrolytes.
66. Charging of sulphated battery produces very little heat.
67. A sulphated battery should be charged always for a longer period at low rate.
68. Undercharging of a lead acid battery causes increase in specific gravity of the electrolyte.
69. In constant current charging method the supply voltage is reduced as the battery gets charged.
70. In constant voltage charging, charging current increases as the battery gets charged.
71. The emf of a storage battery depends upon the size of the electrodes.
72. The plates of alkaline cells do not buckle or swell.
73. The capacity of Edison cell decreases when its electrolyte is exposed to air.
74. Edison cells cannot be kept in discharged condition for a long period.
75. Short circuits in alkaline cells do not reduce the life.
76. When two cells are connected in parallel, it should be ensured that they have equal emfs.
77. Static electricity is produced by friction.
78. Coulomb's law for the force between electric charges most closely resembles with Newton's law of gravitation.
79. Dielectric constant and permittivity are same.
80. Potential of every point inside a hollow charged sphere is same.
81. In electrostatic field $A \times E = 0$. [GATE 1994]
82. The charge in a capacitor is stored in dielectric field.
83. A capacitor is sort of open circuit to dc.
84. The current through a capacitor is zero if the voltage across it is not changing with time.
85. The capacitor never dissipates energy but only stores it.
86. The unit of polarization is same as that of electric field density.
87. Electric field line and equipotential line are never orthogonal.
88. The charge on an isolated conductor resides inside the conductor.
89. The operator 'del' (∇) is a scalar space function.
90. Electrostatic field is solenoidal.
91. Tangential component of the electric field on a perfect conductor will be infinite.
92. In free space, if $\rho = 0$, the Poisson's equation becomes Laplacian equation $\nabla^2 V = 0$.
93. Laplace's equation is nonlinear but Poisson's equation is linear.
94. A magnetic pole is a terminal where a magnetic material meets a non-magnetic material.
95. The net magnetic flux emerging through a closed surface is zero.
96. A toroidal magnet has no air gap.
97. The toroidal type of construction is employed where there must be a minimum of external magnetic field.
98. With the insertion of an iron core into a coil, magnetic field is strengthened.
99. With the insertion of an iron core into a coil the reluctance of the iron path increases.
100. Ferromagnetism arises out of the electron structure.
101. When a ferromagnetic material is magnetized its magnetic poles get oriented in the direction of coercive force.

Answers: **39.** (T), **40.** (F), **41.** (T), **42.** (T), **43.** (T), **44.** (F), **45.** (F), **46.** (T), **47.** (T), **48.** (F), **49.** (F), **50.** (F), **51.** (F), **52.** (T), **53.** (F), **54.** (T), **55.** (T), **56.** (T), **57.** (F), **58.** (T), **59.** (T), **60.** (F), **61.** (T), **62.** (F), **63.** (F), **64.** (T), **65.** (T), **66.** (F), **67.** (T), **68.** (F), **69.** (F), **70.** (F), **71.** (F), **72.** (T), **73.** (T), **74.** (F), **75.** (T), **76.** (T), **77.** (T), **78.** (T), **79.** (T), **80.** (T), **81.** (T), **82.** (T), **83.** (T), **84.** (T), **85.** (T), **86.** (T), **87.** (F), **88.** (F), **89.** (F), **90.** (F), **91.** (F), **92.** (T), **93.** (F), **94.** (T), **95.** (T), **96.** (T), **97.** (T), **98.** (T), **99.** (F), **100.** (T), **101.** (F),

102. During the process of magnetization when all the magnetic dipoles of a magnetic material get oriented in one direction, the core is said to be grain oriented.

103. Static magnetic fields induce currents in closed conducting loops. [GATE E.E. 1994]

104. The material commonly used for shielding or screening magnetism is brass.

105. When the iron price is magnetized various molecules are forced into more definite alignment.

106. Poles of magnet cannot be separated

107. The direction of magnetic lines of force is from N-pole to S-pole.

108. Lines of force never intersect.

109. The polarity of a solenoid can be determined by Cork screw rule.

110. The Biot Savart's law is a general modification of Ampere law.

111. An electromagnetic field is said to be conservative when divergence of the field is zero.

112. MMF is analogous to electromotive force. [R.G.T.U. M.P., December-2010]

113. The reluctance of a material is defined as its ability to conduct magnetic flux. [R.G.T.U. M.P., December-2010]

114. A minus sign is required to be placed before the right hand side of the expression for emf induced just to indicate the phenomenon explained by Lenz.

115. High silicon steel has comparatively higher permeability and high saturation.

116. Hysteresis loss is the amount of energy dissipated as heat in the magnetic material.

117. Eddy current losses are reduced by using thin plates of high resistivity material.

118. Neutral temperature of a thermocouple is constant for a given thermocouple.

119. Thomson effect is not present in lead.

120. Thermoelectric power at neutral temperature is maximum.

Answers: **102.** (F), **103.** (F), **104.** (T), **105.** (T), **106.** (T), **107.** (T), **108.** (T), **109.** (F), **110.** (T), **111.** (F), **112.** (T), **113.** (T), **114.** (T), **115.** (F), **116.** (T), **117.** (T), **118.** (T), **119.** (T), **120.** (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Charge on an electron is _____ C.

2. The mass of electron is _____ .

[U.P. Technical Univ. Second Semester 2009-10]

3. _____ electrons per second will produce current of 1 A.

4. _____ is considered dangerous for human the body. (0.5, 1, 25, 50 mA)

5. The rate of movement of charge in a conductor is known as _____.

6. The ampere is the current which, if maintained in two straight parallel conductors of infinite length, of negligible circular cross-section and placed 1 m apart in vacuum, would produce between these conductors a force of _____ N per metre of length.

7. _____ is the force that causes a current to flow.

8. Voltage across a resistance is called the _____.

9. Voltage is a form of _____ energy.

10. 1 V = 1 _____ per coulomb.

11. Electric pressure is also called the _____.

12. 1 Volt is equal to 1 joule per _____.

13. The ratio of voltage and current _____.

14. The curve representing Ohm's law is _____.

15. A linear resistor is one which obeys _____ law.

16. For the same dimensions of a conductor its resistance depends upon the _____ of the material.

17. Resistance of human body is about _____ Ω.

18. If the circuit voltage is reduced to half and the resistance is doubled, the current will become _____.

19. For a fixed supply voltage the current flowing through a conductor will increase when its length is _____.

20. Elements of electric heaters and filament lamps are made of high resistivity materials. This is done to _____ the filament length.

21. The property of a conductor due to which it induces the flow of current through the conductor is called the _____.

22. The diameter of wire is reduced to one half, keeping the length constant. The new resistance will be _____ times the original value.

23. If the diameter of the wire is halved, its current carrying capacity will become approximately _____.

24. Electrical conductivity is measured in _____.

25. With the rise in temperature the resistance of carbon _____.

26. Resistance of carbon filament lamp _____ with the increase in supply voltage.

27. Two resistors of 12 Ω and 4 Ω respectively are connected in series. A short is placed across the combination. The effective resistance will be _____.

28. A series arrangement of n identical resistors is changed into n parallel arrangement. The new equivalent resistance will become of _____ of the original resistance.

29. When one leg of a parallel circuit gets opened out, the current drawn from the supply will _____.

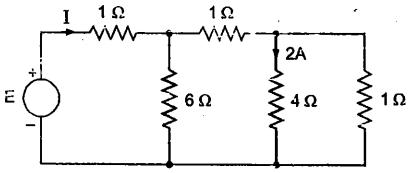
30. Three resistors, each of R ohms are connected to form a triangle. The resistance between any two terminals will be _____ Ω.

31. Twelve identical wires of resistance 6 Ω each are arranged to form the edges of a cube. The effective resistance between the opposite corners of the cube will be _____.

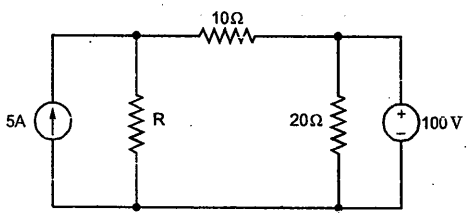
32. The values of E and I for the circuit shown in figure are _____ V and _____ A. [GATE E.E. 1997]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net



33. For the circuit shown in the following figure, the value of R such that the same amount of power is supplied to the 10 Ω resistance by the current and by the voltage source will be _____.



[U.P. Technical Univ. First Semester 2008-09]

34. A voltage source of 100 V has internal resistance of 2 Ω and supplies a load having the same resistance. The power absorbed by the load is _____.
[U.P. Technical Univ. First Semester 2008-09]

35. An iron takes 5 A to 250 V. Its power rating is _____ kw.

36. Resistance of carbon filament lamp _____ with the increase in supply voltage.

37. The law that explains the generation of heat due to flow of current through a conductor is _____ law.

38. The operating cost of ten 100 W lamps at their rated voltage for 20 hours at the rate of Rs. 4.50 per unit is _____.

39. A 200 W, 100 V lamp is to be operated on 250 V supply. The additional resistance required to be connected in series will be _____ Ω.

40. Energy expended or heat generated in joules when a current of I amperes flows through a conductor of resistance R Ω for *t* seconds is given as _____.

41. The element of electric heater is made of _____.

42. When a resistance element of a heater gets fused, we remove a portion of it and connect it to the same supply the power drawn by the heater will _____.

43. A 100 W bulb is connected in series with a room heater. If now 100 W bulb is replaced by a 40 W bulb, the heater output will _____.

44. The voltage applied across an electric iron is halved the power consumption will become _____.

45. For the same voltage, the ratio of resistances of 25 W and 100 W lamps will be _____.

46. If the voltage across the lamp drops by 1 per cent, the power drawn will be reduced by _____ per cent.

47. The practical unit of electrical energy is _____.

48. SI unit of energy is _____.

49. A (pure resistor/pure inductor) is not an energy dissipating element.
[G.G.S.I.P. Univ. Delhi May-2010]

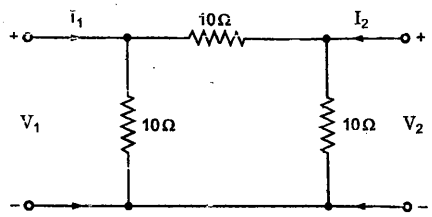
50. An ideal current source has zero internal _____.

51. The terminals across the source are _____ if a current source is to be neglected.

52. A closed path formed by branches in a network is _____.
[Mahamaya Technical Univ. Second Semester 2010-11]

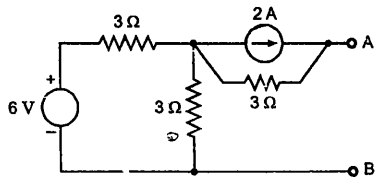
53. Using Thevenin's theorem a circuit can be converted into a (voltage/current) source. [G.G.S.I.P. Univ. Delhi May-2010]

54. For the two port network shown in the figure the admittance matrix is _____.



[GATE E.E. 1997]

55. For the circuit shown in figure, the Norton equivalent source current value is _____ A and its resistance is _____ ohm.



[GATE E.E. 1997]

56. Using Norton's theorem a circuit can be converted into a (current/voltage) source. [G.G.S.I.P. Univ. Delhi May-2010]

57. The efficiency is only _____ when maximum power transfer is achieved. [G.B. Technical Univ. First Semester 2010-11]

58. The resistances of 3 Ω each are connected in delta. The value of equivalent star is _____.
[Mahamaya Technical Univ. Second Semester 2010-11]

59. A 12 V battery has internal resistance of 0.5 Ω. Maximum power will be dissipated in the resistor when load connected to it is of _____ ohm.

60. A battery with an internal resistance of 1 Ω is connected across a nonlinear load where V-I characteristic is given by $7I = V^2 + 2$ V. The current delivered by the battery is _____ A.
[GATE E.E. 1997]

61. If a current of 25 A deposits 33.55 g of silver nitrate from a solution of silver nitrate, then the ECE of silver is _____ gm/coulomb.

62. In a lead acid cell hydrogen is liberated at _____ plate.

63. During charging of a battery the terminal voltage decreases with the _____ in temperature.

64. In a lead acid battery porous rigid plastic sheets are inserted between plates to prevent _____ between plates.

65. The _____ of plates reduces the internal resistance and increases the capacity of the cell.

66. The supply required for charging a lead acid battery is _____.

67. Proper charging rate of battery in amperes is around _____ of its ampere-hour capacity.

68. Battery charging room is to be kept well ventilated so as to reduce the hydrogen concentration below _____ per cent.

69. The best indication about the state of charging of a lead acid battery is given by _____ of electrolyte.

70. To avoid freezing in cold weather, specific gravity of the electrolyte of the lead acid cell should be kept above _____.

71. The expected life of a lead acid battery is _____ years.

72. Lead acid battery should not remain discharged normally for more than _____ hours.

73. The internal resistance of an Edison cell is about _____ times that of the lead acid cell.

74. For a given ampere hour capacity, weight of lead acid cell is _____ of that of Edison cell.

75. Petroleum jelly is applied to the terminals of the lead-acid battery in order to prevent _____.

76. The capacity of a battery is expressed in _____.

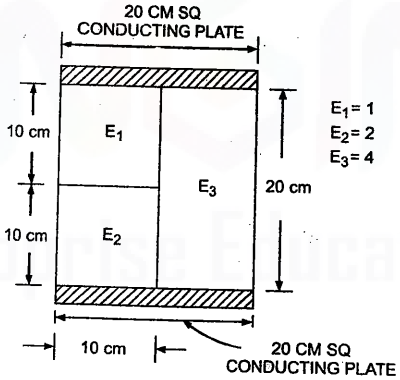
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

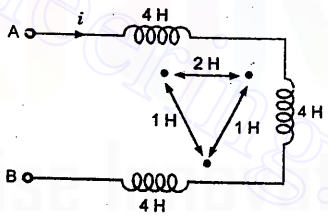
77. The electrolyte used in Edison cell is _____.
78. The unit of electric intensity is _____.
79. The electric field inside a perfectly conducting media is _____.
80. A hollow conductor is at a potential V. The potential at any point inside the hollow conductor is _____. [GATE E.E. 1994]
81. The _____ is the rate of change of potential measured in the direction of electric force.
82. The concept of displacement current was introduced by _____.
83. _____ is a measure of the ability of a capacitor to store an electric charge.
84. There are two concentric conducting spherical surfaces of radii a, $b(a < b)$. The inner spherical surface carries a charge Q and the outer surface grounded. What is the potential of the inner spherical surface? [GATE E.E. 1997]
85. Voltage applied across a glass dielectric produces an electric field 10 times of that of air. The dielectric constant for glass is _____.
86. The relation between electric intensity E, voltage applied V and distance d between the plates of a parallel plate condenser is E = _____.
87. For a quadrupole electric potential varies as _____.

$$\left(\frac{1}{r}, \frac{1}{r^2}, \frac{1}{r^3}\right)$$

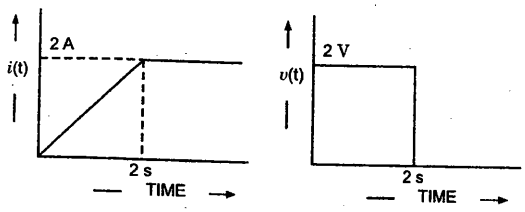
88. A sphere of radii 1 cm can attain a maximum potential of _____ V.
89. If a charge of ρ_s is there on a conductor at a dielectric conductor interface then normal displacement density at dielectric will be _____.
90. In a capacitor, the electric charge is stored in _____.
91. The total excess or deficiency of electrons in a body is called the _____.
92. The capacitance of an isolated sphere of radius 10 cm in air is equal to _____ pF. [GATE E.E. 1997]
93. The capacitance of the arrangement shown in figure is _____ pF. [GATE E.E. 1997]



94. In a cable capacitor, voltage gradient is maximum at the surface of the _____.
95. When a capacitor is charged from a constant current source for a time t, the voltage across it will grow _____.
96. The equivalent capacitance of four capacitors, each of capacitance C and connected in series will be _____. [C, 4C, C/4]
97. Three capacitors of 2 μF, 4 μF and 8 μF are connected in parallel. Their equivalent capacitance will be _____ μF.
98. A capacitor of 10 μF is charged to a pd of 2,000 V. The energy stored in the capacitor is _____ joules.
99. The time constant of an R-C series circuit connected to a dc source is equal to _____.
100. According to coulomb's first law, like poles _____ each other.
101. Absolute permeability of vacuum is _____ H/m.
102. The ratio of intensity of magnetisation to the magnetizing force or intensity of magnetic field is called the _____.
103. In right hand rule when thumb points in the direction of flow of current then finger tips will point the direction of _____ of force.
104. The space between the poles of a magnet is called the _____.
105. The transfer of magnetism from one magnetic material to another is called the magnetic _____.
106. The force experienced by a unit north pole at any point is called the _____ strength.
107. The tubes of force within the magnetic material are called the tubes of _____.
108. The number of lines of force per unit area is a measure of magnetic _____.
109. For vacuum susceptibility is _____.
110. The magnetic field due to an infinite linear current carrying conductor is _____ A/m.
111. Field strength at the centre of a circular coil of turns N and radius r metre is given as _____ A/m.
112. _____ force drives or tends to drive flux through a magnetic circuit.
113. The ratio of total flux (flux in the iron path) to useful flux (flux in the air gap) is known as _____ factor.
114. The product of the number of turns and flux linking with the coil is known as _____.
115. The inductance of a coil is proportional to the _____ of the number of turns, all other parameters remaining the same. [GATE E.E. 1994]
116. The inductance has dimensions of _____.
117. Two identical coils of negligible resistance when connected in series across a 200 V, 50 Hz source draws, a current of 10 A. When the terminals of one of the coils are reversed, the current drawn is 8 A. The coefficient of coupling between the two coils is _____. [GATE E.E. 1997]
118. The equivalent inductance seen at terminals A-B in figure given below is _____ H. [GATE E.E. 1992]



119. The power of retaining some magnetism after removing the magnetising force is called the _____.
120. The magnetising force required to neutralize the magnetism is called the _____ force.
121. The lagging of magnetic flux density B behind the magnetic field intensity is known as magnetic _____.
122. The _____ currents produce a magnetic field of their own which opposes the main magnetic field.
123. The voltage and current waveforms for an element are shown in figure. The circut element is _____ and its value is _____.



Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

124. An electromagnetic field is said to be conservative when curl of the field is _____.

125. If the static magnetic field density is $\vec{B}$, then $\nabla\vec{B}$ = _____.

126. The force on a charge q moving with velocity V under the influence of electric and magnetic fields is given by _____.

127. The value of the magnetic vector potential due to an infinitesimally small current element, evaluated at infinite distance from it is _____.

128. The combination of two dissimilar metals is known as _____.

129. The rate of change of thermo-emf with temperature is known as _____.

130. _____ coefficient is also known as the specific heat of electricity.

ANSWERS

1. 1.602×10^{-19}	2. 9.107×10^{-31} kg	3. 6.25×10^{18}	4. 50 mA	5. electric current

2 CHAPTER

AC Basics and Networks

Short Answer Type Questions With Answers

Q. 1. Why sinusoidal waveshape is insisted for voltages and currents while generating, transmitting and utilising ac electric power ?
[P.T.U. January 2000]

Ans. Sinusoidal wave shape is insisted for voltages and currents while generating, transmitting and utilising ac electrical power because it has following advantages.

(*i*) Sinusoidal voltages and currents produce minimum disturbance in the electrical circuits during operation.

(*ii*) Sinusoidal voltages and currents cause less interference (noise) to nearby communication circuits (telephone lines etc.).

(*iii*) Sinusoidal voltages and currents result in low iron as well as low copper losses in transformers, and ac rotating machines for a given output. So ac machines with sinusoidal voltages and currents operate at higher efficiency.

Q. 2. What do you understand by ω ?

Ans. Each cycle of a sinusoidal wave spans 2π radians. Hence, if this quantity is divided by the time period, angular velocity of the sinusoidal wave is obtained. It is denoted by ω and is expressed in radians per second.

Q. 3. Why the rms value of an alternating current or voltage is used to denote its amplitude ?

Ans. RMS value of an alternating current or voltage is used to denote its amplitude because it is related to the power developed in a resistance by the alternating current or voltage.

Q. 4. What is rms value of an alternating current ? [P.T.U. December 2003]

Ans. The effective or rms value of an alternating current is given by that steady current which when flows through a given resistance for a given time produces the same amount of heat as when the alternating current is flowing through the same resistance for the same time duration.

Q. 5. Do wave shapes other than sine wave have effective value ? Explain.
[P.T.U. December 2000]

Ans. Yes, all the wave shapes including the sine wave have effective value since in each half cycle of the wave, work is being done. Actually the effective value of an alternating wave (sinusoidal or non-sinusoidal) is defined as below:

The rms or effective value of an alternating current or voltage is given by that steady current or voltage which when flows or applied to a given resistance for a given time produces the same amount of heat as when the alternating current or voltage is flowing or applied to the same resistance for the same time.

Q. 6. What is significance of form factor ?

Ans. Form factor is a means of relating the mean value with the effective or rms value of alternating quantity and it is useful in determination of effective or rms values of the alternating quantities whose mean or average values over half a period can be determined conveniently.

Q. 7. What is the significance of peak factor ?

Ans. Knowledge of peak factor of an alternating voltage is very essential in connection with determining the dielectric strength since the dielectric stress developed in an insulating material is proportional to the peak value of the voltage applied to it.

Q. 8. What do you mean by phase and phase difference ?

Ans. The phase of an alternating quantity (voltage or current) at any instant is defined as the fractional part of a cycle through which the quantity has advanced while the phase difference may be defined as the angular displacement between the maximum positive values of the two phasors representing the two quantities having the same frequency.

Q. 9. Why are the inductors usually iron cored ?

Ans. Inductors or choke coils are made of iron core because large valued flux densities can be produced in iron cores and so inductances of large value can be had. Air-cored inductors become too much bulky to provide an inductance of a required value.

Q. 10. Does an inductance draw instantaneous power as well as average power ?
[R.G.T.U. December 2002]

Ans. An inductance draws instantaneous power but no average power. The power drawn by inductance during one quarter cycle is released in another quarter cycle, and so average power drawn by an inductance is zero.

Q. 11. What is skin effect ?

Ans. The phenomenon of concentration of an electric current near the surface of the conductor is known as skin effect.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 12. On what factors does the skin effect depend ?

Ans. The skin effect depends upon the type of material, frequency of current, diameter of conductor and shape of conductor. It increases with the increase of x-section, permeability and supply frequency.

Q. 13. What are active and reactive powers ? **[PTU December 2003]**

Ans. The power which is actually consumed or utilized in an ac circuit is called the true or active power of the circuit. Power is consumed only in resistance. It is given by the product of the circuit voltage V, current I and power factor cos ϕ *i.e.* $P = VI \cos \phi$. It is expressed in watts.

A pure inductor and a pure capacitor do not consume any power, as in a quarter cycle whatsoever power is drawn from the supply source by these components, the same is returned to the supply source in the other quarter cycle. This power which flows back and forth (i.e. in both directions in the circuit) or reacts itself is called the reactive power. This is also known as wattless power. The reactive power of an ac circuit is given by the product of voltage V, current I and sine of the phase angle ϕ i.e. Reactive power, $Q = VI \sin \phi$. It is expressed in reactive volt-amperes.

Q. 14. What is meant by the term dielectric loss in a dielectric ?

Ans. There is a definite amount of dissipation of energy when a dielectric is subjected to alternating voltage. It is this dissipation of energy that is called dielectric loss.

Q. 15. Why is impedance represented by a complex number ?

[R.G.T.U. Bhopal December 2002]

Ans. In an expression $\mathbf{V} = \mathbf{IZ}$, the impedance **Z** is not associated with time varying quantities and is not a phasor in the sense that **V** and **I** are phasors. However, it is represented as a complex number. It is represented as

$\mathbf{Z} = R \pm jX$ +ve sign for inductive reactance and – ve sign for capacitive reactance.

Q. 16. How is complex impedance dependent on frequency ?

[R.G.T.U. Bhopal December 2002]

Ans. Complex impedance has two components viz. real or horizontal component and imaginary or vertical components. The reactance is represented by imaginary component. The inductive and capacitive reactances are given as

Inductive reactance, $X_L = \omega L = 2\pi f L$ where f is supply frequency in Hz.

Capacitive reactance, $X_C = \dfrac{1}{\omega C} = \dfrac{1}{2\pi f C}$ where f is supply frequency in Hz.

Since imaginary component of impedance depends upon the supply frequency so the impedance.

Q. 17. In a series RLC circuit, the voltage across L and C at resonance may exceed even the supply voltage. Why ?

[U.P. Technical Univ. 2005-06]

Ans. When the series circuit is in resonance, the voltage drops across inductance and capacitance will be equal in magnitude but opposite in phase and so nullify each other and supply voltage will be equal to voltage drop across resistance. So the current will be too large and the voltage drops may exceed the supply voltage in case the inductive reactance (or capacitive reactance) exceed the resistance of the circuit.

Q. 18. Why a series resonant circuit is called as an acceptor circuit and a parallel resonant circuit as a rejector circuit ?

[U.P. Technical Univ. 2000-01]

Ans. The series resonant circuit is called an acceptor circuit because such a circuit accepts currents at one particular frequency but rejects currents of other frequencies. Parallel resonant circuit is called the rejector circuit because at resonant frequency the line current is minimum or it almost rejects it.

Q. 19. At resonance the current is maximum in a series circuit and minimum in parallel circuit. Why ? **[U.P. Technical Univ. 2005-06]**

Ans. At resonance in series circuit the inductive reactance is equal to capacitive reactance in magnitude but opposite in phase and so nullify each other and thus impedance is minimum and equal to the resistance of the circuit and, therefore, current is maximum. But at resonance in parallel circuit, net susceptance is zero, the admittance is, therefore, minimum and is equal to conductance of the circuit and the current, being the product of supply voltage and circuit admittance is minimum.

Q. 20. The shape of resonance curve depends on Q of the coil. Why ?

[U.P. Technical Univ. 2005-06]

Ans. Bandwidth of the series RLC circuit, being equal to f_r/Q_r, depends upon the Q of the coil *i.e.* with high-Q coil the resonance curve will be of smaller bandwidth (*i.e.* sharply peaked) while with small-Q coil the resonance curve will be of larger bandwidth (flat). Thus the shape of the resonance curve depends upon the Q of the coil.

Q. 21. What do you mean by the bandwidth of a resonant circuit ? Why is it called 3-dB bandwidth ?

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. Bandwidth of a circuit is defined as the difference of two half power frequencies i.e. the frequencies over which the gain is equal to or greater than $\dfrac{1}{\sqrt{2}}$.

For gain of $\dfrac{1}{\sqrt{2}}$, its value in dB = $20 \log_{10} \dfrac{1}{\sqrt{2}} = -3$ dB.

Hence the bandwidth is also called 3 dB bandwidth.

It is normally denoted by Δf. If ω_1 and ω_2 are two half-power frequencies of an ac circuit, then

$$\text{Bandwidth, } \Delta f = \frac{\omega_2 - \omega_1}{2\pi} = \frac{R}{2\pi L} = \frac{\omega_0}{2\pi Q}$$

Q. 22. Give the conditions for the occurrence of maximum current and maximum power in an R-L series circuit having constant inductance and a variable resistance. What will be their magnitudes ?

Ans. Current will be maximum in the given circuit when R = 0 and will be equal to V/X_L.

Under the condition of maximum power in given circuit, the resistance of the circuit will be equal to inductive reactance *i.e.* $R = X_L$. The magnitude of maximum power would be equal to $V^2/2X_L$.

Q. 23. Give the conditions for the occurrence of maximum current and maximum power in an ac circuit with constant resistance and variable reactance. What will be their magnitudes?

Ans. In an ac circuit with constant resistance and variable reactance, the current and power will be maximum if reactance of the circuit is zero *i.e.* X = 0. The magnitude of maximum current $I_{max} = V/R$ and the magnitude of maximum power, $P_{max} = V^2/R$.

Q. 24. Write the conditions for maximum power transfer to a load.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2005]

Ans. Maximum power will be delivered by a network of impedance $\mathbf{Z} = R + jX$ to load $\mathbf{Z}_L = R_L + jX_L$, if $\mathbf{Z}_L$ is the complex conjugate of the impedance **Z** of the network looking back into the terminals of the network *i.e.* $R_L = R$ and $X_L = -X$.

Q. 25. What do you mean by three-phase balanced load ?

Ans. Any three-phase load will be balanced when the loads (impedances) connected in three phases are same in magnitude as well as in phase.

Q. 26. What is three-phase unbalanced load ?

Ans. Any three-phase load will be unbalanced if impedances in one or more phases differ from the impedance(s) of the remaining phase (s).

Q. 27. Why is an unbalanced load not normally used on a 3-phase 3-wire system ? Any line/phase voltages equal in such situations ?

[PTU 1999]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Normally, unbalanced load is not employed on 3-phase, 3-wire ungrounded star-connected system because unbalanced loading may cause different voltage drops in lines. Consequently the three phase voltages are different (or unbalanced) in magnitude as well as in phase and it is quite possible that one phase voltage may exceed the line voltage. Such a condition is undesirable, since some loads may operate inefficiently due to lowering of the voltage and the other equipment may get damaged due to over-voltage.

Q. 28. What is phase sequence in a 3-phase system ? How is given phase sequence reversed ? **[PTU 1999]**

Ans. Phase sequence is the order or sequence in which the currents or voltages in different phases attain their maximum values one after the other.

The given phase sequence can be reversed by interchanging any two terminals of the supply.

Q. 29. Differentiate between star and delta connections. **[PTU June 2003]**

Ans. In star-connected system similar (either start or finish) terminals of the three phases are connected together to provide star or neutral point while in delta-connected system start terminal of one phase is connected to the finish terminal of the second phase and start terminal of second phase is connected to finish terminal of the third phase and so on to provide a closed circuit in 3-phase system.

Q. 30. Discuss, why the stator windings of alternator are generally star-connected ? **[PTU December 2000]**

Ans. In a star-connected system phase voltage is equal to $1/\sqrt{3}$ times the line voltage, but in a delta-connected system phase voltage is equal to line voltage, therefore, star-connected alternator needs less number of turns per phase and less insulation than a delta-connected alternator for the same line voltage.

Neutral point of a star-connected system can be connected to earth, so relays and protective devices can be provided in star-connected system for protection of the system against ground faults and it is usually done in practice. These are the reasons that 3-phase alternators are usually star-connected.

Q. 31. While measuring power in a balanced three-phase circuit, one of the wattmeters keeps showing zero as the load is varied. How do you account for it ? **[PTU May 2002]**

Ans. One of the two wattmeters, in a two-wattmeter method of measuring power in a balanced 3-phase circuit, will keep showing zero as the load is varied if and only if the power factor of the load remains constant at 0.5. The reading of other wattmeter will vary with the variation in load.

Q. 32. What will happen if the neutral gets disconnected in a 3-phase 4-wire unbalanced circuit ?

Ans. In case of unbalanced 3-phase, 4-wire system when the neutral is disconnected, the loads which are connected between any two line conductors and the neutral are connected in series and potential difference across the combined load becomes equal to line voltage. The potential difference across each load is thus changed as per rating of the load. The changes in voltages and currents are usually very large (in most cases inadmissible).

Q. 33. What are the commonly used filters ? **[Bharathiyar Univ. Nov. 1996]**

Ans. The most commonly used filters are low-pass, high-pass, band-pass, band-reject and all-pass filters.

Q. 34. What is the difference between active and passive filters ? **[Bharathidhasan Univ. Nov. 1995]**

Ans. A passive filter is formed with passive components, such as resistors, inductors and capacitors while active filters make use of transistors or op-amps in addition to resistors and capacitors.

Q. 35. Why are active filters preferred ? **[Bharathiyar Univ. Nov. 1996]**

Ans. Active filters are preferred over passive filters because they provide gain and frequency adjustment flexibility. They pose no loading problem because of high input impedance and low output impedance and they are comparatively less expensive.

Q. 36. What is a low-pass filter ? **[Bharathiyar Univ. Nov. 1995]**

Ans. A filter that provides a constant output from dc upto a cut-off frequency f_C and then passes no signal above that frequency is called a low-pass filter.

Q. 37. What is a high-pass filter ?

Ans. A filter that provides or passes signals above a cut-off frequency f_C is called a high-pass filter. It has a zero gain starting from zero to a frequency f_C and above this frequency the gain is constant.

Q. 38. Write the conditions to be full filled by a periodic function, $f(t)$ to be expanded into a Fourier series.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. There are certain conditions known as Dirichlet conditions, if satisfied, continuous time periodic signal $f(t)$ can be represented by Fourier series.

1. The function $f(t)$ is absolutely integrable within fundamental period or any period *i.e.*

$$\int_{\tau} |f(t)|\,dt < \infty$$

This gives that each coefficient α_k will be finite.

2. The $f(t)$ has finite number of maxima and minima, if any, within the fundamental period.
3. The $f(t)$ is single valued and has finite number of discontinuities, if any, within the fundamental period.

Note that the Dirichlet conditions are sufficient but not necessary conditions for the Fourier series representation.

Q. 39. State the initial value theorem.

[A.M.I.E. Sec B. Circuit and Field Theory Winter 2006]

Ans. This theorem states that if $f(t)$ and $f'(t)$ are Laplace transformable and $\pounds f(t) = F(s)$ and the $\lim s\,F(s)$ exists then

$$\lim_{s\to\infty} sF(s) = \lim_{t\to 0} f(t) \qquad ...(i)$$

The above equation permits evaluation of initial value of the time domain solution $f(t)$ without ever having to determine $f(t)$ formally. It is possible to work directly with the transform version of the solution to obtain initial values by performing the operation called for on the left side of the Eq. (*i*).

Q. 40. State final value theorem using Laplace transform method.

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2007]

Ans. This theorem states that if $f(t)$ and its first derivative $f'(t)$ are Laplace transformable and the $\pounds f(t) = F(s)$ and if poles of $sF(s)$ lie inside the left half of the s-plane, then

$$\lim_{s\to 0} sF(s) = \lim_{t\to\infty} f(t) \qquad ...(i)$$

The above equation is useful in those situations where the transform solution of a problem is available and all that is needed is information about the final or steady-state solution. By performing the operation called for on the left side of Eq. (*i*), information about the final value can be obtained without ever having to evaluate the complete solution in the time domain.

Q. 41. Write the Laplace transform of (*a*) ramp function, (*b*) unit impulse function. **[A.M.I.E. Sec B. Circuit and Field Theory Winter 2005]**

Ans. Laplace transform of ramp function, $F(s) = \dfrac{1}{s^2}$

Laplace transform of unit impulse function = 1

Q. 42. What is the usage of learning convolution integral ?

[A.M.I.E. Sec B. Circuit and Field Theory Summer 2005]

Ans. Convolution integral finds applications in many fields including network analysis and automatic control. They also provide a way of finding the time function.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. A current is said to be direct current when its
(a) magnitude remains constant with time.
(b) magnitude changes with time.
(c) direction changes with time.
(d) magnitude and direction changes with time.

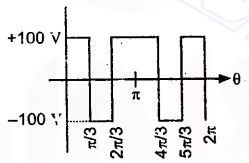
2. A current is said to be alternating when it changes in
(a) magnitude only. (b) direction only.
(c) both magnitude and direction.

3. The most important advantage of using electrical energy in the form of ac is
(a) the construction cost per kW of ac generator is lower than that of dc generator.
(b) conductor of smaller x-section is required in case of ac in comparison to dc for carrying the same current.
(c) less insulation is required in case of ac.
(d) transformation of voltage is possible in case of ac only.

4. The form factor of sinusoidal alternating current is
(a) 1 (b) 0
(c) 1.11 (d) 1.15
[U.P.T.U. E.E. Even Semester 2009-2010]

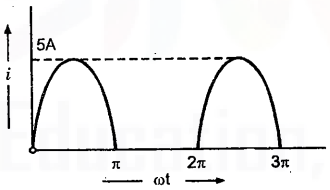
5. The rms value of a sine wave is 100 A. Its peak value is
(a) 70.7 A (b) 141 A (c) 150 A (d) 282.8 A
[R.G.T.U. Basic Electrical Engineering Jan./Feb; 2007]

6. What is the rms value of the voltage waveform shown in the figure?



(a) $200/\pi$V. (b) $100/\pi$V.
(c) 200 V. (d) 100 V.
[GATE E.E. 2002]

7. The current through a resistor has a waveform as shown in figure. The reading shown by a moving coil ammeter will be _____ amperes.



(a) $5/\sqrt{2}$
(b) $2.5/\sqrt{2}$
(c) $5/\pi$ (d) 0
[Delhi Univ. July 1984]

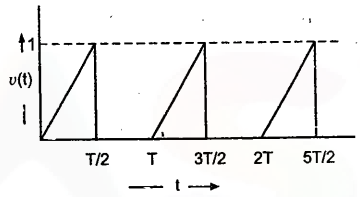
8. A 50 Hz ac voltage is measured with a moving iron voltmeter and a rectifier type ac voltmeter connected in parallel. If the meter readings are V_1 and V_2 respectively and the meters are free from calibration errors, then the form factor of the ac voltage may be estimated as
(a) $\frac{V_1}{V_2}$. (b) $1.11\ V_1/V_2$.
(c) $2\ V_1/V_2$. (d) $\frac{\pi V_1}{2 V_2}$.
[U.P.S.C. I.E.S. E.E.-I, 1993]

9. The rms value of a half-wave rectified symmetrical square wave current of 2 A is
(a) $\sqrt{2}$ A (b) 1 A (c) $\frac{1}{\sqrt{2}}$ A (d) $\sqrt{3}$ A
[GATE E.E. 2005]

10. The rms value of the voltage $u(t) = 3 + 4\cos(3t)$ is
(a) $\sqrt{17}$ V (b) 5 V (c) 7 V (d) $\left(3+2\sqrt{2}\right)$V
[GATE E.E. 2005]

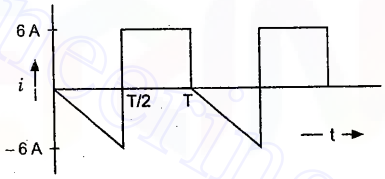
11. The rms value of the resultant current in a wire which carries a dc current of 10 A and a sinusoidal alternating current of peak value 20 A is
(a) 14·1 A (b) 17·3 A (c) 22·4 A (d) 30·0 A
[GATE E.E. 2004]

12. For the triangular waveform in the figure, the rms value of voltage is equal to



(a) $\sqrt{\frac{1}{6}}$ (b) $\sqrt{\frac{1}{3}}$ (c) $\frac{1}{3}$ (d) $\sqrt{\frac{2}{3}}$
[GATE E.E. 2005]

13. The rms value of the periodic waveform given in the figure is



(a) $2\sqrt{6}$ A (b) $6\sqrt{2}$ A (c) $\sqrt{4/3}$ A (d) 1.5 A
[GATE E.E. 2004]

14. Two sinusoidal emfs are given as
$e_1 = A\sin\left(\omega t + \frac{\pi}{4}\right)$ and $e_2 = B\sin\left(\omega t - \frac{\pi}{6}\right)$.
The phase difference between the two quantities in degrees is
(a) 75° (b) 105° (c) 60° (d) 15°

15. The voltage applied to a circuit is $100\sqrt{2}\cos(100\pi t)$ volts and the circuit draws a current of $10\sqrt{2}\sin(100\pi t + \pi/4)$ amperes. Taking the voltage as the reference phasor, the phasor representation of the current in amperes is
(a) $10\sqrt{2}\angle -\pi/4$ (b) $10\angle -\pi/4$
(c) $10\angle +\pi/4$ (d) $10\sqrt{2}\angle +\pi/4$
[GATE E.E. 2011]

Answers: **1.** (a), **2.** (c), **3.** (d), **4.** (c), **5.** (b), **6.** (d), **7.** (c), **8.** (b), **9.** (a), **10.** (a), **11.** (b), **12.** (a), **13.** (a), **14.** (a), **15.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

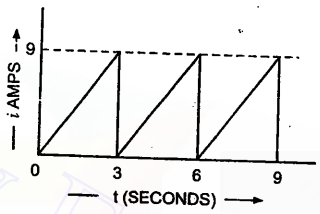
16. If two sinusoids of the same frequency but of different amplitudes and phase difference are added, the resultant is a
(a) sinusoid of the same frequency.
(b) sinusoid of double the original frequency.
(c) sinusoid of half the original frequency.
(d) non-sinusoid.

17. Which of the following statements pertains to resistors only ?
(a) They oppose sudden changes in voltages.
(b) They can act as energy storage devices.
(c) They can dissipate desirable amount of power.
(d) None of the above.

18. In a purely resistive circuit, the average power P_{av} is —— the peak power P_{max}.
(a) double (b) one-half of
(c) one-fourth (d) equal to

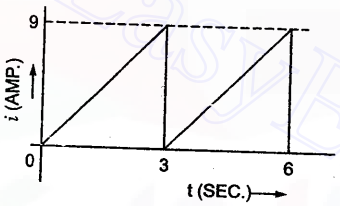
19. A boiler at home is switched on to the ac mains supplying power at 230 V, 50 Hz. The frequency of instantaneous power consumed is
(a) 0 Hz (b) 50 Hz (c) 100 Hz (d) 150 Hz
[GATE E.E. 1996]

20. The current waveform in a pure resistor of 10 Ω is shown in the given figure. Power dissipated in the resistor is
(a) 7.29 W
(b) 52.4 W
(c) 135 W
(d) 270 W



[U.P.S.C. I.E.S. E.E.-I, 1994]

21. The current waveform as shown in figure, is applied in a pure resistor of 10 Ω. What is the power dissipated in the resistor?
(a) 270 W
(b) 135 W
(c) 52 W
(d) 7 W



[U.P.S.C. I.E.S. E.E.-I, 2009]

22. Pure inductive circuit
(a) consume some power on average.
(b) does not consume power.
(c) takes power from the line during some part of the cycle and then returns back during other part of cycle.
(d) none of these.
[U.P.T.U. E.E. Even Semester 2909-10]

23. Purely inductive circuit takes power from the ac mains when
(a) both applied voltage and current increase.
(b) both applied voltage and current decrease.
(c) applied voltage decreases but current increases.
(d) applied voltage increases but current decreases.

24. Unit of inductive reactance is
(a) Henry. (b) millihenry.
(c) Wb. (d) ohm.
[R.G.T.U. Basic Electrical Engineering June 2008]

25. A 10 mH inductor carries a sinusoidal current of 1 A rms at a frequency of 50 Hz. The average power dissipated by the inductor is
(a) 0 W (b) 0.25 W (c) 0.5 W (d) 1.0 W
[U.P.S.C. I.E.S. E.E.-I, 2003]

26. A pure capacitance connected across 50 Hz, 230 V supply consumes 0.04 W. This consumption is attributed to
(a) ohmic loss due to ohmic resistance of plates.
(b) loss of energy in dielectric.
(c) capacitive reactance in ohms.
(d) both (a) and (b).

27. A circuit component that opposes the change in circuit voltage is
(a) resistance. (b) capacitance.
(c) inductance. (d) all of the above.
[A.M.I.E. Elec. Science Summer 1995]

28. The reactance offered by a capacitor to ac of frequency 50 Hz is 10 Ω. If the frequency is increased to 100 Hz, reactance becomes
(a) 20 Ω (b) 5 Ω (c) 2.5 Ω (d) 40 Ω
[R.G.T.U. Basic Electrical Engineering June 2007]

29. A voltage of 50 sin 1000t V is applied across a parallel plate capacitor with plate area of 5 cm^2 and plate separation gap of 5 mm. If the dielectric material in the capacitor has $\varepsilon = 2\varepsilon_0$, then the capacitor current in (Amperes) will be
(a) $\frac{10^4}{\varepsilon_0}\cos 10^3 t$ (b) $\varepsilon_0 10^4 \cos 10^3 t$
(c) $\frac{10^4}{\varepsilon_0}\sin 10^3 t$ (d) $\varepsilon_0 10^4 \sin 10^3 t$
[U.P.S.C. I.E.S E.E.-I, 2000]

30. A two-terminal black box contains a series combination of a resistor and unknown two-terminal linear device. As soon as the battery is connected to the black box the curent is found to be zero. The device is
(a) an inductor. (b) a capacitor.
(c) a resistor. (d) an unknown.

31. A 2-terminal network consists of one of the RLC elements. The element is connected to an ac supply. The current through the element is I A. When an inductor is inserted in series between the source and the element, the current through the element becomes 2I A. What is this element?
(a) A resistor. (b) An inductor.
(c) A capacitor. (d) Cannot be a single element.
[U.P.S.C I.E.S. E.T.E-I, 2007]

32. The pf of a practical inductor is
(a) unity. (b) zero. (c) lagging. (d) leading.
[A.M.I.E. Elec. Science Summer 1994]

33. The power factor of an ordinary electric bulb is
(a) zero. (b) unity.
(c) slightly more than unity. (d) slightly less than unity.
[Delhi Univ. July 1984]

34. The power factor of an ac circuit is equal to
(a) cosine of the phase angle.
(b) sine of the phase angle.
(c) unity for a resistive circuit.
(d) unity for a reactive circuit.
[Nagpur Univ. 1993]

35. Power factor of the following circuit will be zero
(a) resistive. (b) inductive.
(c) capacitive. (d) both (b) and (c).
[U.P.T.U. E.E. Even Semester 2009-10]

36. The power consumed in an inductive circuit will be
(a) VI cos ϕ (b) VI sin ϕ
(c) VI (d) none of these.
[G.B.T.U. E.E. Even Semester 2010-11]

37. When a sinusoidal voltage is applied across R-L series circuit having $R = X_L$, the phase angle will be
(a) 90° (b) 45° lag. (c) 45° lead. (d) 90° leading.
[R.G.T.U. Bhopal Basic E.E. Jan./Feb. 2006]

Answers: **16.** (a), **17.** (c), **18.** (b), **19.** (c), **20.** (d), **21.** (a), **22.** (c), **23.** (c), **24.** (d), **25.** (a), **26.** (d), **27.** (b), **28.** (b), **29.** (b), **30.** (a), **31.** (c), **32.** (c), **33.** (d), **34.** (a), **35.** (d), **36.** (a), **37.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

38. Skin effect occurs when a conductor carries current at ... frequencies.
(a) very low (b) low (c) high

39. The power factor of an ac circuit lies between
(a) 0 and 1. (b) –1 and 1. (c) 0 and –1. (d) none of these.

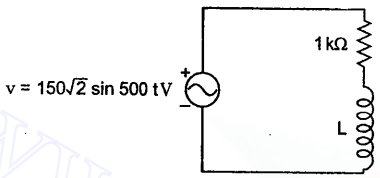
40. In a certain single-phase ac circuit the instantaneous voltage is given by $v = V \sin(\omega t + 30°)$ p.u. and the instantaneous current is given by $i = I \sin(\omega t - 30°)$ p.u. Hence the per-unit value of reactive power is

(a) $\frac{1}{4}$ (b) $\frac{1}{2}$ (c) $\frac{\sqrt{3}}{4}$ (d) $\frac{\sqrt{3}}{2}$

[U.P.S.C. I.E.S E.E.-II, 2002]

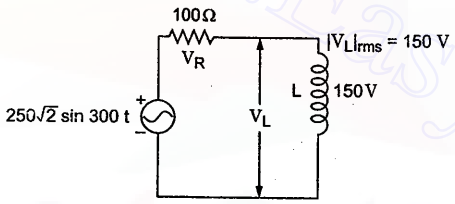
41. Unit of reactive power is
(a) VA. (b) watt. (c) VAR. (d) ohm.
[R.G.T.U. Basic Electrical Engineering June 2008]

42. For the AC circuit as shown below, if the rms voltage across the resistor is 120 V, what is the value of the inductor?



(a) 0.5 H (b) 0.6 H
(c) 1.0 H (d) 1.5 H [U.P.S.C. I.E.S. E.E.-I, 2009]

43. Consider the following, with respect to the circuit as shown below:

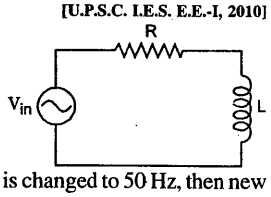


1. $V_R = 100\sqrt{2}$ V 2. $|I|_{rms} = 2$ A
3. L = 0.25 H

Which of the above statements is/are correct?
(a) 1 only (b) 2 and 3
(c) 1 and 3 (d) 1 and 2
[U.P.S.C. I.E.S. E.E.-I, 2009]

44. For an ac circuit, if $v(t) = 160 \sin(\omega t + 10°)$ and $i(t) = 5 \sin(\omega t - 20°)$, then reactive power absorbed by the circuit is
(a) 100 VARs (b) 200 VARs
(c) 300 VARs (d) 400 VARs
[U.P.S.C. I.E.S. E.E.-I, 2010]

45. The R-L circuit of the figure is fed from a constant magnitude variable frequency sinusoidal voltage source v_{in}. At 100 Hz, the R and L element each has a voltage drop U_{rms}. If the frequency of the source is changed to 50 Hz, then new voltage drop across R is



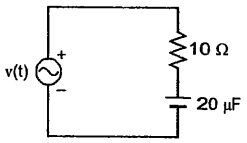
(a) $\sqrt{\frac{5}{8}}\,U_{rms}$ (b) $\sqrt{\frac{2}{3}}\,U_{rms}$
(c) $\sqrt{\frac{8}{5}}\,U_{rms}$ (d) $\sqrt{\frac{3}{2}}\,U_{rms}$ [GATE E.E. 2005]

46. An ac source of 200 V rms supplies active power of 600 W and reactive power of 800 VAR. The rms current drawn from the source is
(a) 10 A (b) 5 A (c) 3·75 A (d) 2·5 A
[U.P.S.C. I.E.S. E.E.-I, 1999]

47. A series circuit containing passive elements has the following current and applied voltage
$v = 200 \sin(2{,}000t + 50°)$, $i = 4 \cos(2{,}000t + 13.2°)$
The circuit elements
(a) must be resistance and capacitance.
(b) must be resistance and inductance.
(c) must be inductance, capacitance and resistance.
(d) could be either resistance and capacitance or resistance, inductance and capacitance. [U.P.S.C. I.E.S. E.E.-I, 1996]

48. A certain R-L series combination is connected across a 50 Hz single-phase ac supply. If the instantaneous power drawn was found to be negative for 2 milliseconds in one cycle, the 'power factor angle' of the circuit must be
(a) 9°. (b) 18°. (c) 36°. (d) 45°.
[U.P.S.C. I.E.S. E.E.-II, 2002]

49. In the given RC circuit, the current $i(t) = 2\cos 5000t$ A. The applied voltage $v(t)$ is



(a) 28.28 cos (5,000 t – 45°) V
(b) 28.28 cos (5,000 t + 45°) V
(c) 28.28 sin (5,000 t – 45°) V
(d) 28.28 sin (5,000 t – 45°) V [U.P.S.C. I.E.S. E.E.-II, 2002]

50. A square wave is fed to an R-C circuit. Then
(a) voltage across R is square and across C is not square.
(b) voltage across C is square and across R is not square.
(c) voltage across both R and C is square.
(d) voltage across both R and C is not square.
[U.P.S.C. I.E.S. E.E. I, 1992]

51. The voltage phasor of a circuit is $10 \angle 15°$ V and the current phasor is $2 \angle -45°$ A. The active and reactive powers in the circuit are
(a) 10 W and 17·32 VAR (b) 5 W and 8·66 VAR
(c) 20 W and 60 VAR (d) $20\sqrt{2}$ W and $10\sqrt{2}$ VAR
[GATE E.E. 1999]

52. In a two-element series circuit, the applied voltage and resultant current are respectively, $v(t) = 50 + 50 \sin(5 \times 10^3 t)$ and $i(t) = 11{\cdot}2 \sin(5 \times 10^3 t + 63{\cdot}4°)$ A
The nature of the elements would be
(a) R-L (b) R-C (c) L-C
(d) neither R, nor L, nor C [U.P.S.C. I.E.S. E.E.-I, 1999]

53. With the increase in applied frequency, the dielectric loss in a material will
(a) increase. (b) decrease. (c) remain constant.
(d) become zero. [U.P.S.C. I.E.S. E.E.-I, 2006]

54. A 100 W, 100 V bulb is to be supplied from 220 V, 50 Hz supply. Which of the following arrangements is preferable?
(a) Additional pure inductance in series with lamp.
(b) Additional resistance in series with the lamp.
(c) Additional inductance and capacitance in series with the lamp.

55. A two terminal black box contains one of the R-L-C elements. The black box is connected to a 220 V ac supply. The current through the source is I. When a capacitance of 0.1 F is inserted in series between the source and the box, the current through the source is 2 I. The element is
(a) a resistance. (b) an inductance.

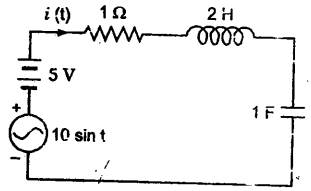
Answers: **38.** (c), **39.** (a), **40.** (c), **41.** (c), **42.** (d), **43.** (b), **44.** (b), **45.** (c), **46.** (b), **47.** (d), **48.** (c), **49.** (a), **50.** (d), **51.** (a), **52.** (b), **53.** (a), **54.** (a), **55.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

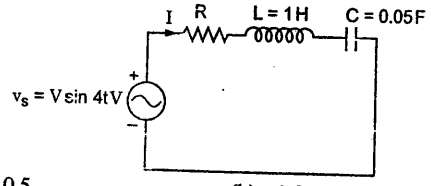
(c) a capacitance.
(d) it is not possible to determine the element. [Nagpur Univ. 1993]

56. In the following circuit $i(t)$ under steady-state is



(a) zero
(b) 5
(c) 7.07 sin t
(d) 7.07 sin $(t - 45°)$
[GATE E.E. 1993]

57. For the circuit shown below, if current leads the applied voltage by $\tan^{-1} 2$, what is the resistance value in ohm?



(a) 0.5 (b) 1.0
(c) 2.0 (d) 9.5 [U.P.S.C. I.E.S. E.E.-I, 2009]

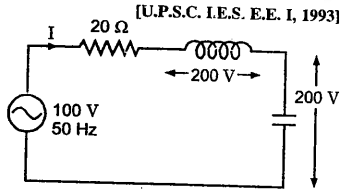
58. For a series RLC circuit energized with a sinusoidal voltage source of frequency 4 rad/s, the applied voltage lags the current by an angle of $\tan^{-1} 2$ degrees. Then the value of R for L = 1 H and C = 0.05 F is
(a) 4.0 ohm (b) 2.0 ohm
(c) 1.0 ohm (d) 0.5 ohm
[U.P.S.C. I.E.S. E.E.-I, 2010]

59. In an ac series RLC circuit, the voltage across R and L is 20 V, voltage across L and C is 9 V and voltage across RLC is 15 V. What is the voltage across C ?
(a) 7 V (b) 12 V (c) 16 V (d) 21 V
[U.P.S.C. I.E.S. E.E.-I, 2004]

60. In an RLC circuit, supplied from an ac source, the reactive power is proportional to the
(a) average energy stored in the electric field.
(b) average energy stored in the magnetic field.
(c) sum of the average energy stored in the electric field and that stored in the magnetic field.
(d) difference between the average energy stored in the electric field and that stored in the magnetic field.
[U.P.S.C. I.E.S. E.E.-I, 1993]

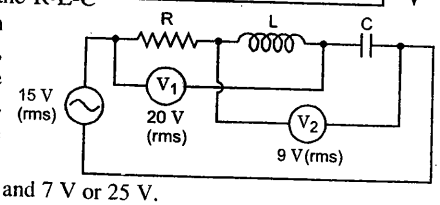
61. If a series RLC circuit excited by a voltage $e = E \sin \omega t$ where $LC < \frac{1}{\omega^2}$
(a) current lags behind the applied voltage.
(b) current leads the applied voltage.
(c) current is in phase with the applied voltage.
(d) voltage across L and C are equal.
[U.P.S.C. I.E.S. E.E. I, 1993]

62. The current in the circuit shown



(a) 5 A (b) 10 A
(c) 15 A (d) 25 A
[GATE E.E. 1999]

63. In the case of the R-L-C circuit shown in the given figure, the voltage across the R, L and C would be respectively

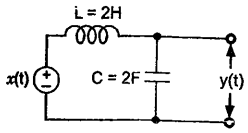


(a) 12 V, 16 V and 7 V or 25 V.
(b) 16 V, 12 V and 7 V or 25 V.
(c) 7 V, 16 V and 12 V. (d) 16 V, 12 V and 25 V.
[U.P.S.C. I.E.S. E.E.-I, 2006]

64. A small capacitance is added to a highly inductive circuit,
(a) the angle between voltage and current will increase.
(b) the p f will increase.
(c) the p f will decrease. (d) the power drawn will decrease.

65. In an R-L-C circuit
(a) power is consumed in resistance only and is equal to $I^2 R$.
(b) exchange of power does not take place between resistance and supply mains.
(c) exchange of power takes place between capacitor and supply mains.
(d) all of the above.

66. $x(t)$: Input voltage
$y(t)$: Output voltage
Consider the circuit shown in the figure.



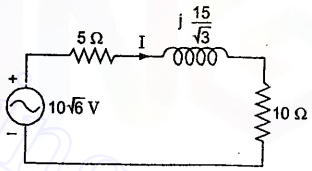
What is the natural response of this system ?
(a) A sinusoid with constant amplitude.
(b) A growing sinusoid.
(c) Zero. (d) A decaying sinusoid.
[U.P.S.C. I.E.S. E.T.E.I, 2007]

67. $(-2 - j5)/(5 + j7)$ is expressed as
(a) $11.31\angle 225°$ (b) $8.49\angle 45°$
(c) $0.627\angle -166.26°$ (d) $46.15\angle -85.03°$
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

68. Real part of admittance is .... and the imaginary part is ....
(a) impedance, resistance. (b) resistance, impedance.
(c) susceptance, inductance. (d) conductance , susceptance.
[U.P.S.C. I.E.S. E.E.-I, 1992]

69. In an ac circuit if voltage $V = (a + jb)$ and current $I = (c + jd)$, then the power is given by
(a) $ac + ad$ (b) $ac + bd$ (c) $bc - ad$ (d) $bc + ad$
[A.M.I.E. Electrical Science Winter 1994]

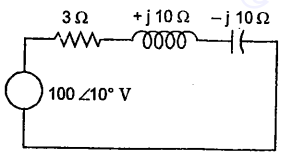
70. Consider the following statements regarding the circuit shown in the figure. If the power consumed by 5 Ω resistor is 10 Ω, then



1. $|I| = \sqrt{2}$ A
2. the total impedance of the circuit is 5 Ω.
3. cos Φ = 0·866.

Which of these statements are correct ?
(a) 1 and 3 (b) 2 and 3 (c) 1 and 2 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 1999]

71. The reactive power drawn from the source in the network shown in the given figure is



(a) 300 VAR..
(b) 200 VAR..
(c) 100 VAR..
(d) zero.
[U.P.S.C. I.E.S. E.E.-I, 1999]

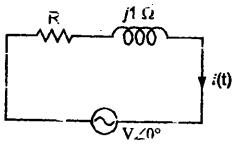
72. The quantity $(12 + j9)$ represents the resistive and reactive components of current drawn by an ac circuit. The phase angle between the applied voltage and current is
(a) 41.4° (b) 53.13° (c) 36.87° (d) 48.6°
[R.G.T.U. Basic Electrical Engineering June/July 2006]

Answers: **56.** (d), **57.** (a), **58.** (d), **59.** (a), **60.** (d), **61.** (b), **62.** (a), **63.** (a), **64.** (b), **65.** (d), **66.** (a), **67.** (c), **68.** (d), **69.** (b), **70.** (a), **71.** (d), **72.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

73. For the network shown, if the current $i(t) = \sqrt{2}\sin(\omega t - 30°)$, then what is the value of R?



(a) 1 Ω (b) 2 Ω
(c) $\sqrt{3}\,\Omega$ (d) $3\sqrt{3}\,\Omega$

[U.P.S.C. I.E.S. E.E.-I, 2008]

74. A voltage of $V = 100\angle 30°$ is applied to an impedance $Z = 3 + j4$. Which one of the following is the power triangle ?

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. E.E.-I, 2008]

75. A 240 V single-phase ac source is connected to a load with an impedance of $10\angle 60°\Omega$. A capacitor is connected in parallel with the load. If the capacitor supplies 1,250 VAR, the real power supplied by the source is
(a) 3,600 W. (b) 2,880 W. (c) 2,400 W. (d) 1,200 W.

[GATE E.E., 2001]

76. A voltage $\bar{V}$ is applied to an ac circuit resulting in the delivery of a current $\bar{I}$. Which of the following expression would yield the true power delivered by the source ?
1. Real part of $\bar{V}\,\bar{I}$.
2. Real part of VI.
3. I^2 times the real part of $\frac{\bar{V}}{\bar{I}}$

Select the correct answer using the codes given below :
Codes:
(a) 1 alone. (b) 1 and 3. (c) 2 and 3. (d) 3 alone.

[U.P.S.C. I.E.S. E.E.-I, 1998]

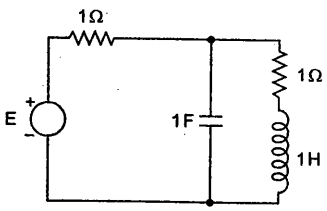
77. In a parallel R-L circuit if I_R is the current in resistor and I_L is the current in the inductor, then
(a) I_R lags I_L by 90°. (b) I_R leads I_L by 270°.
(c) I_L leads I_R by 270°. (d) I_L lags I_R by 90°.

[Delhi, Univ. 1984]

78. When a sinusoidal voltage is applied across R-L parallel circuit so that $R = X_L$ the phase angle will be
(a) 45° lag. (b) 45° leading.
(c) 90° lag. (d) 90° leading.

[R.G.P.V. Bhopal Basic Elec. Engineering Jan./Feb. 2006]

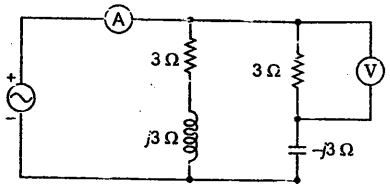
79. If the power dissipated in the circuit shown in the figure is 8 W, then the value of E will be
(a) 2 V
(b) 4 V
(c) 8 V
(d) 16 V



[U.P.S.C. I.E.S. E.E.-I, 2010]

80. Capacitive susceptance is a measure of
(a) a purely capacitive circuit's ability to pass current.
(b) a purely capacitive circuit's ability to resist the flow of current.
(c) the extent of neutralization of reactive power in a circuit.
(d) reactive power in a circuit.

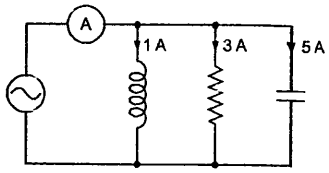
81. In the circuit shown in the given figure, the voltmeter indicates 30 V. The reading of the ammeter will be



(a) 20 A. (b) $10\sqrt{2}$ A. (c) 10 A. (d) zero.

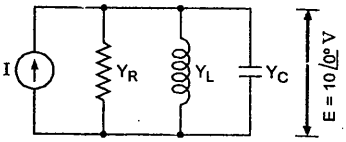
[U.P.S.C. I.E.S. E.E. I, 1994]

82. The current read by the ammeter A in the ac circuit shown in the given figure is
(a) 9 A (b) 5 A
(c) 3 A (d) 1 A



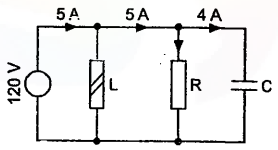
[U.P.S.C. I.E.S. E.E.- I, 1995]

83. In given figure, the admittance values of the elements in Siemens are $Y_R = 0.5 + j0$, $Y_L = 0 - j\,1.5$ and $Y_C = 0 + j\,0{\cdot}3$ respectively. The value of I as a phasor when the voltage E across the elements is $10\ \angle 0°$ V is



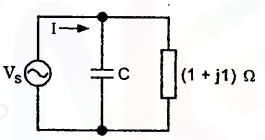
(a) $1{\cdot}5 + j\,0{\cdot}5$ (b) $5 - j\,18$
(c) $0{\cdot}5 + j\,1{\cdot}8$ (d) $5 - j\,12$ [GATE E.E. 2004]

84. In the circuit shown in the given figure, the current through the inductor L is
(a) 0 A (b) 3 A
(c) 4 A (d) 8 A



[U.P.S.C. I.E.S. E.E.-I 2002]

85. In the circuit shown in the figure given below, for what value of C will the current I be in phase with the sinusoidal source voltage $V_s = \sin 2t$?



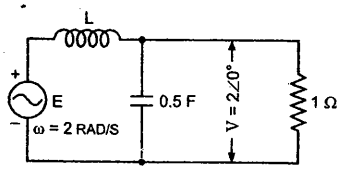
(a) $\frac{1}{4}$F (b) $\frac{1}{2}$F
(c) $\frac{1}{\sqrt{2}}$F (d) 1 F

[U.P.S.C I.E.S. E.E.-I, 2006]

86. A resistance of 'R' Ω and inductance 'L' H are connected across 240 V, 50 Hz supply. Power dissipated in the circuit is 100 W and the voltage across R is 100 V. In order to improve the pf to unity, the capacitor that is to be connected in series should have a value of
(a) 43·7 μF (b) 4·37 μF (c) 437 μF (d) 4·37 mF

[U.P.S.C. I.E.S. E.E.-I, 2000]

87. Consider the following circuit. For the circuit shown in the figure, how much the voltage across the inductor leads the voltage across the capacitor ?



(a) 45° (b) 90° (c) 135° (d) 180°

[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **73.** (c), **74.** (b), **75.** (b), **76.** (d), **77.** (d), **78.** (a), **79.** (b), **80.** (a), **81.** (b), **82.** (b), **83.** (d), **84.** (d), **85.** (a), **86.** (a), **87.** (c),

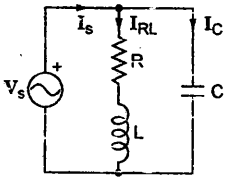
Common Data For Questions 88, 89
An RLC circuit with relevant data is given below.

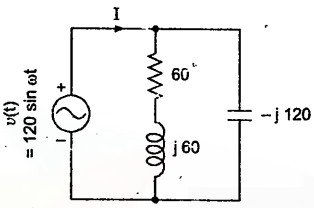
$V_s = 1 \angle 0\ V$
$I_s = \sqrt{2} \angle \pi/4\ A$
$I_{RL} = \sqrt{2} \angle -\pi/4\ A$



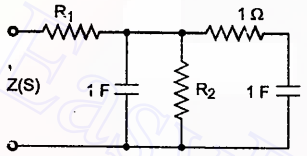
88. The power dissipated in the resistor R is
(a) 0.5 W (b) 1 W
(c) $\sqrt{2}$ W (d) 2 W [GATE E.E., 2011]

89. The current I_C in the figure above is
(a) $-j\,2$ A (b) $-j\frac{1}{\sqrt{2}}$ A
(c) $+j\frac{1}{\sqrt{2}}$ A (d) $+j\,2$ A [GATE E.E., 2011]

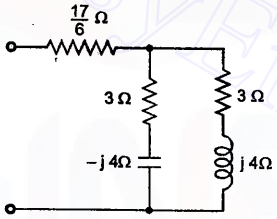
90. For the given ac circuit, what is the value of I ?
(a) $1+j1$ (b) $1+j0$
(c) $2-j1$ (d) $0+j0$ [U.P.S.C. I.E.S. E.E.-I, 2005]



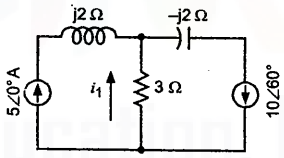
91. For the network shown in the given figure Z(0) = 3 Ω and Z(∞) = 2 Ω. The values of R_1 and R_2 will respectively be
(a) 2 Ω, 1 Ω (b) 1 Ω, 2 Ω
(c) 3 Ω, 2 Ω (d) 2 Ω, 3 Ω [U.P.S.C. I.E.S. E.E.-I, 1994]



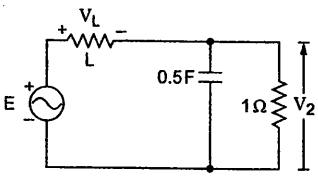
92. The total impedance $Z(j\omega)$ of the circuit shown is
(a) $(6+j0)\ \Omega$
(b) $(7+j0)\ \Omega$
(c) $(0+j8)\ \Omega$
(d) $(6+j8)\ \Omega$ [U.P.S.C. I.E.S. E.E.-I, 2003]



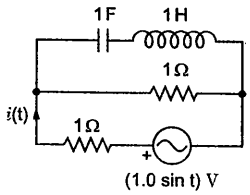
93. For the circuit shown in the figure, the instantaneous current $i_1(t)$ is
(a) $\frac{10\sqrt{3}}{2}\angle 90°$ Amps.
(b) $\frac{10\sqrt{3}}{2}\angle -90°$ Amps.
(c) $5\angle 60°$ Amps.
(d) $5\angle -60°$ Amps. [GATE E.E. E.C.E. 2005]



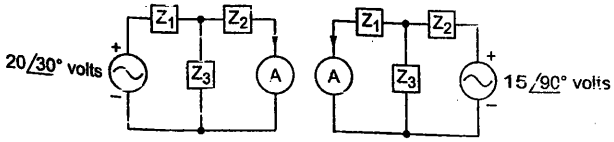
94. For the given circuit, if supply frequency, ω = 2 rad/sec and $V_2 = 2 \angle 0°$ volts, then what is the lead angle of V_L with V_2?
(a) 15°
(b) 45°
(c) 90°
(d) 135° [U.P.S.C. I.E.S. E.E.-I, 2009]



95. The rms value of the current $i(t)$ in the circuit shown in the figure is
(a) $\frac{1}{2}$ A (b) $\frac{1}{\sqrt{2}}$ A
(c) 1 A (d) $\sqrt{2}$ A [GATE E.E. 2011]



96. For the circuit as shown in Fig. (*a*), current through the ammeter is $4 \angle -45°$ Amps. What is the current in the ammeter for the circuit in Fig. (*b*)?



(*a*) (*b*)

(a) $3 \angle 15°$ Amps (b) $2 \angle 30°$ Amps
(c) $4 \angle 45°$ Amps (d) $5 \angle 90°$ Amps [U.P.S.C. I.E.S. E.E.-I, 2009]

97. Under the condition of resonance in R-L-C series circuit, the pf of the circuit is
(a) 0.5 lagging. (b) 0.5 leading.
(c) unity. (d) zero. [R.G.T.U. Basic Electrical Engineering June/July 2006]

98. At resonance power factor of a series R-L-C circuit would be
(a) 0 (b) 1
(c) −1 (d) 1.1 [U.P.T.U. E.E. Even Semester 2009-2010]

99. The current through a series RLC circuit under resonance condition will be
(a) V/R (b) V/X_C
(c) V/X_L (d) none of these [G.B.T.U. Elec. Engg. Even Semester 2010-11]

100. Consider the following statements :
When a series R-L-C circuit is under resonance
1. current is maximum through R.
2. magnitude of the voltage across L is equal to that across C.
3. the power factor of the circuit is unity.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

101. At resonant frequency an R-L-C circuit draws maximum current due to the reason that
(a) the difference between capacitive reactance and inductive reactance is zero.
(b) the impedance is more than resistance.
(c) the voltage across the capacitor equals the applied voltage.
(d) the power factor is less than unity. [U.P.S.C. I.E.S. E.E.-I, 2002]

102. Consider the following statements with respect to a series R-L-C circuit under resonance condition:
1. All the applied voltage appears across R.
2. There is no voltage across either L or C.
3. The voltage across L and C equal and equal to their maximum values. Of these statements
(a) 1 alone is correct. (b) 2 alone is correct.
(c) 1 and 3 are correct. (d) 1 and 2 are correct. [U.P.S.C. I.E.S. Elec. Engg-I, 1995]

103. A series R-L-C circuit will have unity power factor if operated at a frequency of
(a) $1/LC$ (b) $1/\omega\sqrt{LC}$ (c) $1/\omega^2 LC$ (d) $1/2\pi\sqrt{LC}$ [Delhi Univ. July 1984]

104. Consider the following statements:
In a network of resonance
1. the admittance is maximum.
2. the power factor is unity irrespective of the network.
3. the Q of a series RLC resonant circuit is independent of R.

Answers: **88.** (b), **89.** (d), **90.** (b), **91.** (a), **92.** (b), **93.** (a), **94.** (d), **95.** (b), **96.** (a), **97.** (c), **98.** (b), **99.** (a), **100.** (a), **101.** (a), **102.** (a), **103.** (d), **104.** (b),

Downloaded From : www.EasyEngineering.net

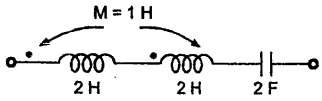
Downloaded From : www.EasyEngineering.net

Of these statements
(a) 1 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 alone is correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

105. A circuit with a resistor, inductor and capacitor in series is resonant of f_0 Hz. If the all the component values are now doubled the new resonant frequency is
(a) $2f_0$ (b) still f_0 (c) $f_0/4$ (d) $f_0/2$
[GATE E.E. 1998]

106. For a series RLC resonant circuit, which one of the following gives the impedances at the lower and upper half power frequencies, respectively ?
(a) $\sqrt{2}R\angle 45°; \sqrt{2}R\angle -45°$ (b) $\left(\frac{1}{\sqrt{2}}\right)R\angle -45°; \left(\frac{1}{\sqrt{2}}\right)R\angle 45°$
(c) $R\angle 45°; R\angle -45°$ (d) $\sqrt{2}R\angle -45°; \sqrt{2}R\angle 45°$
[U.P.S.C. I.E.S. E.E.-I, 2007]

107. The resonant frequency of the given series circuit is



(a) $\frac{1}{2\pi\sqrt{3}}$ Hz
(b) $\frac{1}{4\pi\sqrt{3}}$ Hz (c) $\frac{1}{4\pi\sqrt{2}}$ Hz (d) $\frac{1}{\pi\sqrt{2}}$ Hz
[U.P.S.C. I.E.S. E.E.-I, 2001]

108. If the resonant frequency of the circuit shown in Fig. 1 is 1 kHz, the resonant frequency of the circuit shown in Fig. 2 will be

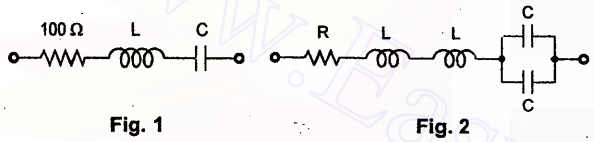


Fig. 1

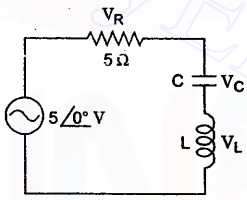
Fig. 2

(a) 4 kHz (b) 2 kHz (c) 0·5 kHz (d) 0·25 kHz
[U.P.S.C. I.E.S. E.E.-I, 2000]

109. In the circuit shown in given figure, the magnitude of V_L and V_C are twice that of V_R. The inductance of the coil is
(a) 2·14 mH. (b) 5·30 mH.
(c) 31·8 mH. (d) 1·32 mH.
[GATE E.E. 2003]



110. In a series RLC circuit at resonance, the magnitude of voltage developed across the capacitor
(a) is always zero.
(b) can never be greater than the input voltage.
(c) can be greater than the input voltage however, it is 90° out of phase with the input voltage.
(d) can be greater than the input voltage and is in phase with the input voltage.
[GATE E.E. 2001]

111. A coil having a resistance of 5 Ω and inductance of 0.1 H is connected in series with a condenser of capacitance 50 μF. A constant alternating voltage of 200 V is applied to the circuit. The voltage across the coil at resonance is
(a) 200 volts (b) 1,788 volts
(c) 1,800 volts (d) 2,000 volts
[U.P.S.C. I.E.S. E.E.-I, 1994]

112. A series R-L-C circuit, consisting of R = 10 Ω, X_L = 20 Ω and X_C = 20 Ω is connected across an ac supply of 100 V(rms). The magnitude and phase angle (with reference to supply voltage) of the voltage across the inductive coil are respectively
(a) 100 V; 90° (b) 100 V; – 90°
(c) 200 V; – 90° (d) 200 V; 90°
[U.P.S.C. I.E.S. E.E.-I, 1997]

113. A series R-L-C circuit, excited by a 100 V variable frequency source, has a resistance of 10 Ω and an inductive reactance of 50 Ω at 100 Hz. If the resonance frequency is 500 Hz, what is the voltage across the capacitor at resonance ?
(a) 100 V (b) 500 V (c) 2,500 V (d) 5,000 V
[U.P.S.C. I.E.S. E.E.-I, 2006]

114. In a series R-L-C circuit, the maximum voltage across the capacitor occurs at a frequency
(a) double the resonant frequency.
(b) equal to resonant frequency.
(c) $\sqrt{2}$ limes the resonant frequency.
(d) below the resonant frequency. [U.P.S.C. I.E.S. E.E.-I, 2006]

115. In a series R-L-C circuit, the voltage across inductance will be maximum
(a) at resonant frequency. (b) just after reasonant frequency.
(c) just before reasonant frequency.
(d) just before and after resonant frequency.

116. A series circuit having a resonant frequency of 60 kHz is connected in series with a signal generator which produces signals of frequencies 20, 30, 40 and 60 kHz. The signals experiencing minimum and maximum impedances will be
(a) 60 kHz and 20 kHz respectively.
(b) 20 kHz and 60 kHz respectively.
(c) 30 kHz and 60 kHz respectively.
(d) 20 kHz and 40 kHz respectively.

117. The frequency at which maximum voltage occurs across the inductance in an R-L-C circuit is
(a) $\frac{1}{2\pi\sqrt{LC}}$ (b) $\frac{1}{2\pi\sqrt{LC-C^2R^2/2}}$
(c) $\frac{1}{2\pi}\sqrt{\frac{1}{LC}-\frac{R^2}{2L^2}}$ (d) $\frac{1}{2\pi\sqrt{LC-R^2}}$

118. The frequency at which maximum voltage occurs across the capacitor in an R-L-C circuit is
(a) $\frac{1}{2\pi\sqrt{LC}}$ (b) $\frac{1}{2\pi\sqrt{LC-C^2R^2/2}}$
(c) $\frac{1}{2\pi}\sqrt{\frac{1}{LC}-\frac{R^2}{2L^2}}$ (d) $\frac{1}{2\pi\sqrt{LC-R^2}}$

119. For a series RLC circuit, the power factor at the lower power frequency is
(a) 0·5 lagging. (b) 0·5 leading.
(c) unity. (d) 0·707 leading.
[U.P.S.C. I.E.S. E.E.-I, 1999]

120. Q-factor of a series R-L-C circuit possessing resonant frequency of 10 Hz and bandwidth of 5 Hz is
(a) 0·5 (b) 2 (c) 2·5 (d) 50
[G.G.S.I.P. Univ. Delhi Univ. Electrical Science, May 2005]

121. When Q-factor of a circuit is high, then
(a) power factor of the circuit is high.
(b) impedance of the circuit is high.
(c) bandwidth is large. (d) none of these.
[U.P.S.C. I.E.S. Elec. Engg.-I, 1992]

Answers: **105.** (d), **106.** (d), **107.** (b), **108.** (c), **109.** (c), **110.** (c), **111.** (c), **112.** (d), **113.** (c), **114.** (d), **115.** (b), **116.** (a), **117.** (b), **118.** (c), **119.** (d), **120.** (b), **121.** (b),

Downloaded From : www.EasyEngineering.net

122. A high Q coil has
(a) large bandwidth. (b) high losses.
(c) low losses. (d) flat response.
[U.P.S.C. I.E.S. E.E.-I, 1992]

123. Consider the following statements regarding the frequency response curve of a series R-L-C circuit.
1. At half power frequencies, the current in the circuit is one-half of the current at resonant frequencies.
2. At half-power frequencies, the power factor angle of the circuit is 45°.
3. At resonant frequency, the power factor angle of the circuit is 90°.
4. Maximum power occurs at resonant frequency.
Of these statements
(a) 1, 2 and 4 are correct. (b) 1, 2 and 3 are correct.
(c) 2 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

124. A coil is tuned to resonance at 500 kHz with a resonating capacitor of 36 pF at 250 kHz, the resonance is obtained with resonating capacitor of 160 pF. What is the self-capacitance of the coil ?
(a) 2.66 pF (b) 5.33 pF (c) 8 pF (d) 10.66 pF
[U.P.S.C. I.E.S E.T.E.-I, 2008]

125. The bandwidth of a resonant circuit is given by
(a) $\frac{R}{2\pi L}$ Hz (b) $\frac{f_r}{Q}$ Hz
(c) $\frac{2\pi R}{L}$ Hz (d) $2\pi f_r/Q$ Hz
(e) both (a) and (b).

126. In a series resonant circuit, with the increase in L
(a) resonant frequency will decrease.
(b) band width will decrease.
(c) Q will increase. (d) all of the above.

127. In a series resonant circuit with the increase in the value of C
(a) resonant frequency will decrease.
(b) Q will decrease.
(c) band width will increase. (d) both (a) and (b).

128. Which of the following will not be affected due to change in R ?
(a) Bandwidth. (b) Q.
(c) Resonant frequency. (d) None.

129. Change in circuit voltage will affect
(a) resonant frequency. (b) Q.
(c) current. (d) bandwidth.

130. Higher the Q of a series circuit, narrower its
(a) passband. (b) resonance curve.
(c) bandwidth. (d) all of these.

131. An R-L-C series circuit has f_1 and f_2 as the half power frequencies and f_0 as the resonant frequency. The Q-factor of the circuit is given by
(a) $\frac{f_1+f_2}{2f_0}$ (b) $\frac{f_1-f_0}{f_2-f_0}$ (c) $\frac{f_0}{f_1-f_2}$ (d) $\frac{f_1-f_2}{f_0}$
[U.P.S.C. I.E.S. E.E. I, 1994]

132. Resonant frequency f_r of a series R-L-C circuit is related to half power frequencies f_1 and f_2 as
(a) $f_r=\frac{f_1+f_2}{2}$ (b) $f_r=\sqrt{f_1 f_2}$
(c) $f_r=f_2-f_1$ (d) $f_r=\sqrt{f_1}+\sqrt{f_2}$
[A.M.I.E. Sec B. Circuit and Field Theory Winter 1993]

133. A series R-L-C circuit has R = 50 Ω; L = 100 mH and C = 1 μF. The lower half power frequency of the circuit is
(a) 30·55 kHz (b) 3·055 kHz
(c) 51·92 kHz (d) 1·92 kHz [GATE E.E. 2002]

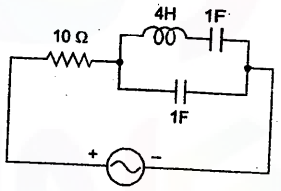
134. A series R-L-C circuit when excited by a 10 V sinusoidal voltage source of variable frequency, exhibits resonance at 100 Hz and has a 3 dB bandwidth of 5 Hz. The voltage across the inductor L at resonance is
(a) 10 V (b) $10\sqrt{2}$ V (c) $\frac{10}{\sqrt{2}}$ V (d) 200 V
[GATE E.E. 1999]

135. An R-L-C resonant circuit has a resonance frequency of 1·5 MHz and a bandwidth of 10 kHz. If C = 150 pF, then the effective resistance of the circuit will be
(a) 29·5 Ω (b) 14·75 Ω (c) 9·4 Ω (d) 4·7 Ω
[U.P.S.C. I.E.S. E.E.-I, 1998]

136. The resonant frequency of an RLC series circuit is 1.5 MHz with the resonating capacitor of 150 pF. The bandwidth is 10 kHz. The effective value of the resistor is
(a) 16.3 Ω (b) 9.5 Ω (c) 7.4 Ω (d) 4.7 Ω
[U.P.S.C. I.E.S. E.E.-I, 2010]

137. If a series RLC circuit resonates at 1.5 kHz and consumes 100 watts from a 100 volts ac source operating at resonant frequency with a bandwidth of 0.75 kHz; the values of R, L and Q-factor of the circuit are respectively
(a) 100 Ω; $\frac{0.2}{3\pi}$ H; 2 (b) 50 Ω; $\frac{0.1}{2\pi}$ H; 4
(c) 100 Ω; $\frac{2}{3\pi}$ H; 1 (d) 50 Ω; $\frac{0.3}{2\pi}$ H; 3
[U.P.S.C. I.E.S. E.E.-I, 2010]

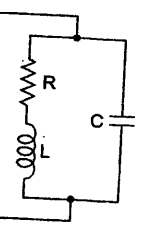
138. The following circuit resonates at
(a) all frequencies
(b) 0.5 rad/s
(c) 5 rad/s
(d) 1 rad/s [GATE E.E. 1993]



139. An R-L-C series circuit has f_1 and f_2 as the half power frequencies and f_r as the resonant frequency. The selectivity of the circuit is given by
(a) $\frac{f_1+f_2}{f_r}$ (b) $\frac{f_2-f_1}{2f_r}$ (c) $\frac{f_2-f_1}{f_r}$ (d) none of these.

140. In an R-L-C series resonant circuit, if inductance of the circuit is made double and the capacitance is made half, which of the following will be affected ?
(a) Resonant frequency. (b) Selectivity of the circuit.
(c) Current at resonant frequency.
(d) Impedance at resonant frequency.

141. At resonance, the parallel circuit of fig below constituted by an iron-cored coil and a capacitor behaves like:
(a) an open circuit.
(b) a short circuit.
(c) a pure resistor of value R.
(d) a pure resistor of value much higher than R. [GATE E.E. 1994]



Answers: **122.** (c), **123.** (c), **124.** (b), **125.** (e), **126.** (d), **127.** (d), **128.** (c), **129.** (c), **130.** (d), **131.** (c), **132.** (a), **133.** (b), **134.** (d), **135.** (d), **136.** (d), **137.** (a), **138.** (b), **139.** (c), **140.** (b), **141.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

142. When resonant frequency for an R-L-C parallel circuit is given by $\frac{1}{2\pi\sqrt{LC}}$, the essential condition is that
(a) inductance must be non-resistive.
(b) capacitance must be non-leaky.
(c) current is minimum at resonance.
(d) all of the above.

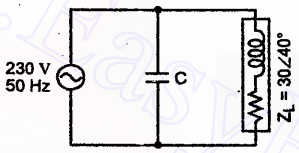
143. The dynamic resistance of a parallel resonant circuit is given by
(a) $\frac{LC}{R_L}$ (b) LCR_L (c) $\frac{C}{LR_L}$ (d) $\frac{L}{CR_L}$
[A.M.I.E. Sec. B Circuit and Field Theory Winter 1993]

144. A parallel circuit is said to be in resonance when the admittance is purely
(a) capacitive. (b) inductive. (c) susceptive. (d) conductive.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

145. A lossy capacitor is represented by an ideal capacitor C with a high resistance R in parallel. What is the Q of the circuit at frequency ω?
(a) ω CR (b) $\frac{1}{(\omega CR)}$ (c) $\frac{\omega C}{R}$ (d) $\frac{R}{(\omega C)}$
[U.P.S.C. I.E.S. E.E.-I, 2008]

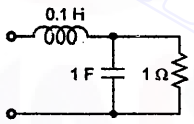
146. In order to tune a parallel resonant circuit to a lower frequency, the capacitance must
(a) be increased. (b) be decreased.
(c) be zero. (d) remain the same.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

147. In the circuit shown in figure, what value of C will cause a unity power factor at the ac source ?



(a) 68.1 μF (b) 165 μF
(c) 0.681 μF (d) 6.81 μF
[GATE E.E. 2002]

148. The resonant frequency for the given circuit will be

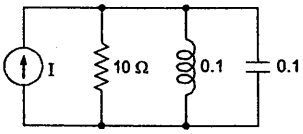


(a) 1 rad/s. (b) 2 rad/s.
(c) 3 rad/s. (d) 4 rad/s.
[GATE E.E. 2008]

149. Consider the following statements S_1 and S_2
S_1 : At the resonant frequency the impedance of a series R-L-C circuit is zero.
S_2 : In a parallel G-L-C circuit, increasing the conductance G results in increase in its Q factor.
Which one of the following is correct?
(a) S_1 is FALSE and S_2 is TRUE.
(b) Both S_1 and S_2 are TRUE.
(c) S_1 is TRUE and S_2 is FALSE.
(d) Both S_1 and S_2 are FALSE. [GATE E.E.C. 2004]

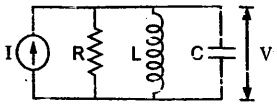
150. Consider the following statements :
If a high-Q parallel resonant circuit is loaded, then
1. the circuit impedance reduces.
2. the resonant frequency reduces.
3. the bandwidth reduces.
Which of the statements given above is/are correct ?
(a) 1 and 2 only. (b) 1 only.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

151. Consider the following circuit:
For the given circuit, the current source is sinusoidal with frequency equal to the resonant frequency of the circuit. What is the value of current through resistor ?



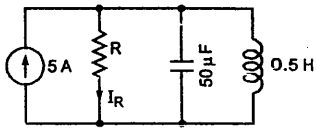
(a) 0 (b) 0.1 I (c) I (d) 10 I
[U.P.S.C. I.E.S. E.E.-I, 2004]

152. For the parallel RLC circuit shown, if R = 10 Ω, L = 0.1 H and C = 0.1 F, the current I is sinusoidal of frequency equal to the resonant frequency of the circuit, then the current through R is



(a) 0 (b) 0.1 I
(c) I (d) 10 I [U.P.S.C. I.E.S. E.E.-I, 2011]

153. In the given circuit, at resonance, i_R amperes is equal to

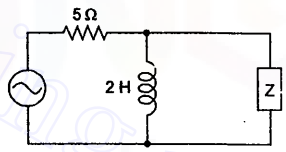


(a) 0 A (b) 10 A
(c) 5 A (d) 0·5 A
[U.P.S.C. I.E.S. E.E.-I, 2002]

154. A circuit has two parallel branches. In one branch, R and L are connected in series while in the other R and C are connected in series. If $R = \sqrt{L/C}$, which one of the following is not correct ?
(a) The circuit is in resonance.
(b) The two branch currents are in quadrature.
(c) The circuit has an impedance independent of its frequency.
(d) The two branch currents are in phase.
[U.P.S.C. I.E.S. E.E.-I, 2005]

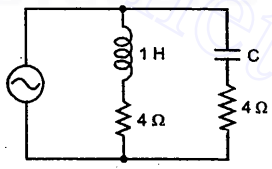
155. A parallel circuit consists of two branches. One branch has R_L and L connected in series and the other branch has R_C and C connected in series. Consider the following statements
1. The two branch currents will be in quadrature if $R_L R_C = L/C$.
2. The impedance of the whole circuit is independent of frequency, if $R_L = R_C$ and $\omega = 1/\sqrt{LC}$.
3. The circuit is in resonance for all the frequencies if $R_L = R_C$.
4. The two branch currents will be in phase at $\omega = 1/\sqrt{LC}$.
Which of the above statements are correct ?
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 3 and 4
[U.P.S.C. I.E.S. E.E.-I, 2002]

156. The value of Z in given figure which is most appropriate to cause parallel resonance at 500 Hz is



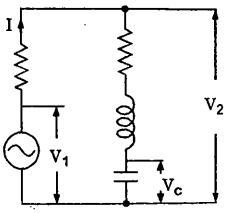
(a) 125·00 mH
(b) 304·2 μF
(c) 2·0 μF
(d) 0·05 μF
[GATE E.E. 2004]

157. The value of the capacitance 'C' in the given ac circuit to make it a constant resistance circuit or for the supply current to be independent of its frequency is



(a) $\frac{1}{16}$ F (b) $\frac{1}{12}$ F
(c) $\frac{1}{8}$ F (d) $\frac{1}{4}$ F
[U.P.S.C. I.E.S. E.E.-I, 2001]

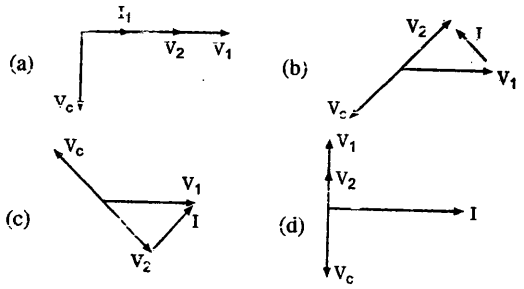
158. The circuit shown in the figure is energized by a sinusoidal voltage source V_1 at a frequency which causes resonance with a current of I. The phasor diagram which is applicable to this circuit is



Answers: **142.** (d), **143.** (d), **144.** (d), **145.** (b), **146.** (a), **147.** (a), **148.** (c), **149.** (d), **150.** (b), **151.** (c), **152.** (c), **153.** (c), **154.** (d), **155.** (a), **156.** (d), **157.** (a), **158.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

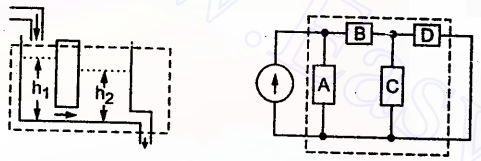


[GATE E.E. 2006]

159. For a parallel RLC circuit, if R = 40 Ω. L = 2 H and C = 0.5 F, the bandwidth and quality factor are respectively
(a) 20 rad/s, 0.05 (b) 10 rad/s, 20
(c) 20 rad/s, 10 (d) 0.05 rad/s, 20
[U.P.S.C. I.E.S. E.E.-I, 2010]

160. In an RLC series resonant circuit, if the maximum stored energy is increased by 10% and at the same time the energy dissipated per cycle is reduced by 10%, it will result in which one of the following?
(a) An 11% decrease in quality factor.
(b) An increase in the resonant frequency by 11%.
(c) A 22% increase in quality factor.
(d) A decrease in the resonant frequency by 22%.
[U.P.S.C. I.E.S. E.E.-I, 2009]

161. If the electrical circuit of figure (*b*) is an equivalent of the coupled tank system of figure (*a*), then



(*a*) *Coupled tank* (*b*) *Electrical equivalent*

(a) A, B are resistances and C, D capacitances.
(b) A, C are resistances and B, D capacitances.
(c) A, B are capacitances and C, D resistances.
(d) A, C are capacitances and B, D resistances. [GATE E.E. 2010]

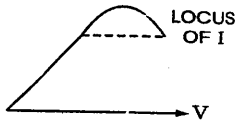
162. A parallel resonant circuit can be employed
(a) as a high impedance.
(b) to reject a small band of frequencies.
(c) to amplify certain frequencies.
(d) to amplify voltage. (e) both (a) and (b).

163. Q-factor of a parallel resonant circuit is
(a) $\dfrac{2\pi f_r}{\text{bandwidth}}$
(b) $2\pi \times \dfrac{\text{maximum stored energy}}{\text{energy dissipated per cycle}}$
(c) $\dfrac{\text{maximum stored energy}}{\text{energy dissipated per cycle}}$
(d) none of the above.

164. In series as well as parallel reasonant circuit, increase in resistance would cause
(a) increase in bandwidth of both the circuits.
(b) decrease in bandwidth of both the circuits.
(c) decrease in bandwidth in series circuit and increase in bandwidth in parallel circuit.
(d) increase in bandwidth in series circuit and decrease in bandwidth in parallel circuit.

165. At a frequency more than the resonant frequency
(a) both of the series and parallel circuits are capacitive.
(b) both of the series and parallel circuits are inductive.
(c) series circuit is inductive and parallel circuit is capacitive.
(d) series circuit is capacitive and parallel cirucit is inductive.

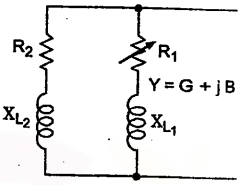
166. The given figure indicates the locus for the total current I taken by a two-branch parallel circuit fed from a constant voltage ac source V, when one element of the circuit is varied. Each branch contains two elements (R, L or C) in series.

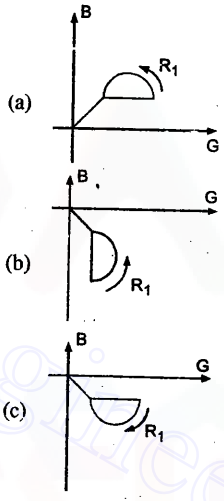


Consider the following combinations
1. Fixed R and C.
2. Fixed R and variable L.
3. Variable R and fixed R.
4. Fixed R and variable C.

The arrangements at the two branches are respectively.
(a) 1 and 2 (b) 2 and 3 (c) 1 and 4 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-I, 1995]

167. The admittance locus of the circuit shown in figure is



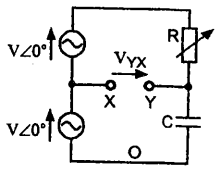


[U.P.S.C. I.E.S. E.E.-I, 1994]

168. A sinusoidal source of voltage V and frequency *f* is connected to a series circuit of variable resistance, R and a fixed reactance, X. The locus of the tip of the current phasor, I, as R is varied from 0 to ∞ is
(a) a semicircle with a diameter of V/X.
(b) a straight line with a slope of R/X.
(c) an ellipse with V/R as major axis.
(d) a circle of radius R/X and origin at (0, V/2). [GATE E.E. 1998]

169. A fixed capacitor of reactance – *j*0·02 Ω is connected in parallel across a series combination of a fixed inductor of reactance *j* 0·01 Ω and a variable resistance R. As R is varied from zero to infinity, the locus diagram of the admittance of this L-C-R circuit will be
(a) a semicircle of diameter *j* 100 and centre at zero.
(b) a semicircle of diameter *j* 50 and centre at zero.
(c) a straight line inclined at an angle.
(d) a straight line parallel to the *x*-axis. [GATE E.E. 1999]

170. In the figure given below all phasors are with reference to the potential at point "O". The locus of voltage phasor V_{YX} as R is varied from zero to infinity is shown by



Answers: **159.** (d), **160.** (c), **161.** (d), **162.** (e), **163.** (b), **164.** (a), **165.** (c), **166.** (c), **167.** (b), **168.** (a), **169.** (a), **170.** (b).

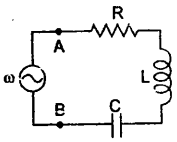
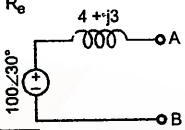
(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2007]

171. The R-L-C series circuit shown is supplied from a variable frequency voltage source. The admittance-locus of the R-L-C network at terminals AB for increasing frequency ω is



(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2007]

172. Voltage source is represented as shown in the figure given below. What is the equivalent current source?



(a) 
(b) 
(c) 
(d)

[U.P.S.C. I.E.S E.E.-I, 2008]

173. Currents I_1, I_2 and I_3 meet at a junction (node) in a circuit. All currents are marked as entering the node. If $I_1 = -6 \sin(\omega t)$ mA and $I_2 = 8 \cos(\omega t)$ mA, then I_3 will be

(a) $10 \cos(\omega t + 36.87)$ mA (b) $14 \cos(\omega t + 36.87)$ mA

(c) $-14 \sin(\omega t + 36.87)$ mA

(d) $-10 \cos(\omega t + 36.87)$ mA [GATE E.E. 1999]

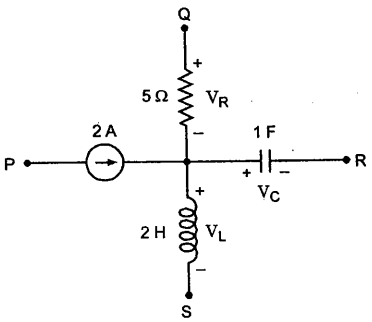
174. Three currents i_1, i_2 and i_3 are approaching a node. If $i_1 = 10 \sin(400t + 60°)$ A, and $i_2 = 10 \sin(400t - 60°)$ A, the i_3 is

(a) 0 (b) 10 (sin cos t) A

(c) -10 (sin 400 t) A (d) $-5\sqrt{3}$ (3 sin 400 t) A

[U.P.S.C. I.E.S. E.E.-I, 2002]

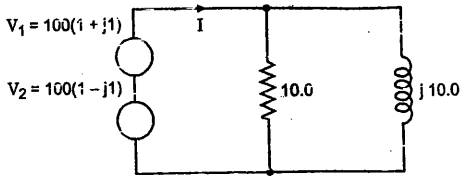
175. A segment of a circuit is shown in given figure $V_R = 5$ V, $V_C = 4 \sin 2t$. The voltage V_L is given by



(a) $3-8 \cos 2t$ (b) $32 \sin 2t$

(c) $16 \sin 2t$ (d) $16 \cos 2t$ [GATE E.E. 2003]

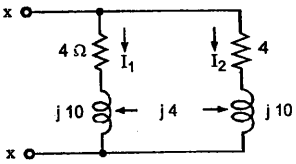
176. The phase angle of the current 'I' with respect to the voltage V_1 in the circuit shown in the figure is



(a) 0° (b) 45° (c) −45° (d) −90°

[U.P.S.C. I.E.S. E.E.-I, 1997]

177. Consider the following statements : In the circuit shown in the figure, if the equivalent impedance between $x - x$ is Z_{eq} then



1. $Z_{eq} = 2 + j5$
2. $Z_{eq} = 2 + j3$
3. $I_1 = -I_2$
4. $I_1 = I_2$

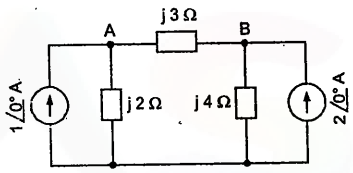
Of these statements

(a) 1 alone is true. (b) 2 and 4 are correct.

(c) 2 and 3 are correct. (d) 1 and 4 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1997]

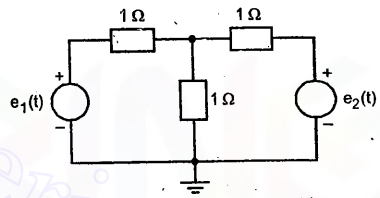
178. For the network shown in the given figure, the voltage V_B will be



(a) $j\,5{\cdot}33$ V (b) $5{\cdot}33$ V (c) $-j\,5{\cdot}33$ V (d) $j\,3{\cdot}33$

[U.P.S.C. I.E.S. E.E.-I, 2000]

179. In the circuit shown in given figure, $e_1(t) = \sqrt{3} \cos(\omega t + 30°)$ and $e_2(t) = \sqrt{3} \sin(\omega t + 60°)$. What is the voltage $v(t)$ across the 1 Ω grounded resistor?



(a) [cos ωt] V

(b) [sin $(\omega t + 30°)$ + cos $(\omega t + 60°)$] V

(c) $\left[1 \angle 90°\right]$ V

(d) [j 1] V

[U.P.S.C. I.E.S. E.E.-I, 2006]

180. If all the elements in a particular network are linear, then the superposition theorem would hold when the excitation is

(a) dc only. (b) ac only.

(c) either ac or dc. (d) an impulse.

[U.P.S.C. I.E.S. Elec. Engg.-I, 1993]

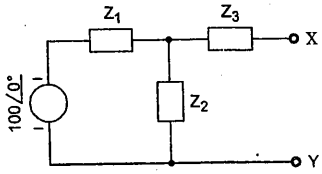
181. In the given figure

$Z_1 = 10 \angle -50°$,

$Z_2 = 10 \angle -60°$,

$Z_3 = 50 \angle 53.13°$.

Thevenin impedance seen from X-Y is



Answers: **171.** (a), **172.** (d), **173.** (d), **174.** (c), **175.** (b), **176.** (d), **177.** (b), **178.** (a), **179.** (a), **180.** (c), **181.** (a),

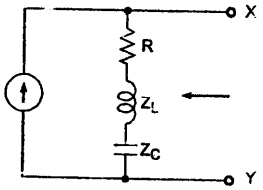
(a) $56.6 \angle 45°$ (b) $60 \angle 30°$

(c) $70 \angle 30°$ (d) $34.4 \angle 65°$ [GATE E.E. 2003]

182. In the figure the current source is $1 \angle 0°$ A, R = 1 Ω, the impedances are $Z_C = -j\,\Omega$, and $Z_L = 2j\Omega$. The Thevenin equivalent looking into the circuit across X-Y is



(a) $\sqrt{2} \angle 0°$ V, $(1+2j)\,\Omega$

(b) $2 \angle 45°$ V, $(1+2j)\,\Omega$

(c) $2 \angle 45°$ V, $(1+j)\,\Omega$

(d) $\sqrt{2} \angle 45°$ V, $(1+j)\,\Omega$ [GATE E.E. 2006]

183. The circuit shown in Fig. 1 is replaced by its Norton's equivalent in Fig. 2. The value of I will be

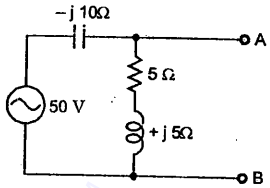


Fig. 1

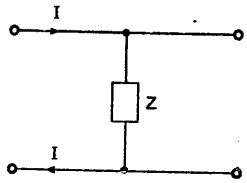

Fig. 2

(a) $2{\cdot}5 \angle 45°$ A (b) $5 \angle 90°$ A

(c) $10 \angle -90°$ A (d) $15 \angle -45°$

[U.P.S.C. I.E.S. E.E.-I, 2000]

184. Consider the following statements: The transfer impedance and admittance of a network remain constant when the position of excitation and response are interchanged if the network

1. is linear.
2. consists of bilateral elements.
3. has high impedance or admittance as the case may be.
4. is resonant.

Of these statements

(a) 1 and 2 are correct. (b) 1, 3 and 4 are correct.

(c) 2 and 4 are correct. (d) 1, 2, 3 and 4 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1994]

185. Which of the following statements are associated with Thevenin's theorem ?

1. Impedance through which current is required is removed and open-circuit voltage is found.
2. It is applicable to only dc circuits.
3. The network is replaced by a voltage source and a series impedance remains after removing the load impedance.

Select the correct answer using the code given below :

(a) 1 and 2 only. (b) 1 and 3 only.

(c) 2 and 3 only. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

186. The Thevenin's equivalent of a circuit operating at ω = 5 rads/s, has $V_{OC} = 3.71\angle -15.9°$ V and $Z_0 = 2.38 - j0.667\Omega$. At this frequency, the minimal realization of the Thevenin's impedance will have a

(a) resistor and a capacitor and an inductor.

(b) resistor and a capacitor.

(c) resistor and an inductor. (d) capacitor and an inductor.

[GATE E.E. 2008]

187. While applying reciprocity theorem.

(a) initial conditions are taken into consideration.

(b) impedances are real quantities.

(c) admittances are real quantities.

(d) none of the above.

[A.M.I.E. Sec. B. Circuit Theory and Control Summer 2006]

188. In a linear network, the ratio of voltage excitation to current response is unaltered when the position of excitation and response are interchanged. The assertions stems from the

(a) principle of duality. (b) reciprocity theorem.

(c) principle of superposition. (d) equivalence theorem.

[U.P.S.C. I.E.S. E.E.-I, 1993]

189. A certain network N feeds a load resistance as shown in Fig 1. It consumes a power of 'P'. If an indicated network is added as shown in Fig. 2, the power consumed by R will be

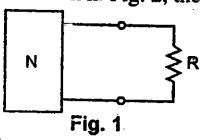

Fig. 1

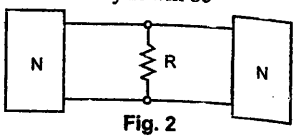

Fig. 2

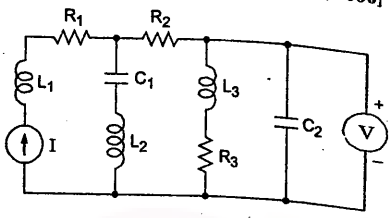
(a) less than P. (b) equal to P.

(c) between P and 4P. (d) more than 4P.

[U.P.S.C. I.E.S. E.E.-I, 2000]

190. In the circuit shown in the figure, the current source I = 1 A, the voltage source V = 5 V, $R_1 = R_2 = R_3 = 1\ \Omega$, $L_1 = L_2 = L_3 = 1$ H, $C_1 = C_2 = 1$ F. The currents (in A) through R_3 and the voltage source V respectively will be



(a) 1, 4 (b) 5, 1 (c) 5, 2 (d) 5, 4

[GATE E.E. 2006]

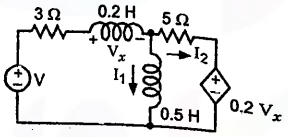
191. The state equation for the current I_1 shown in the network shown below in terms of the voltage V_x and the indepedent source V_x is given by

(a) $\frac{dI_1}{dt} = -1.4V_x - 3.75I_1 + \frac{5}{4}V$

(b) $\frac{dI_1}{dt} = -1.4V_x - 3.75I_1 - \frac{5}{4}V$

(c) $\frac{dI_1}{dt} = -1.4V_x + 3.75I_1 + \frac{5}{4}V$

(d) $\frac{dI_1}{dt} = -1.4V_x + 3.75I_1 - \frac{5}{4}V$



[GATE E.E. 2007]

192. According to maximum power transfer theorem, when is the maximum power absorbed by one network from another network?

(a) The impedance of one of the networks is half that of the other.

(b) The impedance of one is the complex conjugate of the other.

(c) The impedance of one is equal to that of the other.

(d) Only the resistive parts of both are equal.

[U.P.S.E. I.E.S. E.E.-I, 2008]

193. An independent voltage source in series with an impedance $Z_s = R_s + jX_s$ delivers a maximum average power to a load impedance Z_L when

(a) $Z_L = R_s + jX_s$ (b) $Z_L = R_s$

(c) $Z_L = jX_s$ (d) $Z_L = R_s - jX_s$

[GATE E.C.E. 2007]

194. If the source impedance of a constant voltage source is $R_i + jX_i$ and the load impedance is $R_L + jX_L$ and if only R_L can be varied, then for maximum power to be delivered at the load.

(a) $R_L = R_i$ (b) $R_L = \sqrt{R_i^2 + X_i^2}$

Answers: **182.** (d), **183.** (b), **184.** (a), **185.** (b), **186.** (b), **187.** (d), **188.** (b), **189.** (b), **190.** (d), **191.** (a), **192.** (b), **193.** (d), **194.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) $R_L = [R_i^2 + (X_L + X_i)^2]^{1/2}$
(d) $R_L = R_i + (X_L + X_i)$
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

195. An ac source of voltage E_s and an internal impedance of $Z_s = (R_s + jX_s)$ is connected to a load of impedance $Z_L = (R_L + jX_L)$. Consider the following conditions in this regard.
1. $X_L = X_s$ if only X_L is varied.
2. $X_L = -X_s$ if only X_L is varied.
3. $R_L = \sqrt{R_s^2 + (X_s + X_L)^2}$ if only R_L is varied.
4. $|Z_L| = |Z_s|$ if the magnitude of Z_L is varied, keeping the phase angle fixed.

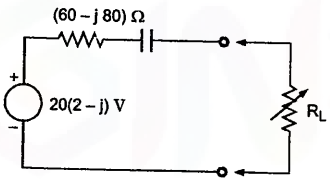
Among these conditions, those which are to be satisfied for maximum power transfer from the source to the load would include
(a) 2 and 3 (b) 1 and 3 (c) 1, 2 and 4 (d) 2, 3 and 4
[U.P.S.C. I.E.S. E.E.-I, 1993]

196. Under the conditions of maximum power transfer from an ac source to a variable load
(a) the load impedance must also be inductive, if the generator impedance is inductive.
(b) the sum of the source and the load impedances is zero.
(c) the sum of the source reactance and load reactance is zero.
(d) the load impedance has the same phase angle as the generator impedance.
[U.P.S.C. I.E.S. E.E.-I, 1995]

197. If the combined generator and line impedance is $(5 + j10)\ \Omega$, then for the maximum power transfer to a load impedance from a generator of constant generated voltage, the load impedance is given by which one of the following:
(a) $(5 + j10)\ \Omega$ (b) $(5 - j10)\ \Omega$
(c) $(5 + j5)\ \Omega$ (d) $5\ \Omega$
[U.P.S.C. I.E.S. E.E.-I, 2004]

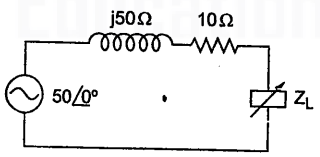
198. A voltage source having an internal impedance of $8 + j6\ \Omega$ supplies power to a resistive load. What should be the load resistance for maximum power transferred to it ?
(a) $8\ \Omega$ (b) $6\ \Omega$ (c) $10\ \Omega$ (d) $\sqrt{10}\ \Omega$
[U.P.S.C. I.E.S. E.E.-I, 2004]

199. The Thevenin equivalent of a network is as shown in the given figure. For maximum power transfer to the variable and purely resistive load R_L, its resistance should be



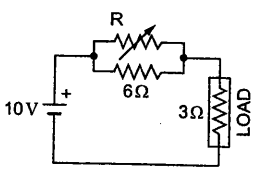
(a) $60\ \Omega$ (b) $80\ \Omega$ (c) $100\ \Omega$ (d) infinity.
[U.P.S.C. I.E.S. E.E.-I, 1998]

200. The maximum power that can be transferred in the load Z_L in the given circuit is



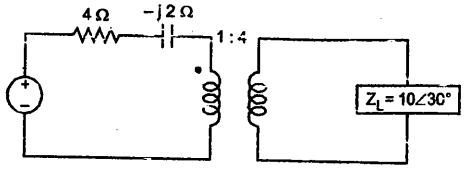
(a) 12.25 W
(b) 62.5 W
(c) 24.5 W
(d) 500 W
[U.P.S.C. I.E.S. E.E.-I, 2010]

201. In the given circuit, the value of R required for the transfer of maximum power to the load having a resistance of $3\ \Omega$ is



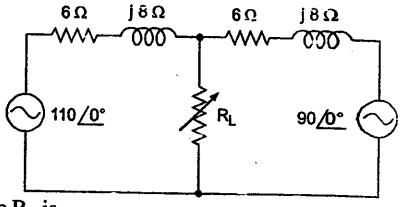
(a) zero (b) $3\ \Omega$
(c) $6\ \Omega$ (d) infinity
[GATE E.E. 2011]

202. The impedance seen by the source in the circuit shown is given by



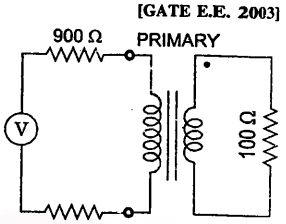
(a) $(0{\cdot}54 + j\,0{\cdot}313)\ \Omega$ (b) $(4 - j2)\ \Omega$
(c) $(4{\cdot}54 - j\ 1{\cdot}69)\ \Omega$ (d) $(4 + j2)\ \Omega$ [GATE E.E. 2000]

203. Two ac sources feed a common variable load as shown in the given figure. Under the maximum power transfer condition, the power absorbed by the load resistance R_L is



(a) 2200 W (b) 1250 W (c) 1000 W (d) 625 W
[GATE E.E. 2003]

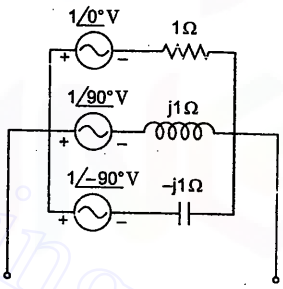
204. Consider the circuit shown in the given figure. For maximum power transfer to the load, the primary to secondary turn ratio must be



(a) 9:1 (b) 3:1
(c) 1:3 (d) 1:9
[U.P.S.C.I.E.S. E.E. I, 1995]

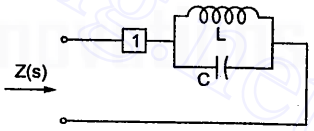
205. A source of angular frequency 1 rad/sec has a source impedance consisting of $1\ \Omega$ resistance in series with 1 H inductance. The load that will obtain the maximum power transfer is
(a) $1\ \Omega$ resistance.
(b) $1\ \Omega$ resistance in parallel with 1 H inductance.
(c) $1\ \Omega$ resistance in series with 1 F capacitor.
(d) $1\ \Omega$ resistance in parallel with 1 F capacitor.
[GATE E.C.E. 2003]

206. Replace the adjoining circuit by a single voltage source in series with an impedance.



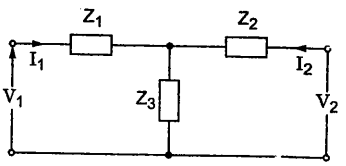
(a) 2 V, $1\ \Omega$
(b) 1 V, $3\ \Omega$
(c) 3 V, $1\ \Omega$
(d) 2 V, $3\ \Omega$
[U.P.S.C. I.E.S. E.E.-I, 2009]

207. A reactance network in the Foster's I form has poles at $\omega = 0$ (zero) and $\omega = \infty$ (infinity). The element in box-1 in the given network is



(a) a capacitor.
(b) an inductor.
(c) a parallel LC circuit.
(d) a series LC circuit.
[U.P.S.C. I.E.S. E.E.-I, 2010]

208. If the Z-parameters for the T-network as shown in figure are $Z_{11} = 40\ \Omega$, $Z_{22} = 50\ \Omega$ and $Z_{12} = Z_{21} = 30\ \Omega$, then what are the values of Z_1, Z_2 and Z_3?



(a) $10\ \Omega$, $20\ \Omega$ and $30\ \Omega$ (b) $20\ \Omega$, $30\ \Omega$ and $20\ \Omega$
(c) $30\ \Omega$, $40\ \Omega$ and $10\ \Omega$ (d) $40\ \Omega$, $50\ \Omega$ and $10\ \Omega$
[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **195.** (d), **196.** (c), **197.** (b), **198.** (c), **199.** (c), **200.** (b), **201.** (a), **202.** (c), **203.** (d), **204.** (b), **205.** (c), **206.** (c), **207.** (d), **208.** (a),

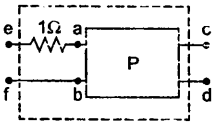
209. The two-port network P shown in the figure has ports 1 and 2, denoted by terminals (a, b) and (c, d) respectively. It has an impedance matrix Z with parameters denoted by z_{ij}. A 1 Ω resistor is connected in series with the network at port 1 as shown in the figure. The impedance matrix of the modified two-port network (shown as a dashed box) is



(a) $\begin{pmatrix} z_{11}+1 & z_{12}+1 \\ z_{21} & z_{22}+1 \end{pmatrix}$ (b) $\begin{pmatrix} z_{11}+i & z_{12} \\ z_{21} & z_{22}+1 \end{pmatrix}$

(c) $\begin{pmatrix} z_{11}+1 & z_{12} \\ z_{21} & z_{22} \end{pmatrix}$ (d) $\begin{pmatrix} z_{11}+i & z_{12} \\ z_{21}+i & z_{22} \end{pmatrix}$

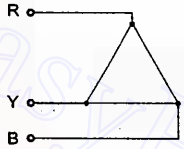
[GATE E.E. 2010]

210. Which of the following are the necessary conditions for an entire 3-Φ system to be balanced ?
1. The line voltages are equal in magnitude.
2. The phase differences between successive line voltages are equal.
3. The impedances in each of the phases are identical.

Select the correct answer using the codes given below:
Codes:
(a) 1, 2 and 3 (b) 1 and 3 (c) 1 and 2 (d) 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 1996]

211. The instantaneous values of currents in phases R and Y of a 3-phase system are 25 A each. For a phase sequence of BRY, the instantaneous value of current in phase B is
(a) 25 A (b) 50 A (c) 12.5 A (d) 43.3 A

212. The phase sequence of the 3-phase system shown in given figure is



(a) RYB (b) RBY
(c) BRY (d) YBR
[GATE E.E. 2004]

213. The rated voltage of a 3-phase power system is given as
(a) rms phase voltage. (b) peak phase voltage.
(c) rms line-to-line voltage. (d) peak line-to-line voltage.
[GATE E.E. 2004]

214. Total instantaneous power supplied by a 3-phase ac supply to a balanced R-C load as
(a) zero. (b) constant.
(c) pulsating with zero average.
(d) pulsating with non-zero average. [GATE E.E. 2004]

215. An alternator is delivering power to a balanced load at unity pf. The phase angle between the line voltage and the line current is
(a) 90° (b) 60° (c) 30° (d) 0°
[U.P.S.C. I.E.S. E.E.-I, 1997]

216. E_{oa}, E_{ob} and E_{oc} are three phase voltages while E_{ab}, E_{bc} and E_{ca} are three line voltages of a balanced three-phase system having a-b-c phase sequence. In relation to E_{oc}, E_{bc} would
(a) lag by 30°. (b) lead by 30°.
(c) have the same phase.
(d) have no definite phase relationship.
[U.P.S.C. I.E.S. E.E.-I, 1997]

217. In the balanced 3-phase voltage system generated by a star-connected alternator, V_{YB} lags E_R by
(a) 90° (b) 120° (c) 60° (d) 30°
[R.G.T.U. Basic Electrical Engineering June 2007]

218. For a 3-phase load balanced condition, each phase has the same value of _____.
(a) impedance (b) resistance
(c) power factor (d) all of these
[G.B.T.U. E.E. Even Semester 2016-11]

219. A three-phase heating unit and induction motor are connected in parallel across a 208 V three-phase supply. Motor is rated at 5 hp, 0.8 pf with efficiency of 0.85. Heating unit is rated at 1,500 W. The line current will be equal to
(a) 185 A (b) 1.85 A (c) 18.5 A (d) 15 A
[U.S.S.C. I.E.S. E.E.-I, 1999]

220. For delta-connected circuit the correct relationship is
(a) $V_L = V_{ph}$ (b) $I_{ph} \times \sqrt{3} = I_L$
(c) $V_L = I_L \times \sqrt{3}$ (d) both (a) and (b).
[R.G.T.U. Basic Electrical Engineering June 2008]

221. A balanced delta connected load has an impedance of $9\angle 30°\ \Omega$ per phase. What is the impedance per phase of its equivalent star ?
(a) $27\angle 30°\ \Omega$ (b) $27\angle 90°\ \Omega$
(c) $3\angle 30°\ \Omega$ (d) $3\angle 20°\ \Omega$
[U.P.S.C. I.E.S. E.E.-I, 2004]

222. A 3-phase star-connected symmetrical load consumes P watts of power from a balanced supply. If the same load is connected in delta to the same supply, the power consumption will be
(a) P (b) $\sqrt{3}$P (c) 3P (d) P/3
[R.G.T.U. Basic Electrical Engineering December 2006]

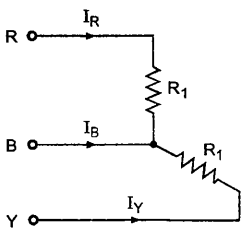
223. A 3-phase delta-connected symmetrical load consumes P watts of power from a balanced supply. If the same load is connected in star to the same supply, then what is the power consumption ?
(a) $\frac{P}{3}$ (b) P (c) $\sqrt{3}$ P (d) 3P
[U.P.S.C. I.E.S. E.E.-I, 2005]

224. A 3-phase 3-wire supply feeds a star connected load consisting of 3 equal resistors. If one of the resistors is to be removed, then what is the reduction in power as compared to the original power ?
(a) 25% of the original power.
(b) 33.3% of the original power.
(c) 50% of the original power.
(d) 66.66% of the original power. [U.P.S.C. I.E.S. E.E.-I, 2007]

225. Three identical impedances are connected in delta to a 3-phase supply of 400 V. The line-current is 34.65 A and the total power taken is 14.4 kW. The resistance of the load in each phase (in ohm) is
(a) 20 (b) 16 (c) 12 (d) 10
[U.P.S.C. I.E.S. E.E. I, 1993]

226. A balanced RYB-sequence, Y-connected (Star-connected) source with V_{RN} = 100 volts is connected to a Δ-connected (Delta-connected) balanced load of $(8 + j6)$ ohms per phase. Then the phase current and line current values respectively, are
(a) 10 A; 30 A (b) $10\sqrt{3}$ A; 30 A
(c) 10 A; 10 A (d) $10\sqrt{3}$ A; $10\sqrt{3}$ A
[U.P.S.C. I.E.S. E.E.-I, 2010]

227. For the three-phase circuit shown in the figure the ratio of the currents $I_R : I_Y : I_B$ is given by



(a) 1 : 1 : $\sqrt{3}$ (b) 1 : 1 : 2
(c) 1 : 1 : 0 (d) 1 : 1 : $\sqrt{3}/2$
[GATE E.E. 2005]

Answers: **209.** (c), **210.** (a), **211.** (b), **212.** (b), **213.** (c), **214.** (b), **215.** (c), **216.** (b), **217.** (a), **218.** (d), **219.** (c), **220.** (d), **221.** (c), **222.** (c), **223.** (a), **224.** (c), **225.** (c), **226.** (b), **227.** (a),

228. Two resistors of equal values are connected in series across the lines B and C of a symmetrical 3-phase, 400 V system. What is the magnitude of the voltage between the line A and the junction of resistors ?

(a) $400/\sqrt{3}$ (b) $200\sqrt{3}$ (c) 400/3 (d) $100\sqrt{3}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

229. Power factor of an inductive circuit is usually improved by adding a capacitor to it in

(a) series. (b) parallel. (c) either in series or parallel.

[R.G.T.U. Basic Electrical Engineering December 2006]

230. To improve the pf in three-phase circuits, the capacitor bank is connected in delta to make

(a) capacitance calculation easy.
(b) capacitance very small.
(c) the connection elegant.
(d) the pf correction more effective. [U.P.S.C. I.E.S. E.E.-I, 1999]

231. A balanced delta-connected load of $(8 + j6)\ \Omega$ per phase is connected to a 400 V, 50 Hz, 3-phase supply lines. If the input power factor is to be improved to 0·9 by connecting a bank of star-connected capacitors the required kVAR of the bank is

(a) 42·7 (b) 10·2 (c) 28·8 (d) 38·4

[GATE E.E. 2003]

232. A 400 V, 50 Hz, three-phase balanced source supplies power to a star-connected load whose rating is $12\sqrt{3}$ kVA, 0·8 pf (lag). The rating (in kVAR) of the delta-connected (capacitive) reactive power bank necessary to bring the pf to unity is

(a) 28·78 (b) 21·60 (c) 16·60 (d) 12·47

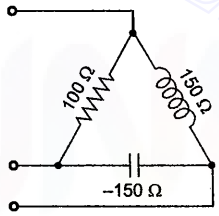
[GATE E.E. 2006]

233. A lamp load is given a supply from 3-phase-4-wire, 230/400 V ac supply system. If a three phase motor is now switched on across the same supply, then neutral current will

(a) increase. (b) decrease.
(c) remain unchanged. (d) unpredictable.

[R.G.T.U. Basic Electrical Engineering Jan./Feb. 2007]

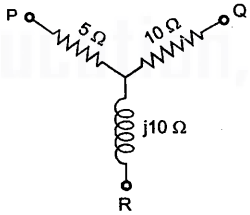
234. A set of 3 equal resistors, each of value R_X connected in star across R_{YB} in place of load as shown in the given figure consumes the same power as the unbalanced delta connected load. The value of R_X is



(a) 33.33 Ω (b) 100 Ω
(c) 173.2 Ω (d) 300 Ω

[U.P.S.C.I.E.S. E.E. II, 1995]

235. In the delta equivalent of the given star-connected circuit Z_{QR} is equal to



(a) 40 Ω (b) $(20 + j\ 10)\ \Omega$
(c) $\left(10 + j\frac{10}{3}\right)\Omega$
(d) $(10 + j\ 30)\ \Omega$

[U.P.S.C.I.E.S. E.E. I, 1995]

236. The power measurement in balanced three-phase circuit can be done by

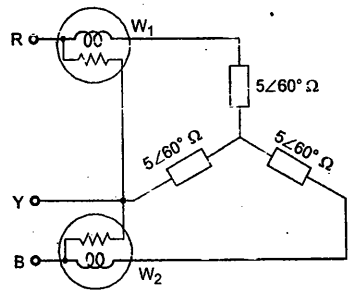
(a) one wattmeter method only.
(b) two wattmeters method only.
(c) three wattmeters method only.
(d) any one of the above. [U.P.T.U. E.E. Even Semester 2009-10]

237. The power delivered to a 3-phase load can be measured by the use of 2 wattmeters only when the

(a) load is balanced. (b) load is unbalanced.
(c) 3-phase load is connected to the source through 3-wires.
(d) 3-phase load is connected to the source through 4-wires.

[U.P.S.C. I.E.S. E.E.-I, 1995]

238. The line-to-line input voltage to the 3-phase, 50 Hz ac circuit shown in the given figure is 100 V_{rms}. Assuming that the phase sequence is RYB, the wattmeters would read



(a) $W_1 = 886$ W and $W_2 = 886$ W
(b) $W_1 = 500$ W and $W_2 = 500$ W
(c) $W_1 = 0$ W and $W_2 = 1000$ W
(d) $W_1 = 250$ W and $W_2 = 750$ W [GATE E.E. 2003]

239. While measuring power in a 3-phase load by 2 WM method. The readings of two wattmeters are equal and opposite when

(a) pf is unity. (b) load is balanced.
(c) phase angle is between 60° and 90°.
(d) the load is pure inductive.

[R.G.T.U. Basic Electrical Engineering Jan/Feb. 2007]

240. In 2 WM method of power measurement, one of the WM will show negative reading when the load pf angle is strictly

(a) less than 30°. (b) less than 60°.
(c) greater than 30°. (d) greater than 60°.

[R.G.T.U. Basic Electrical Engineering December 2006]

241. Two-wattmeter method is employed to measure power in a 3-phase balanced system with the current coils connected in the A and C lines. The phase sequence is ABC. If the wattmeter with its current coil in A-phase line reads zero, then the power factor of the 3-phase load will be

(a) zero lagging. (b) zero leading.
(c) 0.5 lagging. (d) 0.5 leading.

[U.P.S.C. I.E.S. E.E. I, 1993]

242. The ratio of the readings of two wattmeters connected to measure power in a balanced 3-phase load is 5:3 and the load is inductive. The power factor of the load is

(a) 0.917 lead. (b) 0.917 lag.
(c) 0.6 lead. (d) 0.6 lag.

[U.P.S.C. I.E.S. E.E.-I, 1994]

243. When two-wattmeter method of measurement of power is used to measure power in a balanced three-phase circuit, if the wattmeter reading is zero, then

(a) power consumed in the circuit is zero.
(b) power factor of the circuit is zero.
(c) power factor is unity. (d) power factor is 0·5.

[U.P.S.C. I.E.S. E.E.-I, 2002]

244. If the reading of two-wattmeters are equal and positive in two-wattmeter method, the load pf in a balanced 3-phase 3-wire circuit will be

(a) zero (b) 0·5 (c) 0·866 (d) unity

[U.P.S.C. I.E.S. E.E.-I, 1999]

245. The power of a three-phase, three-wire balanced system was measured by two-wattmeter method. The reading of one of the

Answers: **228.** (b), **229.** (c), **230.** (b), **231.** (b), **232.** (d), **233.** (c), **234.** (b), **235.** (d), **236.** (d), **237.** (c), **238.** (c), **239.** (d), **240.** (d), **241.** (c), **242.** (b), **243.** (d), **244.** (d), **245.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

wattmeters was found to be double that of the other. What is the pf of the system ?

(a) 1 (b) 0·866 (c) 0·707 (d) 0·5

[U.P.S.C. I.E.S. E.E.-I, 2004]

246. In the measurement of power on balanced load by two-wattmeter method in a 3-phase circuit, the reading of the wattmeters are 3 kW and 1 kW respectively, the latter being obtained after reversing the connections of the current coil. The pf of the load is

(a) 0·277 (b) 0·554 (c) 0·625 (d) 0·866

[U.P.S.C. I.E.S. E.E.-I, 2002]

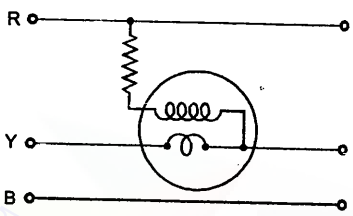
247. Two wattmeters, which are connected to measure the total power on a three-phase system supplying a balanced load, read 10·5 kW and – 2·5 kW respectively. The total power and the pf, respectively are

(a) 13·0 kW, 0·334 (b) 13·0 kW, 0·684

(c) 8·0 kW, 0·52 (d) 8·0 kW, 0·334

[GATE E.E. 2005]

248. A wattmeter is installed in a balanced 3-ϕ system and is connected as shown in given circuit diagram below. The wattmeter will measure _____ power.



(a) true
(b) reactive
(c) apparent (d) total

249. W_1 and W_2 are the readings of two wattmeters used to measure power of a 3-phase balanced load. The reactive power drawn by the load is

(a) $W_1 + W_2$ (b) $W_1 - W_2$

(c) $\sqrt{3}(W_1 + W_2)$ (d) $\sqrt{3}((W_1 - W_2))$

[A.M.I.E. Sec B. Elec. Machines Summer 1994, 1997]

250. v_{RN}, v_{YN} and v_{BN} are the instantaneous line to neutral voltages and i_R, i_Y and i_B are instantaneous line currents in a balanced three phase circuit, the computation $v_{RN}(i_Y - i_B) - (v_{YN} - v_{BN})\, i_R$ will yield a quantity proportional to the

(a) active power. (b) power factor.

(c) reactive power. (d) complex power.

[GATE E.E. 1993]

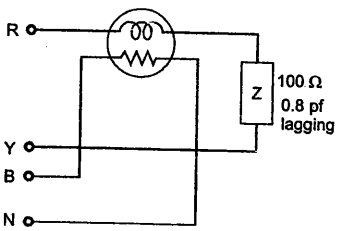
251. Readings of 1,154 and 577 watts are obtained when two-wattmeter method was used on a balanced load. The delta connected load impedance for a system of 100 V will be

(a) $5 \angle \pm 30°$ (b) $5 \angle +30°$

(c) $5 \angle -30°$ (d) $5 \angle -90°$

[U.P.S.C. I.E.S. E.E.-I, 1993]

252. A single phase load is connected between R and Y terminals of a 415 V, symmetrical, 3-phase, 4-wire system with phase sequence RYB. A wattmeter is connected in the system as shown in the given figure. The power factor of the load is 0·8 lagging. The wattmeter will read



(a) – 795 W (b) – 597 W (c) + 597 W (d) + 795 W

[GATE E.E. 2004]

253. In a 3-phase supply, floating neutral is undesirable because it may result in _____ across the load.

(a) unequal line voltages (b) high voltage

(c) low voltage

254. Phase reversal in a 4-wire unbalanced load supplied from a balanced 3-phase supply causes change in

(a) the power consumed.
(b) magnitude of phase currents.
(c) only the magnitude of the neutral current.
(d) magnitude as well as phase angle of the neutral current.

255. Three unequal impedances are connected in delta to a 3-phase, 3-wire system.

(a) The voltages across the three phases will be different.
(b) Both of the phase currents and line currents will be unbalanced.
(c) Phase currents will be unbalanced but the line currents will be balanced.
(d) None of the above.

256. Which one of the following functions is a periodic one ?

(a) $\sin(10\pi t) + \sin(20\pi t)$ (b) $\sin(10t) + \sin(20\pi t)$

(c) $\sin(10\pi t) + \sin(20t)$ (d) $\sin(10t) + \sin(25t)$

[U.P.S.C. I.E.S. E.T.E., 2008]

257. Any waveform can be expressed in Fourier series if

(a) sampling conditions are satisfied.
(b) dirchiet conditions are satisfied.
(c) maxwell's conditions are satisfied.
(d) none of the above conditions is required to be satisfied.

258. The complex wave is symmetrical when,

(a) it contains only even harmonics.
(b) it contains only odd harmonics.
(c) it contains both odd and even harmonics.
(d) phase difference between even harmonics and fundamental is either $\frac{\pi}{2}$ or $\frac{3\pi}{2}$.

259. Two complex waves will have the same wave form if

(a) they contain the same harmonics.
(b) harmonics are similarly spaced with respect to the fundamental.
(c) the ratio of corresponding harmonics to their respective fundamentals is the same.
(d) all of the above.

260. The Fourier series of a real periodic function has only

P. cosine terms if it is even Q. sine terms if it is even.

R. cosine terms if it is odd S. sin terms if it is odd.

Which of the above statements are correct ?

(a) P and S. (b) P and R. (c) Q and S. (d) Q and R.

[GATE E.C.E. 2009]

261. The Fourier series expansion of an even periods function contains

(a) only cosine terms. (b) cosine terms and a constant.

(c) only sine terms. (d) sine terms and a constant.

[A.M.I.E. Sec B. Circuit Theory and Control Summery 2006]

262. The trigonometric Fourier series for a complex wave will contain positive cosine terms only when

(a) it contains even harmonics.
(b) its two half cycles are symmetrical.
(c) its value is zero at $\theta = \pi, 2\pi$ etc.
(d) its value is zero at $\theta = \frac{\pi}{2}, \frac{3\pi}{2}$ etc.

263. A function $f(\theta)$ satisfies the relation $f(-\theta) = -f(\theta)$ when this function contains

Answers: **246.** (a), **247.** (d), **248.** (b), **249.** (d), **250.** (c), **251.** (b), **252.** (b), **253.** (a), **254.** (d), **255.** (b), **256.** (a), **257.** (b), **258.** (b), **259.** (d), **260.** (a), **261.** (a), **262.** (d), **263.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

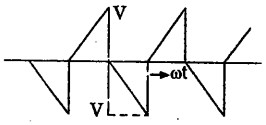
(a) only cosine terms. (b) only sine terms.
(c) both sine and cosine terms.
(d) none of the above.

264. For the expansion of $f(\omega t)$ in Fourier series $a_0 + a_1 \cos \omega t + \ldots + a_n \cos n\omega t + \ldots + \beta_1 \sin \omega t \ldots + b_n \sin n\omega t$ if $f(\omega t) = f(-\omega t)$ then
(a) $a_n = 0$ (b) $b_n = 0$ for all n
(c) $a_0 = 0$ (d) $a_n = 0$ for all n except $n = 0$.
[U.P.S.C. I.E.S. E.E.-I, 1994]

265. The Fourier series expansion of an odd periodic function contains
(a) cosine terms. (b) constant terms only.
(c) sine terms. [A.M.I.E. Sec B. Circuit & Field Theory Winter 1994]

266. Which of the following conditions is true for even function
(a) $f(t) = -f(n \pm \frac{T}{2})$ (b) $f(t) = -f(t)$
(c) $f(t) = f(-t)$ (d) $f(t) = f(T)$
[A.M.I.E. Sec B. Circuit & Field Theory Winter 1994]

267. The waveform shown in the figure given below contains



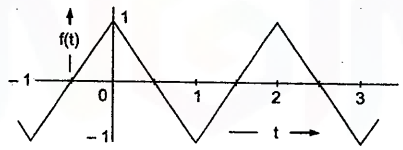
(a) only odd cos terms.
(b) only even sin terms.
(c) both sin and cos odd terms.
(d) both sin and cos even terms.

268. The Euler's identity is given by
(a) $e^{\pm j\omega t} = \sin \omega t \pm j \cos \omega t$ (b) $e^{\pm j\omega t} = \cos \omega t \pm j \sin \omega t$
(c) $e^{\pm j\omega t} = \sin \omega t \mp j \cos \omega t$ (d) none of these.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]

269. The complex exponential Fourier coefficient of a real valued time signal has
(a) odd symmetry. (b) even symmetry.
(c) conjugate symmetry. (d) no symmetry.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

270. The Fourier series for the function $f(x) = \sin^2 x$ is
(a) $\sin x + \sin 2x$ (b) $1 - \cos 2x$
(c) $\sin 2x + \cos 2x$ (d) $0{\cdot}5 - 0{\cdot}5 \cos 2x$
[GATE E.E. 2005]

271. Four series for the waveform, $f(t)$ shown in figure is



(a) $\frac{8}{\pi^2}\left[\sin(\pi t) + \frac{1}{9}\sin(3\pi t) + \frac{1}{25}\sin(5\pi t) + \ldots\right]$
(b) $\frac{8}{\pi^2}\left[\sin(\pi t) - \frac{1}{9}\cos(3\pi t) + \frac{1}{25} - \sin(5\pi t) + \ldots\right]$
(c) $\frac{8}{\pi^2}\left[\cos(\pi t) + \frac{1}{9}\cos(3\pi t) + \frac{1}{25}\cos(5\pi t) + \ldots\right]$
(d) $\frac{8}{\pi^2}\left[\cos(\pi t) - \frac{1}{9}\cos(3\pi t) + \frac{1}{25}\sin(5\pi t) + \ldots\right]$
[GATE E.E. 2002]

272. An even waveform when expressed in exponential fourier series will contain
(a) only imaginary coefficient. (b) only real coefficient.
(c) both of (a) and (b). (d) none of these.

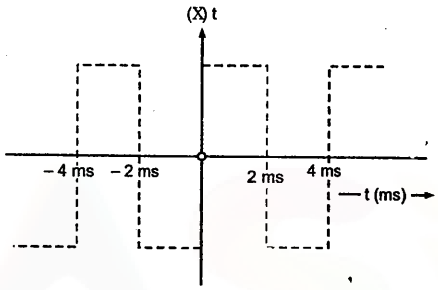
273. An exponential Fourier series coefficient is $\frac{j10}{2\pi n}$, trigonometric series cosine term coefficient will be
(a) $\frac{10}{\pi n}$ (b) $\frac{10j}{\pi n}$ (c) zero. (d) indeterminate.

274. Even higher harmonics will be of significant value in
(a) discontinuous waveform (b) continiuous waveform.
(c) both. (d) neither.

275. Let $x(t) = 5 \cos(50t + \sin 5t)$. Its instantaneous frequency (in rad/s) at $t = 0$ has the value
(a) 5 (b) 50 (c) 55 (d) 250
[U.P.S.C. I.E.S. E.E.-II, 2002]

276. A function $f(t) = \sin 1.1\,t + \sin 3.3\,t$ has the time period of
(a) $\frac{\pi}{1.1}$ (b) $\frac{2\pi}{1.1}$ (c) $\frac{2\pi}{3.3}$ (d) $\frac{2\pi}{2.2}$
[U.P.S.C. I.E.S. E.E.-I, 1994]

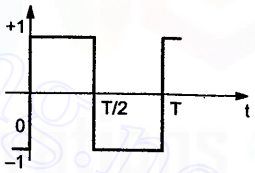
277. A periodic rectangular signal, $x(t)$ has the waveform shown in the figure. Frequency of the fifth harmonic of its spectrum is



(a) 40 Hz (b) 200 Hz (c) 250 Hz (d) 1,250 Hz
[GATE E.E. 1996]

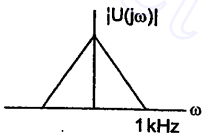
278. If an ac voltage wave is corrupted with an arbitrary number of harmonics, then the overall voltage waveform differs from its fundamental frequency component in terms of
(a) only the peak values.
(b) only the rms values.
(c) only the average values
(d) all the three measures (peak, rms, and average values).
[GATE E.E., 2000]

279. The second harmonic component of the periodic waveform given in the figure has an amplitude of

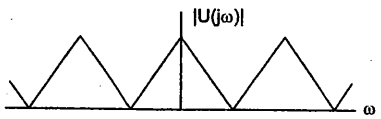


(a) 0 (b) 1
(c) $\frac{2}{\pi}$ (d) $\sqrt{5}$
[GATE E.E. 2010]

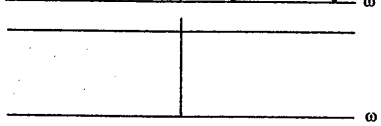
280. The frequency spectrum of a signal is shown in the figure. If this signal is ideally sampled at intervals of 1 ms, then the frequency spectrum of the sampled signal will be



(a)



(b)



Answers: **264.** (b), **265.** (c), **266.** (c), **267.** (c), **268.** (a), **269.** (b), **270.** (d), **271.** (c), **272.** (b), **273.** (c), **274.** (a), **275.** (c), **276.** (b), **277.** (d), **278.** (d), **279.** (a), **280.** (b),

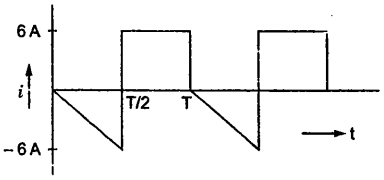
(c) 
(d)

[GATE E.E. 2007]

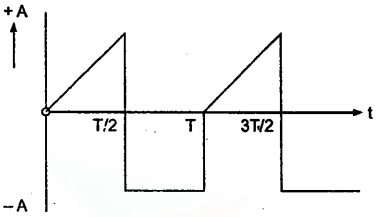
281. The rms value of the periodic waveform given in the figure is



(a) $2\sqrt{6}$ A
(b) $6\sqrt{2}$ A
(c) $\sqrt{4/3}$ A
(d) 1·5 A

[GATE E.E. 2004]

282. The rms value of the periodic waveform $e(t)$, shown in figure is



(a) $\sqrt{3/2}$ A
(b) $\sqrt{2/3}$ A
(c) $\sqrt{3}$ A
(d) $\sqrt{2}$ A

[GATE E.E. 1995]

283. Two current waveforms as shown in Fig. 1 and Fig. 2, are passed through identical resistors of 1 Ω. The ratio of heat produced in these resistors in a given time by current of Fig. 1 to Fig. 2 is

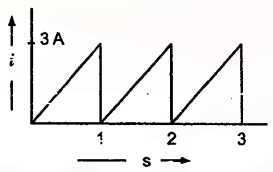


Fig. 1

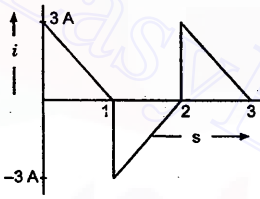

Fig. 2

(a) 2 : 1 (b) 1 : 2 (c) 1 : 1 (d) 1 : $\sqrt{2}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

284. The rms thermal noise currents of three resistors are I_1, I_2 and I_3 respectively. If these resistors are connected in parallel, the total equivalent noise current 'I' will be

(a) $I_1 + I_2 + I_3$ (b) $(I_1\ I_2\ I_3)^{1/3}$
(c) $\sqrt{I_1^2 + I_2^2 + I_3^2}$ (d) $\sqrt{I_1} + \sqrt{I_2} + \sqrt{I_3}$

[U.P.S.C. I.E.S. E.E.-II, 1998]

285. If the current flowing through a 20 ohm resistor is given as,

$i(t) = 4 + 5 \sin \omega t - 3 \cos 3\omega t$ amp,

then what is the power consumed by the resistor?

(a) 1000 W (b) 660 W
(c) 500 W (d) 180 W [U.P.S.C. I.E.S. E.E.-I, 2009]

286. What is the average power for periodic non-sinusoidal voltages and currents ?

(a) The average power of the fundamental component alone.
(b) The sum of the average powers of the harmonics excluding the fundamental.
(c) The sum of the average powers of the sinusoidal components including the fundamental.
(d) The sum of the root mean square power of the sinusoidal components including the fundamental.

[U.P.S.C. I.E.S. E.T.E.-I 2008]

287. In a two element series network, the voltage and current respectively are given as, $v(t) = 50 \sin (314t) + 50 \sin (942t)$V and $i(t) = 10 \sin (314t + 60°) + 8 \sin (942t + 45°)$ A, then the power factor of the network is approximately

(a) 0.9 (b) 0.6 (c) 0.3 (d) 0.1

[U.P.S.C. I.E.S. E.E.-I, 2008]

288. A function is given by $f(t) = \sin^2 t + \cos 2t$. Which of the following is true ?

(a) f has frequency components at 0 and $1/2\pi$ Hz.
(b) f has frequency components at 0 and $1/\pi$ Hz.
(c) f has frequency components at $1/2\pi$ and $1/\pi$ Hz.
(d) f has frequency components at 0, $1/2\pi$ and $1/\pi$ Hz.

[GATE E.C.E. 2009]

289. A pure resistance of 10 Ω has an applied voltage V(t) given as

$$V(t) = 230\left[1 - \frac{(\omega t)^2}{\lfloor 2} + \frac{(\omega t)^4}{\lfloor 4} - \frac{(\omega t)^6}{\lfloor 6} \ldots\right] \text{ volts}$$

The instantaneous current in the resistor is given by

(a) 23 cos ωt (b) 23 sin ωt
(c) 230 sin ωt (d) 230 cos ωt

290. If a capacitor is energised by a symmetrical square wave current, then the steady-state voltage across the capacitor will

(a) square wave. (b) triangular wave.
(c) step function. (d) impulse function.

[U.P.S.C. I.E.S. E.E.-I, 1993]

291. A 10 μF capacitor is fed from an ac voltage source containing a fundamental and a third harmonic of strength one-third of fundamental. The third harmonic current flowing through the capacitor expressed as percentage of the fundamental under steady-state condition will be

(a) 150% (b) 100% (c) 50% (d) 33%

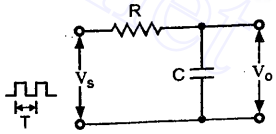
[U.P.S.C. I.E.S. E.E.-I, 1999, 2008]

292. Three identical star-connected resistors of 1·0 pu are connected to an unbalanced 3-phase supply. The load neutral is isolated. The symmetrical components of the line voltages in pu are : $V_{ab1} = X \angle \theta_1$. $V_{ab2} = Y \angle \theta_2$. If all the pu calculations are with the respective base values, the phase-to-neutral sequence voltages are:

(a) $V_{an1} = X \angle \theta_1 + 30°$, $V_{an2} = Y \angle \theta_2 - 30°$
(b) $V_{an1} = X \angle \theta_1 - 30°$, $V_{an2} = Y \angle \theta_2 + 30°$
(c) $V_{an1} = \frac{1}{\sqrt{3}} X \angle \theta_1 - 30°$, $V_{an2} = \frac{1}{\sqrt{3}} Y \angle \theta_2 - 30°$
(d) $V_{an1} = \frac{1}{\sqrt{3}} X \angle \theta_1 - 60°$, $V_{an2} = \frac{1}{\sqrt{3}} Y \angle \theta_2 - 60°$

[GATE E.E. 2006]

293. The waveform of the output voltage 'V_o' for the circuit shown in the given figure (RC >> 1) is a



(a) sinusoidal wave.
(b) square wave.
(c) series of spikes.
(d) triangular wave.

[U.P.S.C. I.E.S. E.E.-II, 2000]

294. When a periodic triangular voltage of peak amplitude 1 V and frequency 0.5 Hz is applied to a parallel combination of 1 Ω resistance and 1 F capacitance, the current through the voltage source has waveform

(a) (b)

Answers: **281.** (a), **282.** (b), **283.** (c), **284.** (c), **285.** (b), **286.** (d), **287.** (b), **288.** (b), **289.** (a), **290.** (b), **291.** (b), **292.** (b), **293.** (d), **294.** (d),

(c)  (d)  [GATE E.E. 1999]

295. In a 3-phase system __ __ the harmonics have negative phase sequence.
(a) 5 (b) 11 (c) 17 (d) all of these.

296. In a three-phase, balanced, delta connected system, each phase voltage contains a fundamental, a third harmonic and a fifth harmonic of RMS values : 100 V, 30 V and 20 V respectively. What is the RMS value of the line-to-line voltage?
(a) $\sqrt{100^2+30^2+20^2}$ (b) $\sqrt{3}\times\sqrt{100^2+30^2+20^2}$
(c) $\sqrt{100^2+20^2}$ (d) $\sqrt{3}\times\sqrt{100^2+20^2}$
[U.P.S.C. I.E.S. E.E.-I, 2009]

297. A voltage of $\{200\sqrt{2}\sin 314t + 6\sqrt{2}\sin(924+30°) + 8\sqrt{2}\cos(1570t+30°)\}$V is given to a harmonic distortion meter. The meter will indicate a total harmonic distortion of approximately
(a) 4·5% (b) 6·5% (c) 7·5% (d) 8·5%
[U.P.S.C. I.E.S. E.E.-I, 2000]

298. Which of the following will act as short circuit at $t = 0^+$ with zero initial conditions ?
(a) Capacitor. (b) Inductor.
(c) Resistor. (d) None of these.

299. Which of the following will act as open circuit at $t = 0^+$ with zero initial conditions?
(a) Resistor. (b) Capacitor.
(c) Inductor. (d) None of these.

300. Transient disturbance occurs in a circuit whenever it is
(a) shorted.
(b) suddenly connected or disconnected from the supply.
(c) subjected to changing voltage.
(d) all of the above.

301. In electrical circuits, transient currents are associated with
(a) resistors. (b) inductors.
(c) capacitors. (d) both (b) and (c).

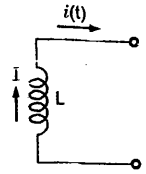
302. The transients produced due to sudden but energetic changes from one steady state of a circuit to another are known as_____ transients.
(a) transition (b) relaxation
(c) initiation (d) none of these

303. A component that opposes the change in circuit current is
(a) resistance. (b) capacitance.
(c) inductance. (d) conductance.
[A.M.I.E. Electrical Science Summer 1996]

304. For a dc voltage an indcutor
(a) is virtually a short circuit.
(b) is an open circuit.
(c) depends on polarity. (d) depends on voltage value.
[A.M.I.E. Electrical Science Summer 1996]

305. Consider the following data:
1. Input applied for $t < t_0$ 2. Input applied for $t \geq t_0$
3. State of the network at $t = t_0$
4. State of the network at $t > t_0$
Among these, those needed for determining the response of a linear network for t > 0 would include
(a) 1, 3 and 4 (b) 2, 3 and 4
(c) 2 and 3 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-I, 1993]

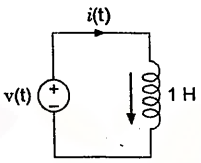
306. An inductor with inductance L and initial current I_0 is shown as



The correct admittance diagram for it is

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 1994]

307. If a pulse voltage v (*t*) of 4 V magnitude and 2 second duration is applied to a pure inductor of 1 H. with zero initial current, The current (in amps) drawn at $t = 3$ seconds will be
(a) zero (b) 2
(c) 4 (d) 8



[U.P.S.C. I.E.S. E.E. I, 1994]

308. Inductance affects the flow of direct current at the time of
(a) turning off. (b) turning on.
(c) turning on and off. (d) none of the above.

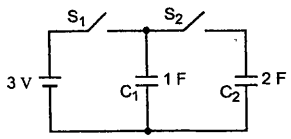
309. A 0.2 H inductor with an initial current of 4 A is in parallel with a resistor of 100 Ω. The current at 0.8 ms is
(a) $4e^{-0.4}$ A (b) $4e^{-16\times10^{-6}}$ A
(c) $4e^{-0.4\times10^{-3}}$ A (d) $4e^{-16\times10^{-3}}$ A
[U.P.S.C. I.E.S. E.E.-I, 2011]

310. The time domain relationship between voltage and current in a capacitor is

(a) $i_C(t) = \frac{1}{C}\frac{dv_C(t)}{dt}$ (b) $i_C(t) = \frac{1}{C}\int_{-\infty}^{t} v_C(t)dt$

(c) $i_C(t) = C\int_{-\infty}^{t} v_C(t)dt$ (d) none of the above.
[A.M.E.E. Sec B. Circuit Theory and Control Summer 2006]

311. In the figure shown, all elements used are ideal. For time $t < 0$, S_1 remained closed and S_2 open. At $t = 0$, S_1 is opened and S_2 is closed. If the voltage V_{c2} across the capacitor C_2 at $t = 0$ is zero, the voltage across the capacitor combination at $t = 0^+$ will be



(a) 1 V (b) 2 V (c) 1.5 V (d) 3 V.
[GATE E.E. 2009]

312. A current impulse, 5 $d(t)$ is forced through a capacitor C. The voltage, $v_C(t)$, across the capacitor is given by

Answers: **295.** (d), **296.** (a), **297.** (a), **298.** (a), **299.** (c), **300.** (d), **301.** (d), **302.** (a), **303.** (c), **304.** (a), **305.** (c), **306.** (a), **307.** (d), **308.** (c), **309.** (a), **310.** (c), **311.** (a), **312.** (d),

Downloaded From : www.EasyEngineering.net

(a) $5t$ (b) $5u(t) - C$ (c) $\frac{5}{C}t$ (d) $\frac{5u(t)}{C}$

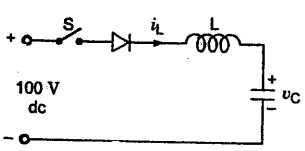
[GATE E.E. 2002]

313. When a series R-L circuit is connected to a voltage V at $t = 0$, the current passing through the inductor I. at $t = 0^+$ is

(a) $\frac{V}{R}$ (b) ∞ (c) 0 (d) $\frac{V}{L}$

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

314. In the circuit of figure, the switch 'S' is closed at $t = 0$ with $i(0) = 0$, and $v_c(0) = 0$. In the steady-state v_c equals



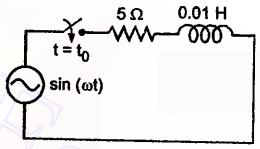
(a) 200 V
(b) 100 V
(c) zero (d) −100 V

[GATE E.E. 1992]

315. A unit step voltage is applied at $t = 0$ to a series RL circuit with zero initial conditions

(a) it is possible for the current to be oscillatory.
(b) the voltage across the resistor at $t = 0^+$ is zero.
(c) the energy stored in the inductor in the steady-state is zero.
(d) the resistor current eventually falls to zero. [GATE E.E. 2001]

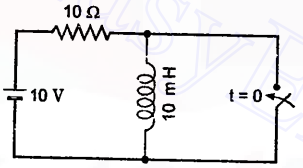
316. Consider the circuit shown in given figure. If the frequency of the source is 50 Hz, then a value of t_0 which results in a transient free response is



(a) 0 ms (b) 1·78 ms
(c) 2·71 ms (d) 2·91 ms

[GATE E.E. 2002]

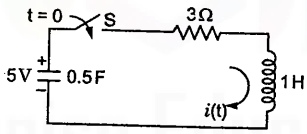
317. The circuit shown in the figure is in steady-state when the switch is closed at $t = 0$. Assuming that the inductance is ideal, the current through the inductor at $t = 0^+$ equals



(a) 0 A (b) 0·5 A
(c) 1 A (d) 2 A

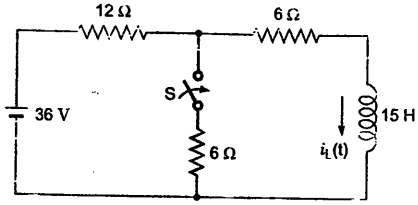
[GATE E.E. 2005]

318. The nature of current response $i(t)$ for $t \geq 0$ for the network shown in



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2011]

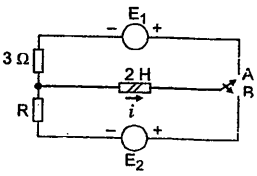
319. In the circuit shown in the figure, the switch S has been open for a long time. It is closed at $t = 0$. For $t > 0$ the current flowing through the inductor will be given by



(a) $i_L(t) = 1.2 + 0.8\,e^{-2t}$ (b) $i_L(t) = 0.8 + 1.2\,e^{-2t}$
(c) $i_L(t) = 1.2 - 0.8\,e^{-2t}$ (d) $i_L(t) = 0.8 - 1.2\,e^{-2t}$

[U.P.S.C. I.E.S. E.E.-I, 1993]

320. In the circuit shown in the given figure, the switch is moved from position A to B at time $t = 0$. The current i through the inductor satisfies the following conditions :



$i(0) = -8$A, $\frac{di}{dt}(t = 0) = 3$A/s,
$i(\infty) = 4$ A.
The value of R is

(a) 0.5 ohm (b) 2 ohm (c) 4 ohm (d) 12 ohm

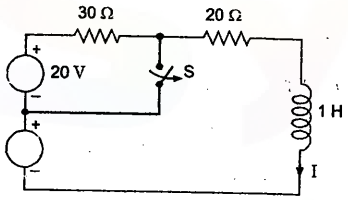
[U.P.S.C. I.E.S. E.E.-I, 2002]

321. If an R-L circuit having impedance angle ϕ is switched on when the applied sinusoidal voltage wave is passing through an angle θ, there will be no switching transient if

(a) $\theta - \Phi = 0$ (b) $\theta + \Phi = 0$
(c) $\theta - \Phi = 90°$ (d) $\theta + \Phi = 90°$

[U.P.S.C. I.E.S. E.E.-I, 1994]

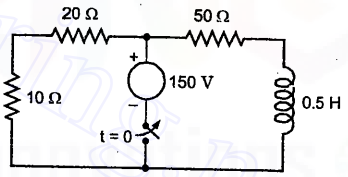
322. Consider the following circuit:
The circuit shown in the figure atttains a steady-state with the switch S closed. What is the value of $i(t)$ for $t \leq 0$ if the switch is opened at $t = 0$?



(a) $0{\cdot}5 + 0{\cdot}5\,e^{-50t}$ (b) $0{\cdot}6 - 0{\cdot}1\,e^{-50t}$
(c) $0{\cdot}5 - 0{\cdot}05\,e^{-50t}$ (d) $0{\cdot}6 + 0{\cdot}6\,e^{-20t}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

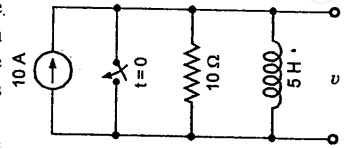
323. In the circuit shown in the figure, the switch is opened at $t = 0$ after having been closed for a long time. What is the current through 50 Ω resistor ?



(a) $3\,e^{-1/160t}$
(b) $3\,e^{-1/100t}$
(c) $3\,e^{-100t}$ (d) $3\,e^{-160t}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

324. In the circuit shown in the given figure, if the switch is closed at $t = 0$, then the voltage $v(0^+)$ and its derivative $\left.\frac{dv}{dt}\right|_{t=0^+}$ will be respectively



(a) 10 V, 50 V/s (b) 10 V, − 50 V/s
(c) 100 V, 200 V/s (d) 100 V, − 200 V/s

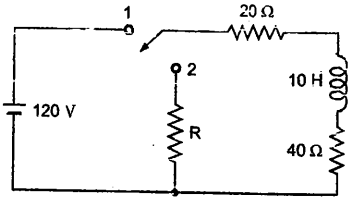
[U.P.S.C. I.E.S. E.E.-I, 1999]

325. A coil of inductance 10 H and resistance 40 Ω is connected as shown in the figure. After the switch has been in contact with point 1 for a very long time, it is moved to point 2 at $t = 0$.

Answers: **313.** (c), **314.** (b), **315.** (b), **316.** (b), **317.** (c), **318.** (b), **319.** (a), **320.** (a), **321.** (a), **322.** (b), **323.** (d), **324.** (d), **325.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net



If, at $t = 0^+$, the voltage across the coil is 120 V, the value of resistance R is

(a) 0 Ω (b) 20 Ω (c) 40 Ω (d) 60 Ω

[GATE E.E. 2005]

326. For the value of obtained in above question 325, the time taken for 95% of the stored energy to be dissipated is close to

(a) 0·10 s (b) 0·15 s (c) 0·50 s (d) 1·0 s

[GATE E.E. 2005]

327. In an R-L circuit connected to an alternating sinusoidal voltage, the magnitude of transient current primarily depends on the

(a) instant in the voltage cycle at which circuit is closed.
(b) impedance of the circuit.
(c) frequency of the voltage.
(d) peak value of steady state current.

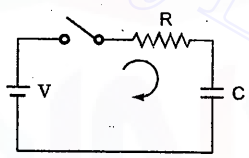
328. A series R-L circuit is to be connected to an ac source $v(t) = V_m \sin(\omega t + \phi)$ volt. Which one of the following is correct ? The transient current will be absent if the source is connected at a time t_0 such that

(a) $\omega t_0 = 0$ (b) $\omega t_0 = \frac{\pi}{2}$

(c) $\omega t_0 = \tan^{-1}\frac{\omega L}{R}$ (d) ωt_0 has any arbitrary value.

[U.P.S.C. I.E.S. E.E.-I, 2008]

329. The transient response of the initially relaxed network shown in figure is



(a) $i = \frac{V}{R} e^{-t/CR}$

(b) $i = \frac{V}{R} e^{t/RC}$

(c) $i = \frac{V}{R}(1 - e^{-t/RC})$

(d) $i = \frac{V}{R}(1 + e^{-t/RC})$

[U.P.S.C. I.E.S. E.E.-I, 1993]

330. An R-C series circuit is excited by a dc source. After its switching on

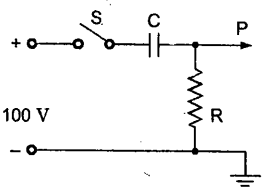
(a) the voltages across resistance R and capacitance are equal.
(b) the voltage across resistance is zero.
(c) the voltage across capacitance is zero.
(d) the sum of the voltage across R and C is always equal to the supply voltage.

331. An initially relaxed RC-series network with R = 2 MΩ and C = 1 μF is a switched on to a 10 V step input. The voltage across the capacitor after 2 seconds will be

(a) zero (b) 3.68 V (c) 6.32 V (d) 10 V

[U.P.S.C. I.E.S. E.E.-I, 1998]

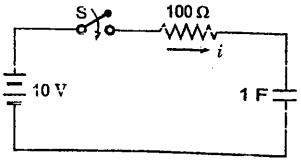
332. In the network shown in the figure given below C = 5 μF and R = 2 MΩ. The potential at P, at the instant of closing the switch S and 10 seconds after closing S will respectively be



(a) 0 V and 63.2 V.
(b) 100 V and 63.2 V.
(c) 0 V and 36.8 V.
(d) 100 V and 36.8 V.

[U.P.S.C. I.E.S. E.E. I, 1993]

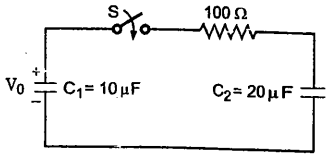
333. In the circuit shown in the figure, the switch S is closed at $t = 0$. The value of current at $t = 0^+$ will be



(a) zero (b) − 1 A
(c) + 1 A
(d) indeterminate.

[U.P.S.C. I.E.S. E.E.-I, 1993]

334. In the network shown in figure given below, the capacitor C_1 is initially charged to a voltage V_0 before the switch S is closed. In the steady-state



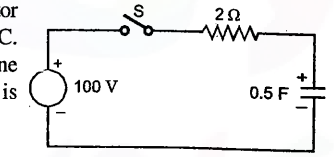
(a) C_1 and C_2 are charged to equal coulombs.
(b) C_1 and C_2 are charged to equai voltage.
(c) C_1 and C_2 are discharged fully.
(d) C_2 alone is charged to voltage V_0. [A.M.I.E. Sec B. Winter 1994]

335. The steady-state current in the R-C series circuit, on the application of step voltage of magnitude E will be

(a) zero. (b) E/R. (c) $\frac{E}{R} e^{\frac{-t}{CR}}$ (d) $\frac{E}{RC} e^{-t}$

[U.P.S.C. I.E.S. E.E.-I, 1993]

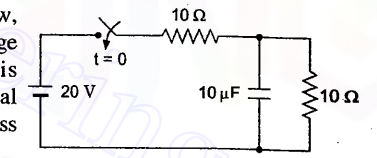
336. In the given figure, the capacitor initially has a charge of 10 C. The current in the circuit one second after the switch S is closed will be



(a) 14·7 A (b) 18·5 A
(c) 40·0 A (d) 50·0 A

[GATE E.E. 2004]

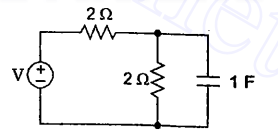
337. In the figure given below, the initial capacitor voltage is zero. The switch is closed at $t = 0$. The final steady-state voltage across the capacitor is



(a) 20 V (b) 10 V (c) 5 V (d) 0 V

[GATE E.E. 2005]

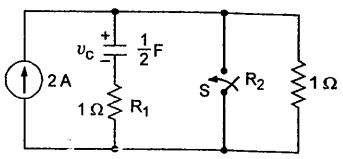
338. What is the time constant of the circuit?



(a) 0.5 s (b) 1 s
(c) 2 s (d) 4 s

[U.P.S.C. I.E.S. E.E.-I, 2008]

339. The circuit shown in the given figure is in steady-state with switch 'S' open. The switch is closed at $t = 0$. The values of $V_c(0^+)$ and $V_c(\infty)$ will be respectively



(a) 2 V, 0 V (b) 0 V, 2 V (c) 2 V, 2 V (d) 0 V, 0 V

[U.P.S.C. I.E.S. E.E.-I, 1997]

Answers: **326.** (c), **327.** (a), **328.** (c), **329.** (a), **330.** (d), **331.** (c), **332.** (d), **333.** (c), **334.** (b), **335.** (a), **336.** (a), **337.** (b), **338.** (b), **339.** (a),

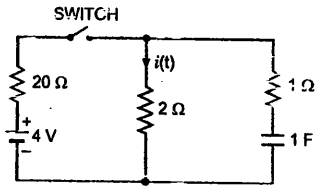
340. In the circuit shown, switch is opened at $t = 0$. Prior to that switch was closed $i(t)$ at $t = 0^+$ is

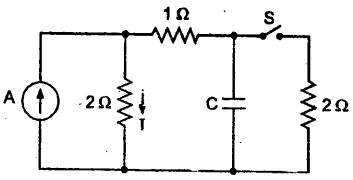


(a) $\frac{2}{3}$ A (b) $\frac{3}{2}$ A

(c) $\frac{1}{3}$ A (d) 1 A

[U.P.S.C. I.E.S. E.E.-I, 1999]

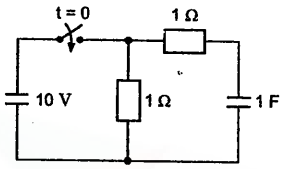
341. The steady-state in the circuit, shown in the given figure is reached with S open. S is closed at $t = 0$. The current I at $t = 0^+$ is



(a) 1 A (b) 2 A (c) 3 A (d) 4 A

[U.P.S.C. I.E.S. E.E.-I, 2001]

342. In the circuit shown in given figure, the switch is closed at $t = 0$. The current through the capacitor will decrease exponentially with a time constant

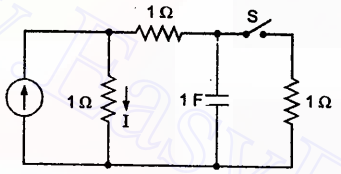


(a) 0·5 s (b) 1 s

(c) 2 s (d) 10 s

[U.P.S.C. I.E.S. E.E.-I, 2002]

343. In the given circuit, the steady-state is attained with S open. S is closed at $t = 0$. What is the value of current I at $t = 0^+$?



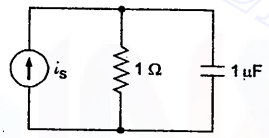
(a) 2 A

(b) 2·25 A

(c) 3 A (d) 4 A

[U.P.S.C. I.E.S. E.E.-I, 2005]

344. In the circuit shown in the figure, if $i_s = u(t)$ A, then what are the initial and steady-state voltages across the capacitor ?



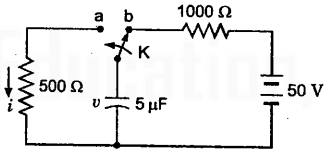
(a) 1 V and 1 V respectively.

(b) 1 V and 0, respectively.

(c) 0 and 1 V, respectively. (d) 0 and 0, respectively.

[U.P.S.C. I.E.S. E.E.-I, 2006]

345. At $t = 0$, the switch K is thrown from b to a of the circuit shown in the figure. What are the values of $v(0^+)$ and $i(0^+)$?



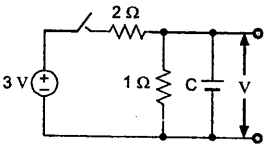
(a) 50 V, 90 mA

(b) 50 V, 100 mA

(c) 50 V, 110 mA (d) 50 V, 120 mA

[U.P.S.C. I.E.S. E.E.-I, 2006]

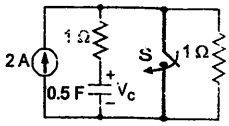
346. In the network shown, it is given that v = 1 V and $\frac{dv}{dt} = -10$ V/s at a time t, where t is the time after the switch S is closed. What is the value of C?



(a) 0.05 F (b) 0.1 F (c) 0.15 F (d) 0.2 F

[U.P.S.C. I.E.S. E.E.-I, 2008]

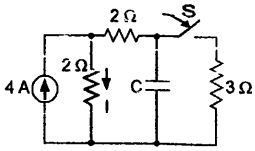
347. The circuit shown in the given figure is in steady-state with switch S open. The switch is closed at $t = 0$. What are the values of $V_C(0^+)$ and $V_C(\infty)$, respectively?



(a) 0 V, V (b) 0 V, 2 V (c) 2 V, 0 V (d) 2 V, 2 V

[U.P.S.C. I.E.S. E.E.-I, 2007]

348. Steady state is reached with S open. S is closed at $t = 0$. What is value of the current I at $t = 0^+$?

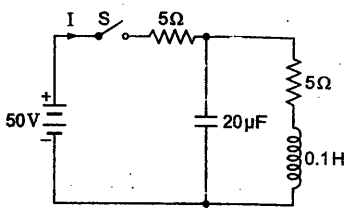


(a) 1 A (b) 2 A

(c) 3 A (d) 4 A

[U.P.S.C. I.E.S. E.E.-I, 2007]

349. The network shown in the figure is initially at rest. What is the initial current I when the switch S is closed at $t = 0$?



(a) 0 A

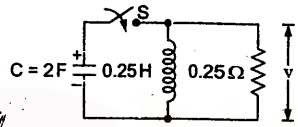
(b) 5 A

(c) 10 A

(d) 20 A

[U.P.S.C. I.E.S. E.E.-I, 2009]

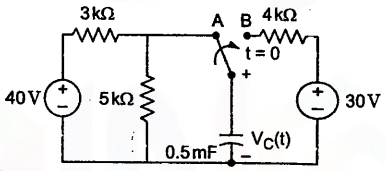
350. For the given circuit, the initial inductor current and the voltage across the capacitor are zero and 2, respectively. When the switch S is closed at $t = 0$, the values of v and $\frac{dv}{dt}$ are, respectively



(a) 2, −4 (b) 0, 0.25

(c) 0, −0.5 (d) 2, 0 [U.P.S.C. I.E.S. E.E.-I, 2010]

351. For the circuit shown in the figure, the switch has been in position A for a long time. At $t = 0$, switch is moved to B. Then, the capacitor voltage $V_C(t)$ for $t > 0$ is

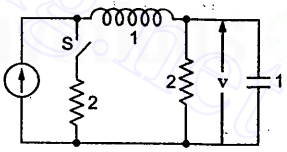


(a) $V_C(t) = (24 - 6\,e^{-2t})$ V (b) $V_C(t) = (30 - 15\,e^{-0.5t})$ V

(c) $V_C(t) = (6 - 6\,e^{-2t})$ V (d) $V_C(t) = (30 - 5\,e^{-0.5t})$ V

[U.P.S.C. I.E.S. E.E.-I, 2010]

352. The circuit as shown in the figure is in the steady state. The switch S is closed at $t = 0$. What are the values of v and $\frac{dv}{dt}$ at $t = 0^+$?



(a) 0 and 4 (b) 4 and 0

(c) 2 and 0 (d) 0 and 2

[U.P.S.C. I.E.S. E.E.-I, 2009]

353. A 100 Ω resistor has an effective inductance of 0.1 μH and a distributed capacitance of 10 pF. Its time constant at medium frequency is

(a) 0 ns (b) 1 ns (c) 2 ns (d) 3 ns

[U.P.S.C. I.E.S. E.E.-I, 2011]

Answers: **340.** (a), **341.** (b), **342.** (b), **343.** (c), **344.** (c), **345.** (b), **346.** (b), **347.** (c), **348.** (d), **349.** (c), **350.** (a), **351.** (d), **352.** (b), **353.** (c),

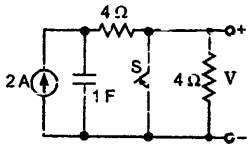
354. In the given network, S is closed for a long time till steady state is attained. S is opened at $t = 0$. What are the values of voltage V at $t = 0^+$ and $t = \infty$?



(a) 8 V, 8 V (b) 4 V, 8 V
(c) 8 V, 4 V (d) 4 V, 4 V

[U.P.S.C. I.E.S. E.E.-I, 2007]

355. A series L-C circuit is suddenly connected to a dc voltage source of V volts. The current in the series circuit, just after the switch is closed, is equal to

(a) $\frac{V}{L}$ (b) $\frac{V}{C}$ (c) zero (d) $\frac{V}{LC}$

356. Transient current in an R-L-C circuit is oscillatory when

(a) $R = 0$ (b) $R > 2\sqrt{\frac{L}{C}}$
(c) $R < 2\sqrt{\frac{L}{C}}$ (d) $R = 2\sqrt{\frac{L}{C}}$

357. A series R-L-C circuit is switched on to a step voltage V at $t = 0$. What are the initial and final values of the current in the circuit, respectively ?

(a) $\frac{V}{R}, \frac{V}{R}$ (b) Zero, Infinity
(c) Zero, Zero (d) Zero, $\frac{V}{R}$

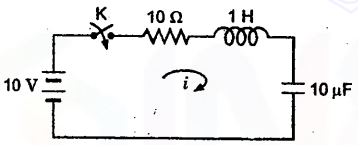
[U.P.S.C. I.E.S. E.E.-I, 2008]

358. When is a series RLC circuit overdamped ?

(a) $\frac{R^2}{4L^2} = \frac{1}{LC}$ (b) $\frac{R^2}{4L} < \frac{1}{C}$
(c) $\frac{R^2}{4L} > \frac{1}{C}$ (d) $\frac{R^2}{4C^2} = \frac{1}{LC}$

[U.P.S.C. I.E.S. E.E.-I, 2007]

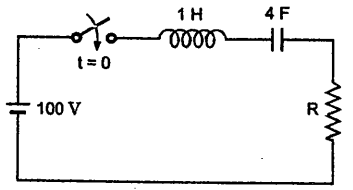
359. Initially, the circuit shown in the given figure was relaxed. If the switch is closed at $t = 0$, the values of $i(0^+)$, $\frac{di}{dt}(0^+)$ and $\frac{d^2i}{dt^2}(0^+)$ will respectively be



(a) 0, 10, – 100 (b) 0, 10, 100
(c) 10, 100, 0 (d) 100, 0, 10

[U.P.S.C. I.E.S. E.E.-I, 2000]

360. In the given circuit, the value of R that will give critical damping is



(a) 1 Ω (b) 2 Ω (c) 4 Ω (d) 10 Ω

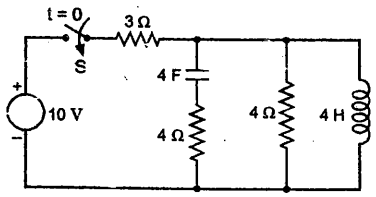
[U.P.S.C. I.E.S. E.E. I, 1995]

361. In the network shown in the given figure, there is no initial current through L_2 and no initial voltage across the C. The switch 'S' is closed at $t = 0$. The current i_{L1} in the inductor L_1 and the voltage v_C across C at $t = 0^+$ and $t = \infty$ will be

	$i_{L_1}(0^+)$	$i_{L_1}(\infty)$	$v_C(0^+)$	$v_C(\infty)$
(a)	1/3 A	1/3 A	2/3 V	2/3 V
(b)	0	1/3 A	0	1 V
(c)	1/3 A	0	2/3 V	0
(d)	0	1/3 A	0	2/3 V

[U.P.S.C. I.E.S E.E.-I, 1995]

362. In the circuit shown in the given figure, the switch is closed at time $t = 0$. The voltage across the inductance at $t = 0^+$, is



(a) 2 V (b) 4 V (c) – 6 V (d) 8 V

[GATE E.E. 2003]

363. In the circuit shown in the figure, the constant current source of value I is switched on at $t = 0$. What are the values of currents i_1 and i_2 at $t = 0$, with zero initial conditions ?

	i_1	i_2
(a)	I	0
(b)	0	I
(c)	$\frac{R_2}{R_1 + R_2} I$	$\frac{R_1}{R_1 + R_2} I$
(d)	0	0

[U.P.S.C. I.E.S. E.E.-I, 2006]

364. For the network function $\frac{V(s)}{I(s)} = \frac{s+3}{2s+3}$, the $v(t)$ at $t = 0$ for the relaxed circuit with unit step $i(t)$, is

(a) 0.5 V (b) 1.0 V
(c) 1.5 V (d) 2.0 V [U.P.S.C. I.E.S. E.E.-I, 2011]

365. Consider the following statements:
A step voltage is applied to an underdamped series RLC circuit in which R is variable. If R is
1. increased, the steady-state voltage across C will be reduced.
2. increased, the frequency of transient oscillations across C will be reduced.
3. reduced, the transient oscillations will die down at a fast rate.
4. reduced to zero, the peak amplitude of the voltage across C will be double that of input voltage.

Which of the above statements is/are correct?

(a) 2 only. (b) 4 only.
(c) 2 and 4 only. (d) 1, 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2010]

366. Consider the following equations with respect to the below network:

1. $L_1 \frac{di_1(t)}{dt} = R_1 i_1(t) - e_c(t) + e(t)$

2. $L_1 \frac{di_1(t)}{dt} = -R_1 i_1(t) - e_c(t) + e(t)$

Answers: 354. (d), 355. (c), 356. (c), 357. (c), 358. (c), 359. (a), 360. (a), 361. (d), 362. (b), 363. (b), 364. (a), 365. (c), 366. (b),

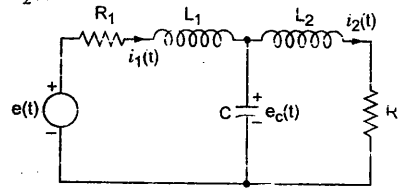
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

3. $L_2 \frac{di_2(t)}{dt} = -R_2 i_2(t) + e_c(t)$

4. $C \frac{de_c(t)}{dt} = i_1(t) - i_2(t)$

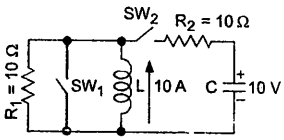
Which of the above statements is/are correct?



(a) 1 only.
(b) 2, 3 and 4.
(c) 1, 3 and 4.
(d) 1, 2 and 4.

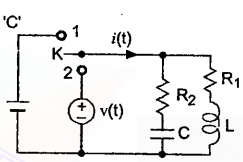
[U.P.S.C. I.E.S. E.E.-I, 2009]

367. In the circuit shown in figure. Switch SW_1 is initially closed and SW_2 is open. The inductor L carries a current of 10 A and the capacitor charged to 10 V with polarities as indicated. SW_2 is closed at $t = 0$ and SW_1 is opened at $t = 0$. The current through C and the voltage across L at ($t = 0^+$) is

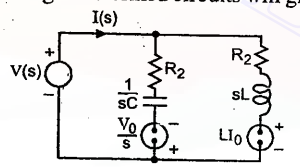


(a) 55 A, 4.5 V (b) 5.5 A, 45 V
(c) 45 A, 5.5 A (d) 4.5 A, 55 V [GATE E.E. 2007]

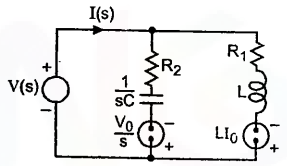
368. In the circuit shown in the figure, the switch 'K' was initially at position '1' and a current 'I' was flowing through the inductor 'L' and a voltage 'V_0' existed across the capacitor 'C'. If at $t = 0$, the switch 'K' is put on the position '2' in the circuit shown in the figure which one of the following transformed circuits will give $i(t)$ for $t > 0$?



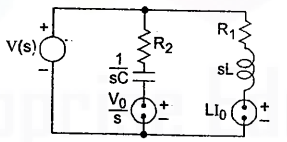
(a)



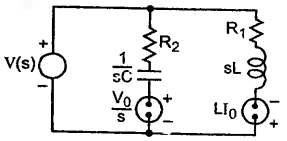
(b)



(c)

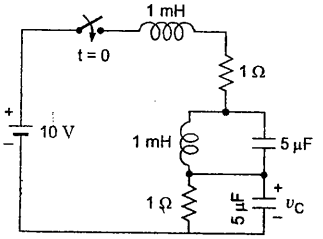


(d)



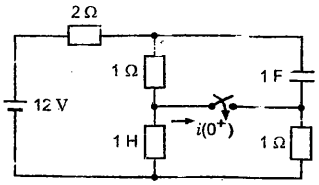
[U.P.S.C. I.E.S. E.E.-I, 2000]

369. In the circuit shown in given figure, the switch is closed at time $t = 0$. The steady-state value of the voltage V_c is



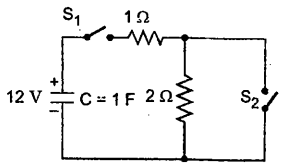
(a) 0 V (b) 10 V
(c) 5 V (d) 2·5 V
[GATE E.E. 2002]

370. Consider the following circuit: The circuit shown is in steady-state before closing the switch. What is the current $i(0^+)$ through the switch if the circuit is closed at $t = 0$?

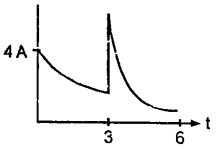


(a) −4 A (b) 0 A
(c) 4 A (d) 12 A
[U.P.S.C. I.E.S. E.E.-I, 2004]

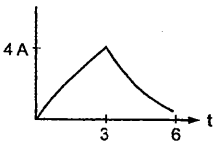
371. The capacitor in the circuit as shown below is initially charged to 12 V with S_1 and S_2 open. S_1 is closed at $t = 0$ while S_2 is closed at $t = 3$. The waveform of the capacitor current is represented by



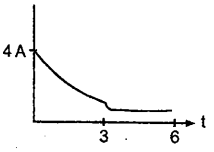
(a)



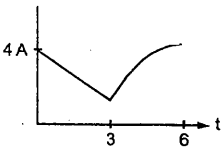
(b)



(c)

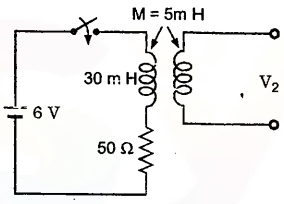


(d)



[U.P.S.C. I.E.S. E.E.-I, 2003]

372. In the circuit shown in the given figure, the switch is closed at $t = 0$. The induced voltage V_2 will have a maximum value of



(a) 0·6 V (b) 1 V
(c) 3·78 V (d) 6 V
[U.P.S.C. I.E.S. E.E.-I, 1994]

373. In an R-L-C series circuit, if the resistance R and inductance L are kept constant but capacitance is decreased, then which of the following statements is/are correct?

1. Time constant of the circuit is changed.
2. Damping ratio decreases.
3. Natural frequency increases.
4. Maximum overshoot is unaffected.

Select the correct answer using the code given below:
(a) 1 and 2. (b) 2 only. (c) 2 and 3. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2005]

374. Consider the following statements about the quality factor of a R-L-C circuit:

1. For the critically damped circuit, the quality factor Q = 1/2.
2. Higher the value of quality factor higher will be the bandwidth of the circuit.
3. Higher the value of quality factor lower will be the bandwidth of the circuit.
4. For under damped circuit the value of Q is greater than 1/2.

Which of these statements are correct?
(a) 1 and 2 (b) 1 and 3 (c) 2 and 4 (d) 1, 3 and 4
[U.P.S.C. I.E.S. E.E.-I, 2002]

375. For a parallel R-L-C resonant circuit, the damped frequency is $\sqrt{8}$ r/s and bandwidth is 2 r/s. What is its resonant frequency?

(a) 2 (b) $\sqrt{7}$ (c) $\sqrt{10}$ (d) 3
[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **367.** (d), **368.** (d), **369.** (c), **370.** (b), **371.** (a), **372.** (b), **373.** (c), **374.** (d), **375.** (d),

Downloaded From : www.EasyEngineering.net

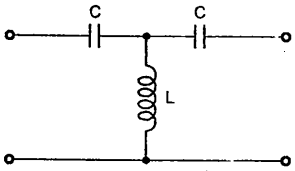
Downloaded From : www.EasyEngineering.net

376. The shunt element of a bandstop filter is
(a) inductive. (b) capacitive.
(c) parallel combination of L and C.
(d) series combination of L and C.

377. The shunt element of a bandpass filter is
(a) inductive. (b) capacitive.
(c) parallel combination of L and C.
(d) series combination of L and C.

378. The condition for a network with Z_s series impedance and Z_p shunt impedance to have a passband is
(a) $0 > \frac{Z_s}{4Z_p} > -1$ (b) $1 > \frac{Z_s}{4Z_p} > 0$
(c) $0 > \frac{Z_s}{4Z_p} > 1$ (d) $0 > \frac{Z_s}{4Z_p} > -1$

379. The circuit shown in the figure is a



(a) low-pass filter.
(b) high-pass filter.
(c) band-pass filter.
(d) differentiator.
[U.P.S.C. I.E.S. E.E.-I, 1992]

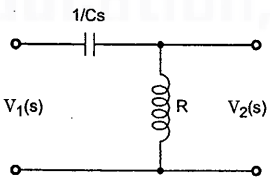
380. A first order, low-pass filter is given with R = 50 Ω and C = 5 μF. What is the frequency at which the gain of the voltage transfer function of the filter is 0·25 ?
(a) 4·92 kHz (b) 0·49 kHz (c) 2·46 kHz (d) 24·6 kHz
[GATE E.E. 2002]

381. The voltage-ratio transfer function of an active filter is given by $\frac{V_2(s)}{V_1(s)} = \frac{(s^2+\delta)}{(s^2+\alpha s+\delta)}$. The circuit in question is
(a) low-pass filter. (b) high-pass filter.
(c) band-pass filer. (d) band-reject filter.
[U.P.S.C. I.E.S. E.E.-I, 1998]

382. The transfer function $T(s) = \frac{s^2}{s^2+as+b}$ belongs to an active
(a) low-pass filter. (b) high-pass filter.
(c) band-pass filter. (d) band-reject filter.
[U.P.S.C. I.E.S. E.E.-I, 1995]

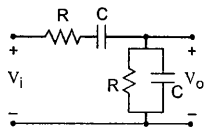
383. The transfer function $\frac{V_2(s)}{V_1(s)} = \frac{10s}{s^2+10s+100}$ is for an active
(a) low-pass filter. (b) band-pass filter.
(c) high-pass filter. (d) all pass filter.
[U.P.S.C. I.E.S. E.E.-I, 2001]

384. The sinusoidal steady-state voltage gain of the network shown in the given figure will have magnitude equal to 0·707 at an angular frequency of



(a) zero (b) RC rad/s
(c) $\frac{1}{RC}$ rad/s (d) 1 rad/s
[U.P.S.C. I.E.S. E.E.-I, 1997]

385. The RC circuit shown in the figure is

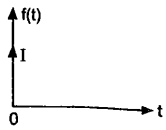


(a) a low-pass filter.
(b) a high-pass filter.
(c) a band-pass filter.
(d) a band-reject filter.
[GATE E.C.E. 2007]

386. Which one of the following statements is correct?
A waveguide can be considered to be analogous
(a) low-pass filter. (b) high-pass filter.
(c) band-pass filter. (d) band-stop filter.
[U.P.S.C. I.E.S. E.E.-I, 2004]

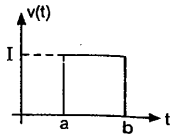
387. Which of the following functions represents parabolic characteristic?
(a) $f(t) = t$ (b) $f(t) = t^2$ (c) $f(t) = e^{-at}$
[A.M.I.E. Sec B. Winter 1994]

388. What does the function $f(t)$ plotted in the figure represent?



(a) Unit step function.
(b) Unit impulse function.
(c) Unit ramp function.
(d) Unit parabolic function.
[U.P.S.C. I.E.S. E.E.-I, 2008]

389. Consider the following functions for the rectangular voltage pulse shown in the given figure :



1. $v(t) = u(t-a) - u(t-b)$
2. $v(t) = u(b-t) - u(a-t)$
3. $v(t) = u(b-t) \cdot u(t-a)$
4. $v(t) = u(a-t) \cdot u(t-b)$

Which of these functions describe the pulse shown in the given figure ?
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) 2, 3 and 4. (d) 1, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

390. Which one of the following is the mathematical representation for the average power of the signal $x(t)$?
(a) $\frac{1}{T}\int_0^T x(t)dt$ (b) $\frac{1}{T}\int_0^T x^2(t)dt$
(c) $\frac{1}{T}\int_{-T/2}^{T/2} x(t)dt$ (d) $\lim_{T\to\infty}\frac{1}{T}\int_{-T/2}^{T/2} x^2(t)dt$
[U.P.S.C. I.E.S. E.T.E-I, 2007]

391. A signal $x(t)$ given by
$$x(t) = \begin{cases} 1, & -T/4 < t \le 3T/4 \\ -1, & 3T/4 < t \le 7T/4 \\ -x(t+T) & \end{cases}$$
Which among the following gives the fundamental Fourier term of $x(t)$?
(a) $\frac{4}{\pi}\cos\left(\frac{\pi t}{T} - \frac{\pi}{4}\right)$ (b) $\frac{4}{\pi}\cos\left(\frac{\pi t}{2T} + \frac{\pi}{4}\right)$
(c) $\frac{4}{\pi}\sin\left(\frac{\pi t}{T} - \frac{\pi}{4}\right)$ (d) $\frac{4}{\pi}\sin\left(\frac{\pi t}{2T} + \frac{\pi}{4}\right)$
[GATE E.E. 2007]

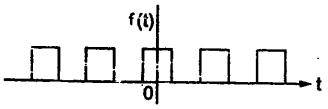
392. Let $x(t)$ be a periodic signal with time period T. Let $y(t) = x(t-t_0) + x(t+t_0)$ for some t_0. The Fourier series coefficients of $y(t)$ are denoted by b. If $b_k = 0$ for all odd k, then t_0 can be equal to
(a) $\frac{T}{8}$ (b) $\frac{T}{4}$
(c) $\frac{T}{2}$ (d) 2T [GATE E.E. 2008]

393. The Fourier series expansion $f(t) = a_0 + \sum_{n=1}^{\infty} a_n \cos n\omega t + b_n \sin n\omega t$ of the periodic signal shown below will contain the following nonzero terms

Answers: **376.** (d), **377.** (c), **378.** (a), **379.** (b), **380.** (c), **381.** (d), **382.** (b), **383.** (b), **384.** (c), **385.** (c), **386.** (b), **387.** (b), **388.** (b), **389.** (a), **390.** (d), **391.** (a), **392.** (b), **393.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net



(a) a_0 and b_n, $n = 1, 3, 5, \ldots \infty$
(b) a_0 and a_n, $n = 1, 2, 3, \ldots \infty$
(c) a_0, a_n and b_n, $n = 1, 2, 3, \ldots \infty$
(d) a_0 and a_n, $n = 1, 3, 5, \ldots \infty$

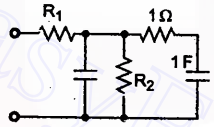
[GATE E.E., 2011]

394. The Fourier Series coefficients, of a periodic signal $x(t)$, expressed as $x(t) = \sum_{k=-\infty}^{\infty} a_k e^{j2\pi kt/T}$ are given by $a_{-2} = -j1$; $a_{-1} = 0.5 + j0.2$; $a_0 = j2$; $a_1 = 0.5 - j0.2$; $a_2 = 2 + j1$; and $a_k = 0$; for $|k| > 2$.
Which of the following is true?
(a) $x(t)$ has finite energy because only finitely many coefficients are non zero.
(b) $x(t)$ has zero average value because it is periodic.
(c) The imaginary part of $x(t)$ is constant.
(d) The real part of $x(t)$ is even. [GATE E.E., 2009]

395. The impedance of a parallel R-C network is $Z(s) = \frac{5s}{s^2 + 0{\cdot}5s + 100}$. Then the values of R, L and C are, respectively
(a) $10\ \Omega, \frac{1}{20}\text{H}, \frac{1}{5}\text{F}$ (b) $\Omega, \frac{1}{2}\text{H}, \frac{1}{5}\text{F}$
(c) $10\ \Omega, \frac{1}{20}\text{H}, \frac{1}{2}\text{F}$ (d) $2\ \Omega, \frac{1}{20}\text{H}, \frac{1}{5}\text{F}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

396. For the network shown in the given figure, $Z(0) = 3\ \Omega$ and $Z(\infty) = 2\ \Omega$. What are the values of R_1 and R_2, respectively?
(a) $2\ \Omega, 1\ \Omega$ (b) $3\ \Omega, 2\ \Omega$
(c) $1\ \Omega, 2\ \Omega$ (d) $2\ \Omega, 3\ \Omega$



[U.P.S.C. I.E.S. E.E.-I, 2007]

397. A system is represented by $\frac{dy}{dt} + 2y = 4t\,u(t)$.
The ramp component in the forced response will be
(a) $t\,u(t)$ (b) $2t\,(ut)$ (c) $3t\,u(t)$ (d) $4t\,u(t)$

[U.P.S.C. I.E.S. E.E.-I, 1997]

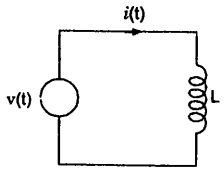
398. If the step response of an initially relaxed circuit is known, then the ramp response can be obtained by
(a) integrating the step response.
(b) differentiating the step response.
(c) integrating the step response twice.
(d) differentiating the step response twice.

[U.P.S.C. I.E.S. E.E.-I, 1993]

399. Consider the following statements :
A unit impulse $\delta(t)$ is mathematically defined as
1. $\delta(t) = 0, t \neq 0$ 2. $\int_{0^+}^{\infty} \delta(t)dt = 1$
3. $\int_{-\infty}^{+\infty} \delta(t)dt = 1$
Of these statements
(a) 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1994]

400. In the circuit shown in figure given below, it is desired to have a constant direct current $i(t)$ through the ideal inductor. The nature of the voltage source $v(t)$ must be
(a) constant voltage.
(b) linearly increasing voltage.
(c) an ideal impulse.
(d) exponentially increasing voltage. [GATE E.E. 1998]



401. If the unit step response of a network is $(1 - e^{-at})$ then its unit impulse response will be
(a) $\alpha\, e^{-\alpha t}$ (b) $\frac{1}{\alpha} e^{-t/\alpha}$ (c) $\frac{1}{\alpha\, e^{-t/\alpha}}$ (d) $(1 - \alpha)^{-\alpha t}$

[U.P.S.C. I.E.S. E.E.-I, 1997]

402. Laplace transform of the output response of a linear system is the system transfer function when the input is
(a) a step signal (b) a ramp signal.
(c) an impulse signal. (d) a sinusoidal signal.

[U.P.S.C. I.E.S. E.E.-I, 1997]

403. Consider the following statements:
The impulse response of a linear network can be used to determine the
1. step response.
2. response of the sinusoidal input.
3. elements of the network uniquely.
4. interconnection of network elements.
Which of the following statements are correct ?
(a) 1 and 2 (b) 2 and 3 (c) 3 and 4 (d) 1 and 4

[U.P.S.C. I.E.S. E.E.-I, 1999]

404. A first order linear system is initially relaxed. For a unit step signal $u(t)$, the response is $v_1(t) = (1 - e^{-3t})$ for $t > 0$. If a signal $3u(t) + d(t)$ is applied to the same initially relaxed system, the response will be
(a) $(3 - 6e^{-3t})u(t)$ (b) $(3 - 3e^{-3t})u(t)$
(c) $3u(t)$ (d) $(3 + 3e^{-3t})u(t)$

[U.P.S.C. I.E.S. E.E.-I, 1995]

405. The Laplace transform of a unit impulse function is
(a) $\frac{1}{s}$ (b) $\frac{1}{s^2}$ (c) 1 (d) s

[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

406. Laplace transform of unit impulse, δt, is
(a) $\frac{1}{s}$ (b) 1 (c) ∞ (d) 0

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

407. What is the Laplace transform of a function $\delta(t-2)$?
(a) 2 (b) 0 (c) e^{-2s} (d) $2s$

[U.P.S.C. I.E.S. E.E.-I, 2008]

408. $F^*(s)$ for $f(t) = u(t)$ is
(a) $1 - e^{-st}$ (b) e^{-st} (c) $\frac{1}{e^{-st}}$ (d) $\frac{1}{1 - e^{-st}}$

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]

409. Consider the function : $F(s) = \frac{\omega}{s^2 + \omega^2}$ where $F(s)$ = Laplace transform of $f(t)$. The final value of $f(t)$ is equal to
(a) infinite. (b) zero.
(b) finite constant. (d) a value in between -1 and $+1$.

[U.P.S.C. I.E.S. E.E.-I, 2008]

410. For which of the following function the Laplace transform will be $2/s^3$?
(a) $f(t) = t$ (b) $f(t) = 2t$ (c) $f(t) = t^2$

[A.M.I.E. Sec B. Winter 1994]

411. What is the Laplace transform of $\cos \omega_0 t$?

Answers: **394.** (c), **395.** (a), **396.** (a), **397.** (b), **398.** (a), **399.** (b), **400.** (c), **401.** (a), **402.** (c), **403.** (a), **404.** (c), **405.** (a), **406.** (b), **407.** (c), **408.** (d), **409.** (d), **410.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $\frac{\omega_0}{s^2+\omega_0^2}$ (b) $\frac{s}{s^2+\omega_0^2}$

(c) $\frac{\omega_0}{(s+\omega_0)^2}$ (d) $\frac{s}{(s+\omega_0)^2}$

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

412. What is the Laplace transform of a delayed unit impulse function $\delta(t-1)$?

(a) 1 (b) zero (c) exp (–s) (d) s

[U.P.S.C. I.E.S. E.T.E-I, 2007]

413. The Laplace transform of a transportation lag of 5 seconds is

(a) exp (–5s) (b) exp (5s) (c) $\frac{1}{s+5}$ (d) $\exp\left(\frac{-s}{5}\right)$

[U.P.S.C. I.E.S. E.E.-I, 2001]

414. The Laplace transform of $(t^2-2t)u(t-1)$ is

(a) $\frac{2}{s^3}e^{-s}-\frac{2}{s^2}e^{-s}$ (b) $\frac{2}{s^3}e^{-2s}-\frac{2}{s^2}e^{-s}$

(c) $\frac{2}{s^3}e^{-s}-\frac{2}{s}e^{-s}$ (d) none of the above.

[GATE E.E. 1998]

415. Laplace transform of $\sin(\omega t+\alpha)$ is

(a) $\frac{s\cos\alpha+\omega\sin\alpha}{s^2+\omega^2}$ (b) $\frac{\omega}{s^2+\omega^2}\cos\alpha$

(c) $\frac{s}{s^2+\omega^2}\sin\alpha$ (d) $\frac{s\sin\alpha+\omega\cos\alpha}{s^2+\omega^2}$

[U.P.S.C. I.E.S. E.T.E-I, 2008]

416. A rectangular current pulse of duration T and magnitude I has the Laplace transform

(a) I/s (b) (I/s)exp(–Ts)

(c) (I/s) exp (Ts) (d) (I/s) [1 – exp (–Ts)

[GATE E.E. 1999]

417. The Laplace transform of first derivative $f'(t)$ of a function $f(t)$ is

(a) $\frac{F(s)}{s}$ (b) $sF-f(0)$

(c) F(s) – F(0) (d) $f(0)$

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

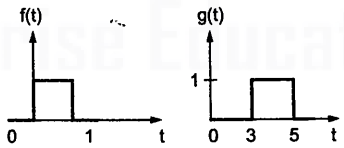
418. Given the Laplace transform of $f(t)=F(s)$, the Laplace transform of $[f(t)e^{-at}]$ is equal to

(a) F(s + a) (b) $\frac{F(s)}{(s+a)}$ (c) $e^{as}F(s)$ (d) $e^{-as}F(s)$

[U.P.S.C. I.E.S. E.E.-I, 2008]

Common Data For Q. 419 and 420

Given $f(t)$ and $g(t)$ as shown below:



419. $g(t)$ can be expressed as

(a) $g(t)=f(2t-3)$ (b) $g(t)=f\left(\frac{t}{2}-3\right)$

(c) $g(t)=f\left(2t-\frac{3}{2}\right)$ (d) $g(t)=f\left(\frac{t}{2}-\frac{3}{2}\right)$

[GATE E.E., 2010]

420. The Laplace transform of $g(t)$ is

(a) $\frac{1}{s}(e^{3s}-e^{5s})$ (b) $\frac{1}{s}(e^{-5s}-e^{-3s})$

(c) $\frac{e^{-3s}}{s}(1-e^{-2s})$ (d) $\frac{1}{s}(e^{5s}-e^{3s})$

[GATE E.E., 2016]

421. Let the Laplace transform of a function $f(t)$ which exists for $t>0$ be $F_1(s)$ and the Laplace transform of its delayed version $f(t-\tau)$ be $F_2^*(s)$. Let $F_1^*(s)$ be the complex conjugate of $F_1(s)$ with the Laplace variable set as $s=\sigma+j\omega$. If $G(s)=\frac{F_2(s).F_1^*(s)}{|F_1(s)|^2}$, then the inverse Laplace transform of G(s) is

(a) an ideal impulse $\delta(t)$

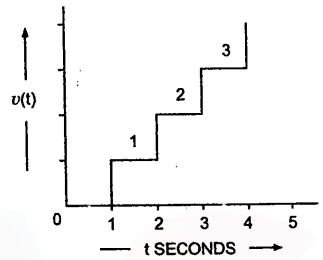
(b) an ideal delayed impulse $\delta(t-\tau)$

(c) an ideal step function $u(t)$

(d) an ideal delayed step function impulse $u(t-\tau)$

[GATE E.E., 2011]

422. Consider the voltage waveform shown in the given figure. The equation for $v(t)$ is



(a) $u(t-1)+u(t-2)+u(t-3)$

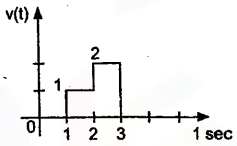
(b) $u(t-1)+2u(t-2)+3u(t-3)$

(c) $u(t)-u(t-1)+u(t-2)+u(t-4)$

(d) $u(t-1)+u(t-2)+u(t-3)-3u(t-4)$

[U.P.S.C. I.E.S. E.E.-I, 1995]

423. Consider the following diagram : Which one of the following gives Laplace transform of the wavelength $v(t)$ shown in the above diagram ?



(a) $[e^s+e^{2s}+2e^{3s}]/s$

(b) $[e^s+e^{2s}-2e^{3s}]/s$

(c) $[e^{-s}+e^{-2s}+2e^{-3s}]/s$ (d) $[e^{-s}+e^{-2s}+2e^{-3s}]/s$

[U.P.S.C. I.E.S. E.E.-I, 2004]

424. A unit impluse input to linear network has a response R(t) and a unit step input to the same network has response $s(t)$. The response R(t)

(a) equals $\frac{ds}{dt}(t)$. (b) equals the integral of $s(t)$.

(c) is the reciprocal of $s(t)$. (d) has no relation with $s(t)$.

[U.P.S.C. I.E.S E.E.-I, 1994]

425. Nonlinear system cannot be analysed by Laplace transform because

(a) it has no zero initial conditions.

(b) superpositon law cannot be applied.

(c) non-linearity is generally not well defined.

(d) all of the above.

[U.P.S.C. I.E.S. E.E.-I, 1992]

426. What is the transfer function of a system whose impulse response is $e^{-3t}\sin 2t$?

(a) $\frac{13}{s^2+6s+13}$ (b) $\frac{1}{s^2+6s+13}$

Answers: **411.** (b), **412.** (c), **413.** (a), **414.** (c), **415.** (d), **416.** (d), **417.** (c), **418.** (a), **419.** (d), **420.** (c), **421.** (b), **422.** (d), **423.** (c), **424.** (a), **425.** (a), **426.** (c),

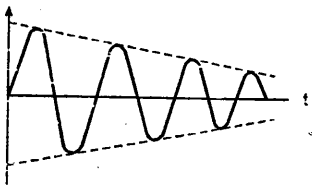
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) $\frac{2}{s^2+6s+13}$ (d) $\frac{5}{s^2+6s+13}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

427. The response shown in the given figure is the Laplace transform of the function



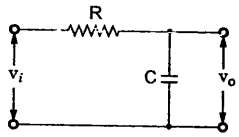
(a) $\frac{\omega}{(s+\alpha)^2+\omega^2}$

(b) $\frac{\alpha}{(s+\alpha)^2+\omega^2}$

(c) $\frac{s+\alpha}{(s+\alpha)+\omega^2}$ (d) $\frac{s}{(s+\alpha)^2+\omega^2}$

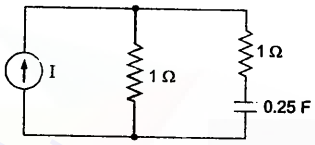
[U.P.S.C. I.E.S. E.E.-I, 1999]

428. If $v_i = \delta(t)$, v_0 will be



(a) $\frac{1}{RC}e^{-t/RC}$
(b) $\delta(t)$
(c) 0
(d) $\frac{R}{C}e^{-tC/R}$

429. In the circuit shown below, the initial voltage across the capacitor is 2 V and I is a unit step current source. Then the voltage across the capacitor for $t > 0$ is



(a) $(2 - e^{-2t})u(t)$ (b) $(2 + e^{2t})u(t)$
(c) $(1 - e^{-2t})u(t)$ (d) $(1 + e^{-2t})u(t)$

[U.P.S.C. I.E.S. E.E.-I, 2003]

430. The response of a network $i(t) = K te^{-at}$ for $t \geq 0$ where a is real positive, the value of 't' at which the $i(t)$ will become maximum, is
(a) α (b) 2α (c) $1/\alpha$ (d) α^2

[U.P.S.C. I.E.S. E.E.-I, 2001]

431. The response of an initially relaxed system to a unit ramp excitation is $(t + e^{-t})$. Its step response will be

(a) $\frac{1}{2}t^2 - e^{-t}$ (b) $1 - e^{-t}$ (c) e^{-t} (d) t

[U.P.S.C. I.E.S. E.E.-I, 2001]

432. The Laplace transform of the function $f(t)$ is F(s), $u(t)$ represents the unit step function. The inverse Laplace transform of $e^{-4}F(s)$ is
(a) $f(t)\,u(t-1)$ (b) $f(t-1)\,u(t)$
(c) $f(t-1)\,u(t-1)$ (d) $\frac{f(t)}{(t-1)}$

[U.P.S.C. I.E.S. E.E.-I, 2000]

433. The transfer function of the system described by $\frac{d^2y}{dt^2} + \frac{dy}{dt} = \frac{du}{dt} + 2u$ with u as input and y as output is

(a) $\frac{(s+2)}{(s^2+s)}$ (b) $\frac{(s+1)}{(s^2+s)}$ (c) $\frac{2}{(s^2+s)}$ (d) $\frac{2s}{(s^2+s)}$

[GATE E.E. 2002]

434. For the function $\mathcal{L}[f(t)] = \frac{3s+1}{s(s^2+4s+5)}$ $\left.\frac{df}{dt}\right|_{t=0}$ will be

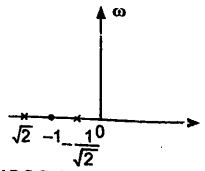
(a) 3 (b) $\frac{1}{3}$ (c) zero (d) $\frac{2}{3}$

[U.P.S.C. I.E.S. E.E.-I, 1999]

435. The response of a linear, time-invariant system to a unit step is $s(t) = (1 - e^{-t/RC})\,u(t)$, where $u(t)$ is the unit step. What is the impulse response of this system ?
(a) $e^{-t/RC}$ (b) $e^{-t/RC}\,u(t)$
(c) $1/RC[e^{-t/RC}\,u(t)]$ (d) $\delta(t)$

[U.P.S.C. I.E.S. E.T.E-I, 2007]

436. Consider the following pole-zero diagram of a system function $Z(s) = V(s)/I(s)$. What will be the magnitude of the voltage phasor for $i(t) = \sin t$?



(a) 3/2 (b) 1
(c) 2/3 (d) 1/3

[U.P.S.C. I.E.S. E.E.-I, 2004]

437. Which of the following conditions are necessary for the validity of initial value theorem $\lim_{s\to\infty} sF(s) = \lim_{t\to 0} f(t)$
(a) $f(t)$ and its derivative $f'(t)$ must have Laplace transform.
(b) If the Laplace transform of f(t) is F(s), the lim $sF(s)$ must exist.
(c) Only f(t) must have Laplace transform.
(d) both (a) and (b). [A.M.I.E. Sec B. Winter 1994]

438. Given $F(s) = \frac{(s+2)}{s(s+1)}$, the initial and final values of $f(t)$ will be respectively
(a) 1, 2 (b) 2, 1 (c) 1, 1 (d) 2, 2

[U.P.S.C. I.E.S. E.E.-I, 1994]

439. If $F(s) = \frac{1}{s}\frac{(s+1)}{(s+k)}$ and $\frac{f(t)}{t\to\infty} = \frac{1}{2}$, then the value of k is
(a) 1/2 (b) 1 (c) 2 (d) μ

[U.P.S.C. I.E.S. E.E.-I, 1993]

440. Let Y(s) be the Laplace transformation of the function $y(t)$, then the final value of the function is
(a) $\lim_{s\to 0} Y(s)$ (b) $\lim_{s\to\infty} Y(s)$
(c) $\lim_{s\to 0} sY(s)$ (d) $\lim_{s\to\infty} sY(s)$ [GATE E.E. 2002]

441. The Laplace transform of a function $f(t)$ is $F(s) = \frac{5s^2+23s+6}{s(s^2+2s+2)}$.
As $t \to \infty$, $f(t)$ approaches
(a) 3 (b) 5 (c) $\frac{17}{2}$ (d) ∞

[GATE E.E. 2005]

442. If the unilateral Laplace transform X(s) of a signal $x(t)$ is $\frac{7s+10}{s(s+2)}$, then the initial and final values of the signal would be respectively
(a) 3·5 and 5 (b) zero and 7
(c) 5 and zero (d) 7 and 5

[U.P.S.C. I.E.S. E.E.-I, 2000]

443. Consider the function $F(s) = \frac{5}{s(s^2+3s+2)}$ where F(s) is the Laplace transform of the function $f(t)$. The initial value of $f(t)$ is equal to
(a) 5 (b) $\frac{5}{2}$ (c) $\frac{5}{3}$ (d) 0

[GATE E.E. 2004]

Answers: **427.** (a), **428.** (a), **429.** (d), **430.** (c), **431.** (b), **432.** (c), **433.** (a), **434.** (c), **435.** (c), **436.** (c), **437.** (d), **438.** (a), **439.** (c), **440.** (c), **441.** (a), **442.** (d), **443.** (d),

Downloaded From : www.EasyEngineering.net

444. The Laplace transform of the function $i(t)$ is

$$I(s) = \frac{10s+4}{s(s+1)(s^2+4s+5)}$$. Its final value will be

(a) $\frac{4}{5}$ (b) $\frac{5}{4}$ (c) 4 (d) 5

[U.P.S.C. I.E.S. E.E.-I, 1997]

445. For $V(s) = \frac{s+2}{s(s+1)}$, the initial and final value of $v(t)$ will be respectively

(a) 1 and 1 (b) 2 and 2 (c) 2 and 1 (d) 1 and 2

[U.P.S.C. I.E.S. E.E.-I, 1998]

446. The time domain behaviour of an RL circuit is represented by

$$L\frac{di}{dt} + Ri = V_0(1 + Be^{-Rt/L}\sin t)u(t)$$

For an initial current of $i(0) = \frac{V_0}{R}$, the steady state value of the current is given by

(a) $i(t) \to \frac{V_0}{R}$ (b) $i(t) \to \frac{2V_0}{R}$

(c) $i(t) \to \frac{V_0}{R}(1+B)$ (d) $i(t) \to \frac{2V_0}{R}(1+B)$

[GATE E.C.E. 2009]

447. For the function $x(t)$, $x(s)$ is given by :

$$x(s) = e^{-s}\left[\frac{-2}{s(s+2)}\right]$$

Then, what are the initial and final values of $x(t)$, respectively ?

(a) 0 and 1 (b) 0 and –1 (c) 1 and 1 (d) –1 and 0

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

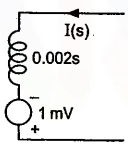
448. A linear time invariant system has an impulse response e^{2t}, for $t > 0$. If initial conditions are 0 and the input is e^{3t}, the output for $t > 0$ is

(a) $e^{3t} - e^{2t}$ (b) e^{5t}

(c) $e^{3t} + e^{2t}$ (d) None of the above

[GATE E..C.E., 2000]

449. A 2 mH inductor with some initial current can be represented as shown below, where s is the Laplace Transform variable. The value of initial current is



(a) 0.5 A (b) 2.0 A

(c) 1.0 A (d) 0.0 A [GATE E.C.E. 2006]

450. A unit step current of 1 A is applied to a network whose driving point impedance is $Z(s) = \frac{V(s)}{I(s)} = \frac{s+3}{(s+2)^2}$; then the steady-state and initial values of the voltage developed across the source are respectively

(a) $\left(\frac{3}{4}V, (V)\right)$ (b) $\left(\frac{1}{4}V, \frac{3}{4}V\right)$

(c) $\left(\frac{3}{4}V, 0\,V\right)$ (d) $\left(1\,V, \frac{3}{4}V\right)$

[U.P.S.C. I.E.S. E.E.-I, 2003]

451. Convolution of a function $f(t)$ with unit impulse $s(t)$ results

(a) $f(0)$ (b) $f(t)$

(c) $f(t+1)$ (d) $f(t-1)$

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

452. Given two continuous time signals $x(t) = e^{-t}$ and $y(t) = e^{-2t}$ which exist for $t > 0$, the convolution $z(t) = x(t)^* y(t)$ is

(a) $e^{-t} - e^{-2t}$ (b) e^{-3t}

(c) e^{+t} (d) $e^{-t} + e^{-2t}$ [GATE E.E., 2011]

453. If $u(t)$, $r(t)$ denote the unit step and unit ramp functions respectively and $u(t) * r(t)$ their convolution, then the function $u(t+1) * r(t-2)$ is given by

(a) $(1/2)(t-1)(t-2)$ (b) $(1/2)(t-1)u(t-2)$

(c) $(1/2)(t-1)^2 u(t-1)$ (d) none of these. [GATE E.E., 2007]

454. Which one of the following is the correct relation ?

(a) $F(at) \leftrightarrow aF(\omega/a)$ (b) $F(at) \leftrightarrow aF(a\omega)$

(c) $F(t/a) \leftrightarrow aF(\omega/a)$ (d) $F(at) \leftrightarrow (1/a)F(\omega/a)$

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

455. The transfer function of a system $Z(s) = \frac{V(s)}{I(s)} = \frac{s}{s+3}$. The system is at rest for $t < 0$. What will be the value of $v(t)$ for $t \geq 0$, if $i(t) = 3u(t)$, where $u(t)$ is a unit step ?

(a) e^{-t} (b) $2e^{-3t}$ (c) $3e^{-3t}$ (d) $4e^{-t}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

456. Inverse Laplace transform of $\frac{1}{s-a}$ is

(a) $\sin at$ (b) $\cos at$ (c) e^{at} (d) e^{-at}

[A.M.I.E. Sec B. Circuit & Field Theory Winter 1993]

457. The response of an initially relaxed linear circuit to a signal V_s is $e^{-2t}.u(t)$. If the signal is changed to $\left(V_s + 2\frac{dV_s}{dt}\right)$ the response would be

(a) $-4e^{-2t}u(t)$ (b) $-3e^{-2t}u(t)$

(c) $4e^{-2t}u(t)$ (d) $5e^{-2t}u(t)$

[U.P.S.C. I.E.S. E.E.-I, 1994]

458. If $i(t) = \frac{1}{4}(1 - e^{-2t})u(t)$, where $u(t)$ is a unit step voltage, then the complex frequencies associated with $i(t)$ would include

(a) $s = 0$ and $s = j2$ (b) $s = j2$ and $s = -j2$

(c) $s = -j2$ and $s = -2$ (d) $s = 0$ and $s = -2$

[U.P.S.C. I.E.S. E.E.-I, 1998]

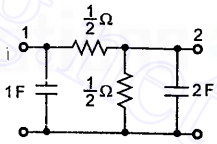
459. The complex frequencies associated with the current $i(t) = 5 + 10e^{-3t}\cos(50t + 90°)$ are

(a) $0, -3 \pm j50$ (b) $0, 50 + j3$

(c) $0, 50 \pm j3$ (d) $0, 50 + j3$

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

460. Consider the following circuit : What is the short-circuit natural frequency at port 1 of the circuit ?



(a) $s + 2 = 0$ (b) $s + 1 = 0$

(c) $2s + 1 = 0$ (d) $2s + 3 = 0$

[U.P.S.C. I.E.S. E.E.-I, 2004]

461. The input-output relationship of a system is given by $r(t) = \frac{d^2c(t)}{dt^2} + 3\frac{dc(t)}{dt} + 2c(t)$ where $r(t)$ and $c(t)$ are input and output respectively. The transfer function of the system is equal to

(a) $\frac{1}{(s^2+s+2)}$ (b) $\frac{1}{(s^2+3s+2)}$

(c) $\frac{2}{(s^2+3s+2)}$ (d) $\frac{2}{(s^2+5s+3)}$

[U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **444.** (a), **445.** (d), **446.** (a), **447.** (b), **448.** (a), **449.** (a), **450.** (c), **451.** (b), **452.** (a), **453.** (c), **454.** (d), **455.** (c), **456.** (c), **457.** (b), **458.** (d), **459.** (c), **460.** (a), **461.** (b),

Downloaded From : www.EasyEngineering.net

452. The network function $F(s) = \dfrac{(s+2)}{(s+1)(s+3)}$ represents an

(a) RC impedance.
(b) RL impedance.
(c) RC impedance and RL admittance.
(d) RC adimittance and RL impedance.

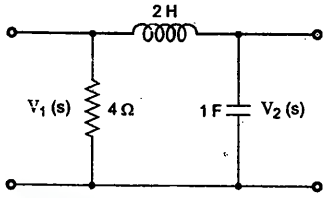
[U.P.S.C. I.E.S. E.E.-I, 1998, 2008]

463. $F(s) = \dfrac{(s+1)(s+3)}{s(s+2)}$ represents an

(a) RC impedance. (b) RC admittance.
(c) RC impedance and an RL admittance.
(d) RL admittance.

[U.P.S.C. I.E.S. E.E. I, 1995]

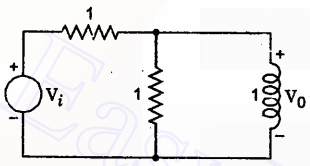
464. The open-circuit voltage ratio $\dfrac{V_2(s)}{V_1(s)}$ of the network shown in given figure is



(a) $1 + 2s^2$
(b) $\dfrac{1}{1+2s^2}$
(c) $1 + 2s$
(d) $\dfrac{1}{1+2s}$

[U.P.S.C. I.E.S. E.E.-I, 1994]

465. Select the correct transfer function $V_0(s)/V_i(s)$ from the following, for the given network



(a) $\dfrac{2}{s(s+1)}$
(b) $\dfrac{s}{(s+2)}$
(c) $\dfrac{s}{(2s+1)}$ (d) $\dfrac{2s}{(s+1)}$

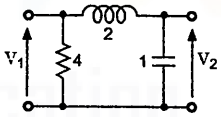
[U.P.S.C. I.E.S. E.E.-I, 2002]

466. Let the transfer function of a network be $H(f) = |H(f)|\, e^{j\varphi(f)} = 2e^{-j4\pi f}$. If a signal $x(t)$ is applied to such a network, the output $y(t)$ is given by

(a) $2x(t)$ (b) $x(t-2)$ (c) $2x(t-2)$ (d) $2x(t-4\pi)$

[U.P.S.C. I.E.S. E.E.-II, 2002]

467. For the two port network shown in figure, what is the voltage transfer function $V_2(s)/V_1(s)$?



(a) $s/(1+2s^2)$ (b) $s/(1+2s)$
(c) $1/(1+2s^2)$ (d) $1/(1+2s)$

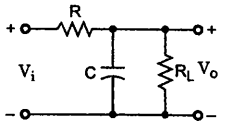
[U.P.S.C. I.E.S. E.E.-I, 2005]

468. The system function $H(s) = \dfrac{1}{s+1}$. For an input signal $\cos t$, the steady state response is

(a) $\dfrac{1}{\sqrt{2}}\cos\left(t-\dfrac{\pi}{4}\right)$ (b) $\cos t$
(c) $\cos\left(t-\dfrac{\pi}{4}\right)$ (d) $\dfrac{1}{\sqrt{2}}\cos t$

[U.P.S.C. I.E.S. E.E.-I, 2001]

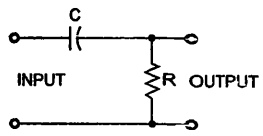
469. If the transfer function of the following network is $\dfrac{V_o(s)}{V_i(s)} = \dfrac{1}{2+sCR}$ the value of the load resistance R_L is



(a) R/4 (b) R/2
(c) R (d) 2R

[GATE E.C.E. 2009]

470. The transfer function for the diagram shown below is given by which one of the following:



(a) $\dfrac{1}{(1+sRC)}$
(b) $\dfrac{sRC}{(1+sRC)}$
(c) $\dfrac{sRC}{(1-sRC)}$ (d) $1 + sRC$

[U.P.S.C. I.E.S. E.E.-I, 2008]

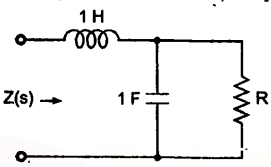
471. Which of the following transfer functions is / are minimum phase transfer functions(s) ?

1. $\dfrac{1}{(s-1)}$ 2. $\dfrac{(s-1)}{(s+3)(s+4)}$
3. $\dfrac{(s-2)}{(s+3)(s-4)}$

Select the correct answer using the code given below :
(a) 1 and 3. (b) 1 only. (c) 2 and 3. (d) None of these.

[U.P.S.C. I.E.S. E.E.-I, 2008]

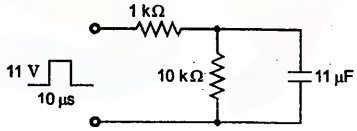
472. The driving-point impedance of the circuit shown in the figure is



(a) $\dfrac{s^2+Rs}{1+Rs}$ (b) $\dfrac{Rs^2+s+R}{Rs+1}$
(c) $\dfrac{s^2(R+1)+3}{1+Rs}$ (d) $\dfrac{1}{(1+Rs)^2}$

[U.P.S.C. I.E.S. E.E.-I, 1993]

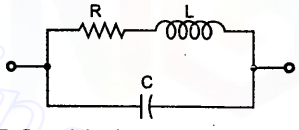
473. An 11 V pulse of 10 μs duration is applied to the circuit shown in given figure. Assuming that the capacitor is completely discharged prior to applying the pulse, the peak value of the capacitor voltage is



(a) 11 V (b) 5·5 V (c) 6·32 V (d) 0·96 V

[GATE E.E. 2002]

474. If the driving-point impedance function $\dfrac{2s+1}{8s^2+4s+1}$ is synthesized as shown in the given figure, then the values of R, L and C will be respectively



(a) 1, 2 and 4 (b) 2, 1 and 4
(c) 1, 4 and 2 (d) 4, 2 and 1

[U.P.S.C. I.E.S. E.E.-I, 1999]

475. The driving-point impedance of a one-port reactive network is given by

(a) $\dfrac{(s^2+1)(s^2+2)}{s(s^2+2)(s^2+4)}$ (b) $\dfrac{(s^2+1)(s^2+3)}{s(s^2+2)(s^2+4)}$
(c) $\dfrac{(s^2+1)}{(s^2+2)(s^2+3)}$ (d) $\dfrac{1}{s+1}$

[U.P.S.C. I.E.S. E.E.-I, 1998]

476. The driving point impedance function $Z(s) = \dfrac{s^2+2s+2}{s^2+s+1}$ can be realized as a

(a) R-C network. (b) R-L network.
(c) L-C network. (d) R-L-C network.

[U.P.S.C. I.E.S. E.E.-I, 2003]

Answers: **462.** (c), **463.** (c), **464.** (b), **465.** (c), **466.** (c), **467.** (c), **468.** (a), **469.** (c), **470.** (b), **471.** (d), **472.** (b), **473.** (c), **474.** (a), **475.** (b), **476.** (d),

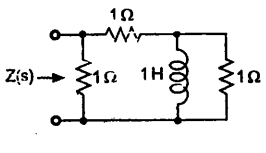
477. What is the driving point operational impedance of the network given below ?



(a) $\frac{(2s+1)}{(3s+2)}$ (b) $\frac{(s+1)}{(2s+2)}$

(c) $\frac{s}{(3s+2)}$ (d) $\frac{(s+2)}{(s+3)}$

[U.P.S.C. I.E.S. E.E.-I, 2007]

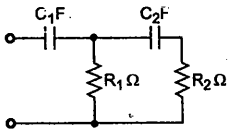
478. The driving point impedance $Z(s) = \frac{s+2}{s+3}$. The system is initially at rest. For a voltage signal of unit step, the current $i(t)$ through the impedance Z is given by

(a) $2 - e^{-t}$ (b) $\frac{3}{2} - \frac{1}{2}e^{-3t}$

(c) $\frac{3}{2} - \frac{1}{2}e^{-2t}$ (d) $3 - 2e^{-2t}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

479. If $Z(s) = \frac{s^2+8s+15}{s^2+4s}$ for the given circuit, then what is the value of R_1 ?

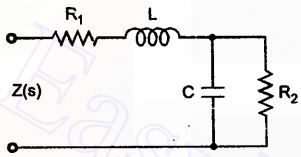


(a) $\frac{17}{16}\Omega$ (b) $\frac{9}{8}\Omega$

(c) $\frac{19}{16}\Omega$ (d) $\frac{21}{16}\Omega$

[U.P.S.C. I.E.S. E.E.-I, 2007]

480. The impedance $Z(s)$ of the one-port network shown in the figure is given by



(a) $\frac{s^2 + s\frac{L}{C} + \frac{R_1}{CL}}{s + \frac{1}{LC}}$

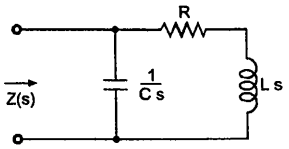
(b) $\frac{s^2 + s\frac{L + C R_1 R_2}{R_2 LC} + \frac{R_1 + R_2}{R_2 LC}}{s + \frac{1}{R_2 C}}$

(c) $\frac{s^2 + s\frac{L + C}{R_1 R_2} + \frac{R_1}{LC}}{s + \frac{1}{R_1 C}}$

(d) $\frac{s^2 + s\frac{L + R_2 C}{R_1 LC} + \frac{R_1 + R_2}{R_1 LC}}{s + \frac{1}{R_1 C}}$

[U.P.S.C. I.E.S. E.E.-I, 1997]

481. The impedance $Z(s)$ in the circuit shown is



(a) $\frac{1}{C}\left\{\frac{s + \frac{R}{L}}{s^2 + \left(\frac{R}{L}\right)s + \frac{1}{LC}}\right\}$ (b) $\frac{1}{L}\left\{\frac{s + \frac{1}{RC}}{s^2 + \frac{1}{RC}s + \frac{1}{LC}}\right\}$

(c) $\frac{1}{L}\left\{\frac{s + \frac{R}{L}}{s^2 + \frac{1}{RC}s + \frac{1}{LC}}\right\}$ (d) $\frac{1}{C}\left\{\frac{s + \frac{1}{RC}}{s^2 + \left(\frac{R}{L}\right)s + \frac{1}{LC}}\right\}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

482. From the given list of driving point impedance functions, which one can be realised using R and C elements only ?

1. $Z_1(s) = \frac{s+8}{(s+2)(s+6)}$ 2. $Z_2(s) = \frac{(s+2)(s+6)}{(s+4)}$

3. $Z_3(s) = \frac{s(s+4)}{(s+2)}$ 4. $Z_4(s) = \frac{(s+2)}{(s+1)(s+3)}$

(a) $Z_1(s)$ (b) $Z_2(s)$ (c) $Z_3(s)$ (d) $Z_4(s)$

[U.P.S.C. I.E.S. E.E.-I, 2005]

483. The impulse response of an R-L circuit is a

(a) rising exponential function.

(b) decaying exponential function.

(c) step function. (d) parabolic function.

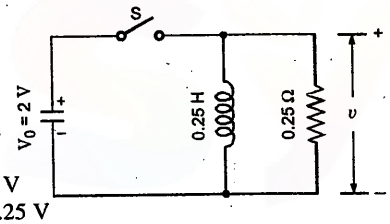
[U.P.S.C. I.E.S. E.E.-I, 1997]

484. A voltage $v(t) = 6e^{-2t}$ is applied at $t = 0$ to a series R-L circuit with L = 1 H. If $i(t)$ 6 [exp $(-2t)$ – exp $(-3t)$] then R will have a value of

(a) $\frac{2}{3}\Omega$ (b) 1 Ω (c) 3 Ω (d) $\frac{1}{3}\Omega$

[U.P.S.C. I.E.S. E.E.-I, 1999]

485. For the circuit given in the fig $V_0 = 2$ V and the inductor is initially relaxed. The switch S is closed at $t = 0$. The value of v at $t = 0^+$ is



(a) 3 V (b) 2 V

(c) 0.5 V (d) 0.25 V

[U.P.S.C. I.E.S. E.E. I, 1995]

486. Consider the following statements

1. Transfer impedance is the reciprocal of transfer admittance.
2. One can derive transfer impedance of a network if its driving point impedance and admittance are known.
3. Driving point impedance is the ratio of the Laplace transform of voltage and current time functions at the input.

Of these statements

(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.

(c) 2 and 3 are correct. (d) 3 alone is correct.

[U.P.S.C. I.E.S E.E.-I, 1996]

487. A pulse of unit amplitude and width 'a' is applied to a series RL circuit as shown in the figure. The current $i(t)$ as 't' tends to infinity will be

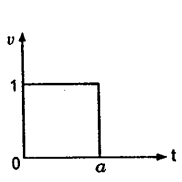


Fig. 1

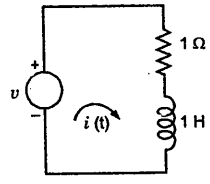

Fig. 2

(a) zero. (b) 1 A.

(c) a value between zero and one depending upon the width of the pulse.

(d) infinite.

[U.P.S.C. I.E.S. E.E.-I, 1997]

Answers: **477.** (a), **478.** (c), **479.** (a), **480.** (b), **481.** (a), **482.** (d), **483.** (b), **484.** (c), **485.** (b), **486.** (d), **487.** (a),

Downloaded From : www.EasyEngineering.net

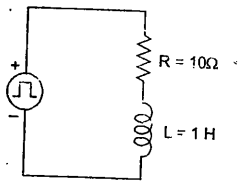
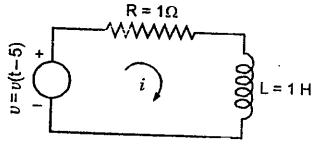
488. An R-C series circuit, initially at rest has a step voltage signal. The response $v(t)$ across C is $v(t) = 1 - e^{-3t}$. If now there is an initial voltage at C of 3 volts. What is $v(t)$ for the same step signal ?
(a) $1 + 3e^{-3t}$ (b) $1 + 2e^{-3t}$
(c) $3e^{-3t}$ (d) none of the above
[U.P.S.C. I.E.S. E.E.-I, 2006]

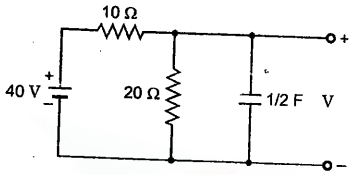
489. A unit impulse voltage is applied at $t = 0$ to the R-L circuit shown, while $i(0^-) = 1$ A. What is the expression for $i(t)$?
(a) e^{-10t} (b) $1{\cdot}5\ e^{-10t}$
(c) $2e^{-10t}$ (d) $10\ e^{-10t}$
[U.P.S.C. I.E.S. E.E.-I, 2005]



490. A unit step $u(t-5)$ is applied to the R-L network. The current is given by
(a) $1 - e^{-t}$
(b) $[1 - e^{-(t-5)}]u(t-5)$
(c) $(1 - e^{-t})u(t-5)$
(d) $1 - e^{-(t-5)}$
[U.P.S.C. I.E.S. E.E.-I, 2001]



491. In the network shown in the given figure, if the voltage v at the time considered is 20 V, then $\frac{dv}{dt}$ at that time will be
(a) 1 V/s (b) 2 V/s (c) − 2 V/s (d) zero
[U.P.S.C. I.E.S. E.E.-I, 1997]



492. An initially relaxed 100 mH inductor is switched on at $t = 1s$, to an ideal 2 A dc current source. The voltage across the inductor would be
(a) zero (b) $0{\cdot}2\ \delta(t)$ V
(c) $0{\cdot}2\ \delta(t-1)$ V (d) $0{\cdot}2u(t-1)$ V
[U.P.S.C. I.E.S. E.E.-I, 1998]

493. The realization of the reactance function $Z(s) = \frac{4(s^2+1)(s^2+9)}{s(s^2+4)}$ requires a minimum of
(a) 4 inductors and 4 capacitors.
(b) 3 inductors and 1 capacitor.
(c) 1 inductor, 1 capacitor, and 1 resistor.
(d) 2 inductors and 2 capacitors.

494. In the network shown in Fig. 1 if the 1 F capacitor had an initial voltage of 2 V, then which of the following would represent the s-domain equivalent circuits ?

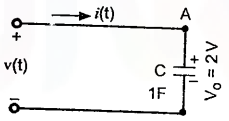


Fig. 1

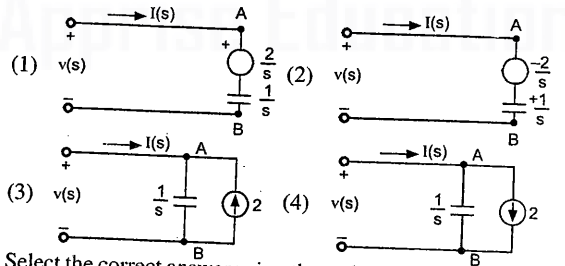


Select the correct answer using the codes given below :
Codes :
(a) 1 and 3. (b) 1 and 4. (c) 2 and 3. (d) 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 1998]

495. The Fourier transform of a unit step function is given as
(a) $F(j\omega) = 1/j\omega$ (b) $F(j\omega) = j\omega$
(c) $F(j\omega) = j/\omega$ (d) $F(j\omega) = \omega/j$

496. Fourier transform $\delta(t)$ is given as
(a) zero. (b) 1 (c) $2\pi\delta(\omega)$ (d) $\pi\delta(\omega)$

497. The Fourier transform of a function $f(t)$ is given as
(a) $\int_{-\infty}^{+\infty} f(t)e^{-j\omega t}\,dt$ (b) $\int_{0}^{\infty} f(t)e^{-j\omega t}\,dt$
(c) $\int_{0}^{\infty} f(t)e^{-\omega t}\,dt$ (d) none of these.

498. If the Fourier transform of $f(t)$ is $F(j\omega)$, then what is the Fourier transform of $f(-t)$?
(a) $F(j\omega)$ (b) $F(-j\omega)$
(c) $-F(j\omega)$ (d) Complex conjugate of $F(j\omega)$
[U.P.S.C. I.E.S. E.T.E-I, 2008]

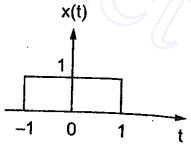
499. Let $x(t)$ be a real signal with the Fourier transform $X(f)$. Let $X^*(f)$ denote the complex conjugate of $X(f)$. Then
(a) $X(-f) = X^*(f)$ (b) $X(-f) = X(f)$
(c) $X(-f) = -X(f)$ (d) $X(-f) = -X^*(f)$
[U.P.S.C. I.E.S. E.E.-II, 2002]

500. If $f(t)$ is an even function, then what is its Fourier transform $F(j\omega)$?
(a) $\int_{0}^{\infty} f(t)\cos(2\omega t)dt$ (b) $2\int_{0}^{\infty} f(t)\cos(\omega t)dt$
(c) $2\int_{0}^{\infty} f(t)\sin(\omega t)dt$ (d) $\int_{0}^{\infty} f(t)\sin(2\omega t)dt$
[U.P.S.C. I.E.S. E.T.E-I, 2008]

501. The Fourier transform of a function is equal to its two-sided Laplace transform evaluated
(a) on the real axis of the s-plane.
(b) on a line parallel to the real axis of the s-plane.
(c) on the imaginary axis of the s-plane.
(d) on a line parallel to the imaginary axis of the s-plane.
[U.P.S.C. I.E.S. E.T. E-I, 2008]

502. Let $x(t) = \text{rect}\left(t - \frac{1}{2}\right)$ (where rect $(x) = 1$ for $-\frac{1}{2} \le x \le \frac{1}{2}$ and zero otherwise). Then if $\sin(x) = \frac{\sin(\pi x)}{\pi x}$, the Fourier Transform of $x(t) + x(-t)$ will be given by
(a) $\sin\left(\frac{\omega}{2\pi}\right)$ (b) $2\sin\left(\frac{\omega}{2\pi}\right)$
(c) $2\sin\left(\frac{\omega}{2\pi}\right)\cos\left(\frac{\omega}{2}\right)$ (d) $\sin\left(\frac{\omega}{2\pi}\right)\cos\left(\frac{\omega}{2}\right)$
[GATE E.E., 2008]

503. $x(t)$ is a positive rectangular pulse from $t = -1$ to $t = +1$ with unit height as shown in the figure. The value of $\int_{-\infty}^{\infty} |X(\omega)|^2\,d\omega$ {where $X(\omega)$ is the Fourier transform of $x(t)$} is
(a) 2 (b) 2π
(c) 4 (d) 4π
[GATE E.E., 2010]



504. A real signal $x(t)$ has Fourier transform $X(f)$. Which one of the following is correct ?
(a) Magnitude of $X(f)$ has even symmetry while phase of $X(f)$ has odd symmetry.
(b) Magnitude of $X(f)$ has odd symmetry while phase of $X(f)$ has even symmetry.

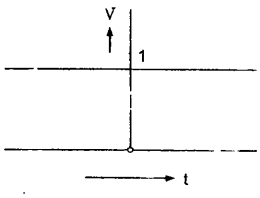
Answers: **488.** (b), **489.** (c), **490.** (c), **491.** (b), **492.** (c), **493.** (d), **494.** (a), **495.** (a), **496.** (b), **497.** (a), **498.** (b), **499.** (a), **500.** (b), **501.** (c), **502.** (c), **503.** (d), **504.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Both magnitude and phase of $X(f)$ have even symmetry.
(d) Both magnitude and phase of $X(f)$ have odd symmetry.
[U.P.S.C. I.E.S. E.T. E-I, 2007]

505. For the function shown in figure Fourier transform is



(a) $\frac{2}{j\omega}$ (b) $\frac{j\omega}{2}$
(c) $2\pi\delta(\omega)$ (d) $\pi\delta(\omega)+\frac{2}{j\omega}$

506. If the Fourier transform of $x(t)$ is $\frac{2}{\omega}\sin(\pi\omega)$, then what is the Fourier transform of $e^{j5t}x(t)$?

(a) $\frac{2}{\omega-5}\sin(\pi\omega)$ (b) $\frac{2}{\omega}\sin\{\pi(\omega-5)\}$
(c) $\frac{2}{\omega+5}\sin\{\pi(\omega+5)\}$ (d) $\frac{2}{\omega-5}\sin\{\pi(\omega-5)\}$
[U.P.S.C. I.E.S. E.T.E-I, 2006]

507. Which one of the following represents the Fourier Transform $X(j\omega)$ of the signal $X(t) = t\,e^{-at}u(t)$?

(a) $X(j\omega)=\frac{j\omega}{(a+j\omega)}$ (b) $X(j\omega)=\frac{j\omega}{(a+j\omega)^2}$
(c) $X(j\omega)=\frac{(a+j\omega)^2}{j\omega}$ (d) $X(j\omega)=\frac{1}{(a+j\omega)^2}$
[U.P.S.C. I.E.S. E.E.-II, 2004]

508. What is the inverse Fourier transform of $u(\omega)$?

(a) $\frac{1}{2}\delta(t)+\frac{1}{\pi t}$ (b) $\frac{1}{2}\delta(t)$
(c) $2\delta(t)+\frac{1}{\pi t}$ (d) $2\delta(t)+\text{sgn}\,(t)$
[U.P.S.C. I.E.S. E..T.E-I, 2006]

509. What is the inverse z transform of $X(z)$?

(a) $\frac{1}{2\pi j}\oint X(z)z^{n-1}dz$ (b) $\frac{1}{2\pi j}\oint X(z)z^{n+1}dz$
(c) $\frac{1}{2\pi j}\oint X(z)z^{1-n}dz$ (d) $2\pi j\oint X(z)z^{-(n+1)}dz$
[U.P.S.C. I.E.S. E.T.E-I, 2006]

Answers: **505.** (c), **506.** (d), **507.** (d), **508.** (a), **509.** (a).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below.
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): It is impossible to change the current through an inductor by finite amount in zero time.
(R): The current through an inductor can be changed by finite amount in zero time only when an infinite voltage is applied across it.

2. (A): A coil, when connected across 230 V dc supply, will draw more current in comparison to that when connected across 230 V ac supply.
(R): The inductance of the coil opposes the flow of alternating current (not that of direct current).

3. (A): Effective resistance of the iron-cored choke coil is more than its true resistance.
(R): The iron-cored choke coil draws power from ac supply mains to meet the iron loss occuring in core in addition to the power loss in ohmic resistance.

4. (A): If the voltages across R, L and C elements connected in series in an ac circuit are 300, 100 and 500 V respectively, then the total voltage applied will be 500 volts.
(R): The applied voltage is equal to the maximum voltage existing across any of the three elements.
[U.P.S.C. I.E.S. E.E. I, 1993]

5. (A): Power factor is defined as the ratio of apparent power to the average power in an ac circuit.
(R): The magnitude of power factor is always less than unity.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

6. (A): Sinusoidal response in an ac circuit can be represented in rectangular form as $v = V\cos\theta + jV\sin\theta$, exactly in a way similar to vectors which we come across for force analysis in mechanics.
(R): Phasors are nothing but vectors.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

7. (A): In an alternating circuit if impressed voltage is $(100 - j50)$ volts and the current is $(3 - j4)$ amperes, the reactive power in the circuit is 250 VA.
(R): True power is the real part of (VI).
[U.P.S.C. I.E.S. E.E. I, 1994]

8. (A): In a series R-L-C circuit, the current is a minimum at resonant frequency.
(R): The maximum voltage across the capacitor occurs at a frequency lower than the resonant frequency.
[U.P.S.C. I.E.S. E.E.-I, 2003]

9. (A): It is necessary that the tuning coil should be of high resistance and low inductance.
(R): High value of Q-factor means not only higher magnification but also a higher selectivity of the tuning coil.

Answers: **1.** (a), **2.** (a), **3.** (a), **4.** (c), **5.** (d), **6.** (a), **7.** (b), **8.** (d), **9.** (d),

Downloaded From : www.EasyEngineering.net

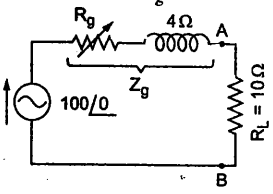
Downloaded From : www.EasyEngineering.net

10. (A): Resonance occurs in an R-L-C circuit (simple series or parallel) at a frequency of $\omega_0 = \frac{1}{\sqrt{LC}}$.
(R): The impedance of the circuit at this frequency is maximum. [U.P.S.C. I.E.S E.E.-i, 1993]

11. (A): A network is said to be in resonance when the voltage and current at the network input terminals are in phase.
(R): In a two-terminal network containing at least one inductor and one capacitor, the resonance is defined as the condition which exists when the input impedance of the network is purely resistive. [U.P.S.C. I.E.S. E.E.-I, 2011]

12. (A): Kirchhoff's current law is valid for an ac circuit containing R, L and C.
(R): The sum of rms current at any junction of the circuit is always zero. [U.P.S.C. I.E.S. E.E.-i, 1993]

13. In the circuit shown in the given figure, R_g is variable between 3 and 30 ohms, R_L being fixed.



(A): For maximum power transfer across the terminals AB $R_g = 3\ \Omega$.
(R): When maximum power transfer occurs $R_L = |\overline{Z}g|$
[U.P.S.C. I.E.S. E.E. I, 1994]

14. (A): In delta connected three-phase balanced circuit
1. Line current = phase current $\times \sqrt{3}$.
2. Line voltage = phase voltage.
(R): For balanced 3-phase circuits the three voltages are equal in magnitude and displaced by 120°. [U.P.S.C. I.E.S. E.E. I, 1993]

15. (A): In a 3-phase supply, floating neutral is undesirable.
(R): Floating neutral in a 3-phase supply system may give rise to high voltage across the load.

16. (A): There are pulsations in power of a balanced three-phase system.
(R): The three-phase generators produce sinusoidal voltages and current. [U.P.S.C. I.E.S. E.E.-I, 2002]

17. (A): Equivalent network obtained from Δ—Y transformation relationships in general is valid only for one frequency.
(R): The impedances involved in Δ—Y vary with frequency. [U.P.S.C. E.E.-I, 2001]

18. (A): Generated voltage or current wave have no odd harmonic.
(R): The field system and armature coils of the generators are all symmetrical and so generates mostly symmetrical voltage waves.

19. (A): In a purely capacitive circuit, the current wave is more distorted than the voltage wave.
(R): The harmonics in the current wave are increased in proportion to their frequency numbers.

20. (A): RMS value of line voltage is more than $\sqrt{3}$ times of the rms value of phase voltage.
(R): In a star-connected system, the line voltage contains no tripile frequency harmonic content.

21. (A): The Fourier series expansion of the square wave contains only cosine terms.
(R): The wave is an even function. [U.P.S.C. I.E.S. E.E.-I, 1995]

22. (A): Line currents of 3-phase 3-wire system cannot contain zero sequence current whether it is delta connected or star connected.
(R). Fourth wire is necessary for the flow of zero sequence currents in the lines of the 3-phase system.

23. (A): The zero sequence components of line-to-line voltages are non-existent regardless of the degree of imbalance in these voltages.
(R): The sum of line voltages is zero.

24. (A): A high-pass R-C circuit has a lower cut-off frequency but does not have any upper cut-off frequency.
(R): The transfer function of a high-pass R-C circuit can be written as

$$|H| = \frac{1}{\sqrt{1+(f_1/f)^2}},\ \theta = \arctan(f_1/f) \text{ where } f_1 = \frac{1}{2\pi RC}$$

[U.P.S.C. I.E.S. E.T.E-I, 2008]

25. (A): Laplace transform is preferred for solving networks involving higher order differential equations.
(R): The classical method for solving differential equations of higher order is quite cumbersome.

26. (A): The Laplace transform of $e^{-at}\sin\omega t$ is $\frac{\omega}{(s+a)^2+\omega^2}$.
(R): If the Laplace transform of f(t) = F(s) then Laplace transform of $e^{-at}F(s) = F(s+a)$ [U.P.S.C. I.E.S. E.E. I-1992]

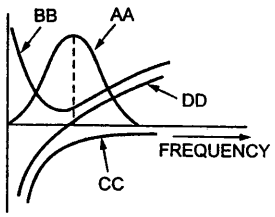
27. (A): Transfer impedance of network is always the reciprocal of its transfer admittance.
(R): The impedance of a network is the reciprocal of its admittance. [U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **10.** (c), **11.** (a), **12.** (a), **13.** (b), **14.** (b), **15.** (c), **16.** (d), **17.** (d), **18.** (d), **19.** (a), **20.** (d), **21.** (a), **22.** (a), **23.** (a), **24.** (b), **25.** (a), **26.** (a), **27.** (d).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1. The response of a series R-L-C circuit fed from a fixed rms voltage and variable frequency source is represented graphically in the given figure. Match list 1 with list 2 and select the correct answer using the codes given below the lists:



List 1 (Curve)		List 2 (Quantity)
A.	AA	1. Current.
B.	BB	2. Impedance.
C.	CC	3. Capacitance reactance.
D	DD	4. Net reactance.
		5. Inductive reactance.

Answers: **6.** (c), **7.** (a), **8.** (a), **9.** (c).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. AC varies in magnitude and reverses in polarity.
2. Periodic time, T = supply frequency, f.
3. Most of the ac instruments (voltmeters and ammeters) indicate average value.
4. Peak-to-peak voltage is twice the peak value of voltage.
5. An insulation is subjected to peak value of applied alternating voltage to it.
6. The average value of an unsymmetrical alternating quantity is computed over whole cycle.
7. An electric iron is rated as 230 V, 500 W, ac. The value of 230 V refers to average value.
8. The rms value of a sinusoidal ac voltage is equal to its value at an angle of $\pi/4$ radian.

Answers: **1.** (T), **2.** (F), **3.** (F), **4.** (T), **5.** (T), **6.** (T), **7.** (F), **8.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

9. The size (cross-sectional area) of a conductor, with regard to heating effect, is determined on the basic of peak-to-peak value of current to be carried by it.
10. The ratio of effective value to average value is called the Q-factor.
11. The form factor for dc supply voltage is always is unity.
12. The phase difference between two alternating quantities is measured by the angular distance between the points where the two curves cross the base or reference line in the same direction.
13. Each 180° (or π radian) rotation of the phasor generates a complete cycle.
14. When two waves are 90° out of phase, one has its peak value when the other is at zero value.
15. The phase difference between the two waveforms can be compared only when they have the same effective value.
16. A phasor is a line which represents the rms value and phase of an alternating quantity.
17. An inductor opposes equally the dc as well as ac.
18. A pure inductance connected across 230 V, 50 ac supply consumes 125 watts.
19. An inductor does not offer any opposition to dc.
20. A capacitor blocks alternating current.
21. The inductors are designed to have low value of Q-factor.
22. Ohmic resistance is termed as effective resistance.
23. Electrical power converted into heat due to flow of ac through an ohmic resistance is called the reactive power.
24. Average power in a pure resistive circuit is equal to product of average values of current and voltage.
25. The average power P_{av} is equal to one half of the peak power for sinusoidal waveforms.
26. The inductive reactance of a circuit decreases with the increase in supply frequency.
27. Pure inductive circuit draws zero current.
28. With the increase in supply frequency the capacitive reactance of the circuit will decrease.
29. Capacitive reactance increases with the increase in capacitance.
30. While drawing phasor diagram for a series circuit, current is the reference phasor.
31. Power factor is the cosine of the angle between voltage and current phasor. **[R.G.T.U. M.P., December, 2010]**
32. The pf of an ac circuit is given as Q-factor of the circuit.
33. A leading pf implies that the current leads the voltage.
34. The relation between apparent power (kVA), true power (kW) and reactive power (kVAR) is $kVA = \sqrt{(kW)^2 + (kVAR)^2}$.
35. The rating given on the name plate of a transformer indicates the true power which it can supply.
36. In an ac circuit, the reciprocal of impedance is called reluctance. **[R.G.T.U. M.P., December, 2010]**
37. At resonance, the power factor of the circuit is unity. **[R.G.T.U. M.P., December, 2010]**
38. The ratio of the bandwidth to the resonant frequency is called the quality factor.
39. In a series resonant circuit, lower the resistance in the circuit, more steep will be the current response.
40. In a parallel R-L circuit, as the frequency increases, impedance Z decreases.
41. In a parallel resonant circuit, the value of resistance has effect on the resonant frequency.
42. When a capacitor is connected in parallel to an inductive circuit, the phase angle increases and pf decreases.
43. In a highly capacitive circuit the actual power will be lesser than reactive power.
44. The operator j has a numerical value of $\sqrt{-1}$.
45. The conjugate of $(a - jb)$ is $(a + jb)$.
46. The product of $(a + jb)$ and $(c - jd)$ is equal to $(ac + bd) + j(bc - ad)$.
47. Parallel R-C circuit behaves as a purely capacitive circuit at low frequency.
48. In an R-L-C circuit, susceptance is equal to $\frac{X}{Z}$.
49. A series RLC circuit is purely reactive at the resonance frequency. **[A.M.I.E. Sec. B, Circuit Theory Control Winter 2005]**
50. In a series R-L-C circuit at resonance admittance is maximum.
51. In a series resonant circuit, the magnification of current is zero.
52. In a series resonant circuit, the voltage across the circuit is the same as the voltage across the inductance or capacitance.
53. For sharp rise in current, in case of R-L-C series resonant circuit, R should be low.
54. At half-power points of a resonance curve, the current is half of current at resonance.
55. The frequency range between two half power frequencies is known as the bandwidth.
56. A highly selective circuit has high Q-factor. **[Mahamaya Technical Univ., Second Semester 2010-11]**
57. The quality factor Q is defined as

$$Q = \frac{1}{2\pi} \times \frac{\text{Total energy stored}}{\text{Energy dissipated per cycle}}$$

[A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]

58. Tellegen's theorem is applicable to any lumped network. **[A.M.I.E. Sec B. Circuit & Field Theory Summer 1995]**
59. For a network with m meshes, there are $(m - 1)$ independent mesh equations. **[A.M.I.E. Sec B. Circuit & Field Theory Summer 1995]**
60. In two phase system, voltage differ by 180°.
61. In a balanced 3-phase star-connected system E_{RY} lags behind E_B by 90 electrical degrees.
62. In a 3-phase balanced star-connected load circuit, neutral current is unpredictable.
63. In a balanced 3-phase delta-connected circuit, phase current is equal to line current.
64. The power in a 3-phase system is given by $\sqrt{3} V_L I_L \cos\phi$ where ϕ is the phase angle between line voltage and line current.
65. The minimum number of wattmeters to measure power is a 3-phase unbalanced star-connected load is two.
66. Three unequal impedances are connected in star to a 3-phase system. The phasor sum of three line currents will be zero.

Answers: **9.** (F), **10.** (F), **11.** (T), **12.** (T), **13.** (F), **14.** (T), **15.** (F), **16.** (T), **17.** (F), **18.** (F), **19.** (T), **20.** (F), **21.** (F), **22.** (T), **23.** (F), **24.** (F), **25.** (T), **26.** (F), **27.** (F), **28.** (T), **29.** (F), **30.** (T), **31.** (T), **32.** (F), **33.** (T), **34.** (T), **35.** (F), **36.** (F), **37.** (T), **38.** (F), **39.** (T), **40.** (F), **41.** (T), **42.** (F), **43.** (T), **44.** (T), **45.** (T), **46.** (T), **47.** (F), **48.** (F), **49.** (F), **50.** (T), **51.** (F), **52.** (F), **53.** (T), **54.** (F), **55.** (T), **56.** (T), **57.** (F), **58.** (T), **59.** (T), **60.** (F), **61.** (T), **62.** (F), **63.** (F), **64.** (F), **65.** (T), **66.** (T),

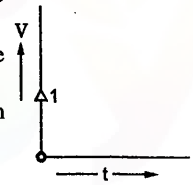
67. Shunt capacitors are employed for power factor improvement.
[Mahamaya Technical Univ., Second Semester 2010-11]
68. Every non-sinusoidal waveform has large number of harmonics.
69. A square wave has only even harmonics.
70. Non-sinusoidal waveforms possessing mirror-image symmetry have only even harmonics.
71. Transient analysis can be performed in a purely resistive circuit.
[Mahamaya Technical Univ., Second Semester 2010-11]
72. After very long time, a capacitor behaves as short circuit.
[Mahamaya Technical Univ. Second Semester 2010-11]
73. An inductor at $t = 0^+$ with zero initial conditions acts as short-circuit.
74. A capacitor with zero initial conditions at $t = 0^+$ acts as current source.
75. The current through an inductor follows an exponential growth.
76. In an R-L series circuit excited by a dc source the final value of the current is independent of L.
77. A pure inductance having no initial energy is connected across a pure capacitance having some initial energy. The current in the circuit will eventually decay to zero.
78. In an R-C series circuit excited by a dc voltage of V volts, the initial current is zero.
79. The transient current in loss-free L-C circuit, when excited by an ac source is an undamped.
80. Higher time constant of an R-C integrator circuit implies a faster rise or fall of input pulse voltage.
[A.M.I.E. Sec B. Circuit and Field Theory Summer 1995]
81. A series R-I_c circuit can be used as low-pass filter if the output is taken as the resistor voltage.
82. A series R-C circuit can be used as low-pass filter if the output is taken as the resistor voltage.
83. An unwanted high frequency that is superimposed on a low frequency alternating voltage can be attenuated by using low pass filter.
84. A π–type filter with shunt capacitance is a high pass filter.
85. Two basic filter actions are shunting and blocking.
86. In general, a high-pass filter can be used as phase-lag network.
87. A transformer with an isolated secondary winding also is effectively a high pass filter.
88. A bandpass filter attenuates frequencies which fall outside its bandwidth.
89. A parallel resonance L-C circuit in series with the load is a bandpass filter.
90. A band-reject filter attenuates frequencies that fall within its reject bandwidth.
91. Filters using both L and C elements usually provide a sharper response than those using only L or C.
92. The function $\exp(t^2)$ does not have a Laplace transform.
[A.M.I.E. Sec B. Circuits & Field Theory Summer 1994]
93. The system characterised by the equation $y = mx + c_i$ is linear.
[A.M.I.E. Sec B. Circuit & Field Theory Summer 1994]
94. The Laplace transform of $\sin \omega t$ is $\frac{2\omega s}{(s^2+\omega^2)^2}$.
95. The Laplace transform of $\cos(\omega_0 t + \phi)$ is $\frac{s^2+\omega^2}{s\sin\phi + \omega_0 \cos\phi}$.
96. The Laplace transform of unity impulse function is 1.
97. The Laplace transform of a unit parabolic function is $2/s^3$.
98. Laplace transform of a delayed unit impulse function $\delta(t-1)$ is s.
99. Figure depicted here represents unit impulse function.



100. According to final value theorem $f(t) = \lim_{t\to\infty} F(s)$.
$s\to 0$

Answers: **67.** (T), **68.** (T), **69.** (T), **70.** (F), **71.** (F), **72.** (F), **73.** (F), **74.** (F), **75.** (T), **76.** (T), **77.** (F), **78.** (F), **79.** (T), **80.** (F), **81.** (T), **82.** (F), **83.** (T), **84.** (F), **85.** (T), **86.** (F), **87.** (T), **88.** (T), **89.** (F), **90.** (T), **91.** (T), **92.** (T), **93.** (T), **94.** (F), **95.** (F), **96.** (T), **97.** (T), **98.** (F), **99.** (T), **100.** (F).

Fill in the Blanks Type Questions

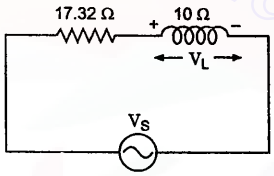
Note: Fill in the blanks with appropriate word or words.

1. When an electric current is passed through a bucket full of water, lot of bubbing is there. The electric current is _____.
2. An alternating current of frequency 50 Hz and maximum value 250 is given as $i =$ _____.
3. An alternating current of frequency 50 Hz has a maximum value of 100 A. Its value $\frac{1}{600}$ second after the instant the current is zero will be _____.
4. An ac given by $i = 100 \sin 314t$ will achieve a value of 86.6 A _____ second after the instant the current is zero.
5. A sinusoidal voltage varies from zero to maximum of 250 V. The voltage at the instant of 60° of the cycle will be _____.
6. A sine wave has a frequency of 60 Hz. Its angular frequency is _____ radians per second.
7. The standard supply frequency in India in _____ Hz.
8. The time period or periodic time T of an alternating quantity is the time taken in seconds to complete one _____.
(alternation/cycle)
9. An alternating current is given by the expression $i = 200 \sin (314t + \pi/6)$ amperes. The maximum value is _____ and the frequency of the current is _____.
10. The mean value of the current $i = 20 \sin t$ from $t = 0$ to $t = \frac{\pi}{2}$ is _____.
11. A constant current of 2.8 A exists in a resistor. The rms value of current is _____ A.
12. Power dissipated in 10 Ω resistance when a voltage of $100 (1 + \sin 314t)$ is applied across it will be _____.
13. The length of a phasor in a phasor diagram normally represents _____ value of the alternating quantity.

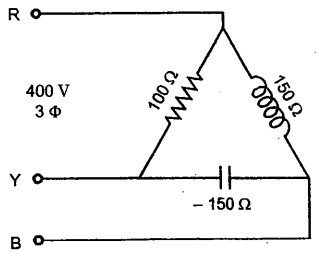
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

14. The form factor is the ratio of _____ value to _____ value.
15. The peak factor is the ratio of _____ value to _____ value.
16. The form factor for half wave rectified current is_____.
17. The emf induced in a coil rotating in a uniform magnetic field is maximum when the flux linkage by the coil is _____.
[A.M.I.E. Summer 1995]
18. A sinusoidal current having rms value of $8\angle 0°$ A is added to another sinusoidal current of rms value $6\angle 90°$ A. The rms value of the resultant current is _____.
[U.P. Technical Univ. First Semester 2009-10]
19. The opposition to the flow of an alternating current is called the _____.
20. In a purely inductive circuit _____ power is zero. (apparent/true/reactive)
21. If the supply frequency of a purely inductive circuit is doubled, the circuit current will be _____.
22. If the supply frequecy of a purely capacitive circuit is trippled, the circuit current will be _____.
23. The power consumed in an ac circuit will be minimum when phase difference between I and V is _____.
24. In an ac circuit, the ratio of active power to apparent power is called the _____ factor. (power/peak/form)
25. The heat developed in an electric iron is attributed to _____ power. (apparent/reactive/true)
26. Effective resistance of an iron-cored choke coil is _____ than its ohmic resistance. (more/less)
27. In the circuit below the voltage Vs has a phase angle of _____ with respect to V_L.
[GATE E.E. 1994]



28. The increase in resistance due to non-uniform distribution of current in a conductor is known as_____ effect.
[GATE E.E., 1994]
29. In a series R-C circuit current _____ with the increase in frequency. (increases/decreases)
30. At very high frequency a series R-C circuit behaves as almost purely _____ circuit. (resistive/capacitive/inductive)
31. At very low frequency a series R-C circuit behaves as almost purely _____ circuit.
32. The power factor in a RLC series circuit will be lagging if _____.
[Mahamaya Technical Univ. Second Semester 2010-11]
33. The symbol j represents _____ rotation of a phasor by _____ degrees.
34. The numerical value of operator j^2 is equal to _____. (0, –1, +1)
35. Parallel R-C circuit behaves as purely capacitive circuit at very _____ frequencies. (low/high)
36. In an R-L-C parallel circuit, admittance is defined as the reciprocal of _____.
37. While drawing a phasor diagram for an ac parallel circuit _____ is taken as reference phasor.
38. Common condition to both series and parallel resonance is ____.
[Mahamaya Technical Univ. Second Semester 2010-11]
39. A series R-L-C circuit has the following parameter values R = 10 Ω, L = 0.01 H, C = 100 μF. The Q-factor of the circuit at resonance is _____.
[GATE E.E. 1995]
40. A parallel ac circuit draws _____ current when in resonance.
41. The ability of a resonant circuit to discriminate between one particular frequency and all others is called its _____
42. Selectivities of different resonance circuits are compared in terms of their _____.
43. In case of a resonant circuit the formula relating the resonance frequency ω_0, the quality factor Q_0 and the bandwidth $\Delta\omega$ is ($\omega_0 = Q_0 \times \Delta\omega$, $Q_0 = \omega_0 \times \Delta\omega$, $\Delta\omega = Q_0\omega_0$)
[G.G.S.I.P. Univ. Delhi May 2010]
44. A tuned circuit provides a voltage of known _____ across a known resistance.
45. If the coil employed in a tuned circuit is of low resistance, its selectivity will be _____.
46. In a parallel R-L circuit, the phase angle _ _____ with the decrease in frequency.
47. The frequency, at which an R-L-C network behaves as a purely resistive network, is called the _____ frequency.
48. In case of a series circuit Q factor is _____ magnification while in case of parallel circuit it is _____ magnification.
49. The power dissipated at the half-power points is _____ power dissipated at resonance.
50. A choke coil of inductance L and series resistance R is shunted by a capacitance C. The dynamic impedance of the resonant circuit is _____. $\left[\frac{R}{LC}, \frac{C}{RL}, \frac{L}{RC}\right]$
51. In a balanced 3-phase star-connected system line voltages are 30°_____ of the respective phase voltages.
52. In a balanced delta-connected system line currents are 30°_____ the respective phase currents.
53. In delta-connected generator, the sum of instantaneous voltage around the delta is equal to _____.
[Mahamaya Technical Univ. Second Semester 2010-11]
54. A delta connected load with 10 Ω resistor in each phase is connected across a 400 V line to line voltage balanced 3-Φ supply. The power per phase consumed by this load is _____ kW.
[A.M.I.E. Winter 1996]
55. Three resistors of 10 Ω each forming a delta-connected load are connected across a 3-Φ balanced supply line to line voltage of 400 V. The total power consumed by this load is_____ kW.
[A.M.I.E. Winter 1996]
56. If W_1, W_2 and W_3 are the readings of three wattmeters used to measure the power in 3-phase, 4-wire circuit, the total power of load circuit will be _____.
[U.P. Technical Univ. First Semester 2008-09; M.T.U. Second Semester 2010-11]
57. In two wattmeter method, if the readings are equal with opposite sign then the power factor of the load is _____.
[G.B. Technical Univ. First Semester 2010-11
58. A set of 3 equal resistors, each of value R_X, connected in star across RYB of fig shown consumes the same power as the unbalanced delta-connected load shown. The value of R_X is _____Ω
[GATE E.E. 1994]



Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

59. Lamps of 40 W, 100 W and 200 W are connected in different phases of a 3-phase, 4-wire supply. If the neutral wire breaks, then the lamp likely to fuse first will be _____. (40/100/200 W)

60. Fourier series of even function do not have _____ terms.
[A.M.I.E. Sec B. Circuit and Field Theory Summer 1994]

61. The Fourier series expansion of a periodic function with half-wave symmetry contains only _____ harmonics.
[A.M.I.E. Sec B. Circuit and Field Theory Summer 1996]

62. A function $f(t)$ satisfying the condition $f(t) = f(-t)$ is said to be an _____ function.
[A.M.I.E. Sec B. Circuit and Field Theory Summer 1996]

63. Non-sinusoidal waveforms when applied to an average responding voltmeter will cause the meter to read high or low depending upon the _____ of the waveform.
[A.M.I.E. Sec B. Electronic & Elec. Measurements Summer 1994]

64. A _____ is an instrument designed to measure the relative amplitudes of signal frequency components in a complex waveform.
[A.M.I.E. Sec B. Electronic & Elec. Measurements Summer 1994]

65. A measure of distortion represented by a particular harmonic is the ratio of _____ of the harmonic to that of fundamental.
[A.M.I.E. Sec B. Electronic & Elec. Measurements Winter 1994]

66. Time constant of RL circuit is _____.
[Mahamaya Technical Univ. Second Semester 2010-11]

67. The time constant of an R-C series circuit is defined as the time taken by the voltage across the capacitor to become _____ per cent of its final value. (63.2/36.8/50)

68. Double transients occur in _____ circuits.

69. In a loss free R-L-C circuit, the transient current will be _____. (oscillating/non-sinusoidal/sinusoidal)

70. An R-C coupling circuit is effectively a _____ filter for pulsating dc.

71. A series resonant L-C circuit in series with the load is a _____ filter.

72. For sharper filtering the filters are to be connected in _____.

73. The Laplace transform of a unit step function is _____.

$\left(1/\frac{1}{s}/s/\frac{1}{s^2}\right)$

74. The Fourier transform of a unit step function is given as _____.

75. The Laplace transform of $f(t) = t^2$ will be _____.

76. Laplace transformation of $f(t - T)$ is _____.
[A.M.I.E. Sec B. Circuit & Field Theory Summer 1993]

77. Laplace transformation of convolution, we have varying functions is equal to the _____ of Laplace transformation of each of two functions.
[A.M.I.E. Sec B. Circuit & Field Theory Winter 1993]

78. The convolution of two time varying functions $f_1(t)$ and $f_2(t)$ is _____.
[A.M.I.E. Sec B. Circuits & Field Theory Summer 1995]

79. The Laplace transform of the impulse function $\delta(t)$ _____.
[A.M.I.E. Sec B. Circuit & Field Theory Summer 1996]

80. The convolution of the functions $f_1(t) = e^{-2t}\ u(t)$ and $f_2(t) = t\,u(t)$ is equal to_____.
[GATE E.E. 1995]

ANSWERS

1. dc	2. $250 \sin 314t$	3. 50 A	4. 1/300	5. 216.5 V

CHAPTER 3

DC Machines

Short Answer Type Questions With Answers

Q. 1. What is energy balance equation?

Ans. According to the principle of energy conservation the energy input to the electromechanical energy conversion device is equal to the summation of the useful output energy, the energy converted into heat, and the change in the energy stored in the magnetic/electric field *i.e.*

Energy input from electrical source = Mechanical energy output + increase in energy stored in the magnetic/electric field + energy converted into heat.

Q. 2. Predominant energy storage occurs in the air gap of an electromechanical energy conversion device. Is this statement correct ? Give reason in support of your answer.

Ans. The statement is correct. This is because the reluctance of air gap is much larger than that of the magnetic material.

Q. 3. When the armature of an electromagnetic relay moves to close the air gap instantaneously, where does the energy come from for doing mechanical work?

Ans. In instantaneous movement of armature to close the air gap flux linkages ψ remains almost constant and there is no electrical input. The energy required in doing mechanical work comes from the field energy which is reduced by an equal amount.

Q. 4. When the armature of an electromagnet relay moves to close the air gap slowly, where does the energy come from for doing mechanical work?

Ans. In slow movement of armature to close the air gap, current i stays substantially constant, energy is drawn from electrical source, half of the input energy is utilised in doing mechanical work and rest is stored in the magnetic field.

Q. 5. Why electromechanical energy conversion devices with magnetic field as the coupling medium between electrical and mechanical systems are more common than the devices with electric field ?

Ans. Because energy storing capacity of magnetic field is much larger (about 25,600 times) than that of electric field.

Q. 6. Why energy storing capacity of magnetic field is much larger than that of electric field ?

Ans. Because the value of permittivity of free space is very small compared to permeability of free space.

Q. 7. How can the direction of the stator revolving field be reversed ? **[Bharathiyar Univ. April 1996]**

Ans. The direction of the stator revolving field can be reversed by reversing any two of the three supply lines to the stator winding.

Q. 8. What is the basic power equation for a dynamo ?

Ans. $P_{input} = P_{output} + P_{losses}$

Q. 9. Define heating time constant of the machine. **[A.M.I.E. Sec B. Summer 1996]**

Ans. Heating time constant may be defined as the time during which the machine will attain 63.2% of its final steady temperature.

Q. 10. Why the cooling time constant of a rotating machine is usually larger than its heating time constant ?

Ans. The cooling time constant of a rotating machine is usually larger than its heating time constant owing to poor ventilation conditions, when the machine cools.

Q. 11. What informations should the rating of a machine give ?

Ans. The rating of an electrical rotating machine should include the output, voltage, speed and any other information that may be necessary for the proper operation of the machine.

Q. 12. In what terms are dc machines rated ?

Ans. The dc machines are rated in terms of kW output at a given speed and voltage.

Q. 13. What is the main factor which governs the size and rating of an electric machine ?

Ans. "Temperature rise" is the main factor which governs the size and rating of an electric machine.

Q. 14. What are the standard period for short-time rating of a machine ? **[A.M.I.E. Sec B. Winter 1994]**

Ans. Standard short-time ratings are 10, 30, 60 and 90 minutes.

Q. 15. Explain why a motor of smaller rating can be selected for a short time duty ? **[U.P. Technical Univ. Electric Drive 2005-06]**

Ans. The short-time duty motor operates at a constant load for some specified periods which is then followed by a period of rest.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The period of run (or load) is so short that machine cannot attain its steady temperature rise while the period of rest is too long that the motor temperature drops to the ambient temperature. Thus a motor of smaller rating can be operated with a larger power output for the maximum temperature rise in a short duration.

Q. 16. Why machines having long core length are provided with radial ventilating ducts while machines having deep cores are provided with axial cooling ? [A.M.I.E. Sec. B. Summer 1995]

Ans. Radial ventilating ducts provided with long core machines take away heat at a faster rate. Also in case of deep cores axial ventilating ducts do. Otherwise the central portion of long core and inner portion of deep core may attain a temperature higher than permissible value.

Q. 17. The outside of the machine should be cleaned frequently and the air passages blown out regularly. Why ?

Ans. Otherwise dust deposit upon the external surface of a machine will act as a heat insulant and in air ducts will restrict the flow of cooling air and consequently temperature will rise.

Q. 18. Why it is necessary to use a large number of coils and commutator segments with the coils evenly distributed around the surface of the armature of a dc machine ?

Ans. It is done so as to have practically constant unidirectional voltage at the brushes.

Q. 19 Why do the coils used in commercial generators consist of several turns in series ?

Ans. It is done so as to increase the magnitude of generated emf, being in direct proportion to the number of turns in the coil.

Q. 20. Why are cast iron yokes used in small dc machines ?

Ans. On account of low cost.

Q. 21. Why are fabricated steel yokes used in large machines ?

Ans. On account of high permeability thereby resulting in reduced weight.

Q. 22. What for field coils are provided in a dc machine ?

Ans. Field coils are provided to give, under various conditions of operation, the number of ampere-turns of excitation required to give proper flux through the armature to induce the emf.

Q. 23. Write the standard value of flux density in each part of the magnetic circuit of a standard machine. [A.M.I.E. Sec B. Winter 1999]

Ans. Standard values of flux density taken for a medium size dc machine is about 0.8 T in the air gap. In the field poles, yoke and armature it is about 1 T and in teeth portion it is taken about 1.5 to 2.0 T.

Q. 24. Why is the pole shoe section of a dc machine made larger than its body ? [A.M.I.E. Sec B. Summer 2003]

Ans. The pole shoe acts as a support to the field coils and spreads out the flux over the armature periphery more uniformly and due to larger x-section area reduces the reluctance of the magnetic path.

Q. 25. Why is the armature core of a dc machine laminated ? [A.M.I.E. Sec B. Winter 2001]

Ans. To reduce the eddy current loss.

Q. 26. Why is the air-gap between the pole-pieces and the armature kept very small ?

Ans. To reduce the reluctance of the magnetic path.

Q. 27. What is the best-suited material for commutator segments ? [A.M.I.E. Sec B. Summer 1996]

Ans. Silvered copper (extruded copper) containing about 0.05% silver.

Q. 28. Why are carbon brushes used in a dc machine? [A.M.I.E. Sec B. Electrical Machines Winter 2006]

Ans. The brushes are employed to collect current from the commutator and supply it to the external load circuit. The rate of wear caused to carbon brushes is the same as that of commutator segment and therefore contact made is always smoother and sparkless. Carbon brushes also have self lubricating property.

Q. 29. Why are the brushes staggered ? [A.M.I.E. Sec B. Summer & Winter 1994]

Ans. The brushes are staggered in order to prevent ridge formation on the surface of the commutator.

Q. 30. What is the primary reason for making the coil span of a dc (machine) armature winding equal to a pole-pitch. [A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. By making coil span of a dc armature winding equal to pole pitch, we have full-pitch winding, hence emf induced in the winding is maximum.

Q. 31. Why fractional pitch winding is preferred over full pitch winding ?

Ans. To affect saving in the copper of end connections and to have improved commutation.

Q. 32. What are the different types of armature windings commonly used in dc machines ? [A.M.I.E. Sec B. Summer 1996]

Ans. Lap and wave windings.

Q. 33. For what type of dc machine, wave winding is employed ?

Ans. For low current and high voltage rating machine.

Q. 34. For what type of dc machine lap winding is employed ?

Ans. For high current and low voltage rating machine.

Q. 35. A particular application employing a dc generator requires high voltage and low current. Should the machine be lap wound or wave wound. [A.M.I.E. Sec B. Summer 1994]

Ans. Wave wound.

Q. 36. Why are equalizer rings used in lap wound dc machines ? [A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. Equaliser rings are used in lap wound machines to avoid unequal distribution of current at the brushes thereby assist in achieving sparkless commutation.

Q. 37. A dummy coil is in the armature winding of a dc machine. Is the machine lap wound or wave wound ? [A.M.I.E. Sec B. Winter 1997]

Ans. Wave wound.

Q. 38. What is the nature (shape) of the dc armature mmf waveform ? [A.M.I.E. Sec B. Summer 2000]

Ans. Triangular.

Q. 39. What is the nature (shape) of air gap flux distribution in space at no load in dc machines ?

Ans. Flat topped.

Q. 40. What is armature reaction ?

Ans. Armature reaction is the effect of the magnetic field set up by the armature current on the distribution of flux under the main poles of a dc machine.

Q. 41. What are the two unwanted effects of armature reaction ? [A.M.I.E. Sec B. Winter 2002]

Ans. Demagnetization or weakening of main field and cross-magnetization or distortion of field.

Q. 42. Differentiate between geometrical neutral axis and magnetic neutral axis. [A.M.I.E. Sec B. Winter 2002]

Ans. Geometrical neutral axis is the axis between the magnetic poles and magnetic neutral axis is along zero magnetic field.

Q. 43. In a dc machine, along which one of the following axes the armature mmf is directed ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(*a*) Polar axis (*b*) Brush axis (*c*) Interpolar axis.
[A.M.I.E. Sec B. Summer, 1996]

Ans. Brush axis.

Q. 44. When the brushes in a dc machine are placed at the interpolar axis, is the armature mmf fully demagnetising, fully cross-magnetising or partly demagnetising and partly cross-magnetising ? [A.M.I.E. Sec B. Winter, 1995]

Ans. Fully cross-magnetising.

Q. 45. Why in dc machines sometimes brushes are shifted from neutral axis by a small angle ?
[A.M.I.E. Sec B. Summer 1996]

Ans. So as to lie along mnp to provide sparkless commutation.

Q. 46. What is reactance emf in dc machines ?
[A.M.I.E. Sec B. Winter 2002]

Ans. The self induced emf in the coil undergoing commutation is called the reactance voltage.

Q. 47. In a dc machine without interpole to get improved commutation, whether the brush shift should be varied with change in load or brush shift should be fixed ? [A.M.I.E. Sec B. Summer 2000]

Ans. Brush shift should be varied with the change in load in a dc machine so as to lie along mnp to provide improved commutation.

Q. 48. What is meant by commutation ? [R.G.P.V. Bhopal December 2002]

Ans. The process of reversal of current in the armature coils by means of brushes and commutator bars, is called the commutation process.

Q. 49. Explain bad commutation. [R.G.P.V. Bhopal December 2002]

Ans. A machine is said to have poor or bad commutation if there is sparking at the brushes and commutator surface. The bad commutation may be caused by mechanical or electrical conditions. The mechanical conditions include uneven commutator surface, non-uniform brush pressure, vibration of brushes in the brush holders etc. The electrical conditions include an increase in voltage between the commutator segments, an increase in the current density at the trailing edge of the brush etc.

Q. 50. What is linear commutation ?
[A.M.I.E. Sec B. Winter 1995; Summer, 1996]

Ans. Linear commutation is an ideal commutation and causes change of current in a coil undergoing commutation from $+I_C$ to $-I_C$ uniformly.

Q. 51. Name the factor that opposes full reversal of current in a coil undergoing commutation. [A.M.I.E. Sec B. Winter, 1994]

Ans. Self inductance of the coil undergoing commutation.

Q. 52. What is the location of interpole ?

Ans. Commutating poles are located midway between the main poles.

Q. 53. Why are the interpoles of a dc machine tapered ?
[A.M.I.E. Sec B. Winter 1994]

Ans. Interpoles are tapered in order to ensure that there is no saturation at the root of the pole at heavy overloads.

Q. 54. Is the interpole AT required for a compensated dc machine more or less than of an uncompensated one ?
[A.M.I.E. Sec B. Summer, 1993]

Ans. Interpole AT required for a compensated dc machine are less than of an uncompensated one.

Q. 55. Why are commutating poles provided in the construction of a large dc machine ? [A.M.I.E. Sec B. Summer 1996]

Ans. In a large dc machine armature reaction effect becomes very large and the commutation problem increases owing to large armature currents. Commutating poles are, therefore, provided to overcome these problems.

Q. 56. How is the polarity of an commutating pole assigned in a dc generator ? [A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. In case of a dc generator, the polarity of the commutating pole will be the same as that of the main pole just ahead in the direction.

Q. 57. What is compensating winding ?

Ans. A compensating winding is an auxiliary winding embedded in slots located in the faces of the main poles.

Q. 58. What is the purpose of compensating winding in a dc machine ?

Ans. The purpose of compensating winding is to neutralize the effect of armature reaction outside the influence of the interpoles and particularly to maintain uniform flux distribution under the faces of the main poles.

Q. 59. In what way compensating winding is connected to the armature ?

Ans. The compensating winding is connected in series with the armature in a manner so that the direction of current through the compensating winding conductors in any pole face will be opposite to the direction of current through the adjacent armature conductors.

Q. 60. Air gap lengths under the main poles of a dc machine are less than those under the interpoles. Why ? [A.M.I.E. Sec B. Winter 1995]

Ans. The gaps under the interpoles are kept longer than that under the main poles (1.5 to 1.7 times the main gap) in order to avoid saturation in the interpoles.

Q. 61. What do you understand by self excitation mode of dc machine? Name two dc machines working in this mode. [P.T.U. June 2003]

Ans. The dc machine in which field winding(s) is/are self excited by the current supplied by the machine itself is called the self-excitation mode of the machine. In such machines the field coils are interconnected with the armature winding.

The self excited machines may be (*i*) dc series machine (*ii*) dc shunt machine (iii) compound wound.

Q. 62. Why are permanent magnet generators rarely used in industry ?

Ans. Because of very small output.

Q. 63. Why is it necessary to wind series field coils of a medium or large size dc generators with a small number of turns of thick wire ?

Ans. Since the series field winding has to carry the full-load current, series field winding is wound with a fewer turns of thick wire or strips.

Q. 64. Why is it necessary to wind field coils of a dc shunt generator with a large number of turns of fine wire.

Ans. The field coils of a dc shunt generator are wound with a large number of turns of fine wire so as to have high resistance in order to keep shunt field current as low as possible as well as to provide required mmf.

Q. 65. What is the volt drop allowed for all brushes of each polarity for carbon or graphite brushes ?

Ans. 1 V per brush.

Q. 66. What type of current flows in stator winding and rotor winding of a dc shunt generator ? [A.M.I.E. Sec B. Winter 2003]

Ans. In stator : dc
In rotor : ac.

Q. 67. Why does saturation curve starts from some value higher than zero ?

Ans. Due to residual magnetism.

Q. 68. In a dc machine flux per pole decreases with increase of load. Justify the statement. [A.M.I.E. Sec B. Summer 2003]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. In a dc machine, flux per pole decreases with the increase of load due to demagnetization effect of armature reaction.

Q. 69. In what respect the separately excited dc generator is superior to self excited dc generator?

Ans. The separately excited dc generator has the advantage of stable operation with any field excitation over self excited generators.

Q. 70. What is the field circuit critical resistance ?

[U.P. Technical Univ. 2002-03]

Ans. It is the maximum value of resistance in the field circuit of a dc shunt generator with which the dc shunt generator will be able to excite.

Q. 71. A dc shunt generator can operate under short-circuit condition but series and cumulative compound generators cannot operate under this condition. Explain the reason.

[A.M.I.E. Sec B. Winter 1996]

Ans. In a dc shunt generator the field is connected across the armature and hence under short-circuit condition, some voltage exists across the armature because of residual flux and this keeps the shunt generator to function at low voltage. The shunt generator field also carries small current under these conditions.

In case of series and cumulative compound generators, the series field under the short-circuit condition carries excessive current and hence terminal voltage starts decreasing due to excessive demagnetizing effects of armature reaction. Thus the terminal voltage finally reduces to zero and, therefore, such machines cannot operate under short-circuit condition.

Q. 72. Why it is not advisable to fully load a dc shunt generator until its voltage builds up to the rated value ?

[A.M.I.E. Sec B. Winter 1994]

Ans. Building up process in a dc shunt generator is a step by step process which means that initially when the machine is started, generated voltage is small circulating small current. In case the generator is loaded fully at this stage, the magnitude of excitation current will become very small and hence resulting into the rate of build up becoming very small. Thus the time taken for the voltage to build-up to its rated value will become large. Hence it is advisable not to fully load the dc shunt generator during the process of build-up of voltage.

Q. 73. A dc shunt genertor is developing rated terminal voltage at some speed. For this generator, answer the following and give a brief explanation in support of your answers:

(*i*) If only the direction of rotation is reversed, will the generator build-up ?

(*ii*) If the direction of rotation and also the residual magnetism are reversed, will the generator build up ?

[A.M.I.E. Sec B. Summer 2002]

Ans. (*i*)The generator will not build up. With the direction of rotation reversed, the polarity of the generated emf will be reversed. The direction of field current will also reverse and hence the residual magnetism present in the poles will be wiped off and the generator will fail to build up.

(*ii*) When the direction of rotation and the residual magnetism both are reversed, then the small emf produced initially will strengthen the field further and hence the generator will build up voltage.

Q. 74. Why does the external characteristic of a dc shunt generator turns back as it is overload.

[U.P.S.C. I.E.S. Electrical Engineering II, 2001]

Ans. With the increase in current supplied by the machine (*i*) voltage drop across the armature winding and the contact resistance of the brushes increases (*ii*) field is weakened due to increase in effect of armature reaction. As a result terminal voltage decreases with increase in load current. The decrease in terminal voltage causes further decrease in field current. This will in turn cause the emf and, therefore, terminal voltage to drop too. Thus the effects are cumulative and terminal voltage is reduced to a much greater extent.

In the beginning the effect of decrease in resistance predominates over the effect of decreased terminal voltage but when the load current reaches a certain value (much higher than the full-load current) the demagnetising effect of armature reaction and voltage drop in the armature become so important that a further decrease in load resistance causes a decrease in current rather than increase and so the characteristic turns back.

Q. 75. The terminal voltage of a dc generator at full load is more than its open-circuit voltage. What is the mode of excitation of the generator ?

[A.M.I.E. Sec B. Summer 1995]

Ans. Cumulative compound.

Q. 76. What kind of generator can be expected to have no load voltage and full load voltage to be same ?

[A.M.I.E. Sec B. Winter 1999]

Ans. Flat-compounded dc generator.

Q. 77. A differentially compounded dc generator is delivering full-load current at a terminal voltage of 220 V. If the series winding is short-circuited, then its terminal voltage will .....

[A.M.I.E. Sec B. Summer 2000]

Ans. Terminal voltage will increase because of series field winding being shorted. This is because series field which opposes the shunt field in a differentially compounded dc generator becomes zero.

Q. 78. A dc generator can run to generate the same no load voltage with different modes of excitation. For which mode of excitation the short-circuit current will be minimum?

[A.M.I.E. Sec B. Winter 1994]

Ans. Differential compound wound generator.

Q. 79. Why a dc shunt generator is used for battery charging ?

[A.M.I.E. Sec B. Winter 1997]

Ans. Because a dc shunt generator can be made to provide constant output voltage.

Q. 80. What type of dc generator is suitable for electric welding ?

[A.M.I.E. Sec B. Winter 2002]

Ans. Differentially compounded dc generator.

Q. 81. Why is differentially compound dc generator used for welding purpose ? [A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. Because in a differentially compounded dc generator, the terminal voltage drops very rapidly with the increase in load current and, therefore, short-circuit cannot cause any damage to it.

Q. 82. Why it is necessary to operate generators in parallel for supply of power ?

Ans. For higher efficiency of operation, reliability, convenience and economy in maintenance and repair and possibility of additions to plant capacity with the growth in load on the power station.

Q. 83. Are dc series generators employed for power supply ? If not, then what is application of operation of dc series generators in parallel ?

Ans. No, dc series motors, employed in locomotives, are frequently arranged to operate as dc series generators during electric braking.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 84. Is parallel operation of two dc series generators inherently unstable? If yes, how is it made stable?

Ans. By connecting the armatures of the two machines operating in parallel through a heavy copper bar or by cross-connecting their field windings.

Q. 85. Why is it desirable that the generators operating in parallel should have the same voltage regulation?

Ans. So as to share the total load in proportion to their respective rated capacity.

Q. 86. Why are dc shunt generators more suitable for parallel operation ? [A.M.I.E. Sec B. Electrical Machines September 2005]

Ans. The dc shunt generators are most suited for stable parallel operation due to their slightly drooping voltage characteristics. Their satisfactory operation is due to the fact that any tendency on the part of a dc shunt generator to take more or less than the proper share of the load results in certain changes of the system voltage which immediately opposes this tendency.

Q. 87. Why is the presence of equalizer bars essential for parallel operation of compound generators and where should it be connected ? [A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. Since compound dc generators consist of series field windings and normally have rising external characteristics in operating regions, it is necessary to equalize their field currents. This is usually done by means of an auxiliary bus on the main switchboard, called as *equalizing bus-bar* (or bar). A momentary change in load distribution between the generators does not affect the series fields, and so stable operation is obtained.

Q. 88. Is equalizer bar needed for parallel operation of under-compounded generators ? [A.M.I.E. Sec B. Winter 1996]

Ans. No.

Q. 89. Which is the simplest way to shift load from one dc shunt generator running in parallel with the other dc shunt generator ? [A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. The simplest way to shift load from one dc shunt generator operating in parallel with the other dc shunt generator is to reduce its excitation and increase the excitation of other dc shunt generator on which the load is to be shifted.

Q. 90. Why is commutator needed in a dc motor ?

Ans. In case of a dc motor, it is necessary that the current through the coils of the armature winding be reversed as a particular coil leaves one pole (say the N-pole), crosses the neutral line and comes under the influence of next pole which is of opposite polarity (*i.e.* S-pole). The commutator is required for this purpose.

Q. 91. Explain why the emf generated in the armature of a *dc* motor is called the back emf ? [U.P. Technical Univ. Tutorial Question Bank]

Ans. Since induced emf in a dc motor opposes the voltage applied to the armature of a dc motor, it is called back or counter emf.

Q. 92. Why the torque developed in a dc generator is called the backward torque ?

Ans. Since the electromagnetic torque developed in a dc generator opposes the outside driving torque, it is called the backward torque.

Q. 93. When a dc motor produces maximum output power ?

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. A dc motor produces maximum output power when voltage drop in armature is equal to back emf E_b *i.e.* when back emf equals half the applied voltage.

Q. 94. Why the motors are not operated to develop maximum power in practice ?

Ans. Because it necessitates a current well beyond the normal operating range. Also an amount of power equal to the mechanical power developed would be wasted in heating the armature, so taking other losses into account, the efficiency would be well below 50%.

Q. 95. Why the leading horn of pole piece is made longer than the trailing horn and cut farther from the armature surface in case of a dc motor ?

Ans. To equalise the distribution of magnetic flux under poles.

Q. 96. Brushes in a dc motor are given a backward shift why ?

[A.M.I.E. Sec B. Summer 1993]

Ans. In a dc motor, the brushes are given backward shift in order to reduce sparking at the commutator. The backward shift of brushes will induce an emf in the required direction in the short-circuited coils of the armature undergoing commutation and hence improves commutation.

Q. 97. Why large variable speed dc motors are fitted with compensating windings ? [A.M.I.E. Sec B. Summer 1997]

Ans. To reduce sparking in commutation and prevent field distortion owing to armature reaction.

Q. 98. How are interpoles wound in a (*i*) generator (*ii*) motor ?

Ans. In case of a motor, interpoles must have polarity of the main poles behind them, while in case of a generator the polarity of the interpoles will be same as that of the main pole just ahead in the direction of rotation.

Q. 99. Why is the starting torque of a dc series motor more than that of a dc shunt motor of the same rating ?

Ans. In case of a dc series motor flux Φ is directly proportional to armature current I_a (before saturation) and, therefore, torque developed $T_e \propto I_a^2$ while in case of a dc shunt motor torque developed $T_e \propto I_a$. Obviously on the basis of the same kW output and speed, a dc series motor develops the torque more than that of a shunt motor.

Q. 100. Why is dc series motor highly variable speed motor ?

[U.P.S.C. I.E.S. Electrical Engineering II, 2004]

Ans. In a dc series motor, field winding is connected in series with the armature winding, therefore, field flux varies approximately linearly with load ($I_{sc} = I_a = I_L$) and thus the motor speed N being inversely proportional to field flux varies. That is why, a dc series motor is said to be highly variable speed motor.

Q. 101. A dc motor should not be allowed to run without load, why ?

[A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. On no load the series motor would attain tremendously high speed and the motor may get damaged due to heavy centrifugal forces set up in rotating parts.

Q. 102. Why a dc series molor is used for traction drive?

[U.P.S.C. I.E.S. Electrical Engineering II, 2006]

Ans. Because dc series motor develops large starting torque and slows down with the increase in load and so gets automatically relieved from heavy excessive load.

Q. 103. A dc shunt motor runs away at heavy loads. Comment.

[A.M.I.E. Sec B. Summer 1998]

Ans. The field may be weakened, due to armature reaction at heavy loads, to the extent that the motor run away.

Q. 104. What happens when the field winding of a dc shunt motor gets disconnected while in normal operation ?

[A.M.I.E. Sec B. Winter 1992]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The flux will drop to practically zero value and, therefore, the speed will increase to an extremely high value and the motor may get damaged due to heavy centrifugal forces.

Q. 105. Why cumulative compound wound dc motors are not suitable for applications requiring adjustable speed for field control ?

Ans. Because with a weakened shunt field the series field will overpower the shunt field; hence the changes in load may produce unstable speeds.

Q. 106. What would happen to the speed and the armature current of a dc shunt motor if the supply voltage is halved but the load torque is kept constant ?

[A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. The shunt field current is equally affected by variations in applied voltage and, therefore, up to magnetic saturation, the motor speed remains unaffected due to variations in applied voltage. However, the armature current will be doubled because $T \propto \phi I_a$.

Q. 107. Why differentially compounded motor is not used in practice ?

[A.M.I.E. Sec B. Summer 2003]

Ans. The differential arrangement of the windings is a disadvantage in very heavy overload as the field may be weakened too much and the motor may tend to race, taking a very large current.

Q. 108. A long shunt dc compound motor is cumulatively compounded. Without any change in connection, it is now run as a dc generator. State whether it will now be differentially or cumulatively compounded. [A.M.I.E. Sec B. Summer 2000]

Ans. When a cumulatively compounded long shunt dc motor is run as a generator, the shunt and series field currents produce flux in opposite directions and thus it will operate as a differentially compounded generator.

Q. 109. Why the dc motors are mostly gear motors ?

Ans. Because the low speed motors are much more expensive than high speed motors of the same kW output rating.

Q. 110. Which of the following three motors has the poorest speed regulation :

Shunt motor, series motor or cumulative compound motor ?

Ans. Series motor.

Q. 111. What are the factors that affect the speed of a dc motor ?

[U.P. Technical Univ. Second Semester 2003-04]

Ans. The factors influencing the speed of a dc motor are : (*i*) Applied or terminal voltage (*ii*) Flux per pole ϕ (*iii*) Resistance of armature circuit and (*iv*) Load or armature current.

Q. 112. What factors do limit the increase of speed of dc shunt motors in field rheostat control ?

Ans. The factors limiting the increase of speed of dc shunt motors in field rheostat control are demagnetizing effect of armature reaction on the field, commutation problems at high speed and large centrifugal forces developed at high speed.

Q. 113. Why is field control considered superior to armature resistance control for dc shunt motors ?

Ans. Because power wasted in controlling resistance is very small and field control method of speed control is independent of load on motor and permits remote control of speed.

Q. 114. What is the effect of inserting resistance in the field circuit of a dc shunt motor on its speed and torque ?

Ans. For a constant supply voltage flux will decrease, therefore, speed will increase and torque will decrease.

Q. 115. Which method we must adopt to control the speed of a dc shunt motor above the base speed ? [A.M.I.E. Sec B. Summer 1996]

Ans. Field control method.

Q. 116. While controlling the speed of a dc shunt motor what should be done to achieve a constant torque drive ?

Ans. Applied voltage should be maintained constant so as to maintain field strength constant.

Q. 117. In the armature circuit of dc motor, an external resistance is introduced. How shall it affect the speed of the motor ?

[P.T.U. May 2002]

Ans. The speed will decrease.

Q. 118. A dc shunt motor is running at rated speed with a resistance R in series with the armature, will the speed of the motor increase or decrease if additional resistance of finite value is connected (*a*) across R and (*b*) in series with R ?

[A.M.I.E. Sec B. Summer 1993]

Ans. (*a*) Speed will increase. (*b*) Speed will decrease.

Q. 119. A dc separately excited motor, with resistance R in series with armature, is driving a constant torque load. A resistance of finite value is placed across the armature terminals. Will the motor speed increase or decrease ? Answer with a reason.

[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. When a resistance is put across the armature terminals, supply current *i.e.* current flowing through the series resistance R will increase for constant armature current/constant driving torque ($T \propto I_a$ for constant field) and this increased current in series connected resistance will cause more voltage drop across it therefore result in smaller back emf and drop in speed.

Q. 120. For a dc motor, the field-flux speed control method is called a constant power drive method. Why ?

[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. For a dc motor, the speed is inversely proportional to the flux per pole while the torque is directly proportional to it, so for a given armature current the motor will provide constant power and the field flux speed control method is known as *constant power drive control method.*

Q. 121. In what respect shunted armature control is superior to armature series resistance control?

Ans. More stable operation is obtained.

Q. 122. How the speed above normal can be obtained in case of dc series motors ?

Ans. By weakening the field which can be accomplished by

(*i*) shunting a portion of motor current around the series field *i.e.* field diverter method.

(*ii*) reducing the number of turns of the field winding through which the current flows i.e. tapped field control.

(*iii*) regrouping of field coils i.e. paralleling field coils.

Q. 123. Do the motors run faster in series combination or parallel combination ?

Ans. Motors will run faster in parallel combination.

Q. 124. The torque for the series combination of two dc series motors is T_s and that for their parallel combination is T_p. What is the relation between T_s and T_p if the mechanical power is same ?

[A.M.I.E. Sec B. Summer 1993]

Ans. $T_s = 4T_p$.

Q. 125. What is the speed range (approximately) for the series-parallel system of speed control of series motors widely used in (electric) traction work ? [A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. For the series-parallel system of speed control of series motors, the speed of motor when running in parallel is 4 times that of motors when running in series.

Q. 126. Why the power loss in control resistance for many applications of dc series motors is not too serious as in case of dc shunt motors?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Because in case of dc series motors, the control is utilized for a large portion of time for reducing the speed under light load conditions and is only employed intermittently while carrying full load.

Q. 127. What would happen if a dc motor is directly switched on to the supply, without any starter ? **[U.P.T.U. 2005-06]**

Ans. If the dc motor is directly switched on to the supply, it will draw heavy current (about 10–12.5 times rated current) and the motor armature winding may get burnt.

Q. 128. Why is the starting current high in a dc motor? **[U.P.S.C. I.E.S. 2002]**

Ans. When the motor is at rest the speed of a dc motor is zero, therefore, back emf is zero and if a dc motor is connected directly to the supply mains a heavy current will be drawn because from emf equation of armature circuit ($E_b = V - I_a R_a$), armature current is given as $\frac{V - E_b}{R_a}$ and armature resistance R_a is very small.

Q. 129. Why a starter is necessary for a dc motor ?

Ans. For protection of motor against the flow of excessive current during starting period, it is necessary to insert high resistance in series with the armature circuit.

Q. 130. What precautions are taken during starting of dc shunt and series motors and why ?

Ans. It is necessary to ensure, before starting a dc motor, that the field circuit is closed, the rheostat in series with the shunt field winding is at zero resistance position and starting resistance in series with the armature circuit is at maximum value. It will restrict armature current to a safer value and develop higher torque at the starting instant.

In case of a dc series motor it is also necessary that there is significant load on it while starting it.

Q. 131. For stopping the motor, the line switch should always be opened rather than throwing back the starting arm. Why ?

Ans. If the starter arm is thrown back the field circuit is broken at the last contact button and owing to inductive nature of the field, this will cause a hot arc and burn the contact.

Q. 132. It is desirable that the starting lever of a motor starter should fall back to off position when the power fails. Why ?

Ans. If the starter arm remains in the "ON" position on power failure, on restoration of power supply, no back emf will be acting in the armature circuit, the armature being directly across the supply mains will draw excessive current and will get damaged.

Q. 133. What would happen if the external resistance, used for starting the dc motor, is left in the armature circuit? **[A.M.I.E. Sec B. Summer 2001]**

Ans. It would cause (*i*) additional loss of energy resulting in reduced operating efficiency and (*ii*) reduction in operating speed of motor.

Q. 134. Why no-volt release is provided in a dc series motor?

Ans. To protect the dc series motor against no volt and no-load.

Q. 135. Why is it desirable to make an independent circuit of the no-volt release coil?

Ans. To make the operation of no-volt release independent of variations in the field current.

Q. 136. What are the requirements of good electric braking ? **[J.N. Univ. April 2003]**

Ans. The requirements of good electric braking are:

(*i*) The braking should be quick and reliable in action.

(*ii*) The braking must be controllable.

(*iii*) Some suitable means must be provided for dissipation of kinetic energy of the moving parts of the motor and its driven machines.

(*iv*) Failure of any part of the braking system must result in application of brakes.

Q. 137. What are various types of electric braking used ? **[J.N. Univ. November 2003]**

Ans. There are three types of electric braking, all of which are applicable to the usual types of electric motors, viz. plugging (or counter-current braking), dynamic (or rheostatic) braking and regenerative braking.

Q. 138. What are braking systems applicable to a dc shunt motor ? **[Anna Univ. Summer 2003]**

Ans. The braking systems applicable to a shunt motor are plugging, dynamic and regenerative braking.

Q. 139. What is meant by plugging?

Ans. Plugging means stopping of an electric motor by instantaneously reversing its torque till it stops.

Q. 140. How plugging of a dc motor is done?

Ans. Plugging is obtained in a dc motor by reversing the supply terminals to the armature of the motor.

Q. 141. What is dynamic braking ? **[Anna Univ. Summer 2003]**

Ans. In dynamic braking, the motor is disconnected from the supply and operated as a generator driven by the kinetic energy of the motor and its driven machines. The kinetic energy of rotation is converted into electrical energy which is dissipated in the external resistance connected across the motor at the braking instant.

Q. 142. Why rheostatic braking is economical to plugging?

Ans. In rheostatic braking, energy required from the supply to brake the motor is eliminated as compared to the plugging.

Q. 143. What is the most economical method of electric braking?

Ans. Regenerative braking.

Q. 144. What is regenerative braking ? **[Anna Univ. Summer 2003]**

Ans. In regenerative braking, the electric machine operation is changed from motoring to generating, mechanical energy is converted into electrical energy, part of which is returned to the supply and the rest of the energy is lost as heat in the windings and bearings of the electrical machines.

Q. 145. In case of a dc series motor, when it is disconnected from the supply and is connected across a braking resistance, it is essential to change over the field winding connections. Why?

Ans. Otherwise, the current through the field winding will also be reversed, and no braking effect will occur.

Q. 146. What is meant by "energy loss" in a machine ?

Ans. Whole of the input energy to the electrical machine is not converted into useful output energy but a part of the energy is converted into heat and is lost for the useful purpose of the machine. The energy converted into heat is called the energy loss.

Q. 147. What is the basic power equation for a dynamo ?

Ans. $P_{input} = P_{output} + P_{losses}$

Q. 148. What are the different types of losses in a dc machine ?

Ans. The different types of losses that occur in a dc machine are (*i*) copper or electrical losses (*ii*) iron or magnetic losses and (*iii*) mechanical or friction and windage losses.

Copper or electrical losses include power lost in heating the shunt field and also in heating the armature circuit, which includes armature winding, brush contacts, series field and interpole field.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Iron or magnetic losses include the hysteresis and eddy current losses which are present in any part of the machine that is constructed of iron and subjected to variations of magnetic flux.

Mechanical losses consist of power losses due to friction of the bearings, air friction or windage, as it is called, caused by the motion of the moving parts through the surrounding medium, and the friction between brushes and commutator.

Q. 149. What are the no-load losses in a dc machine ?

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. No-load losses in a dc machine consists of (*i*) core loss or iron loss, windage loss and loss due to friction and bearing.

Q. 150. Why do copper losses occur in a dc machine ?

Ans. Copper losses occur in a dc machine due to power consumed in forcing a current against the resistance of windings and connections.

Q. 151. How do the various losses occurring in a dc machine vary with the load ?

Ans. The copper losses occurring in armature winding, series field winding, compensating winding and interpole winding, if provided, almost vary as the square of the load current while that occurring in dc shunt field winding remain practically constant. Rotational losses (iron and mechanical losses) are almost independent of load.

Q. 152. Which of the power losses occurring in electrical machines are influenced by the magnitude of flux, the load and the square of the load?

Ans. Core or iron losses are influenced by the magnitude of flux; copper losses (armature, series field, interpoles, compensating windings) are proportional to the square of the load while brush-contact loss is proportional to the load.

Q. 153. What are the components of iron loss in a dc machine and in which part of the machine it occurs.

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. Iron loss consists of hysteresis and eddy current losses caused by changing flux densities in the iron core.

Hysteresis loss incurs in revolving armature and teeth of a dc machine.

Eddy current loss incurs in armature core and teeth of pole faces.

Q. 154. On what factors do hysteresis and eddy current losses depend ?

Ans. Hysteresis loss depends upon the peak magnitude of the flux density attained in a magnetic cycle, frequency of magnetic cycles, volume of magnetic material and type of magnetic material.

Eddy current loss depends also upon the thickness of magnetic material laminations in addition to factors mentioned above.

Q. 155. Why CROS cannot be used in small rotating machines ?

Ans. In small rotating machines it is difficult to correspond the axis of core with the rolling direction.

Q. 156. When does the maximum efficiency of a dc machine take place ?

Ans. When variable losses equal constant losses.

Q. 157. What should be the ratio of full-load copper loss to constant loss of a dc machine if the maximum efficiency is to occur at 80% of the full-load ?

[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. Since maximum efficiency occurs at 80% of full-load,

$(0.8)^2 \times$ full-load copper loss = constant loss

and full-load copper loss : constant loss :: 1 : 0.64 **Ans.**

Q. 158. Why brake test is performed with small machines only ?

Ans. Testing of a large machine entails a considerable loss of energy, infact in case of very large machines there may be no facility for such a test.

Q. 159. Why Swinburne's test cannot be performed on dc series machines ?

Ans. Because on no load dc series motor will attain such a high speed that it will get damaged and secondly this test is only applicable to those machines in which flux and speed remain constant.

Q. 160. Why constant losses can be considered equal to input to a machine at no load ?

Ans. Because at no-load variable losses (armature copper losses and losses in series field winding, interpole winding and compensating winding, if any) are negligible owing to negligible armature current.

Q. 161. Why Swinburne's test is considered convenient and economical method for testing of dc shunt machines ?

Ans. Because power required to test a large dc machine by Swinburne's test is quite small.

Q. 162. Why Hopkinson's test is also called the regenerative or back-to-back test ?

Ans. The motor supplies mechanical power which is used to drive the generator while generator develops electrical power to be utilized in driving the dc motor in addition to electrical power drawn from the supply mains.

Q. 163. State with reason whether field test on two indentical dc series machines is regenerative method ? **[A.M.I.E. Sec B. Winter 1994]**

Ans. Field test is not regenerative test because output of generator is not fedback to motor but is dissipated in a resistor.

Q. 164. In the Hopkinson's test on two dc machines, machine A has a field current of 1.4 A and machine B has a field current of 1.3 A. Which machine acts as a generator ?

[Bharthihasan Univ. April 1997]

Ans. Machine having higher excitation will generate higher emf if the machines are identical and operating at the same speed. So the machine having higher excitation (field current) *i.e.* machine A is operating as a generator.

Q. 165. Which of the machine in Hopkinson's test has iron loss less than in the other and why ?

[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. The machine operating as a motor will have iron loss less than that operating as a generator because the excitation of the motor will be lesser than that of the generator.

Multiple Choice Type Questions

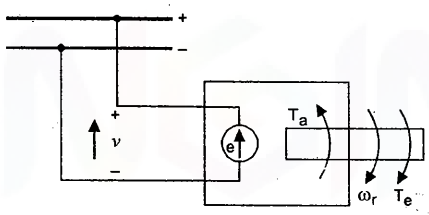
Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The developed electromagnetic force and/or torque in electro-mechanical energy conversion system act in a direction that tends
(a) to increase the stored energy at constant flux.
(b) to decrease the stored energy at constant flux.
(c) to decrease the coenergy at constant mmf.
(d) to decrease the stored energy at constant mmf.
[GATE E.E. 1992]

2. For a linear electromagnetic circuit, the following statement is true
(a) Field energy is equal to the coenergy.
(b) Field energy is greater than the coenergy.
(c) Field energy is lesser than the coenergy.
(d) Coenergy is zero. **[GATE E.E. 2004]**

3. In an electromechanical energy conversion device, the developed torque depends upon
(a) stator field strength and torque angle.
(b) stator field and rotor field strengths.
(c) stator field and rotor field strengths and the torque angle.
(d) stator field strength only. **[U.P.S.C. I.E.S. E.E.-II 2001]**

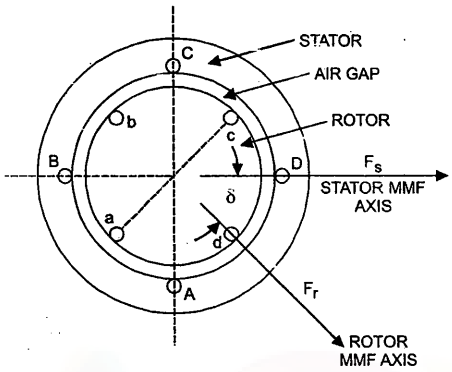
4. An electromechanical energy conversion device is shown in the figure. The instantaneous values of armature induced emf, busbar voltage and armature current are respectively e, v and i. T_e, T_a and ω_r represent external torque, armature developed torque and angular velocity of shaft respectively. Assume that the given directions of parameters in the figure are positive. If the device is working in generating mode then



(a) all parameters will have the positive direction.
(b) e, v, T_e and ω_r will have negative direction and others will remain in positive direction.
(c) T_a and i will have negative direction and others will remain in positive direction.
(d) T_e and ω_r will have negative direction and others will remain in positive direction. **[U.P.S.C. I.E.S. E.E.-II 1999]**

5. In electromechanical energy conversion devices (e.g. generators and motors), a small air gap is left between the stator and the rotor in order to
(a) reduce the reluctance of the magnetic path.
(b) increase flux density in the air gap.
(c) permit mechanical clearance.
(d) avoid saturation of field.

6. When the stator and rotor windings of a 2-pole rotating electrical machine are excited, each would produce a sinusoidal mmf distribution in the air gap with peak values F_s and F_r respectively. The rotor mmf lags stator mmf by a space angle δ at any instant as shown in the figure. Thus, half of stator and rotor surfaces will form one pole with the other half forming the second pole. Further, the direction of torque acting on the rotor can be clockwise or counter-clockwise.



The following table gives four sets of statements as regards poles and torque. Select the correct set corresponding to the mmf axis as shown in the figure.

	Stator Surface ABC forms	*Stator Surface CDA forms*	*Rotor Surface abc forms*	*Rotor Surface cda forms*	*Torque is*
(a)	North Pole	South Pole	North Pole	South Pole	Clockwise
(b)	South Pole	North Pole	North Pole	South Pole	Counter-clockwise
(c)	North Pole	South Pole	South Pole	North Pole	Counter-clockwise
(d)	South Pole	North Pole	South Pole	North Pole	Clockwise

[GATE E.E. 2003]

7. Following are some of the properties of rotating electrical machines.
P Stator winding current is dc, rotor winding current is ac.
Q Stator winding current is ac, rotor winding current is dc.
R Stator winding current is ac, rotor winding current is ac.
S Stator has salient poles and rotor has commutator.
T Rotor has salient poles and slip-rings and stator is cylindrical.
U Both stator and rotor have polyphase windings.

DC machines, synchronous machines and induction machines exhibit some of the above properties as given in the following table. Indicate the correct combination from this table:

	DC Machines	*Synchronous Machines*	*Induction Machines*
(a)	PS	QT	RU
(b)	QU	PT	RS
(c)	PS	RU	QT
(d)	RS	QU	PT

[GATE E.E. 2003]

Answers: **1.** (b), **2.** (a), **3.** (c), **4.** (a), **5.** (c), **6.** (c), **7.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

8. A short-circuited rectangular coil falls under gravity with the coil remaining in a vertical plane and cutting perpendicular horizontal magnetic lines of force. It has _____ acceleration.
(a) zero (b) increasing
(c) decreasing (d) constant

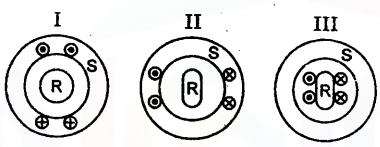
9. If a current carrying coil is placed in a uniform magnetic field direction of magnetic induction, then
(a) the net force and torque on the coil are both zero.
(b) the net force is zero but torque is finite.
(c) the net force is finite but torque is zero.
(d) the net force and torque are both finite.
[A.M.I.E. Sec B. Elec. Machines Summer 1997]

10. The general expression for the instantaneous value of the torque of dynamo-electric machines is given by

$$T = \frac{1}{2} i_1^2 \frac{dL_1}{d\theta} + \frac{1}{2} i_2^2 \frac{dL_2}{d\theta} + i_1 i_2 \frac{dM}{d\theta}$$

where i_1 and i_2 are rotor and stator currents respectively, L_1 and L_2 are rotor and stator windings self inductances.
M is the mutual inductance between stator and rotor windings and θ is the angular displacement of rotor.
For a synchronous machine (cylindrical rotor), the torque is given by only the third term of the equation because
(a) the average value of i_1^2 and i_2^2 each is zero.
(b) the first and second terms cancel each other.
(c) $\frac{dL_1}{d\theta}$ and $\frac{dL_2}{d\theta}$ have opposite signs and $\frac{dL_1/d\theta}{dL_2/d\theta} = \frac{i_2^2}{i_1^2}$.
(d) L_1 and L_2 do not vary with respect to θ.
[U.P.S.C. I.E.S. E.E.-II 1997]

11. Three singly-excited electromagnetic structures are shown in the figures labelled I, II and III (R-Rotor, S-stator). The reluctance torque can be developed in



(a) I and II. (b) I alone. (c) II and III. (d) II alone.
[U.P.S.C. I.E.S. E.E.-II 1999]

12. Reluctance torque in rotating machines is present, when
(a) air gap is not uniform.
(b) reluctance seen by stator mmf varies.
(c) reluctance seen by rotor mmf varies.
(d) reluctance seen by the working mmf varies.

13. A rotating electrical machine having its self inductances of both the stator and the rotor windings, independent of rotor position will definitely not develop
(a) starting torque. (b) synchronising torque.
(c) hysteresis torque. (d) reluctance torque.
[GATE E.E. 2004]

14. A circular metallic disc is placed in a vertical magnetic field of constant induction in the downward direction. If the disc is rotated in a horizontal plane, the emf induced will be
(a) zero.
(b) constant independent of disc size.
(c) increasing radially in the outward direction.
(d) decreasing radially in the outward direction.
[A.M.I.E. Sec. B. Elec. Machines Winter 1994]

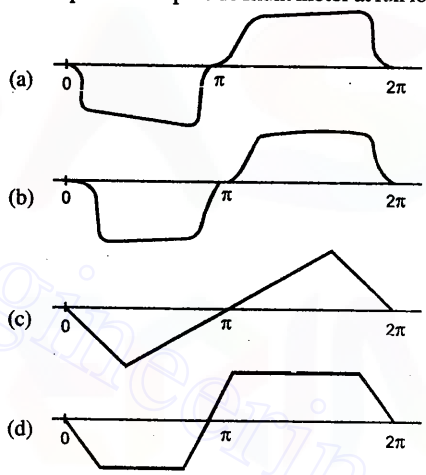
15. The emf induced in a conductor rotating in a bipolar field is
(a) dc. (b) ac.
(c) dc and ac both. (d) none of these.
[A.M.I.E. Sec. B. Elec. Machines Winter 1993]

16. A conductor is rotating within a magnetic field. At which of the positions do the peak voltages occur ?
(a) At right angles to the axis of magnetic field.
(b) Along the axis of the magnetic field.
(c) At 45° angles to the axis of magnetic field.
(d) Anywhere.

17. EMF induced in a coil rotating in a uniform magnetic field will be maximum when the
(a) flux linking with the coil is maximum.
(b) rate of change of flux linkage is minimum.
(c) rate of change of flux linkage is maximum.
(d) rate of cutting flux by the coil sides is minimum.

18. For a P-pole machine, the relation between electrical and mechanical degrees is
(a) $\theta_{elec} = \frac{2}{P}\theta_{mech}$ (b) $\theta_{elec} = \frac{4}{P}\theta_{mech}$
(c) $\theta_{elec} = \theta_{mech}$ (d) $\theta_{elec} = \frac{P}{2}\theta_{mech}$
[U.P.S.C. I.E.S. E.E.-II, 2010]

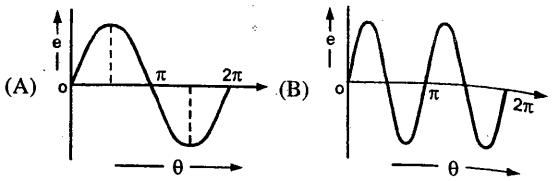
19. What is the form of an air gap flux density waveform of an uncompensated 2-pole dc shunt motor at full load?



[U.P.S.C. I.E.S. E.E.-II, 2006]

20. An elementary cylindrical machine has one full-pitch coil in the stator, but the rotor may have (*i*) two poles or (*ii*) four poles of permanent magnets. The time varying voltage that would be induced in the stator coil for one rotation of the rotor, while the rotor is revolving at a constant speed, are shown in figures A, B, C and D above.
Select the correct combination from the code given below:

	2-pole	4-pole
(a)	A	D
(b)	A	B
(c)	C	D
(d)	B	C



Answers: **8.** (d), **9.** (a), **10.** (d), **11.** (d), **12.** (d), **13.** (b), **14.** (a), **15.** (b), **16.** (b), **17.** (c), **18.** (d), **19.** (a), **20.** (b),

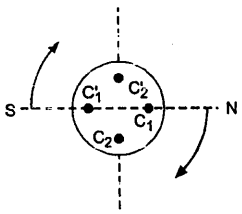
(C) 
(D) 
[U.P.S.C. I.E.S. E.E.-II, 2006]

21. Two magnetic poles revolve around a stationary armature carrying two coils ($c_1 - c_1'$, $c_2 - c_2'$) as shown in the figure. Consider the instant when the poles are in a position as shown. Identify the correct statement regarding the polarity of the induced emf at this instant in coil sides c_1 and c_2.



(a) ⊙ in c_1, no emf in c_2. (b) ⊗ in c_1, no emf in c_2.
(c) ⊙ in c_2, no emf in c_1. (d) ⊗ in c_2, no emf in c_1.
[GATE E.E. 2005]

22. In a dc motor the windage loss is proportional to
(a) supply voltage. (b) square of the supply voltage.
(c) square of the flux density.
(d) square of the armature speed. [A.M.I.E. Elec. Science Summer 1995]

23. Which of the following are the variable losses in a rotating machine?
(a) Core loss and mechanical loss.
(b) Core loss and stray load loss.
(c) Copper loss and core loss.
(d) Copper loss and stray load loss. [U.P.S.C. I.E.S. E.E.-II, 2007]

24. Stray losses are sum of:
(a) Iron and mechanical losses.
(b) Copper and iron losses.
(c) Copper and mechanical losses.
(d) None of these. [G.B.T.U. Even Semester 2010-11]

25. Generally the no-load losses of an electrical machine is represented in its equivalent circuit by a
(a) parallel resistance with a low value.
(b) series resistance with a low value.
(c) parallel resistance with a high value.
(d) series resistance with a high value. [U.P.S.C. I.E.S. E.E.-II 2002]

26. Neglecting all losses, how is the developed torque (T) of a dc separately excited motor, operating under constant terminal voltage, related to its output power (P)?
(a) $T \propto \sqrt{P}$ (b) $T \propto P$ (c) $T^2 \propto P^3$
(d) T is independent of P. [GATE E.E. 1992; U.P.S.C. I.E.S. E.E.-II, 2007]

27. The duty cycle of a motor is

Load	Duration
20 kW	120 s
10 kW	120 s
stopped	280 s

The continuous rating of motor suitable for above application would be
(a) 20 kW. (b) 16.4 kW. (c) 14.14 kW. (d) 9 kW.

28. The principle of dynamically induced emf is utilised in
(a) transformer. (b) choke.
(c) generator. (d) thermocouple.
[R.G.T.U. B.E.E. December 2006]

29. In a dc machine
(a) the current and emf in armature conductors are alternating while those at the terminals are unidirectional.
(b) the current and emf in armature conductors are unidirectional while those at the terminals are alternating.
(c) the current and emf in armature conductors and at the terminals are unidirectional.
(d) the emf in armature conductors and at the terminals is alternating while current there is unidirectional.

30. Which of the following is not a part of dc machine?
(a) Armature. (b) Commutator.
(c) Field winding. (d) Damping winding.
[R.G.T.U. B.E.E. June 2008]

31. The field coils of a dc generator are usually made of
(a) mica. (b) copper. (c) cast iron. (d) carbon.
[R.G.T.U. B.E.E. Jan/Feb. 2007]

32. Laminated yoke in dc motor can reduce
(a) speed regulation. (b) iron loss.
(c) temperature rise. (d) sparking on load.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

33. Pole shoe of a dc machine is laminated for the purpose of
(a) decreasing hysteresis loss.
(b) decreasing eddy current loss.
(c) decreasing both hysteresis and eddy current loss.
(d) manufacturing ease. [A.M.I.E. Sec.B Elec. Machines Summer 1995]

34. The function(s) of pole shoes in a dc machine is/are to
(a) support the field coils.
(b) reduce the reluctance of the magnetic path.
(c) spread out the flux to achieve uniform flux distribution in the air gap.
(d) all of the above.

35. Poles of dc machine are often laminated to
(a) reduce pulsation loss. (b) reduce armature reaction.
(c) reduce iron weight. (d) dissipate more heat.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

36. The ventilating ducts in most of the dc machines are
(a) radial. (b) longitudinal.
(c) radial as well as longitudinal.
(d) none of these.

37. Armature of a dc machine is made of
(a) conducting material. (b) insulating material.
(c) non-ferrous material. (d) silicon steel.

38. Consider the following parts of a dc machine:
1. Yoke 2. Armature core
3. Brushes 4. Pole core
Which of the above parts are subjected to iron loss?
(a) 1 and 2 only. (b) 2 only.
(c) 1 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2010]

39. The armature of a dc machine is laminated
(a) to reduce the hysteresis loss.
(b) to reduce eddy current loss.
(c) to reduce the mass. (d) to reduce the inductance.
[R.G.T.U. B.E.E. December 2006]

40. What are slot wedges in a dc machine made of ?
(a) Mild steel. (b) Silicon steel.
(c) Fibre. (d) Cast iron.
[U.P.S.C. I.E.S. E.E.-II, 2007]

41. The armature of a dc machine is made of silicon steel laminations to
(a) reduce hysteresis loss only.
(b) reduce the eddy current loss only.
(c) increase the permeability.
(d) reduce both hysteresis and eddy current loss.
[A.M.I.E. Sec B. Elec. Machines Winter 2000]

Answers: **21.** (a), **22.** (d), **23.** (d), **24.** (a), **25.** (c), **26.** (b), **27.** (c), **28.** (c), **29.** (a), **30.** (d), **31.** (b), **32.** (b), **33.** (b), **34.** (d), **35.** (a), **36.** (c), **37.** (d), **38.** (b), **39.** (b), **40.** (c), **41.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

42. In a dc machine, the armature is always on the rotor unlike an ac machine where it could be either on the stator or rotor, because
(a) commutation action would otherwise not be possible.
(b) armature reaction demagnetising action would otherwise be more.
(c) otherwise it would not be possible to place compensating winding in pole shoes.
(d) self-starting of dc motor would not be possible otherwise.
[U.P.S.C. I.E.S. E.E.-II 2000]

43. The teeth in the armature of a dc machine are sometimes skewed. This is done to reduce
(a) hysteresis loss. (b) copper loss.
(c) eddy current loss. (d) vibrations.

44. The commutator of a dc motor serves the purpose of
(a) changing ac to dc. (b) converting dc into ac.
(c) reducing friction. (d) avoiding arc at the brushes.
[R.G.T.U. B.E.E. June/July 2006]

45. To avoid formation of grooves in the commutator
(a) the brushes of opposite polarity should track each other.
(b) the brushes of same polarity should track each other.
(c) brush position has no effect on the commutator grooving.

46. In a dc machine, the brushes are physically placed in the.
(a) polar axis and electrically connected to the coils lying in the interpolar axis.
(b) polar axis electrically connected to the coils lying in the polar axis.
(c) interpolar axis and electrically connected to the coils lying in polar axis.
(d) interpolar axis and electrically connected to the coils lying in inter polar axis.

47. The factors responsible for rapid wear of brushes are
(a) high mica insulation between commutator bars.
(b) excessive spring pressure. (c) abrasion from dust.
(d) rough commutator bars. (e) all of the above.

48. In dc machines, the armature windings are placed on the rotor because of the necessity for
(a) electromechanical energy conversion.
(b) generation of voltage. (c) commutation.
(d) development of torque. [A.M.I.E. Elec. Science Winter 1993]

49. Wave winding is employed in a dc machine of
(a) high current and low voltage rating.
(b) low current and high voltage rating.
(c) high current and high voltage rating.
(d) low current and low voltage rating. [U.P.S.C. I.E.S. E.E.-II, 2006]

50. If two 8-pole dc machines of identical armatures are wound, one with lap winding and the other with wave winding, then
(a) wave wound machine will have more rated current and more voltage.
(b) lap would machine will have more rated voltage and more current.
(c) lap wound machine will have more rated voltage and less current.
(d) wave wound machine will have more rated voltage and less current.
[U.P.S.C. I.E.S. E.E.-II, 1999]

51. The armature resistance in case of lap wound armature having Z conductors each conductor of length l metres, x-sectional area a m^2, resistivity and P poles will be
(a) $\rho\frac{l}{a}\frac{Z}{P^2}$. (b) $\rho\frac{l}{a}Z$. (c) $\rho\frac{l}{a}ZP$. (d) $\rho\frac{l}{a}ZP^2$.

52. In lap winding, the number of brushes is always _____ the number of poles.
(a) double (b) same as (c) half (d) none of these.

53. A P-pole lap wound dc machine had an armature current I_a. The conductor current in the armature winding is
(a) I_a (b) I_a/P (c) PI_a
(d) none of above. [A.M.I.E. Sec.B Elec. Machines Winter 1994]

54. A lap wound dc machine has 400 conductors and 8 poles. The voltage induced per conductor is 2 V. The machine generates a voltage of
(a) 100 V (b) 200 V (c) 400 V (d) 800 V
[A.M.I.E. Sec B. Elec. Machine Design Winter 1994]

55. A 4 pole generator with 16 coils has a two layer lap winding. The pole pitch is
(a) 32 (b) 16 (c) 8 (d) 4
[GATE E.E. 1996]

56. Welding generator will have
(a) lap winding. (b) wave winding.
(c) either lap or wave winding. (d) none of these.

57. If in a 6 pole lap wound dc machine, the air gap under each pole is not the same, this is likely to result in
(a) higher terminal voltage. (b) reduced eddy currents.
(c) unequal currents in parallel paths.
(d) none of the above.

58. The number of parallel paths for a 4-pole duplex lap winding will be
(a) 2 (b) 4 (c) 6 (d) 8
[A.M.I.E. Sec B. Elec. Machine Design Summer 1993]

59. Minimum number of coils for 400 V, 6-pole lap connected dc machine for a maximum voltage of 15 V between adjacent commutator segments should be
(a) 80 (b) 160 (c) 200 (d) 400
[A.M.I.E. Sec B. Elec. Machine Design Summer 1993]

60. Width of a carbon brush should be equal to
(a) less than the width of one commutator segment.
(b) the width of 1 to 2 commutator segments.
(c) the width of 2 to 3 commutator segments.
(d) the width of more than 3 commutator segments.
[A.M.I.E. Sec B. Elec. Machine Design Winter 1993]

61. A duplex lap winding with equalizers and even number of pairs of poles is
(a) doubly re-entrant and number of coils per pair of poles is an odd integer.
(b) double re-entrant and number of coils per pair of poles is an even integer.
(c) singly entrant and number of coils per pair of poles is an even integer.
(d) singly entrant and number of coils per pair of poles is an odd integer.

62. Wave winding is composed of
(a) any odd number of conductors.
(b) any even number of conductors.
(c) that even number which is exact multiple of poles ± 2.
(d) that even number which is exact multiple of poles.

63. For a 4-pole machine wave winding is impossible with _____ armature conductors.
(a) 30 (b) 32 (c) 34 (d) 38

64. In a dc machine, for the same value of ϕ, Z and N; which one of the following statements is correct?

Answers: **42.** (a), **43.** (d), **44.** (b), **45.** (a), **46.** (a), **47.** (e), **48.** (c), **49.** (b), **50.** (d), **51.** (a), **52.** (b), **53.** (b), **54.** (a), **55.** (c), **56.** (a), **57.** (c), **58.** (d), **59.** (b), **60.** (c), **61.** (a), **62.** (c), **63.** (b), **64.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Armature emf is more with wave winding than with lap winding.
(b) Armature emf is less with wave winding than with lap winding.
(c) Armature emf depends on whether the machine is running as a motor or a generator.
(d) Armature emf is same as long as the flux density in the air gap remains the same. [U.P.S.C. I.E.S. E.E.-II 2004]

65. The dummy coils in dc machines are useful to
(a) increase the efficiency. (b) improve the commutation.
(c) reduce the cost of the machine.
(d) maintain mechanical balance of armature.
[U.P.S.C. I.E.S. E.E.-II 2003]

66. A homopolar generator usually has
(a) high voltage and high current.
(b) low voltage and high current.
(c) low voltage and low current.
(d) high voltage and low current.

67. In a dc generator, the ripples in the direct emf generated are reduced by employing
(a) commutator with large number of segments.
(b) equalizer rings. (c) carbon brushes.
(d) graphite brushes.

68. In order to ascertain whether a dc machine is lap wound or wave wound on the basis of visual observations of the armature, one should observe the
(a) connections to the brushes.
(b) connections to the commutator.
(c) connections to the field winding.
(d) direction of end connections.

69. The coil span
(a) must be exactly equal to pole pitch.
(b) can never be equal to pole pitch.
(c) may or may not be exactly equal to pole pitch.
(d) none of the above.

70. The commutator pitch for simplex lap winding is
(a) +1 (b) −1 (c) +1 or −1 (d) average pitch.

71. The commutator pitch for simplex wave winding is equal to
(a) +1 or −1 (b) twice average pitch.
(c) average pitch. (d) half average pitch.

72. In a dc machine armature winding, the number of commutator segments is equal to the number of armature
(a) coils. (b) coil sides.
(c) conductors. (d) turns.

73. How many segments will be there for the commutator of a 6-pole dc machine having a simple wave-wound armature with 72 slots?
(a) 73 (b) 72
(c) 71 (d) 70 [U.P.S.C. I.E.S. E.E.-II, 2011]

74. For both lap and wave windings, there are as many commutator bars as the number of
(a) armature conductors. (b) winding elements.
(c) poles. (d) slots.

75. In a drum type dc armature winding the back pitch and front pitch in terms of the coil-sides must be
(a) even and odd respectively.
(b) odd and even respectively.
(c) both even. (d) both odd.

76. In a dc machine, fractional pitch winding is employed to
(a) increase generated voltage. (b) reduce sparking.
(c) save copper. (d) improve cooling.
(e) both (b) and (c).

77. In a dc machine, the armature winding is made up of number of coils distributed in large number of armature slots instead of placing all the coils into two slots to
(a) have maximum emf at the output terminals.
(b) have maximum emf generated in the armature.
(c) have minimum heat dissipation from the armature.
(d) make the armature dynamically balanced.

78. Aluminium is not used as winding wire in dc machine armature as it
(a) is costlier. (b) is of low resistivity.
(c) is of lower thermal conductivity.
(d) requires large winding space.

79. Short circuiting is caused in the armature winding due to
(a) failure of insulation between two turns of a coil.
(b) failure of insulation between two commutator bars.
(c) grounding of two or more turns of the same coil.
(d) any of the above.

80. In a lap wound dc generator, the equalizer rings are provided to
(a) neutralize the armature reaction effect.
(b) avoid short circuiting.
(c) avoid unequal distribution of currents at brushes.
(d) avoid harmonics generated in the emf.
(e) provide mechanical balancing.

81. In a lap wound dc generator having P poles and Z conductors the maximum number of equalizer rings will be
(a) $\frac{Z}{P}$ (b) $\frac{2Z}{P}$ (c) $\frac{Z}{2P}$ (d) $\frac{Z}{4P}$

82. Number of tappings to each equalizer ring is equal to number of
(a) poles. (b) pole pairs.
(c) parallel paths. (d) commutator segments.

83. A frog-leg winding is used in a dc machine to eliminate
(a) the use of equalizers in lap winding.
(b) the use of compensating winding.
(c) the use of compensating winding.
(d) reactance voltage produced due to commutation.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

84. A 250 V dc generator is run at rated speed with no excitation. The open-circuit voltage will be
(a) zero. (b) very small, say about 2 or 3 V.
(c) about 100 V. (d) 250 V.

85. At a certain speed and flux, the voltage generated by a dc generator is 230 volts. If the speed is increased by 20% and the flux is simultaneously reduced by 10%, the voltage will be
(a) increased by 10%. (b) reduced by 20%.
(c) increased by 8%. (d) decreased by 8%.
[A.M.I.E. Elec. Science Winter 1994]

86. The field coils of a dynamo have an inductance of 8 H and have a resistance of 60 Ω and are connected to 120 V dc source. The steady state current in the field coil is
(a) 15 A. (b) 2 A. (c) Zero A.
(c) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1993]

87. A 4-pole lap wound dc generator has a developed power of P watts and voltage of E volts. The adjacent brushes of the machine are removed as they are worn out. If the machine operates with the

Answers: **65.** (d), **66.** (b), **67.** (a), **68.** (d), **69.** (c), **70.** (c), **71.** (c), **72.** (a), **73.** (b), **74.** (b), **75.** (d), **76.** (e), **77.** (d), **78.** (d), **79.** (d), **80.** (c), **81.** (a), **82.** (b), **83.** (a), **84.** (b), **85.** (c), **86.** (b), **87.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

remaining brushes, the developed voltage and power that can be obtained from the machine are
(a) E, P (b) E/2, P/2 (c) E, P/4 (d) E, P/2
[GATE E.E. 1999]

88. The armature resistance of a 6-pole lap wound dc machine is 0.05 Ω. If the armature is rewound as a wave winding, what is the armature resistance?
(a) 0.45 Ω (b) 0.30 Ω (c) 0.15 Ω (d) 0.10 Ω
[U.P.S.C. I.E.S. E.E.-II, 1994, 2005]

89. A lap wound armature winding, fitted with a commutator and a pair of brushes on it is rotated at a speed N_r in a rotating magnetic field having P poles and rotating at a speed N_f in space N_f and N_r both being in the same direction. The frequency of induced voltage across the brushes on the commutator is
(a) $\frac{N_f P}{120}$ (b) $\frac{(N_f - N_r)}{120} P$
(c) $\frac{(N_f + N_r)}{120} P$ (d) $\frac{N_r P}{120}$
[U.P.S.C. I.E.S. E.E. II 1994]

90. An eight pole dc generator has a simple wave wound armature containing 32 coils of 6 turns each. Its flux per pole is 0.06 Wb. The machine is running at 250 rpm. The induced armature voltage is:
(a) 96 V (b) 192 V
(c) 384 V (d) 768 V
[GATE E.E. 2004; U.P.S.C. I.E.S. E.E.-II, 2011]

91. The emf induced in a conductor of machine driven at 600 rpm, the peak value of flux density is 1.0 Wb/m^2, diameter of machine 2.0 meter and length of machine 0.30 m is:
(a) 41.83 V (b) 29.58 V
(c) 9.42 V (d) 18.84 V
[U.P.S.C. I.E.S. E.E.-II, 2011]

92. A 4-pole dynamo with wave wound armature has 51 slots containing 20 conductors in each slot. The induced emf is 357 V and the speed is 8500 rpm. The flux per pole will be
(a) 3.5 mWb. (b) 1.2 mWb.
(c) 14 mWb. (d) 21 mWb. [GATE E.E. 1996]

93. Approximate physical size of the 50 KW, 1800 rpm dynamo is a function of a 25 kW, 900 rpm dynamo will be
(a) 1. (b) 1/2. (c) 1/4.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1993]

94. In dc machines, the air gap flux distribution in space at no load is
(a) sinusoidal. (b) triangular.
(c) flat topped. (d) pulsating.

95. The armature MMF waveform of a dc machine is
(a) Pulsating (b) Rectangular
(c) Triangular (d) Sinusoidal
[U.P.S.C. I.E.S. E.E.-II, 2010]

96. The armature mmf of a dc machine has
(a) triangular space distribution and rotates at the speed of armature.
(b) trapezoidal space distribution and is stationary in space.
(c) stepped distribution and rotates at the speed of armature.
(d) triangular space distribution and is stationary in space.
[U.P.S.C. I.E.S. E.E.-II 2000]

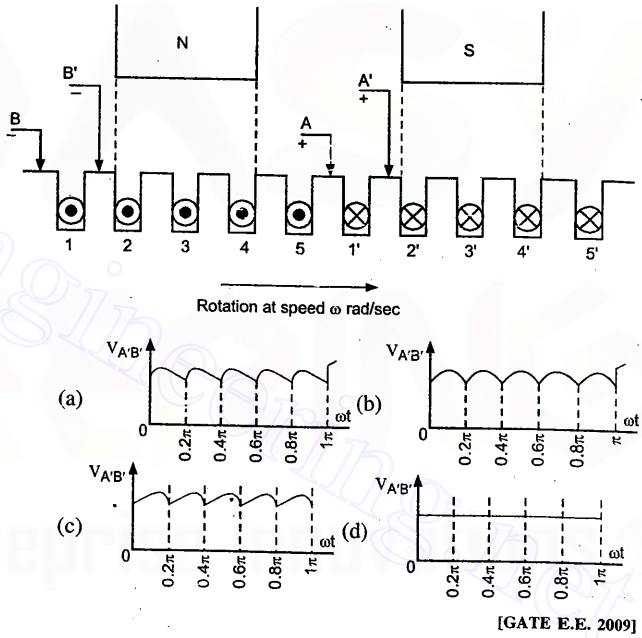
97. A 6-pole lap wound dc machine has 720 conductors and it draws 50 A from supply mains. What is the flux distribution produced by the armature reaction per pole?
(a) Rectangular in wave shape with a peak of 500 AT.
(b) Rectangular in wave shape with a peak of 100 AT.
(c) Triangular in wave shape with a peak of 500 AT.
(d) Triangular in wave shape with a peak of 1000 AT.
[U.P.S.C. I.E.S. E.E.-II, 2005]

98. In a dc machine, the actual flux distribution depends upon
(a) size of air gap. (b) shape of pole shoes.
(c) clearance between tips of the adjacent pole shoes.
(d) all of the above.

99. In a dc machine, the space waveform of the air-gap flux distribution affects
(a) torque only. (b) voltage only.
(c) both the torque and voltage.
(d) neither the torque nor the voltage.

100. In a dc machine the armature mmf is
(a) stationary with respect to the field poles but rotating with respect to the armature.
(b) rotating with respect to field poles as well as armature.
(c) rotating with respect to field poles.
(d) stationary with respect to armature.

101. Figure shows the extended view of a 2 pole dc machine with 10 armature conductors. Normal brush positions are shown by A and B, placed at the interpolar axis. If the brushes are now shifted, in the direction of rotation, to A′ and B′ as shown, the voltage waveform $V_{A'B'}$ will resemble



[GATE E.E. 2009]

102. Armature reaction in a dc shunt generator, running at full load with the brushes not shifted from the geometrical neutral plane and saturation neglected, is
(a) absent. (b) cross-magnetising.
(c) demagnetising. (d) magnetising.
[U.P.S.C. I.E.S. E.E.-II, 2008]

103. In a dc machine without any brush shift, the shift of the magnetic neutral axis owing to armature reaction is
(a) in the direction of rotation for both the generator and the motor.
(b) against the direction of rotation for both the generator and the motor.

Answers: **88.** (a), **89.** (a), **90.** (c), **91.** (d), **92.** (b), **93.** (a), **94.** (c), **95.** (c), **96.** (d), **97.** (c), **98.** (d), **99.** (d), **100.** (a), **101.** (a), **102.** (b), **103.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) in the direction of rotation for the generator and against the direction of rotation for the motor.
(d) against the direction of rotation for the generator and in the direction of rotation of motor.

104. In a dc machine, on no load the magnetic neutral axis
(a) moves from geometrical neutral axis in the direction of rotation.
(b) moves from geometrical neutral axis in the opposite direction of rotation.
(c) coincides with the geometrical neutral axis.
(d) none of the above.

105. Due to magnetic saturation, the flux per pole in a dc machine without brush shift
(a) increases in both the generators and the motors with load.
(b) decreases in both the generators and the motors with load.
(c) increases in generators but decreases in motors with load.
(d) decreases in generators and increases in motors with load.

106. If the brushes are given a small amount of forward shift in case of a dc generator, the armature reaction effect will be
(a) totally demagnetizing. (b) totally cross-magnetizing.
(c) partly demagnetizing and partly cross-magnetizing.
(d) totally magnetizing.

107. In a dc machine, the number of mechanical and electrical degrees will be same when the number of poles on the machine is
(a) 4 (b) 2 (c) 8 (d) 1

108. Air gap at the pole tips of a dc machine is kept more than that at the centre of the pole mainly to reduce
(a) reactance voltage. (b) effect of armature reaction.
(c) losses of armature core. (d) noise of the machine.
[A.M.I.E. Sec B. Elec. Machine Design Winter 1994]

109. Commutation in a dc machine may be explained as a process
(a) in which magnetic field is set up.
(b) by virtue of which emf is induced in the armature conductors.
(c) by which current in a coil is reversed during the period it is short circuited by the brush.
(d) how armature flux affects the main field flux.

110. Current in a coil undergoing commutation is not able to get reversed completely by the end of commutation period. It is due to
(a) reactance voltage induced in the coil.
(b) coil resistance. (c) armature emf.
(d) none of the above.

111. Under-commutation results in
(a) sparking at the middle of the brush.
(b) sparking at the leading edge of the brush.
(c) sparking at the trailing edge of the brush.
(d) no sparking.

112. In a dc shunt generator working on load, the brushes are moved forward in the direction of rotation, as a result of this, commutation will
(a) improve but terminal voltage will fall.
(b) worsen and terminal voltage will fall.
(c) improve and terminal voltage will rise.
(d) worsen and terminal voltage will rise.
[U.P.S.C. I.E.S. Elec. Engineering-II, 1997]

113. In a dc machine, the sparking between brushes and commutator surface may be due to
(a) under commutation. (b) over commutation.
(c) too rapid reversal of current. (d) any of the above.

114. The self induced emf in the coil undergoing commutation is called the
(a) reactance voltage. (b) statically induced voltage.
(c) dynamically induced voltage. (d) none of the above.

115. The sparking at the brushes, in a dc machine, is due to
(a) armature reaction. (b) reactance voltage.
(c) presence of commutator.
(d) high resistance of carbon brushes.

116. The reactance voltage is
(a) directly proportional to armature current and commutation period.
(b) directly proportional to commutation period and inversely proportional to armature current.
(c) directly proportional to armature current and inversely proportional to commutation period.
(d) none of the above.

117. If the armature current is increased to double its previous value, and the time of commutation is halved, how will the reactance voltage vary ?
(a) It will be halved. (b) It will remain the same.
(c) It will be doubled. (d) It will become four times.
[U.P.S.C. I.E.S. E.E.-II, 1993, 2007]

118. Sparkless commutation can be achieved by employing
(a) interpoles. (b) compensating winding.
(c) high resistance carbon brushes.
(d) any one or more of the above methods.

119. To have sparkless commutation, the armature reaction effect in a dc machine is neutralized by
(a) compensating winding and commutating poles.
(b) shifting the brush axis from geometrical neutral axis to magnetic neutral axis.
(c) fixing the brush axis in line with the pole axis.
(d) increasing the field excitation. [U.P.S.C. I.E.S. E.E.-II, 1997]

120. The interpoles in dc machines have a tapering shape in order to
(a) reduce the overall weight.
(b) reduce the saturation in the interpole.
(c) economic on the material required for interpoles and their windings.
(d) increase the acceleration of commutation.
[U.P.S.C. I.E.S. E.E.-II 1998]

121. Consider the following statements:
The use of interpoles in dc machines is to counteract the
1. reactance voltage.
2. demagnetizing effect of armature mmf in the commutating zone.
3. cross-magnetizing effect of armature mmf in the commutating zone.
Which of these statement(s) is/are correct?
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 3 alone.
[U.P.S.C. I.E.S. E.E.-II 2001]

122. Consider the following statements:
1. Interpole windings are connected in series with armature winding.
2. Polarity of interpole must be same as that of the main pole in advance.
3. Distortion of the main field under pole shoes is not affected by the use of interpoles.
Which of these statement(s) regarding interpole used in dc motors is/are correct?
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 1 alone.
[U.P.S.C. I.E.S. E.E.-II 2000]

Answers: **104.** (c), **105.** (b), **106.** (c), **107.** (b), **108.** (b), **109.** (c), **110.** (a), **111.** (c), **112.** (a), **113.** (d), **114.** (a), **115.** (b), **116.** (c), **117.** (d), **118.** (d), **119.** (a), **120.** (b), **121.** (c), **122.** (d),

123. Which of the following are true in respect of interpoles in dc machines ?
1. Reduce armature reaction effects in interpolar region.
2. Windings are connected in series with armature.
3. Have the same dimensions as main poles.

Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

124. Consider the following statements about commutating poles which are fitted on most large dc shunt motors.
1. The commutating poles are placed in geometric neutral planes and their number is usually equal to the number of main poles.
2. The winding on the commutating poles is connected in series with the shunt field winding on the main poles.
3. The polarity of the commutating pole must be that of the next main pole further ahead.
4. The commutating poles neutralise the reactance voltage produced in the coil undergoing commutation.

(a) 1, 2 and 3 are correct. (b) 1 and 4 are correct.
(c) 2, 3 and 4 are correct. (d) 1, 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1996]

125. The compensating windings are placed in the slots in the pole faces to neutralize the
(a) cross-magnetizing effect. (b) demagnetizing effect.
(c) both of the demagnetizing and cross-magnetizing effects.
(d) armature reaction mmf under the pole faces and avoid flash over between positive and negative brushes.

126. In large sized dc machines the compensating windings are provided to
(a) compensate for the decrease in speed due to increase of load.
(b) neutralize the voltage induced in the coil due to high fluctuation of load.
(c) reduce eddy current losses by providing local short-circuits.
(d) none of the above.

127. Compensating winding in a dc machine is placed on
(a) armature in slots. (b) yoke in the interpolar gap.
(c) yoke in the pole faces.
(d) partly in armature slots and partly in pole faces.

128. Compensating windings are employed in dc motors which are likely to operate
(a) at a constant speed over wide range of load.
(b) with rapidly changing loads of wide range.
(c) over wide range of speed by field excitation control.
(d) both (b) and (c).

129. In a dc machine, which of the following statements is true?
(a) Compensating winding is used for neutralizing armature reaction while interpole winding is used for producing residual flux.
(b) Compensating winding is used for neutralizing armature reaction while interpole winding is used for improving commutation.
(c) Compensating winding is used for improving commutation while interpole winding is used for neutralizing armature reaction.
(d) Compensating winding is used for improving commutation while interpole winding is used for producing residual flux.
[GATE E.E., 2006]

130. Consider the following statements in respect of a dc generator:
1. Compensating windings are located in teeth cut out in main poles.
2. Compensating windings are series connected so that the armature reaction is aided at any load.
3. Compensating windings are series connected for cancellation of the armature reaction at any load.
4. Compensating windings are shunt connected to aid the main poles at any load.

Which of the statements given above are correct?
(a) 1 and 2. (b) 1, 2 and 3. (c) 1 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2006]

131. The compensating winding in a dc machine
(a) is located in armature slots for compensation of the armature reaction.
(b) is located on commutating poles for improving commutation.
(c) is located on pole shoes for avoiding the flashover at the commutator surface.
(d) is located on pole shoes to avoid the sparking at the brushes.
[GATE E.E. 2000]

132. In dc machines, the interpoles are provided
(a) for mechanical balancing of machines.
(b) to counteract the demagnetizing effect of armature mmf in the commutating zone.
(c) to counteract the reactance voltage and the cross-magnetizing effect of armature mmf in the commutating zone.
(d) to make commutation sparkless.
(e) both (c) and (d).

133. The commutating flux produced by interpole must be proportional to
(a) armature current. (b) field current.
(c) both armature and field currents.
(d) none of the above.

134. The polarity of the interpole is the
(a) same as that of main pole ahead in case of generators.
(b) same as that of main pole ahead in case of motor.
(c) same as that of main pole behind in case of motor.
(d) same as that of main pole behind in case of generator.
(e) both (a) and (c).

135. The interpole air gap is.....that under the field poles, in dc machines.
(a) smaller than (b) larger than
(c) equal to (d) none of these

136. A dc machine is provided with both interpole and compensating windings. These two windings with respect to armature circuit will be in
(a) series. (b) parallel.
(c) former in series and the latter in parallel.
(d) former in parallel and the latter in series.

137. The mmf necessary for establishment of flux in the magnetic circuit of a dc generator can be obtained by means of field coils excited by
(a) some separate source. (b) the generator itself.
(c) either of the above methods. (d) none of these.

138. In a separately excited dc generator the field is connected
(a) in series with an armature. (b) across the armature.
(c) to an external supply source. (d) none of the above.

139. Series field winding of a dc machine consists of
(a) few turns of thick wire. (b) few turns of thin wire.
(c) many turns of thick wire. (d) many turns of thin wire.

Answers: **123.** (a), **124.** (b), **125.** (d), **126.** (b), **127.** (c), **128.** (d), **129.** (b), **130.** (c), **131.** (c), **132.** (e), **133.** (a), **134.** (e), **135.** (b), **136.** (a), **137.** (c), **138.** (c), **139.** (a),

140. The armature current in a dc shunt generator is given as

(a) $\frac{E_g+V}{R_a}$ (b) $\frac{E_g}{R_a}$ (c) $\frac{E_g-V}{R_a}$ (d) I_L+I_{sh}

141. When the shunt field of a dc compound generator is connected across both the series field and armature. Such a connection is known as

(a) short shunt. (b) long shunt.
(c) cumulative compounding. (d) differential compounding.

142. The series field of a short shunt dc generator is excited by _____ current.

(a) armature (b) shunt field
(c) load (d) I_L+I_{sh}

143. With the increases in field excitation of a dc generator, its generated emf

(a) increases. (b) decreases. (c) remains constant.
(d) goes on increasing proportionately.
(e) increases upto a limit and then remains almost constant.

144. The slight curvature at the lower end of the OCC of a self excited dc generator is due to

(a) magnetic inertia. (b) residual flux.
(c) high speed. (d) high field resistance.

145. The fall in speed of a dc generator due to increase in load can be corrected by

(a) cooling the armature. (b) increasing the excitation.
(c) reducing the load voltage.
(d) increasing the input to the prime mover.

146. The magnetic field which initially induces emf in the armature in a self excited dc generator is because of

(a) permanent magnets. (b) armature rotation.
(c) residual magnetism. (d) none of the above.

147. A generator may loose residual magnetism due to

(a) heating. (b) vibrations.
(c) over excitation. (d) any of these.

148. In dc generators, the residual magnetism is of the order of

(a) 2.5% (b) 10% (c) 15% (d) 25%

149. In comparison to self excited generator, a separately excited generator

(a) is more reliable.
(b) is amenable to better voltage regulation.
(c) has exciting current independent of load characterisitc.
(d) has all of the above features.

150. A separately excited dc generator has an open-circuit voltage E_0 for a certain value of field current. If the field current is halved, the open-circuit voltage will be

(a) $\frac{1}{2}E_0$. (b) less than $\frac{E_0}{2}$.

(c) may be $\frac{E_0}{2}$ or more than $\frac{E_0}{2}$. (d) $2E_0$.

151. The voltage at the terminals of a dc series generator running at rated rpm and no load will be

(a) more than the rated voltage. (b) full rated voltage.
(c) a very small voltage. (d) zero

152. A dc series generator is provided with divertor and is delivering its rated current. If the divertor switch is opened, the terminal voltage will

(a) remain constant. (b) decrease.
(c) increase. (d) none of these.

153. A 4 pole, 25 kW, 200 V wave wound dc shunt generator the current in each parallel path will be

(a) 62.5 A (b) 125 A (c) 31.25 A (d) 250 A

154. A dc shunt generator is supplying a load of 1.8 kW at 200 V. Its armature and field resistances are 0.4 Ω and 200 Ω respectively. What is the generated emf ?

(a) 190 V (b) 196 V (c) 204 V (d) 210 V

[U.P.S.C. I.E.S. E.E.-II, 2007]

155. If the field circuit resistance of a dc shunt generator exceeds its critical value, the generator

(a) fails to build up. (b) builds up a very high voltage.
(c) exceeds its current capacity.
(d) produces power beyond its rating. [A.M.I.E. Winter 1996]

156. A shunt generator has a critical field resistance of 200 Ω at a speed of 800 rpm. If the speed of the generator is increased to 1,000 rpm, what is the change in the critical field resistance of the generator ?

(a) Decreases to 160 Ω (b) Remains the same at 200 Ω
(c) Increases to 250 Ω (d) Increases to 312.5 Ω

[U.P.S.C. I.E.S. E.E. II, 2008]

157. Consider the following statements related to a shunt generator :

1. The full-load voltage is lower than no-load voltage.
2. The above lowering is partly due to voltage drop in armature resistance.
3. The field current does not change with load and has no effect on generated voltage.

Which of the statements given above are correct ?

(a) 1, 2 and 3. (b) Only 1 and 2.
(c) Only 2 and 3. (d) Only 1 and 3.

[U.P.S.C. I.E.S. E.T.E-I, 2006]

158. The factor that is not responsible for drop in terminal voltage of a dc shunt generator on load is

(a) commutation. (b) armature reaction.
(c) armature resistance drop.
(d) field weakening due to (b) and (c).

159. In a dc shunt generator, the voltage build up is generally restricted due to.

(a) armature heating. (b) insulation restrictions.
(c) saturation of iron. (d) speed limitation.

160. Consider the following statements regarding the magnetisation characteristics of a dc generator:

1. It represents the variation of field flux with field current.
2. Variation of open-circuit terminal voltage with field current is independent of speed.
3. It is nonlinear from zero to rated field current.
4. It helps to determine critical field resistance at a given speed.
5. It always starts from the origin.

Which of these statements are correct?

(a) 1 and 4. (b) 1, 2 and 5.
(c) 2, 3 and 4. (d) 3and 5.

[U.P.S.C. I.E.S. E.E.-II, 1999]

161. Out of the following factors for a dc machine

(i) Interpole (ii) Armature resistance
(iii) Armature (iv) Reduction in field current
(v) Effect of armature reaction

The factors that are responsible for decrease in terminal voltage of a shunt generator are

(a) (i), (ii) and (iv). (b) (ii), (iii) and (v).
(c) (i), (iv) and (v). (d) (ii), (iv) and (v).

[GATE E.E. 1996]

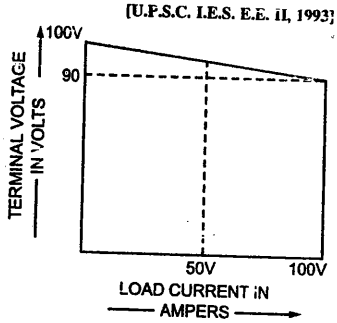
Answers: **140.** (c), **141.** (b), **142.** (c), **143.** (e), **144.** (b), **145.** (d), **146.** (c), **147.** (a), **148.** (a), **149.** (d), **150.** (c), **151.** (c), **152.** (c), **153.** (a), **154.** (c), **155.** (a), **156.** (c), **157.** (b), **158.** (a), **159.** (c), **160.** (a), **161.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

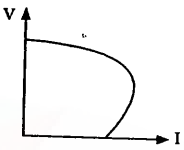
162. A dc shunt generator having a shunt field of 50 Ω was generating normally at 1000 rpm. The critical resistance of the machine was 80 Ω. Due to some reasons, the speed of the primemover became such that the generator just failed to generate. The speed at that time must have been
(a) 1,600 rpm. (b) 800 rpm.
(c) 625 rpm. (d) 500 rpm.
[U.P.S.C. I.E.S. E.E. II, 1993]

163. The external load characteristic of a dc generator at rated speed is assumed to be linear and is shown below. The load circuit comprises only resistance. When the load current is 50 A, the value of load circuit resistance will be



(a) 0.9 Ω. (b) 0.1 Ω
(c) 1.9 Ω. (d) 2.0 Ω.
[U.P.S.C. I.E.S. E.E. II, 1996]

164. The graph represent which characteristic of a dc shunt generator?



(a) Internal characteristic.
(b) External characteristic.
(c) Open-circuit characteristic.
(d) Magnetic characteristic. [U.P.S.C. I.E.S E.E.-II, 2008]

165. An ideal dc generator has a regulation of _____ per cent.
(a) zero (b) 10 (c) 25 (d) 100

166. Consider the following statements
1. In a dc series generator, full-load voltage is more than the no-load voltage.
2. In a separately excited dc generator full-load voltage is more than the no-load voltage.
3. In a dc shunt generator, full-load voltage is less than the no-load voltage.

Of these statements.
(a) 1,2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E. II, 1994]

167. The terminal voltage of an overcompounded dc generator
(a) decreases with the increase in load current.
(b) increases with the increase in load current.
(c) remains constant at all load currents.
(d) none of the above.

168. Consider the following statements :
For a level compounded dc generator to run at constant speed, the series field mmf must effectively compensate
1. armature reaction mmf.
2. armature resistance voltage drop.
3. brush contact voltage drop.

Which of these statements is/are correct ?
(a) 2 and alone. (b) 1 and 2.
(c) 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S E.E.-II, 2000]

169. In a dc compound generator, "flat compound" characteristic, required for certain applications, may be obtained by connecting a variable resistance:
(a) across the series field. (b) in series with the series field.
(c) in parallel with the shunt field.
(d) in series with the shunt field. [U.P.S.C. I.E.S. E.E.-II, 2005]

170. A self excited dc shunt generator driven by its prime mover at the rated speed fails to build up voltage across its terminals at no load. What reason can be assigned for this?
(a) The field circuit resistance is higher than the critical resistance.
(b) The initial shunt field mmf does not assist the residual magnetism.
(c) One of the interpole connection is reversed.
(d) The brush-axis shifts slightly from the geometrical neutral axis of the machine. [U.P.S.C. I.E.S. E.E.-II, 2005]

171. A cumulatively compounded dc generator is supplying 20 A at 200 V. Now if the series field winding is short circuited, the terminal voltage
(a) will remain unaltered at 200 V.
(b) will rise to 220 V.
(c) will shoot upto a very high value.
(d) will become less than 200 V. [U.P.S.C. I.E.S. E.E. I, 1992]

172. A dc generator will be flat compounded if
(a) its terminal voltage remains constant irrespective of the load current supplied by the generator.
(b) generated voltage is in proportion to load current.
(c) the generator is capable of producing higher voltage at light load.
(d) terminal voltage increases slightly with the load.

173. Over or under compounding of a dc generator is achieved by
(a) shunting more or less current from the shunt field.
(b) shunting more or less current from the series field.
(c) connecting it as long shunt.
(d) connecting it as short-shunt.

174. An over-compounded dc generator is supplying 800 A at full load on 500 V. The resistance of each conductor is 0.02 Ω. The percentage of compounding is
(a) 1.6 % (b) 3.2 % (c) 6.4 % (d) 12.8%

175. Which of the following dc generators will be in a position to build up without any residual magnetism in the field ?
(a) Series (b) Shunt
(c) Separately excited (d) Compound

176. Which of the following dc generators has rising V-I characteristics?
(a) Series (b) Shunt
(c) Compound (d) None.

177. Which of the following dc generators will have negligible terminal voltage on no load ?
(a) Shunt (b) Series
(c) Compound (d) None

178. An exciter for turbo-generator is a dc _____ generator.
(a) shunt (b) series
(c) compound (d) separately excited

179. For a specific open-circuit voltage of a dc generator, the short-circuit current will be maximum when it is
(a) separately excited. (b) shunt connected.
(c) cumulatively compounded.
(d) differentially compounded.
[A.M.I.E. Sec B. Elec. Machines Winter 1994]

180. The voltage regulation of a dc generator at full load being zero implies that the generator is
(a) shunt-connected. (b) differentially compounded.
(c) cumulatively compounded. (d) series-connected
[A.M.I.E. Elec. Science Summer 1994]

Answers: **162.** (c), **163.** (b), **164.** (b), **165.** (a), **166.** (d), **167.** (b), **168.** (b), **169.** (a), **170.** (b), **171.** (d), **172.** (a), **173.** (b), **174.** (c), **175.** (c), **176.** (a), **177.** (b), **178.** (a), **179.** (c), **180.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

181. The _____ generator has the poorest voltage regulation
(a) shunt (b) over compounded
(c) under compounded. (d) differential compounded.

182. The voltmeter connected across a generator reads voltage same at no load and at full load (rated). The generator is of the type :
(a) Shunt generator. (b) Series generator.
(c) Level compound. (d) Short-shunt compound.

183. A dc shunt generator when driven without connecting field winding shows an open-circuit terminal voltage of 12 V. When field winding is connected and excited the terminal voltage drops to zero because
(a) field resistance is higher than critical resistance.
(b) there is no residual magnetism in the field circuit.
(c) field winding has got wrongly connected.
(d) there is a fault in armature circuit. [U.P.S.C. I.E.S. E.E.-II 2001]

184. A dc shunt generator, when driven at its rated speed, is found to be not generating any voltage. Which of the following would account for this?
1. There is no residual magnetism.
2. The connection of the field winding is not proper with respect to armature terminals.
3. The resistance of the field circuit is greater than the critical field resistance.
4. The load resistance is less than the critical armature resistance. Select the correct answer using the codes given below:

Codes:
(a) 3 and 4. (b) 1, 3 and 4.
(c) 1, 2 and 3. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1997]

185. The residual magnetism of a dc shunt generator can be regained by
(a) connecting the shunt field to a battery.
(b) running the generator on no load for some time.
(c) grounding the shunt field.
(d) reversing the direction of rotation of the generator.

186. Flashing of field of dc generator means
(a) neutralization of residual magnetism.
(b) creation of residual magnetism by a dc source.
(c) increasing flux density by providing extra ampere-turns in field.
(d) none of the above.

187. A dc series generator is employed
(a) as a booster to maintain constant voltage at the load end of the feeder.
(b) for supplying traction load.
(c) for supplying industrial load at constant voltage.
(d) for battery charging.

188. The type of dc generator used for arc welding purposes is a
(a) series generator. (b) shunt generator.
(c) cumulatively compounded generator.
(d) differentially compounded generator.
[U.P.S.C. I.E.S. E.E. II, 1995]

189. The essential condition for satisfactory parallel operation of two dc generators is that they should have same
(a) kW output rating.
(b) drooping voltage characteristics.
(c) percentage regulation. (d) speed of operation.

190. When two dc series generators are operating in parallel, an equalizer bar is used
(a) to reduce armature reaction. (b) to increase emf.
(c) to increase the speed. (d) to reduce the flux.
(e) so that the two similar machines take approximately equal load current.

191. The simplest way of shifting load from one shunt generator to the other operating in parallel is by
(a) adjustment of speeds.
(b) adjustment of armature resistances.
(c) adjustment of field rheostats.
(d) using equalizer connections.

192. A pair of similar dc shunt generators operate in parallel and supply a common load. It is required to switch off machine no. 1 and allow machine no. 2 to supply the circuit load. The following operations are to be used to achieve this
1. Switch off the main switch of machine no. 1.
2. Reduce the field current of machine no. 1.
3. Increase the field current of machine no. 2.
4. Ensure that machine no. 1 just floats.

The correct sequence of these operations is
(a) 4, 3, 2, 1. (b) 2, 3, 4, 1. (c) 2, 4, 3, 1. (d) 3, 2, 4, 1.
[U.P.S.C. I.E.S. E.E. II, 1996]

193. Two dc shunt generators having equal open-circuit emfs but slight different load characteristics are operating in parallel, then
(a) the machines will share load equally.
(b) the machine with more drooping characteristic will supply less load.
(c) the machine with more drooping characteristic will supply more load.

194. If field of one of two generators operating in parallel is made very weak, then it will
(a) not take any load. (b) take major share of load.
(c) operate as a motor and run in the same direction.
(d) operate as a motor and run in the opposite direction.

195. DC generators are connected to or disconnected from the busbar only under the floating condition. This is done to avoid
(a) burning of switch contacts.
(b) sudden loading of the prime mover.
(c) mechanical jerk to the shaft.
(d) all of the above.

196. The main factor that leads to unstable parallel operation of flat or over compounded dc generators is
(a) their rising voltage characteristics.
(b) unequal series field resistances.
(c) unequal speed regulation of their prime movers.
(d) their drooping voltage characteristics.

197. In the case of parallel operation of dc compound wound generators, for proper division of load from no load to full load it is essential that they should have the same
(a) KW output rating. (b) percentage regulation.
(c) series field resistance. (d) speed of operation.

198. In parallel operation of two dc compound generators provided with interpoles, the equalizing bar must be connected to
(a) inter pole fields only. (b) series fields only.
(c) junction of series and interpole fields.
(d) none of the above.

199. For parallel operation, the dc generators normally preferred are
(a) shunt. (b) series.
(c) over-compound. (d) under compound.
(e) both shunt and under compound.

200. Equalizer bar is necessary for parallel operation of dc _____ generators.

Answers: **181.** (d), **182.** (c), **183.** (c), **184.** (d), **185.** (a), **186.** (b), **187.** (a), **188.** (d), **189.** (b), **190.** (e), **191.** (c), **192.** (b), **193.** (b), **194.** (c), **195.** (d), **196.** (a), **197.** (b), **198.** (c), **199.** (e), **200.** (e),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) series (b) shunt
(c) over-compound (d) under compound
(e) series and over-compound

201. In the block diagram of a separately excited dc motor, how does the armature induced emf appear as ?
(a) Positive feedback. (b) Negative feedback.
(c) Disturbance input. (d) Output.
[U.S.P.C. I.E.S. E.E.-II. 2005]

202. A 220 V dc machine has an armature resistance of 1 Ω. If the full-load current is 20 A, the difference of induced voltage, when the machine is running as a motor and generator, is
(a) 20 V (b) 0 V (c) 40 V (d) 60 V
[U.P.S.C. I.E.S. E.E.-II, 2006]

203. The current drawn by a 220 V dc motor of armature resistance 0.5 Ω and back emf 200 V is
(a) 40 A (b) 44 A (c) 400 A (d) 440 A
[U.P.S.C. I.E.S. E.E.-II 2001]

204. The current drawn by a 120 V dc motor with back emf of 110 V and armature resistance of 0.4 Ω is
(a) 4 A (b) 25 A (c) 275 A (d) 300 A
[U.P.S.C. I.E.S. E.E.-II 2003]

205. In a dc motor, energy conversion would not have been possible but for
(a) input energy from the supply.
(b) production of back emf in the armature.
(c) use of commutator. (d) rotation of the machine.

206. With the increase in speed of a dc motor
(a) both back emf as well as line current increase.
(b) both back emf as well as line current fall.
(c) back emf increases but line current falls.
(d) back emf falls and line current increases.

207. If the back emf in a dc motor vanishes suddenly, the motor will
(a) start hunting (b) burn.
(c) run at very high speed. (d) run at very slow speed.

208. The output power of any electrical motor is taken from the
(a) armature. (b) field.
(c) coupling mounted on the shaft.
(d) motor frame.

209. The armature shaft must be able to withstand
(a) any unbalanced magnetic pull on the armature core.
(b) twisting strains due to transmission of torque.
(c) bending moment due to weight of the armature and commutator.
(d) all of the above.

210. The output indicated on the name plate of any motor is always the
(a) gross power. (b) power drawn in kVA.
(c) power drawn in kW. (d) output power at the shaft.

211. A thicker wire is used in dc series motor field winding than that in a dc shunt motor
(a) to create more flux. (b) to reduce resistance.
(c) to carry large load current. (d) both (b) and (c).

212. In case of a conductively compensated dc series motor, the compensating winding is provided
(a) in series with the armature winding.
(b) in parallel with the armature winding.
(c) in parallel with the field winding.
(d) as a separate unit.

213. The dc compound motors are generally
(a) level compound. (b) cumulative compound.
(c) differential compound. (d) none of these.

214. In a dc compound motor the field regulator is provided to
(a) control the flux. (b) limit the armature current.
(c) demagnetize field partially. (d) none of the above.

215. The direction of rotation of a dc motor can be determined by
(a) Fleming's right hand rule. (b) Fleming's left hand rule.
(c) Lenz's law. (d) Ampere law.

216. The direction of rotation of a dc shunt motor can be reversed by interchanging
(a) the supply terminals. (b) the field terminals only.
(c) the armature terminals only.
(d) either field or armature terminals.
[A.M.I.E. Elec. Science Winter 1993]

217. When the supply terminals of a dc shunt motor are interchanged
(a) the motor will stop.
(b) the motor will run at its normal speed in the same direction as before.
(c) the direction of rotation will reverse.
(d) the motor will run much faster in the same direction.
[A.M.I.E. Elec. Science Winter 1994]

218. The direction of rotation of a dc series motor can be reversed
(a) by interchanging supply terminals.
(b) by interchanging field terminals.
(c) either by interchanging supply terminals or by interchanging field terminals.
(d) by interchanging supply terminals as well as field terminals.
[U.P.S.C. I.E.S. E.E.-II 2003]

219. The direction of rotation of a dc compound motor can be reversed by interchanging _____ connections.
(a) armature (b) series field
(c) shunt field (d) armature and series field both.

220. The speed of a dc motor is
(a) directly proportional to back emf and flux.
(b) directly proportional to its back emf and inversely proportional to flux.
(c) inversely proportional to both back emf and flux.
(d) directly proportional to flux and inversely proportional to back emf.
[A.M.I.E. Winter 1996]

221. If the load current and flux of a dc motor are held constant and voltage applied across it armature is increased by 5%, the speed of the motor will
(a) increase by 5%. (b) reduce by 5%.
(c) remain unalternated. (d) depends on other factors.

222. If the flux of a dc motor approaches zero, its speed will
(a) approach infinity. (b) approach zero.
(c) remain unchanged. (d) between 0 and ∞.

223. A series motor is working drawing a load current of 1 A from the lines. If now the load is reduced such that the current drawn is halved, the speed of the machine (neglecting the saturation and armature resistance) would be
(a) unchanged. (b) reduced by 50%.
(c) reduced by 100%. (d) increased by 100%.

224. A dc shunt motor runs at rated speed. If its field circuit gets open-circuited, then soon after this the motor speed would tend to
(a) decrease. (b) remain unchanged. (c) increase.
(d) fluctuate around its previous speed.
[A.M.I.E. Elec. Science Winter 1994]

225. The speed of a dc shunt motor _____ from no load to full load.
(a) falls slightly (b) improves slightly
(c) remains unchanged (d) falls rapidly

Answers: **201.** (b), **202.** (c), **203.** (a), **204.** (b), **205.** (b), **206.** (c), **207.** (b), **208.** (c), **209.** (d), **210.** (d), **211.** (d), **212.** (a), **213.** (b), **214.** (a), **215.** (b), **216.** (d), **217.** (b), **218.** (b), **219.** (a), **220.** (b), **221.** (a), **222.** (a), **223.** (d), **224.** (c), **225.** (a),

226. A dc shunt generator has an armature resistance of 0.1 and runs at 1200 rpm when delivering 50 kW at 250 V. The speed of the machine, when run as a motor fed from 250 V supply and drawing 50 kW will be approximately
(a) 1410 rpm. (b) 1020 rpm.
(c) 1100 rpm. (d) 1320 rpm.

227. The speed regulation of a dc motor is given as
(a) $N_o - N_f$ (b) N_o / N_f
(c) $\frac{N_o - N_f}{N_f}$ (d) $\frac{N_o - N_f}{N_o}$

228. A dc motor having full-load speed of 750 rpm and speed regulation of 10% will have no-load speed of
(a) 825 rpm. (b) 675 rpm. (c) 800 rpm. (d) 700 rpm.

229. When is the mechanical power developed by a dc motor maximum?
(a) Back emf is equal to applied voltage.
(b) Back emf is equal to zero.
(c) Back emf is equal to half the applied voltage.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-II, 2008]

230. If the applied voltage to a dc machine is 230V, then the back emf, for maximum power developed is
(a) 115 V (b) 200 V (c) 230 V (d) 460V
[U.P.S.C.I.E.S. E.E. II, 1994]

231. The efficiency of a dc motor when developing maximum power will be about
(a) 100% (b) 50%
(c) less than 50% (d) more than 50%

232. A dc motor develops the maximum mechanical power when the armature current is such that
(a) the back emf is equal to 3/4th of the applied emf.
(b) the back emf is equal to one-half of the applied emf.
(c) the back emf is equal to 1/4th of the applied emf.
(d) the back emf is equal to 2/3rd of the applied emf.
[U.P.S.C. I.E.S. E.E.-II 2004]

233. A 400 V dc shunt motor takes 5 A at no load. $R_a = 0.5\ \Omega$, $R_f = 200\ \Omega$. What is the ratio of speed from full load to no-load when the dc shunt motor takes 50 A on full load?
(a) 0.94 (b) 0.8 (c) 0.6 (d) 0.4
[U.P.S.C. I.E.S. E.E.-II, 2005]

234. A dc shunt motor is running at 1,200 rpm, when excited with 220 V dc. Neglecting the losses and saturation, the speed of the motor when connected to a 175 V dc supply is
(a) 750 rpm. (b) 900 rpm.
(c) 1,050 rpm. (d) 1,200 rpm. [GATE E.E. 1999]

235. The dc motor, which can provide zero speed regulation at full load without any controller is
(a) series. (b) shunt.
(c) cumulative compound. (d) differential compound.
[GATE E.E. 2007]

236. A dc shunt motor having unsaturated magnetic circuit runs at 1,000 rpm with rated voltage. If the applied voltage is half of the rated voltage, the motor will run at
(a) 2000 rpm. (b) 1,000 rpm.
(c) 750 rpm. (d) 500 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2000]

237. What happens to the speed when the flux is reduced by 10% in a 200 V dc shunt motor having an armature resistance of 0.2 ohm carrying a current of 50 A and running at 960 rpm prior to weakening of field. The total torque may be assumed constant. Neglect losses.
(a) 1250 rpm. (b) 1066 rpm.
(c) 920 rpm. (d) 576 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2007]

238. Torque developed in a dc motor depends upon
(a) magnetic field.
(b) current flowing through the armature conductors.
(c) active length of the conductors.
(d) number of armature conductors.
(e) radius of armature. (f) all of these factors.

239. Consider the following statements:
The armature torque in a dc motor is a function of
1. Field flux 2. Armature current
3. Speed 4. Damping
Which of the above statements is/are correct?
(a) 1, 2, 3 and 4. (b) 3 and 4 only.
(c) 1 and 2 only. (d) 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

240. In a dc series motor, the torque developed is
(a) inversely proportional to armature current.
(b) directly proportional to armature current.
(c) proportional to the square of armature current.
(d) proportional to the square root of the armature current.

241. Torque developed by the armature of a dc motor is proportional to which one of the following ?
(a) (Back emf) × (Armature current).
(b) (Magnetic flux per pole) × (Armature current).
(c) (Back emf) × (Magnetic flux per pole).
(d) (Back emf) / (Magnetic flux per pole).
[U.P.S.C. I.E.S E.E.-II, 2007]

242. Armature torque of a dc motor is a function of which of the following factors?
1. Speed. 2. Field flux.
3. Armature current. 4. Residual magnetism.
Select the correct answer using the codes given below:
Codes:
(a) 2 and 3. (b) 1 and 4. (c) 3 and 4. (d) 1 and 2.
[U.P.S.C. I.E.S. E.E.-II 2003]

243. A series motor drawing an armature current of I_a is operating under saturated magnetic conditions. The torque developed in the motor is proportional to
(a) $\frac{1}{I_a}$ (b) $\frac{1}{I_a^2}$ (c) I_a^2 (d) I_a
[U.P.S.C. I.E.S. E.E.-II 2000]

244. What is the increase in torque expressed as percentage of initial torque, if the current drawn by a dc series motor is increased from 10 A to 12 A (neglect saturation)?
(a) 21% (b) 25% (c) 41% (d) 44%
[U.P.S.C. I.E.S. E.E.-II 2004]

245. A 200 V, 2,000 rpm, 10 A, separately excited dc motor has an armature resistance of 2 Ω. Rated dc voltage is applied to both the armature and field windings of the motor. If the armature draws 5 A from the source, the torque developed by the motor is
(a) 4.30 Nm (b) 4.77 Nm (c) 0.45 Nm (d) 0.50 Nm
[GATE E.E. 2002]

246. A PMDC commutator motor has a no-load speed of 6,000 rpm when connected to a 120 V dc supply. The armature resistance is 2.5 Ω and other losses may be neglected. The speed of the motor, when supply voltage of 60 V developing a torque of 0.5 Nm, is
(a) 3,000 rpm. (b) 2,673 rpm.
(c) 2,836 rpm. (d) 5,346 rpm. [GATE E.E. 2000]

Answers: **226.** (b), **227.** (c), **228.** (a), **229.** (c), **230.** (a), **231.** (c), **232.** (b), **233.** (a), **234.** (d), **235.** (d), **236.** (b), **237.** (b), **238.** (f), **239.** (c), **240.** (c), **241.** (b), **242.** (a), **243.** (d), **244.** (d), **245.** (a), **246.** (b),

247. A 240 V dc shunt motor with an armature resistance of 0.5 Ω has a full-load current of 40 A. Find the ratio of the stalling torque to the full-load torque when a resistance of 1 Ω is connected in series with the armature
(a) 4 (b) 12
(c) 5 (d) none of the above.
[GATE E.E. 1998]

248. A dc series motor develops a torque of 20 Nm at 3 A of load current. If the current is increased to 6A, the torque developed will be
(a) 10 Nm (b) 20 Nm (c) 80 Nm (d) 40 Nm
[A.M.I.E. Elec. Science Summer 1995]

249. A 220 V shunt motor develops a torque of 54 Nm at an armature current of 10A. The torque developed when the armature current is 20 A, is
(a) 54 Nm (b) 81 Nm (c) 108 Nm
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1997]

250. In an electric motor, the electromagnetic torque developed is
(a) in opposite direction to both load torque and frictional torque.
(b) in the same direction as the load torque but in opposite direction to frictional torque.
(c) in the same direction as the load torque and frictional torque.
(d) in the same direction as the frictional torque but in the opposite direction to the load torque.

251. The toque-speed characteristic of a dc shunt motor is.
(a) a rectangular hyperbola. (b) a drooping straight line.
(c) a parabola. (d) none of the above.
[R.G.T.U. B.E.E. Dec. 2006; Nov./Dec. 2007]

252. Which of the following curves represents the speed-torque characteristic of a dc series motor ?
(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2008]

253. The horse power obtained from the motor shaft is called the
(a) IHP. (b) BHP.
(c) useful output. (d) none of these.

254. In a dc motor, the shaft torque is less than armature torque. This is due to
(a) eddy current loss. (b) hysteresis loss.
(c) stray loss. (d) all of the above.

255. The mechanical output available at the dc motor shaft is equal to
(a) electrical power input to motor.
(b) electrical power input less iron and friction losses.
(c) electrical power input less copper losses.
(d) electrical power input less total losses (copper loss, iron loss, friction and windage losses).

256. If N is the speed of a dc series motor and I_a is the armature current then
(a) $N \propto \frac{1}{I_a}$ (b) $N \propto I_a$ (c) $N \propto I_a^2$ (d) $N \propto \frac{1}{I_a^2}$

257. For small values of armature current I_a, the torque developed by a dc series motor is proportional to
(a) I_a (b) I_a^2 (c) $\sqrt{I_a}$ (d) $1/I_a$

258. For higher values of armature current I_a, the torque developed by a dc series motor is proportional to
(a) I_a (b) I_a^2 (c) $\sqrt{I_a}$ (d) I/I_a

259. For higher values of armature current, the speed of a dc series motor is
(a) proportional to armature current.
(b) proportional to the square of armature current.
(c) inversely proportional to armature current.
(d) constant.

260. In a dc motor if the brushes are given a backward shift, then
(a) commutation is improved.
(b) commutation is worsened.
(c) speed increases. (d) speed decreases.
(e) speed remains unaffected. (f) both (a) and (c).

261. A 220 V dc machine supplies 20 A at 200 V as generator. The armature resistance is 0.2 Ω. If the machine is now operated as a motor at the same terminal voltage and current but with the flux increased by 10% the ratio of motor speed to generator speed is
(a) 0.87. (b) 0.95. (c) 0.96. (d) 1.06.
[GATE E.E. 2006]

262. T and P are the developed electromagnetic torque and the shaft power of a dc series motor. If losses are neglected, then for constant terminal voltage
(a) $T \propto P$. (b) $T \propto \frac{1}{P}$, (c) $T \propto \sqrt{P}$. (d) $T \propto P^2$.
[A.M.I.E. Sec. B. Advanced Elec. Machines Winter 1999]

263. A 240 V dc series motor takes 40 A when giving its rated output at 1,500 rpm. Its resistance is 0.3 Ω. The value of resistance which must be added to obtain rated torque at 1,000 rpm is
(a) 6 Ω. (b) 5.7 Ω. (c) 2.2 Ω. (d) 1.9 Ω.
[GATE E.E. 2000]

264. Which of the following statements associated with a dc series motor is correct ?
(a) It has poor torque. (b) It gives almost constant speed.
(c) Its field winding consists of few turns of thick wire.
(d) It may run away if its field gets opened.
(e) It can be started on no load.

265. In comparison to shunt and compound motors, a dc series motor develops high torque at start. It is due to its comparatively
(a) few series turns. (b) stronger series field.
(c) larger armature current. (d) smaller armature resistance.

266. A flywheel is normally fitted to
(a) dc series motor driving a constant torque load.
(b) separately excited dc motor driving pulsed torque load.
(c) cumulatively compound motor driving torque load.
(d) differentially compound motor driving pulsed torque load.
[A.M.I.E. Sec B. Winter 1994]

267. An unsaturated dc shunt motor drives a constant torque load at a speed at 1000 rpm taking an armature current of 20 A when 230 V is applied to the motor. If the applied voltage is reduced to 115 V, the motor runs at.
(a) 500 rpm taking an armature current of 20 A.
(b) 1000 rpm taking an armature current of 20 A.
(c) 500 rpm taking an armature current of 40 A.
(d) 1000 rpm taking an armature current of 40 A.
[A.M.I.E. Sec B. Winter 1994]

Answers: **247.** (a), **248.** (c), **249.** (c), **250.** (a), **251.** (b), **252.** (d), **253.** (b), **254.** (c), **255.** (d), **256.** (a), **257.** (b), **258.** (a), **259.** (d), **260.** (f), **261.** (a), **262.** (d), **263.** (d), **264.** (c), **265.** (b), **266.** (c), **267.** (d),

Downloaded From : www.EasyEngineering.net

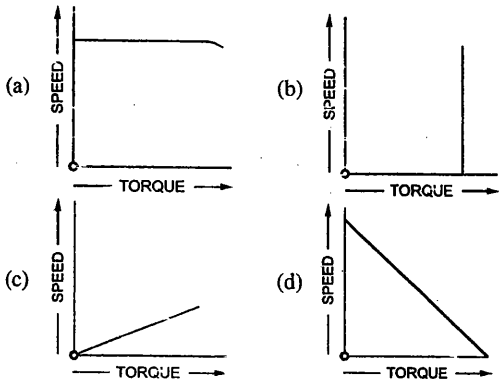
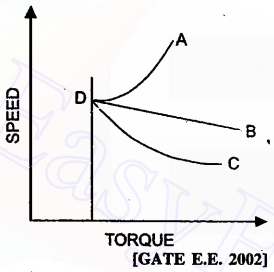
268. If the armature of a dc motor is supplied from a constant current source, and its field from a constant voltage source, then the torque-speed characteristic of the motor will be



[U.P.S.C. I.E.S. E.E. II 1994]

269. An electric motor with "constant output power" will have a torque-speed characteristic in the form of a
(a) straight line through the origin.
(b) straight-line parallel to speed axis.
(c) circle about the origin.
(d) rectangular hyperbola. [GATE E.E. 2001]

270. A dc series motor fed from rated supply voltage is overloaded and its magnetic circuit is saturated. The torque-speed characteristic of this motor will be approximately represented by which curve of figure given:
(a) Curve *A*. (b) Curve *B*.
(c) Curve *C*. (d) Curve *D*.



[GATE E.E. 2002]

271. T is the load torque of a dc series motor having linear magnetization and negligible armature resistance. Speed of the motor is
(a) inversely proportional to $\sqrt{T}$.
(b) directly proportional to $\sqrt{T}$.
(c) inversely proportional to T^2.
(d) directly proportional to T^2.
[A.M.I.E. Sec B. Elec. Machines Winter 1994]

272. An electric train employing a dc series motor is running at a fixed speed, when a sudden slight drop in the mains voltage occurs. This would result in
(a) drop in speed and rise in current.
(b) rise in speed and drop in current.
(c) rise in speed and rise in current.
(d) drop in speed with current unaltered.
[U.P.S.C. I.E.S. E.E. II, 1995]

273. In a dc series motor, if armature current is reduced to 70% of its original value, the torque of the motor will be reduced by
(a) 49% (b) 51% (c) 50% (d) 70%

274. When the torque of a dc series motor is trippled, the power approximately increases by
(a) 33% (b) 50% (c) 75% (d) 150%

275. When an electric train is moving down a hill, the dc motor will operate as a dc
(a) series motor. (b) series generator.
(c) shunt motor. (d) shunt generator.

276. A dc series motor must not be started on no load because it would
(a) not develop starting torque. (b) fail to start without load.
(c) run at dangerously high speed.
(d) draw more current without producing sufficient torque.
[A.M.I.E. Summer 1996]

277. In case of a dc series motor it is possible to have finite no-load speed if a resistance is connected across its
(a) field terminals. (b) armature terminals.
(c) field and armature together.
(d) it is always very high at no-load. [A.M.I.E. Sec B. Winter 1995]

278. It is advisable to start a dc series motor with some load to
(a) limit the flux. (b) limit the current.
(c) limit the speed. (d) avoid sparking.
(e) avoid demagnetization of field system.

279. The speed of a 4-pole dc series motor at no load will be
(a) zero. (b) 3000 rpm.
(c) infinite. (d) 1500 rpm.
(e) depending upon the applied voltage.

280. A dc series motor is best suited for driving
(a) line shafting, blowers and fans.
(b) machine tools. (c) shear and punches.
(d) cranes and hoists. (e) none of these.

281. DC series motor is best suited for electric traction as
(a) it develops high starting torque.
(b) it runs at very high speed at light load.
(c) it is cheaper in cost. (d) it consumes less power.

282. A dc series motor is running at rated speed without any additional resistance in series. If an additional resistance is placed in series, the speed of motor
(a) increases. (b) decreases.
(c) remains unchanged.
(d) oscillates around the rated speed. [A.M.I.E. Sec B. Summer 1994]

283. A dc series motor is used for an overhauling load. It can work stably if
(a) the armature is shunted by a resistor.
(b) the field winding is reversed.
(c) a resistor is put in series with the machine.
(d) a divertor is put across the field. [A.M.I.E. Sec B. Summer 1993]

284. A dc shunt motor is driving a constant torque load. On inserting an additional resistance in the armature circuit, the speed of the motor will
(a) remain unchanged. (b) increase.
(c) decrease. (d) be zero.

285. A dc shunt motor may have rising speed-torque characteristic due to
(a) very high armature circuit resistance.
(b) very high field circuit resistance.
(c) very high demagnetizing armature reaction.
(d) very low demagnetizing armature reaction.

286. Consider the following statements :
If the terminal voltage of a dc shunt motor is halved with the load torque varying as the square of speed, then
1. speed is halved.
2. speed remains unaltered.
3. armature current is doubled.
4. armature current remains unaltered.
Of these statements
(a) 1 and 3 are correct. (b) 1 and 4 are correct.
(c) 2 and 3 are correct. (d) 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II 1993]

Answers: **268.** (b), **269.** (d), **270.** (b), **271.** (a), **272.** (a), **273.** (b), **274.** (c), **275.** (b), **276.** (c), **277.** (b), **278.** (c), **279.** (c), **280.** (d), **281.** (a), **282.** (b), **283.** (a), **284.** (c), **285.** (c), **286.** (c),

287. If the speed of a dc motor increases with load torque, then it is a
(a) series motor. (b) permanent magnet.
(c) differentially compounded motor.
(d) cumulatively compounded motor. [U.P.S.C. I.E.S. E.E.-II 1999]

288. A separately excited dc generator is feeding a dc shunt motor. If the load torque on the motor is halved approximately
(a) armature current of both motor and generator are halved.
(b) armature current of motor is halved and that of the generator is unaltered.
(c) armature current of generator is halved and that of motor is unaltered.
(d) armature current of both motor and generator are unaltered.
[U.P.S.C. I.E.S. E.E. II, 1995]

289. In a dc motor, if armature current is increased, keeping field current constant, the torque developed will
(a) remain unchanged. (b) decrease in inverse proportion.
(c) increase proportionately.
(d) increase in proportion to the square of the armature current.

290. If the supply voltage to a dc shunt motor is increased by 15%, which of the following will reduce ?
(a) Full-load current. (b) Full-load speed.
(c) Starting torque. (d) None of the above.

291. A dc shunt motor is running on no load at 600 rpm. If the motor is run, on no load, continuously for 12 hours, the speed of the motor after 12 hour run will
(a) be 600 rpm. (b) exceed 600 rpm.
(c) fall below 600 rpm. (d) be 450 rpm.

292. A dc shunt motor is driving a constant torque load with normal excitation. If the field current is halved then the motor will run at
(a) rated speed. (b) half of rated speed.
(c) double of rated speed.
(d) slightly less than double the rated speed.

293. A dc shunt motor is driving a mechanical load at rated voltage with normal excitation. If the load torque is increased to double of the normal one, the speed of the motor will
(a) become half. (b) become double.
(c) increase slightly. (d) fall slightly.

294. DC shunt motors are used for driving
(a) machine tools. (b) lathes.
(c) centrifugal pumps. (d) line shafts.
(e) blowers and fans. (f) all of these.

295. When a dc cumulative compound wound motor is loaded,
(a) torque increases and speed decreases.
(b) torque decreases and speed increases.
(c) both speed and torque increase.
(d) both speed and torque decrease.

296. A cumulative compound long shunt motor is driving a load at rated torque and rated speed. If the series field is shunted by a resistance equal to the resistance of the series field, keeping the torque constant.
(a) the armature current increases.
(b) the motor speed increases.
(c) the armature current decreases.
(d) the motor speed decreases.
(e) both (a) and (b).

297. A belt-driven cumulative compounded dc generator is delivering power to the dc mains. If the belt snaps then the machine will run as a
(a) cumulative compounded motor in the same direction.
(b) differentially compounded motor in the same direction.
(c) cumulative compounded motor in the opposite direction.
(d) differentially compounded motor in the opposite direction.
[U.P.S.C. I.E.S. E.E. II, 1994]

298. Consider the following statements.
A cumulatively compounded dc motor runs at a speed N_1 rpm drawing an armature current of I amperes. If, keeping the load torque constant, the series field winding is short circuited, then the
1. speed of the motor will increase.
2. armature current will increase.
3. armature current will decrease.
4. speed of the motor will decrease.
Of these statements
(a) 3 and 4 are correct. (b) 1 and 4 are correct.
(c) 2 and 4 are correct. (d) 1 and 2 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1996]

299. Flywheel is employed with a dc compound motor to reduce peak demand, The compound motor should be
(a) level compound. (b) differential compound
(c) cumulative compound. (d) none of these.

300. In a differentially compounded dc motor, if the shunt field gets suddenly opened, the motor will
(a) first stop and then run in opposite direction as a series motor.
(b) run as a series motor, but at slower speed in the same direction.
(c) run as a series motor in the same direction at high speed.
(d) not work and come to stand still.

301. A differentially compounded dc motor is running at rated speed. If the series field winding of the motor gets short circuited, the speed of the motor will
(a) remain unaltered. (b) increase.
(c) decrease. (d) be zero.

302. When the direction of power flow in a differentially compounded motor reverses, it will operate as a
(a) cumulatively compounded generator.
(b) differentially compounded generator.
(c) series motor. (d) shunt motor.

303. A differentially compounded dc motor with interpoles and with brushes on the neutral axis is to be driven as a generator in the same direction with the same polarity of the terminal voltage. It will then
(a) be a cumulatively compounded generator but the interpole coil connections are to be reversed.
(b) be a cumulatively compounded generator without reversing the interpole coil connections.
(c) be a differentially compounded generator without reversing the interpole coil connections.
(d) be a differentially compounded generator but the interpole coil connections are to be reversed. [GATE E.E. 1995]

304. Running the machine at no load is inadvisable for
(a) dc shunt motor. (b) dc series motor.
(c) induction motor. (d) synchronous motor.
[A.M.I.E. Elec. Science Summer 1994]

305. The dc motor most suitable for applications requiring high starting torque is
(a) shunt. (b) series.
(c) cumulative compound. (d) differential compound.

306. The dc motor that draws almost same power at different loads is
(a) cumulative compound. (b) differential compound.
(c) series. (d) shunt.

Answers: **287.** (c), **288.** (a), **289.** (c), **290.** (a), **291.** (b), **292.** (d), **293.** (d), **294.** (f), **295.** (a), **296.** (e), **297.** (b), **298.** (d), **299.** (c), **300.** (a), **301.** (c), **302.** (a), **303.** (b), **304.** (b), **305.** (b), **306.** (c),

307. Which of the following dc motors will have least percentage increase of input current, for the same percentage increase in torque ?
(a) Cumulative compound. (b) Differential compound.
(c) Shunt. (d) Series.

308. Which of the following dc motors, on removal of load, will run at the maximum speed ?
(a) Series. (b) Shunt.
(c) Cumulative compound. (d) Differential compound.

309. Which of the following dc motors has got maximum self relieving property ?
(a) Shunt. (b) Series.
(c) Cumulative compound. (d) Differential compound.

310. The dc motor, that has poorest speed regulation, is
(a) cumulative compound. (b) differential compound.
(c) series. (d) shunt.

311. Which motor should not be used for centrifugal pumps ?
(a) Shunt. (b) Series.
(c) Cumulatively compound.
(d) Differentially compound. [U.P.S.C. I.E.S. E.E. II, 1992]

312. The ratio of the starting torque to full-load torque is minimum in case of
(a) cumulative compound motors.
(b) differential compound motors.
(c) series motors. (d) shunt motors.

313. Which of the following dc motors has almost constant speed over their full-load range ?
(a) Shunt. (b) Series.
(c) Cumulative compound. (d) None of these.

314. Which of the following dc motors will have highest percentage increase of input current, for the same percentage increase in torque?
(a) Series. (b) Shunt.
(c) Cumulative compound. (d) All equal.

315. Which of the following dc motors has least drop in speed from no-load to rated full load ?
(a) Series motors with interpoles.
(b) Series motors without interpoles.
(c) Shunt motors with interpoles.
(d) Cumulative compound motors with interpoles.

316. A dc motor is to drive a load which is almost nil for certain part of the load cycle and peak value for short duration. The most suitable dc motor is
(a) Series. (b) Shunt.
(c) Differential compound. (d) Cumulative compound.

317. On switching a dc motor to dc supply mains, it is found to rotate in the direction opposite to that for which it is designed. The dc motor is
(a) differential compound. (b) cumulative compound.
(c) series. (d) shunt.

318. For the same power output rating and full-load speed, the motor that will have poorest starting torque, is
(a) cumulative compound. (b) differential compound.
(c) series. (d) shunt.

319. A motor used for punching machine is usually subjected to
(a) full load continuously. (b) part of full load continuously.
(c) no load. (d) intermittent load.

320. For continuously running rolling mills with intermittent loading, the most suitable dc drive is
(a) dc series motor. (b) dc shunt motor.
(c) dc differentially compounded motor.
(d) dc cumulatively compounded motor. [U.P.S.C. I.E.S. E.E. II, 1992]

321. Consider the following statements:
PMDC motors used in cassette tape recorders have
1. magnets on stator and armature on the rotor.
2. magnets on rotor and armature on the stator.
3. electronic commutation and no brushes.
4. mechanical commutation.
5. automatic speed governors.
Of these statements
(a) 1, 3 and 5 are correct. (b) 1, 4 and 5 are correct.
(c) 2, 3 and 5 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II 1998]

322. The speed of a dc motor depends upon
(a) flux per pole. (b) applied voltage to armature.
(c) voltage drop in armature circuit resistance.
(d) all of the above.

323. The speed of a dc shunt motor may be varied by varying
1. Field current. 2. Supply voltage.
3. Armature circuit.
Select the correct answer using the codes given below :
Codes :
(a) 1, 2, and 3. (b) 1 and 2. (c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2005]

324. Consider the following statements:
The speed of a dc motor can be controlled by the variation of
1. armature voltage. 2. field current.
3. armature circuit resistance.
4. angle of brush shift.
Which of the statements given above are correct?
(a) 1, 2, 3. (b) 2, 3, 4.
(c) 1, 3, 4. (d) 1, 2, 4.
[U.P.S.C. I.E.S. Elec. Engineering-II, 2004]

325. The field flux method of speed control of dc shunt motor is generally used for which one of the following ?
(a) Constant hp drive below the base speed.
(b) Constant torque drive above the base speed.
(c) Constant torque drive below the base speed.
(d) Constant hp drive above the base speed.
[U.P.S.C. I.E.S. E.E.-II, 2007]

326. Following controls are considered for dc motors
I. Control flux.
II. Armature resistance control.
III. Supply voltage control.
Which of the above controls play significant role in the speed control of dc motors.
(a) I only. (b) II and III only.
(c) I and III only. (d) I and II.
[U.P.S.C. I.E.S. E.E. II, 1992]

327. The resistance of the field regulator of a dc shunt motor is of the order of
(a) 100 (b) 10 (c) 2 (d) 0.5

328. A dc shunt motor is fitted with a field regulator for speed control. For a constant load torque the speed will be minimum for a regulator resistance of
(a) infinite. (b) zero. (c) none of these.

329. The speed of a dc shunt motor can be raised above its rated value by

Answers: **307.** (d), **308.** (a), **309.** (b), **310.** (c), **311.** (b), **312.** (b), **313.** (a), **314.** (b), **315.** (c), **316.** (d), **317.** (a), **318.** (b), **319.** (d), **320.** (d), **321.** (c), **322.** (d), **323.** (c), **324.** (a), **325.** (d), **326.** (d), **327.** (a), **328.** (b), **329.** (b),

(a) inserting an additional resistance in the armature circuit.
(b) inserting an additional resistance in the field circuit.
(c) reducing the applied voltage.
(d) using either of the above methods.

330. Which of the following statements associated with field control of dc shunt motors is correct ?
(a) Speed can be varied below and above the rated speed to any extent.
(b) Speed can be varied above to any extent and below to a certain extent.
(c) Speed can be varied above to the extent of satisfactory commutation and below no variation.
(d) Speed can be varied above to the extent of satisfactory commutation and below to any extent.

331. A dc shunt motor is supplying a load at its rated speed. The speed can be reduced by
(a) armature circuit resistance control.
(b) field resistance control.
(c) Ward Leonard control. (d) any of the above.

332. The speed of a dc shunt motor supplying a load at its rated speed can be reduced by
(a) connecting an additional resistance in the armature circuit.
(b) connecting an additional resistance in the field circuit.
(c) increasing the applied voltage.
(d) any of the above methods.

333. The most inefficient method for speed control of dc motors is
(a) voltage control. (b) field control.
(c) armature control.

334. A dc shunt motor is operating at no load. If the armature is shunted by a resistance, its speed will
(a) increase. (b) decrease.
(c) remain the same. (d) be unpredictable.
[A.M.I.E. Sec B. Elec. Machines Summer 1994]

335. The shunted armature control method of speed control for dc shunt motors is
(a) less expensive. (b) less wasteful.
(c) suitable for rapidly changing loads.
(d) none of the above.

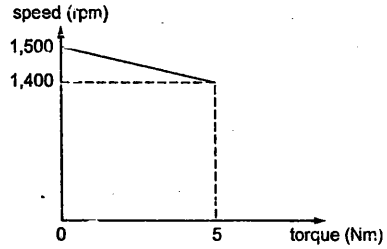
336. The armature voltage control is considered suitable for a dc motor driven at constant
(a) torque. (b) speed. (c) power. (d) current.

337. If the voltage applied across the armature of a dc motor is reduced by 5%, keeping the load current and field current unchanged, the speed of the motor will
(a) increase by about 5%. (b) reduce by about 5%.
(c) remain unaltered. (d) unpredictable.

338. A 220 V, DC shunt motor is operating at a speed of 1,440 rpm. The armature resistance is 1.0 Ω and armature current is 10 A. If the excitation of the machine is reduced by 10%, the extra resistance to be put in the armature circuit to maintain the same speed and torque will be
(a) 1.79 Ω (b) 2.1 Ω
(c) 3.1 Ω (d) 18.9 Ω **[GATE E.E., 2011]**

Common Data for Q. (339-340)

A separately excited DC motor runs at 1,500 rpm under no load with 200 V applied to the armature. The field voltage is maintained at its rated value. The speed of the motor, when it delivers a torque of 5 Nm, is 1,400 rpm as shown in the figure. The rotational losses and armature reaction are neglected.



339. The armature resistance of the motor is
(a) 2 Ω (b) 3.4 Ω
(c) 4.4 Ω (d) 7.7 Ω **[GATE E.E., 2010]**

340. For the motor to deliver a torque of 2.5 Nm at 1,400 rpm, the armature voltage to be applied is
(a) 125.5 V (b) 193.3 V
(c) 200 V (d) 241.7 V **[GATE E.E., 2011]**

341. For a constant supply voltage, what are the effects of inserting a series resistance in the field circuit of a dc shunt motor, on its speed and torque?
(a) Speed will decrease and the torque will decrease.
(b) Speed will increase and the torque will increase.
(c) Speed will increase and the torque will decrease.
(d) Speed will decrease and the torque will increase.
[U.P.S.C. I.E.S. E.E.-II, 2006]

342. A 50 kW dc shunt motor is loaded to draw rated armature current at any given speed. When driven
(*i*) at half the rated speed by armature voltage control and
(*ii*) at 1.5 times the rated speed by field control, the respective output powers delivered by the motor are opproximately.
(a) 25 kW in (*i*) and 75 kW in (*ii*).
(b) 25 kW in (*i*) and 50 kW in (*ii*).
(c) 50 kW in (*i*) and 75 kW in (*ii*).
(d) 50 kW in (*i*) and 50 kW in (*ii*).
[U.P.S.C. I.E.S., 2006; GATE E.E. 2005]

343. In a Ward-Leonard drive, if the field current of the dc generator is suddenly reduced, the controlled dc motor operates
(a) still in the motoring mode.
(b) in dynamic braking mode.
(c) in counter-current braking mode.
(d) in regenerative braking mode. **[A.M.I.E. Sec. B. Summer 1993]**

344. Ward-Leonard system for controlling the speed of a dc motor is used where
(a) the speed in both the directions is required.
(b) very fine speed control over the whole range from zero to normal speed is required.
(c) the accuracy in speed control is required.
(d) all of the above.

345. Variation in speed by Ward Leonard control of dc motors occurs due to variation in
(a) field excitation. (b) armature current.
(c) armature voltage. (d) supply voltage.

346. Ward Leonard control is basically a ——— control method.
(a) armature voltage (b) field
(c) field divertor (d) armature resistance

347. Ward-Leonard control provides speed control
(a) in one direction only. (b) in both directions.
(c) above rated speed. (d) below rated speed.

Answers: **330.** (c), **331.** (a), **332.** (a), **333.** (c), **334.** (c), **335.** (c), **336.** (a), **337.** (b), **338.** (a), **339.** (b), **340.** (b), **341.** (c), **342.** (b), **343.** (d), **344.** (d), **345.** (c), **346.** (a), **347.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

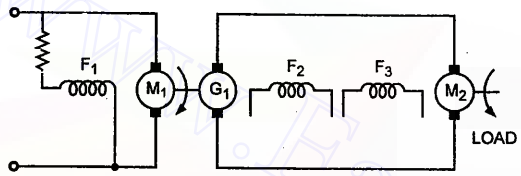
348. For very sensitive and wide speed control, the preferable control method is
(a) field control. (b) armature control.
(c) multiple voltage control. (d) Ward Leonard system.

349. In Ward-Leonard system, the lower limit of speed is imposed by
(a) armature resistance. (b) field resistance.
(c) residual magnetism of the generator.
(d) none of the above.

350. In Ward Leonard method of speed control, the direction of rotation of the motor is reversed usually by reversing the connections of the
(a) generator field terminals. (b) generator armature terminals.
(c) motor armature terminals.
(d) motor field terminals.

351. The main disadvantage(s) of the Ward-Leonard system is/are
(a) high initial cost. (b) poor overall efficiency.
(c) high maintenance cost. (d) all of the above.

352. In a coal mine, Ward Leonard method of speed control, as shown in the given figure, is used to lift coal from the pit through a crane and bucket arrangement. After lifting the coal to desired level and emptying at the dumping ground, the bucket has to be lowered into the pit. The action to be taken at this stage is to reverse the



(a) direction of current in F_2 and slowly increase it.
(b) current in F_3 and slowly increase it.
(c) supply terminal of M_1.
(d) direction of current in F_1 and slowly increase it.
[U.P.S.C. I.E.S. E.E. II 1995]

353. For a given amount of kinetic energy to be released by the flywheel of Ward-Leonard-Ilgner control system at a given percentage reduction in speed, the mass of the flywheel would depend upon its radius of gyration r_g and its initial peripheral speed U_{p1}. The mass of the flywheel is
(a) directly proportional to both r_g^2, and U_{p1}^2
(b) directly proportional to r_g^2, but inversely to U_{p1}^2
(c) inversely proportional to r_g^2, but directly to U_{p1}^2
(d) inversely proportional to both r_g^2 and U_{p1}^2
[U.P.S.C. I.E.S. E.E.-II, 2001]

354. A dc series motor driving an electric train faces a constant power load. It is running at rated speed and rated voltage. If the speed has to be brought down to 0.25, the supply voltage has to be approximately brought down to
(a) 0.75 pu (b) 0.5 pu (c) 0.25 pu (d) 0.125 pu
[GATE E.E. 2003]

355. Consider the following statements regarding speed control of dc motors:
1. Ward Leonard method is suitable for constant torque drive.
2. Field control method facilitates speed control below the base speed.
3. Armature resistance control method is more efficient when compared to Ward Leonard method.
4. Field control method is suitable for constant power drives.

Of these statements
(a) 1, 2 and 3 are correct. (b) 1, 3 and 4 are correct.
(c) 2, 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E. II 1993]

356. Consider the following statements regarding the speed control of dc motors:
1. Ward-Leonard method is suitable for constant torque drives.
2. Ward-Leonard method is suitable for constant power drives.
3. Field-control method facilitates speed control below base speed.
4. Armature resistance control method is more efficient than Ward-Leonard method.
5. Field control method is suitable for constant torque drives.
6. Armature resistance control method is suitable for constant torque drives.

From these the correct answer is
(a) 1, 2, 6 (b) 1, 2, 4 (c) 1, 6 (d) 1, 3, 4
[U.P.S.C. I.E.S. E.E. II 2001]

357. For a given torque, reducing diverter resistance of a dc series motor
(a) increases its speed but armature current remains the same.
(b) increases its speed demanding more armature current.
(c) decreases its speed demanding less armature current.
(d) decreases its speed but armature current remains the same.
[U.P.S.C. I.E.S. E.E.-II 2002]

358. A dc series motor is operating at rated speed with rated excitation. It has two resistances R_1 and R_2 connected across the field and the armature respectively. Speeds above the rated speed can be obtained by
(a) increasing R_1 only. (b) reducing R_2 only.
(c) reducing R_1 and increasing R_2.
(d) increasing R_1 and reducing R_2.

359. If an additional resistance is connected in series with a dc series motor operating at rated speed, the speed of the motor will
(a) reduce. (b) increase.
(c) remain unaltered.
(d) oscillate around the normal speed.

360. If a resistance is connected across the armature of a dc series motor, its speed for a constant load torque will
(a) increase. (b) decrease.
(c) remain unaltered. (d) become zero.

361. Field divertor method of speed control of a dc series motor gives speeds above rated one due to reduction of
(a) field current. (b) armature current.
(c) line current. (d) none of these.

362. The field divertor resistance for a dc series motor is of the order of
(a) 0.1 Ω (b) 10 Ω (c) 50 Ω (d) 100 Ω

363. A dc series motor is running with a divertor connected across its field winding. If the divertor resistance is reduced then the speed of the motor will
(a) decrease. (b) increase.
(c) become excessively high. (d) remain unaltered.

364. Two dc series motors are connected in series and are driving the same mechanical load. If the motors are now connected in parallel, the speed will become
(a) one fourth. (b) half.
(c) double. (d) 4-times.

Answers: **348.** (d), **349.** (c), **350.** (a), **351.** (d), **352.** (a), **353.** (d), **354.** (b), **355.** (d), **356.** (a), **357.** (b), **358.** (c), **359.** (a), **360.** (b), **361.** (a), **362.** (a), **363.** (b), **364.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

365. In series-parallel control of dc series motor, the torque produced in series arrangement will be ——— of that in parallel arrangement.
(a) double (b) four times
(c) half (d) one-fourth

366. The speed of a cumulatively compounded dc motor can be controlled by varying
(a) armature voltage. (b) armature resistance.
(c) shunt field resistance. (d) any of the above.

367. The function of the field regulator in a dc compound motor is to
(a) limit the armature current. (b) vary the armature resistance.
(c) control the field current. (d) none of the above.

368. A cumulatively compounded long shunt motor is driving a load at rated torque and rated speed. If the series field is shunted by a resistance equal to the resistance of the series field, keeping the torque constant,
(a) the armature current increases.
(b) the motor speed increases.
(c) the armature current decreases.
(d) the motor speed decreases. [GATE E.E. 1993]

369. As compared to the use of a single series dc motor for electric traction for a given starting time t, the series parallel control using two similar motors with time $t/2$ for each series and parallel operation would give a saving in starting energy of
(a) 100% (b) 50% (c) 25% (d) zero.
[U.P.S.C. I.E.S. E.E.-II 1998]

370. A dc shunt motor runs at 500 rpm at 220 V. A resistance of 4.5 Ω is added in series with armature for speed control. The armature resistance is 0.5 Ω. The current to stall the motor will be
(a) 44 A (b) 50 A (c) 44.4 A (d) 60 A

371. The current drawn by a dc motor at starting is
(a) zero. (b) very low. (c) normal. (d) very high.

372. High inrush of current during a starting of a dc motor can efficiently be restricted to a safer value by increasing the ..... resistance.
(a) shunt field (b) armature circuit
(c) both (a) and (b) (d) none of these

373. The dc motor draws high current at the starting instant due to absence of back emf. In order to prevent this high inrush of current at start, a resistance is connected
(a) across the field. (b) across the armature.
(c) in series with the armature. (d) in series with the field.

374. For efficient operation of a dc motor, the additional resistance inserted in the armature circuit should be
(a) increased in steps. (b) cut-out in steps.
(c) left in the armature circuit.
(d) removed immediately after start.

375. Consider the following statements regarding the starting of a dc shunt motor:
1. External field resistance should be minimum.
2. External field resistance should be maximum.
3. Reduced voltage should be applied to the armature.
4. Increased voltage should be applied to the armature.
Of these statements
(a) 1 and 3 are correct. (b) 1 and 4 are correct.
(c) 2 and 3 are correct. (d) 2 and 4 are correct.
[U.P.S.C.I.E.S. E.E. II, 1994]

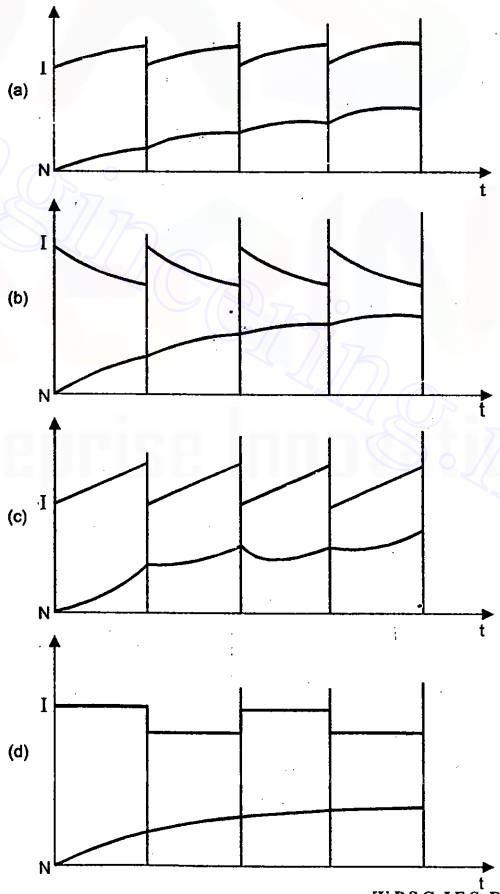
376. Which one of the following statements is correct for the ideal field excitation during starting in case of shunt and compound motors?
(a) Maximum, because motor torque required to overcome friction and load torque.
(b) Maximum, because voltage should be built slowly.
(c) Maximum, because small excitation will lead to low operating speed during starting.
(d) It can be anything because it does not matter in case of these motors. [U.P.S.C. I.E.S. E.E.-II, 2011]

377. Consider the following statements:
At starting, the field excitation of a dc shunt motor is kept at its maximum value to reduce
1. sparking at brushes. 2. acceleration time.
3. starting current. 4. voltage dip in supply.
Of these statements
(a) 1 and 2 are correct. (b) 2, 3 and 4 are correct.
(c) 1, 3, and 4 are correct. (d) 1, 2, 3, and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1998]

378. In dc shunt motors, at start, the field excitation is kept at maximum value in order to
(a) reduce starting torque.
(b) increase acceleration duration.
(c) reduce armature heating.
(d) avoid voltage dip in the supply mains.

379. A dc shunt motor has external resistances of R_a and R_f in the armature and field circuits respectively. Armature current at starting can be reduced by keeping
(a) R_f maximum and R_a minimum.
(b) R_a maximum and R_f maximum.
(c) R_a minimum and R_f maximum.
(d) R_a maximum and R_f minimum. [U.P.S.C. I.E.S. E.E. II, 1996]

380. Which one of the following figures best represents the variation in armature current and speed with time during the starting of a dc shunt motor ?



[U.P.S.C. I.E.S. E.E.-II, 1997]

Answers: **365.** (b), **366.** (d), **367.** (c), **368.** (a), **369.** (c), **370.** (a), **371.** (d), **372.** (b), **373.** (c), **374.** (b), **375.** (a), **376.** (a), **377.** (b), **378.** (c), **379.** (d), **380.** (b),

381. If starter is not used with large dc motor for starting, it will draw a starting current which
(a) is many times its rated full-load current.
(b) will produce excessive voltage drop in line.
(c) may damage the armature and commutator.
(d) will produce very low starting torque.
(e) all of the above except (d).

382. The function of a starter in a dc motor is to
(a) control its speed.
(b) increase its starting torque.
(c) limit the starting current to a safer value.
(d) reduce armature reaction effect.
(e) both (b) and (c). (f) avoid sparking.

383. Direct-on-line (DOL) starters are not suitable for starting large dc motors, because
(a) the starting current will be enormously high, which will cause large voltage drop in the supply mains.
(b) the motor may not start.
(c) the motor may run away.
(d) the starting torque becomes low.

384. A DOL starter is employed for starting motors of ratings up to
(a) 3.75 kW (b) 7.5 kW (c) 15 kW (d) 25 kW

385. In a dc shunt motor, the three point starter
(a) limits the starting current to a safer value.
(b) provides overload protection.
(c) provides no-volt protection.
(d) all of the above.

386. Three point starters are not suitable for applications where speed variation by flux control is required because the motor may
(a) not start. (b) run away.
(c) stop at very high speed. (d) stop at very slow speed.

387. If the handle of a three point starter goes back to OFF position, it may be due to
(a) zero or very low supply voltage.
(b) overload. (c) high field circuit resistance.
(d) all of the above.

388. A 3 point starter is considered suitable for dc _____ motors.
(a) series (b) shunt
(c) compound (d) shunt as well as compound
(e) series as well as compound

389. If the no-voltage release in a dc motor starter fails to operate on failure of supply, on resumption of supply the motor will
(a) not start automatically.
(b) start automatically without trouble.
(c) develop very low starting torque.
(d) get damaged due to flow of excessive current in the armature.

390. The dc motor starter handle should be moved
(a) very slowly in steps. (b) smoothly in steps.
(c) quickly. (d) with a jerk to final position.

391. DC motors are stopped by opening the line switches and not by forcing the handle of the motor starter back to the OFF position. This is due to occurrence of
(a) heavy sparking at the first stud of the starting resistance steps.
(b) heavy sparking at the brushes.
(c) both (a) and (b). (d) none of these.

392. A 4-point starter is used to start and control the speed of a
(a) dc shunt motor with armature resistance control.
(b) dc shunt motor with field weakening control.
(c) dc series motor.
(d) dc compound motor. [GATE E.E., 2011]

393. In a dc compound motor, 4-point starter is employed
(a) to reduce the field current.
(b) to increase the field current.
(c) not to affect the current flowing through 'Hold On' coil even when the field current changes.
(d) none of the above.

394. In a dc compound motor, 4-point starter provides
(a) overload protection. (b) undervoltage protection.
(c) the facility for wide range of speed control by field regulator.
(d) all of the above.

395. A large dc shunt motor can be started preferably using a
(a) compensator. (b) strong field.
(c) weak field. (d) none of these.

396. The simplest form of a motor controller is
(a) relay. (b) toggle switch.
(c) drum switch. (d) magnetic switch.

397. The most economical method of electric braking is
(a) plugging.
(b) dynamic braking with separate excitation.
(c) dynamic braking with self excitation.
(d) regenerative braking.

398. The electric braking system employed with dc shunt motors, in which the armature connections are reversed so that the motor tends to run in opposite direction is called the _____ braking.
(a) plugging (b) rheostatic
(d) dynamic (d) regenerative

399. Plugging of dc machine is normally executed by
(a) reversing the field polarity.
(b) reversing the armature polarity.
(c) reversing both field and armature polarity.
(d) connecting the resistance across armature terminals.
[A.M.I.E. Sec B. Advanced Elec. Machines Winter 2001]

400. A dc shunt motor, running lightly at 1,000 rpm, is operated under plugging. With plugging connections left as it is the final speed of the motor will be
(a) zero. (b) 1,000 rpm.
(c) –1,000 rpm (c) – 2,000 rpm.
[A.M.I.E. Sec B. Summer 1993]

401. In plugging of a dc shunt motor, the resistance is inserted in the armature circuit to
(a) increase the braking torque.
(b) stop the motor quickly.
(c) limit the armature current.
(d) have a shorting effect on the shunt field.

402. The plugging provides _____ braking torque in comparison to rheostatic and regenerative braking systems.
(a) negligible (b) small (c) highest

403. The electric braking system commonly employed in rolling mills, elevators and printing presses is
(a) plugging. (b) rheostatic.
(c) dynamic. (d) regenerative.

404. A 240 V, dc shunt motor draws 15 A while supplying the rated load at a speed of 80 rad/s. The armature resistance is 0.5 Ω and the field winding resistance is 80 Ω.
The net voltage across the armature resistance at the time of plugging will be
(a) 6 V (b) 234 V (c) 240 V (d) 474 V
[GATE E.E. 2008]

Answers: **381.** (e), **382.** (c), **383.** (a), **384.** (a), **385.** (d), **386.** (c), **387.** (d), **388.** (b), **389.** (d), **390.** (b), **391.** (a), **392.** (b), **393.** (c), **394.** (d), **395.** (a), **396.** (b), **397.** (d), **398.** (a), **399.** (b), **400.** (c), **401.** (c), **402.** (c), **403.** (a), **404.** (d),

Statement for Linked Answer Questions (405-406).

A 240 V, dc shunt motor draws 15 A while supplying the rated load at a speed of 80 rad/s. The armature resistance is 0.5 Ω and the field winding resistance is 80 Ω.

405. The net voltage across the armature resistance at the time of plugging will be
(a) 6 V (b) 234 V
(c) 240 V (d) 474 V [GATE E.E., 2008]

406. The external resistance to be added in the armature circuit to limit the armature current to 125% of its rated value is
(a) 31.1 Ω (b) 31.9 Ω
(c) 15.1 Ω (d) 15.9 Ω [GATE E.E., 2008]

407. The dynamic braking is generally used with _____ dc motors.
(a) series (b) shunt
(c) compound (d) all

408. Dynamic braking is very effective if the dc motor
(a) is series excited. (b) is shunt excited.
(c) is separately excited.
(d) has cumulative compound excitation. [A.M.I.E. Sec B. Winter 1994]

409. For non-reversing dc drives it is preferable to use
(a) plugging. (b) regenerative braking.
(c) dynamic braking with separate excitation.
(d) dynamic braking with self excitation.
[A.M.I.E. Sec B. Summer 1994]

410. During rheostatic braking of dc series motors,
(a) the speed is reduced.
(b) the direction of rotation is reversed.
(c) the machine operates as a generator.
(d) none of the above.

411. During rheostatic braking the braking torque is proportional to
(a) speed. (b) 1/speed. (c) $(\text{speed})^2$ (d).

412. Regenerative braking is based on that the back emf is
(a) zero (b) equal to applied voltage.
(c) less than applied voltage. (d) more than applied voltage.

413. In regenerative braking, the motor energy is
(a) dissipated in armature heating.
(b) dissipated in windage losses.
(c) returned to the supply mains.
(d) none of the above.

414. In case of dc shunt motors, the regenerative braking is employed when the load
(a) has an overhauling characteristic.
(b) is variable.
(c) is constant. (d) also acts as a braking force.
(e) is constantly reducing.

415. Regenerative braking
(a) can be easily applied to dc shunt motors.
(b) can be easily applied to dc series motors.
(c) can be used for stopping the motor.
(d) cannot be used when the load on motor has overhauling characteristics.

416. Field copper losses are constant in dc ——— motors.
(a) series (b) shunt
(c) compound (d) none

417. The variable loss in a dc shunt machine is
(a) iron loss. (b) shunt field loss.
(c) armature copper loss. (d) friction and windage loss.

418. Two dc series motors are mechanically coupled. One is operating as a generator and the other as a motor. Which of the following statements are correct ?
(a) The friction losses of the two machines will be the same when both are running at the same speed.
(b) The iron losses of the two machines will be identical when their excitations are identical.
(c) The mechanical losses of the two machines will be identical for identical speeds and excitation of the two machines.
(d) All of the above.

419. Consider the following statements:
In a dc machine, iron loss occurs in
1. armature core. 2. yoke.
3. pole cores. 4. pole shoes.
Which of the statements given above are correct?
(a) 1 and 4. (b) 1 and 2. (c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-II 2004]

420. Two series motors are mechanically coupled. One machine is running as a motor and the other as a generator. The iron and friction losses of the machines will be identical when
(a) their speeds are identical.
(b) their speeds and excitations are identical.
(c) their speeds are equal but back emfs are half the supply voltages.
(d) their ratings and armature sizes are identical.
[U.P.S.C. I.E.S. E.E.-II 1992]

421. In a dc machine mechanical losses occur due to
(a) air resistance of rotation to armature and fan.
(b) brush friction. (c) bearing friction.
(d) all of the above.

422. In a dc machine, mechanical losses are primarily function of
(a) voltage. (b) current.
(c) speed. (d) none of these.

423. The loss in a dc machine, which has the least proportion is
(a) mechanical loss. (b) iron loss.
(c) armature copper loss. (d) field copper loss.

424. The hysteresis loss in a dc machine varies with the frequency of magnetic reversals as
(a) f^2 (b) f (c) $1/f$ (d) $1/f^2$

425. Hysteresis loss in a dc machine is independent of
(a) volume and grade of iron.
(b) frequency of magnetic reversals.
(c) rate of flow of air.
(d) maximum value of flux density.

426. In a dc shunt machine, hysteresis loss
(a) is independent of lamination thickness.
(b) varies as the supply frequency.
(c) varies as 1.6 power flux density.
(d) varies as the volume of the iron core.
(e) all of the above.

427. The eddy current loss in a dc machine varies with the maximum flux density as
(a) $(B_{max})^2$ (b) B_{max} (c) $(B_{max})^{1.6}$ (d) $(B_{max})^{3/2}$

428. In a dc machine, which loss increases rapidly with the increase in frequency of magnetic reversals ?
(a) Copper loss. (b) Hysteresis loss.
(c) Eddy current loss. (d) Mechanical loss.

429. The eddy current loss in a dc machine varies with the thickness of laminations as
(a) t^2 (b) t (c) $1/t$ (d) $1/t^2$

Answers: **405.** (d), **406.** (a), **407.** (d), **408.** (c), **409.** (c), **410.** (c), **411.** (a), **412.** (d), **413.** (c), **414.** (a), **415.** (a), **416.** (b), **417.** (c), **418.** (d), **419.** (a), **420.** (b), **421.** (d), **422.** (c), **423.** (a), **424.** (b), **425.** (c), **426.** (e), **427.** (a), **428.** (c), **429.** (a),

Downloaded From : www.EasyEngineering.net

430. The core (or iron) losses, in a dc machine occur due to
(a) eddy current loss only. (b) hysteresis loss only.
(c) both hysteresis and eddy current losses.
(d) air friction only.

431. Core loss in a dc machine occurs in
(a) armature only. (b) pole shoe only.
(c) yoke only. (d) in all the above three.
[A.M.I.E. Sec B. Elec. Machines Summer 1995]

432. In a dc machine, iron losses are independent of variations in
(a) voltage. (b) speed.
(c) load. (d) both (a) and (b).

433. In a dc machine, iron losses result in
(a) excessive heating of core. (b) loss of efficiency.
(c) rise in temperature of ventilating air.
(d) all of the above.

434. In a dc machine, ohmic or copper losses occur in the
(a) armature winding only. (b) field winding only.
(c) brush contact only. (d) interpole winding only.
(e) all of the above.

435. In a dc machine, armature copper loss varies as
(a) load current. (b) (load current)^2.
(c) 1/load current. (d) 1/(load current)^2.

436. Which of the following losses occuring in a dc machine has the largest percentage ?
(a) Iron loss. (b) Windage loss.
(c) Copper loss. (d) Iron loss.

437. Which of the following losses occuring in a dc machine varies significantly with the load ?
(a) Armature copper loss. (b) Shunt field copper loss.
(c) Magnetic or iron losses. (d) Mechanical losses.

438. The armature core of a dc machine gets overheated due to
(a) copper loss occurring in armature winding only.
(b) eddy current loss only.
(c) hysteresis loss only. (d) all of the above.

439. The armature resistance of a PMDC motor is 0.8 Ω. At no load, the motor draws 1.5 A from a supply voltage of 25 V and runs at 1,500 rpm. The efficiency of the motor while it is operating on load at 1,500 rpm drawing a current of 3.5 A from the same source will be
(a) 48.0% (b) 57.1% (c) 59.2% (d) 88.8%
[GATE E.E. 2004]

440. The maximum efficiency occurs in a separately excited dc generator when the terminal voltage is 220 V and the induced emf is 240 V, the stray losses, if the armature resistance is 0.2 Ω, will be:
(a) 1,000 W (b) 2,000 W
(c) 3,000 W (d) 4,000 W
[U.P.S.C. I.E.S. E.E.-II, 2011]

441. A 200 V dc shunt motor delivers an output of 17 kW with an input of 20 kW. The field winding resistance is 50 Ω and armature resistance is 0.04 Ω. Maximum efficiency will be obtained when the total armature copper losses are equal to
(a) 2,632 W (b) 3,000 W (c) 3,680 W (d) 5,232 W
[U.P.S.C. I.E.S. E.E.-II, 2000]

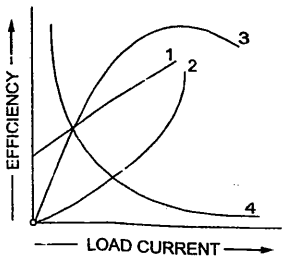
442. Efficiency of a dc shunt machine can be computed by knowing
(a) output and input.
(b) rating of machine and account of constant losses and armature resistance.
(c) either (a) or (b).

443. The overall efficiency of a well designed dc machine may be expected to be around
(a) 99% (b) 92% (c) 75% (d) 50%

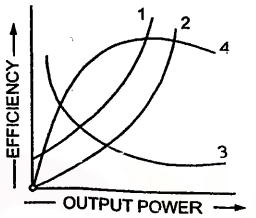
444. Which of the following motors is expected to have maximum full-load efficiency ?
(a) 1 kW (b) 5 kW (c) 30 kW (d) 100 kW

445. The electrical efficiency of a dc machine is given as the ratio of
(a) VI_L and E_gI_a in case of generator.
(b) E_bI_a and VI_L in case of motor.
(c) output/input.
(d) output/output + total loss.
(e) both (a) and (b).

446. The curve giving relation between efficiency and load current for a dc machine is
(a) 1
(b) 2
(c) 3
(d) 4



447. The curve giving relation between efficiency and useful power output in kW for a dc motor is
(a) 1
(b) 2
(c) 3
(d) 4



448. Efficiency of a dc machine is maximum when the variable losses are equal to
(a) constant losses. (b) square of the constant losses.
(c) square root of the constant losses.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Summer 1995]

449. The efficiency of a dc machine will be maximum when
(a) $I = \sqrt{\frac{P_C}{R_a}}$ (b) $I = \frac{\sqrt{P_C}}{R_a}$
(c) $I = \frac{P_C}{R_a^2}$ (d) $I = \frac{P_C}{R_a}$

450. The efficiency of a dc machine will be _____ when the variable losses are equal to constant losses.
(a) 100% (b) maximum
(c) minimum (d) 50%

451. DC machines are generally designed for maximum efficiency around
(a) full load. (b) 75% (c) 50% (d) 25%

452. In direct method of determination of efficiency of a dc machine
(a) copper losses, magnetic losses and mechanical losses are measured.
(b) the machine is actually loaded and input power and output power are measured.
(c) either (a) or (b). (d) none of these.

453. A brake test is usually restricted to _____ dc motors.
(a) small kW output rating
(b) variable speed (c) high speed
(d) constant speed (e) open frame

454. Which of the following test(s) need(s) two machines ?
(a) Brake. (b) Swinburne's.
(c) Retardation. (d) Hopkinson's.
(e) Field. (f) both (d) and (e).

Answers: **430.** (c), **431.** (a), **432.** (c), **433.** (d), **434.** (e), **435.** (b), **436.** (c), **437.** (a), **438.** (d), **439.** (a), **440.** (b), **441.** (a), **442.** (c), **443.** (b), **444.** (d), **445.** (e), **446.** (c), **447.** (d), **448.** (a), **449.** (a), **450.** (b), **451.** (a), **452.** (b), **453.** (a), **454.** (f),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

455. The efficiency of a dc machine can be determined without directly loading it with the following information(s).
(a) Machine rating.
(b) Armature and field resistances.
(c) No-load input of the machine.
(d) all of the above informations.

456. Indirect method of testing is preferred because
(a) it enables the determination of losses without actually loading the machine.
(b) power requirement is very small and so large machines can be tested economically and conveniently.
(c) it does not require any loading arrangement.
(d) the efficiency can be determined at any load.
(e) all of the above.

457. The efficiency of a dc series machine cannot be determined by Swinburne's test as
(a) a series motor has very high starting torque.
(b) a series motor draws excessive current from the supply mains on no load.
(c) a series motor runs at dangerously high speed on no load.
(d) all of the above.

458. In Swinburne's test of a dc machine
(a) no-load losses are calculated and copper losses are measured.
(b) no-load losses are measured and the copper losses are calculated.
(c) both the no-load losses and the copper losses are calculated.
(d) both the no-load losses and the copper losses are measured.

459. The test that can be used for determination of no-load losses in a large dc shunt machine is
(a) brake test. (b) field test.
(c) Hopkinson's test. (d) Swinburne's test.

460. In Swinburne's test of determination of efficiency of a dc shunt machine the no load input power supplies
(a) armature and shunt field copper losses.
(b) iron losses. (c) friction and windage losses.
(d) all of the above.

461. Performance of large dc machines regarding commutation and temperature rise etc. at full load can be checked by _____ test.
(a) brake (b) Swinburne's
(c) Hopkinson's (d) running down

462. In the Kapp's modification of Hopkinson's test for dc machines
(a) the power losses in the two machines are supplied electrically.
(b) the power losses in the two machines are supplied mechanically.
(c) the two machines are not coupled mechanically.
(d) none of the above.

463. The main disadvantage of Hopkinson's test is that
(a) it needs large power.
(b) it needs two identical machines.
(c) no account is taken for change in iron losses due to flux distortion on full load conditions.
(d) all of the above.

464. In Hopkinson's efficiency test for dc machines
(a) both the machines are mechanically coupled.
(b) both the machines are operated at full load.
(c) one machine acts as a generator and another as a motor.
(d) the armature current of the machine operating as a motor is more than that of the machine operating as a generator.
(e) the field current of the machine operating as a generator is more than that of the machine operating as a motor.
(f) all of the above.

465. Two dc shunt machines 200 kW each are tested by Hopkinson's test. The power input would be of the order of
(a) 200 kW (b) 100 kW (c) 35 kW (d) 10 kW

466. The retardation test for dc shunt machines is employed for determination of
(a) stray losses. (b) windage and friction losses.
(c) magnetic or core losses. (d) copper losses.

467. In a field's test for dc series machines, one of the two machines under test operates as a motor and drives the other which operates as a _____ generator.
(a) series (b) shunt
(c) separately excited (d) cumulatively compounded
(e) differentially compounded

468. In a field's test for dc series machines, the series fields of two machines are connected in series so as to make _____ losses of both machines equal.
(a) copper (b) iron
(c) friction and windage (d) total

469. In the field's test for dc series machines, the difficulty of obtaining readings at relatively light loads is overcome by connecting
(a) the generator series field in series with the motor armature.
(b) the motor series field in series with the generator armature.
(c) the generator armature in series with the motor.
(d) the motor armature in series with the generator.

470. In Hopkinson's and field's tests, the main common thing is that
(a) both tests are regenerative.
(b) both tests use two identical mechanically coupled dc machines.
(c) the power drawn in both the tests is negligible to meet the internal losses only.
(d) all of the above.

471. Which of the following tests can be conducted on other than shunt machines ?
(a) Swinburne's test. (b) Retardation test.
(c) Field's test. (d) Back-to-back test.
[U.P.S.C. I.E.S. Elec. Engg-II, 1992]

472. To conduct load test on a dc shunt motor, it is coupled to a generator which is identical to the motor. The field of the generator is also connected to the same supply source as the motor. The armature of generator is connected to a load resistance. The armature resistance is 0.2 pu. Armature reaction and mechanical losses can be neglected. With rated voltage across the motor, the load resistance across the generator is adjusted to obtain rated armature current in both motor and generator. The pu value of this load resistance is
(a) 1.0 (b) 0.98 (c) 0.96 (d) 0.94
[GATE E.E. 2003]

473. Which of the following is not a cross-field machine?
(a) Rosenberg generator. (b) Amplidyne.
(c) Metadyne. (d) Three-wire generator.

474. In case of a cross-field machine, the amplification ratio may be as high as
(a) 10,000:1 (b) 2,000:1 (c) 500:1 (d) 100:1

475. The application(s) of cross-field machines is/are
(a) in automobiles and train services.
(b) in control systems.
(c) both (a) and (b). (d) none of these.

Answers: **455.** (d), **456.** (e), **457.** (c), **458.** (b), **459.** (d), **460.** (d), **461.** (c), **462.** (a), **463.** (b), **464.** (f), **465.** (c), **466.** (a), **467.** (c), **468.** (b), **469.** (a), **470.** (b), **471.** (c), **472.** (c), **473.** (d), **474.** (a), **475.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

476. In cross-field generators
(a) the reversal of speed does not reverse the polarity of the output.
(b) compensating winding is provided in order to increase the amplification factor.
(c) the number of brush studs is double of that of poles.
(d) all of the above.

477. The number of interpoles in a 2-pole cross-field generator will be
(a) 2 (b) 4 (c) 8 (d) none of these

478. In Rosenberg generators,
(a) use of armature reaction is made.
(b) the field coils are shunt connected.
(c) the direction of load current is independent of direction of rotation and remains almost constant between wider limits of speed.
(d) all of the above.

479. Which of the following statement(s) associated with a Rosenberg generator is/are incorrect ?
(a) It is an armature excited high speed machine.
(b) It provides constant current over wider limits of speed.
(c) It is a constant voltage generator at low speeds.
(d) It is essentially a 2-pole machine with two sets of brushes arranged on the axis at right angles to each other.
(e) Its voltage polarity is independent of direction of rotation.

480. In an amplidyne, compensating winding is provided in order to
(a) neutralize the armature reaction setup by the load current.
(b) regulate the load voltage.
(c) reduce sparking at the commutator.
(d) none of the above.

481. An amplidyne is provided with split poles so as to
(a) increase amplification factor.
(b) provide space for interpoles.
(c) increase efficiency.
(d) dampout mechanical oscillations. [A.M.I.E. Winter 2001]

482. Which of the following statements associated with Amplidyne and Metadyne are correct ?
(a) These are cross-field machines.
(b) Amplidyne is fully compensated machine and Metadyne is under compensated machine.
(c) Commutating poles are also provided in these machines.
(d) Compensating winding is connected in series with the load output brush terminals.
(e) all of the above.

483. The inductor of a three-wire generator should be iron-cored so as to
(a) increase the current through it.
(b) reduce the voltage ripples in the output circuit.
(c) reduce the current through it.
(d) improve the voltage regulation of the machine.

484. Which of the following statements associated with a 3-wire generator are correct?
(a) It is an ordinary dc generator with a special provision for connecting the neutral wire to the armature winding.
(b) It is somewhat more expensive than the standard one.
(c) For operating 3-wire compound generators in parallel it is necessary that two equalizer connections are used to connect all series fields in parallel.
(d) There are two series fields on each 3-wire compound generator.
(e) all of the above.

485. If the number of poles in the first stage of a Rototrol (Regulex) is 2, the number of poles in the second stage will be
(a) 2 (b) 4 (c) 6 (d) 8

486. The proper alignment of a machine is essential otherwise
(a) excessive wear and tear will take place on the bearings.
(b) the load current will become excessively high.
(c) the speed of the motor may become abnormal.
(d) the motor may not operate at all.

487. Before connecting the motor to the supply mains it is necessary to ensure that
(a) there is a proper insulation between field winding, armature winding and earth.
(b) protective devices have been adjusted at their proper settings.
(c) all the necessary connections show continuity.
(d) supply voltage is appropriate.
(e) all of the above.

488. For preventive maintenance of a dc machine it is to be ensured that
(a) insulation resistances of the field and armature windings are proper.
(b) commutator and brushes are in good condition.
(c) bearings are properly greased.
(d) motor and its control gear are free from oil and grease.
(e) all of the above.

489. Which of the following statement(s) associated with installation and preventive maintenance of dc machines is incorrect ?
(a) Accumulation of carbon dust on the commutator surface may result in flash-over.
(b) The commutator should be lubricated in order to reduce brush friction.
(c) Accumulation of dust on the machine may result in overheating of the machine.
(d) Sufficient space is necessary all around the motor for movement of operational and maintenance personnels.
(e) Resistance of earth continuity conductor is to be checked periodically in order to ensure the effectiveness of the earthing system.

490. Which of the following statements associated with the installation and preventive maintenance of dc machines is correct ?
(a) The commutator should be regularly lubricated in order to reduce brush friction.
(b) Accumulation of dust on the machine may cause electrical failure of the machine.
(c) Periodic greasing increases the life of the bearings and also provides trouble free service.
(d) None of the above.

491. Growler is used to detect
(a) condition of insulation used.
(b) working condition of bearing.
(c) working condition of bearing.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1996]

492. The sparking at brushes may occur due to
(a) trouble in brushes. (b) trouble in commutator.
(c) trouble in armature. (d) excessive load.
(e) any of the above causes.

Answers: **476.** (d), **477.** (b), **478.** (d), **479.** (c), **480.** (a), **481.** (b), **482.** (e), **483.** (c), **484.** (e), **485.** (b), **486.** (a), **487.** (e), **488.** (e), **489.** (b), **490.** (c), **491.** (a), **492.** (b),

493. An amplidyne has split poles to
(a) provide space for interpoles.
(b) increase amplification factor.
(c) increase efficiency.
(d) damp out oscillations.
[A.M.I.E. Winter 2001]

494. The preventive maintenance schedule of a dc machine includes ____ maintenance.
(a) daily
(b) weekly
(c) monthly
(d) half yearly
(e) yearly
(f) all of these

Answers: **493.** (a), **494.** (f).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): In an electromagnetic energy conversion device forces are set up due to flux in the system which tends to decrease the reluctance and move mechanical parts towards the configuration of minimum reluctance.
(R): The change in field energy of the system with motion under constant magnetic flux conditions is a measure of the force developed. [U.P.S.C. I.E.S. E.E. II, 1996]

2. (A): Most of the total energy of a magnetic circuit of an electro-magnetic energy converting device is confined in the small air gap portion of the circuit.
(R): There is no hysteresis or eddy current loss in the air gap. [U.P.S.C. I.E.S. E.E. II,1993]

3. (A): The pole shoes of a normal dc machine are laminated.
(R): The flux in the poles is unidirectional. [U.P.S.C. I.E.S. E.E. II, 1995]

4. (A): The pole faces or pole shoes are always laminated.
(R): Eddy currents are induced in pole shoes due to fluctuation in the flux distribution on the pole face owing to movement of armature slots and teeth.

5. (A): When large currents are required, it is necessary to use lap winding.
(R): In lap winding, equalizing connections are definitely needed. [U.P.S.C. I.E.S. E.E.-II, 2010]

6. (A) : In a dc generator, even though the armature magnetic field is in quadrature with the main magnetic field, each considered alone, the resultant magnetic field due to interaction of both the fields is shifted backwards by certain angle from the geometrical neutral axis depending upon the load.
(R) : In a dc generator, the trailing pole-tips get magnetically saturated as the load reaches its rated value. [U.P.S.C. I.E.S. E.E. II., 2005]

7. (A): The shunt field winding of a dc machine should not be opened when it is energized.
(R): The shunt field winding has many turns and so has high inductance. So, when it will be opened, when energized, will produce high inductive voltage, dangerous to personnel as well as to its insulation.

8. (A): In a certain case, a dc shunt generator failed to build up the voltage.
(R): Shunt field resistance of a dc shunt generator should be more than its critical field resistance value to generate voltage. [U.P.S.C. I.E.S. E.E.-II, 2011]

9. (A): The voltage regulation of a differentially compounded generator is more than that for a cumulatively compounded generator.
(R): The peak flux density in the air gap of a cumulatively compounded generator is more than that in the air gap of a differentially compounded generator. [U.P.S.C. I.E.S. E.E. II 1994]

10. (A): The speed-torque characteristic of a dc series motor is a perfect hyperbola when the effect of saturation and armature reaction are neglected.
(R): When the effects of saturation and armature reaction are included, the characteristic approaches a straight line. [U.P.S.C. I.E.S. Elec. Engg. II, 1996]

11. (A): DC series motors are suitable for cranes.
(R): DC series motors provide high starting torque. [U.P.S.C. I.E.S. E.E. II., 2003]

12. (A): DC series motors are best suited for electric traction work.
(R): DC series motors develop high torque at start and are self relieving motors.

13. (A): DC series motors are suitable for buses, trains, trolleys, hoists and cranes.
(R): DC series motors are variable speed motors.

14. (A): Armature resistance control method of speed control of dc motors is wasteful and inefficient
(R): Large amount of power is wasted in the control resistances, specially in case of shunt motors.

15. (A): A dc motor draws high current at the time of starting.
(B): While starting a dc motor, it takes some time to develop a non-zero value of back emf. [U.P.S.C. I.E.S. E.E. II., 2008]

16. (A): In the "3-point" type of starter of a dc series motor, the "holding coil" for holding the starter handle in the "ON" stud is connected in such a manner that it is short circuited when the "overload" replay picks up.
(R): In a dc series motor starter, to guard against "racing" due to sudden large reduction of shaft-load, the "holding coil" is connected in series with the armature circuit and the series field winding. [U.P.S.C. I.E.S. E.E.-II., 2004]

17. (A): The direct method of determination of efficiency is not preferred in case of medium and large dc machines.

Answers: **1.** (a), **2.** (b), **3.** (b), **4.** (a), **5.** (b), **6.** (d), **7.** (a), **8.** (c), **9.** (b), **10.** (b), **11.** (a), **12.** (a), **13.** (b), **14.** (a), **15.** (a), **16.** (b), **17.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): The direct method of determination of efficiency of a dc machine is wasteful, needs cumbersome loading arrangement and adequate power supply is to be made available.

18. (A): Field's test for dc series machines is not a regenerative test.

(R): In Field's test for dc series machines the output of the generator is not fed back to the motor but is totally wasted in dead load.

Answers: **18.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Characteristics)

A. Open circuit characteristics.
B. Internal characteristics.
C. External characteristics.
D. Load saturation curve.

List 2 (Relation)

1. V v. I_f
2. E_0 v. I_f
3. E v. I_a
4. V v. I

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	2	1	4	3
(c)	4	1	2	3
(d)	2	3	4	1

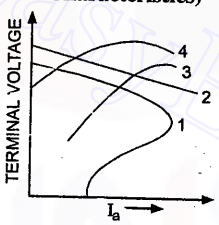
[U.P.S.C. I.E.S. E.E. II., 2005]

2.

List i (Types of DC Generator)

(a) Separately excited.
(b) Series excited.
(c) Shunt excited.
(d) Over-compound excited.

List 2 (External Characteristics)



Codes:	A	B	C	D
(a)	2	3	1	4
(b)	1	4	2	3
(c)	1	3	2	4
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E. II., 2004]

3.

List 1 (DC Motors)

A Cumulatively compounded motor.
B Differentially compounded motor.
C Series motor.
D Shunt motor.

List 2 (Characteristics)

1. Fairly constant speed irrespective of the load.
2. It may start in reverse direction.
3. Definite no-load speed.
4. Never started without load.

Codes:	A	B	C	D
(a)	2	3	1	4
(b)	3	2	4	1
(c)	1	3	2	4
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E. II, 1994; 2005]

4. In relation to dc machines, match the following and choose the correct combination

List 1 (Performance Variables)

A. Armature emf (E).
B. Developed torque (T).
C. Developed power (P).

List 2 (Proportional To)

1. Flux (ϕ), speed (ω) and armature current (I_a)
2. ϕ and ω only
3. ϕ and I_a only
4. I_a and ω only
5. I_a only

Codes:	A	B	C
(a)	3	3	1
(b)	2	5	4
(c)	3	5	4
(d)	2	3	1

[GATE E.E. 2005]

5.

List 1 (DC Machine Quantity)

A. Developed power.
B. Torque.
C. Generated emf.
D. Speed.

List 2 (Relation)

1. $\propto N\phi$
2. $\propto E_b I_a$
3. $\propto E_b/\phi$
4. $\propto I_a\phi$

Codes:	A	B	C	D
(a)	2	4	1	3

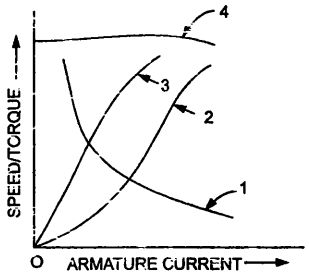
7.



Consider the following statements:
In the above figure, the curves pertain to the dc motor.

A. Speed Vs armature-current characteristic of a dc shunt motor.
B. Torque Vs armature-current characteristic of a dc shunt motor.
C. Speed Vs armature-current characteristic of a dc series motor.
D. Torque Vs armature-current characteristic of a dc series motor.

What is the correct sequence of characteristics?

Codes:	A	B	C	D
(a)	4	1	3	2
(b)	2	1	3	4
(c)	4	3	1	2
(d)	2	3	1	4

[U.P.S.C. I.E.S. E.E.-II, 2010]

8.

List 1 (Type of Machine)		List 2 (Characteristic/Application)
A.	DC shunt generator.	1. Electric traction.
B.	DC series motor.	2. Has good voltage regulation.
C.	Level compounded dc. generator.	3. Must have residual flux.
D.	DC series generator.	4. Used as boosters.

Codes:	A	B	C	D
(a)	4	1	2	3
(b)	3	2	1	4
(c)	4	2	1	3
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-II., 2001]

9.

List 2		List 2
A.	Field Control	1. Below base speed
B.	Armature Control	2. Above base speed
		3. Above base torque
		4. Below base torque

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. For a linear electromagnetic circuit, field energy is equal to the coenergy.
2. In electromechanical energy conversion devices (*e.g.* generators and motors) a small air gap is left between the stator and rotor in order to reduce the reluctance of magnetic path.
3. DC generator converts mechanical power in electrical power. [R.G.T.U. M.P., December, 2010]
4. Hysteresis loss can be reduced by laminating the iron core.
5. The copper losses are power dissipated in the resistance of the windings.

Answers: **1.** (T), **2.** (F), **3.** (T), **4.** (F), **5.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

6. Iron losses are function of both flux and speed.
7. Iron or magnetic losses remain practically constant in case of dc shunt and compound machines.
8. Mechanical losses decrease with the increase in load in case of dc series motors.
9. Windage losses largely depend upon the speed of the motor.
10. Variation in speed has maximum effect on windage losses.
11. The stray losses at no load are zero.
12. A body cools down from 60°C to 50°C in 10 minutes. The body will take the same *i.e.* 10 minutes in further cooling down from 50°C to 40°C, the external conditions remaining unchanged.
13. The heating time constant of a totally enclosed motor is relatively lower.
14. 15 minute rated motors are suitable for light duty cranes.
15. For medium duty cranes the short-time rating motor used is 30 minutes.
16. The generator develops an electric pressure by electromagnetic induction.
17. The emf induced in the coil is maximum when the coil moves parallel to a magnetic field.
18. A conductor is rotating within a magnetic field. The peak voltages occur along the axis of magnetic field.
19. The magnetic field of a dc generator is connected to a 50 Hz sinusoidal supply, the voltage induced in the armature will be of 50 Hz sinusoidal.
20. In small dc machines yokes are made of cast iron.
21. In small dc machines the poles are cast integral with the yoke.
22. The yoke of a dc generator is made of cast iron as it gives mechanical protection to the machine.
23. The armature core of a dc machine is made of silicon steel in order to reduce hysteresis loss.
24. The brushes of a dc machine are made of carbon.

[R.G.T.U. M.P., December, 2010]

25. The yoke or frame of a dc machine provides a return flux path for the magnetic circuit produced by the field windings.
26. Two poles in a dc machine have opposite polarity.
27. The pole shoe acts as a support to field coils and spreads out the flux in the air gap.
28. The pole helps in uniform distribution of flux in the air gap.
29. A large air gap is provided between the pole shoe and armature.
30. Two slip rings put together face to face form a split ring.
31. The commutator is a sort of rotating switch placed between the armature and external load circuit.
32. The mica insulation between commutator segments is harder than the commutator material itself.
33. The coil ends are soldered to commutator risers.
34. Pitting of the commutator segments is caused due to sparking.
35. The commutator of a dc machine is made of iron.
36. The armature of dc machine is made of solid iron.
37. Armature core is laminated to reduce hysteresis loss.
38. The end shields provide support to the armature.
39. The armature shaft is invariably made of cast steel.
40. The armature shaft must be stiff so as to maintain air gap between armature and field narrow.
41. Ventilating ducts are provided in a machine for reducing iron and friction losses.
42. Brushes should have high conductivity and low coefficient of friction.
43. Brush rocker assembly cannot be moved back and forth.
44. Brush holders are insulated from the rocker arm.
45. Ring type of armature winding is most commonly used in dc machines.
46. Drum winding may be either single layer or double layer.
47. Both front and back pitches in a dc machine are always even.
48. If the back pitch is less than front pitch the winding is said to be progressive.
49. Wave winding is preferred for welding generator.
50. Wave winding is most suitable for low voltage and high current machine.
51. Equalizer rings are provided only in case of wave wound dc machines.
52. The armature of a low voltage and high current machine is lap wound.
53. In a dc machine, lap winding is preferred when all the poles do not provide identical flux.
54. Wave winding is sometimes called the series winding.
55. The commutator pitch in case of simplex wave winding is equal to average pitch.
56. The number of parallel paths in a wave windings is equal to the number of poles.
57. The number of parallel paths in the armature winding of a 4-pole lap connected dc machine having 200 armature conductors will be 2.
58. Frog-leg winding is combined lap and wave winding on a single rotor.
59. The equalizer connection must have a very high resistance.
60. The emf of a dc generator increases with the increase of armature speed.
61. In a dc motor, the reluctance of the air gap is negligible in comparison to that of the iron.
62. Any unequal distribution of the magnetic field may result in unbalanced magnetic pull on the armature.
63. When armature conductors pass under a brush, the direction of current in them reverse.
64. In a dc generator the armature mmf is triangularly distributed.
65. In a dc machine the armature mmf is stationary with respect to field poles but rotating with respect to the armature.
66. In a dc generator the shift of brushes, so as to bring them in magnetic neutral plane will cause demagnetization as well as cross-magnetization.
67. Magnetic neutral axis shifts owing to interaction of armature mmf and main mmf.
68. Brushes are to be shifted to the magnetic neutral axis in order to avoid induction of reactance voltage in the coils undergoing commutation.

Answers: **6.** (T), **7.** (T), **8.** (T), **9.** (T), **10.** (T), **11.** (F), **12.** (F), **13.** (F), **14.** (T), **15.** (T), **16.** (T), **17.** (F), **18.** (T), **19.** (T), **20.** (T), **21.** (T), **22.** (F), **23.** (T), **24.** (T), **25.** (T), **26.** (T), **27.** (T), **28.** (F), **29.** (F), **30.** (F), **31.** (T), **32.** (T), **33.** (T), **34.** (T), **35.** (F), **36.** (F), **37.** (F), **38.** (T), **39.** (F), **40.** (T), **41.** (F), **42.** (T), **43.** (F), **44.** (T), **45.** (F), **46.** (T), **47.** (F), **48.** (F), **49.** (F), **50.** (F), **51.** (F), **52.** (T), **53.** (F), **54.** (T), **55.** (T), **56.** (F), **57.** (F), **58.** (T), **59.** (F), **60.** (T), **61.** (F), **62.** (T), **63.** (T), **64.** (T), **65.** (T), **66.** (T), **67.** (T), **68.** (T),

69. In a dc generator, the armature reaction causes demagnetization of the trailing pole tip and magnetization of the leading pole tip.
70. Cross magnetizing component is parallel to the main field.
71. The coil undergoing commutation should be in geometrical neutral axis.
72. The reactance voltage induced in a coil is proportional to the number of turns on the coil.
73. The intensity of sparking at the commutator increases with the increase in load.
74. The sparking at the brushes in a dc machine is due to reactance voltage.
75. In dc machines, dummy coils are provided to reduce sparking at the brushes by neutralizing the reactance voltage.
76. Larger air gaps can be provided on non-interpole machines.
77. If the brush contact resistance is made small, sparking on the commutator surface will be reduced.
78. The compensating winding adds considerably the cost of the machine and doubles the armature copper loss.
79. In a dc machine, the number of conductors in the compensating winding is always less than the number of armature conductors per pole.
80. If all other quantities are same, the number of conductors in compensating winding is less in a lap wound machine than in a wave wound machine.
81. In a dc machine, the commutating or interpole winding is connected across the armature winding.
82. Interpoles are never made of laminated construction.
83. In dc machines, the interpoles are provided to facilitate commutation.
84. Commutating poles or interpoles create a flux in the interpolar region in a direction opposite that produced due to armature reaction.
85. The armature resistance of a dc machine is of the order of 1 Ω.
86. In a dc generator, the critical resistance can be increased by reducing its speed.
87. A dc shunt generator has full-load voltage regulation of 7.5% at rated speed of 600 rpm. The voltage regulation, when the generator is driven at 750 rpm will be more than 7.5%.
88. Internal or total characteristic of a dc generator is of interest mainly to the designer.
89. Internal characteristic of a dc generator is also referred to as the performance characterisitc.
90. The term 'voltage regulation' is used to indicate the degree of variation in terminal voltage from rated load to no load.
91. The fall in speed of a dc generator due to increase in load can be corrected by increasing the input to the prime mover.
92. A generator may lose residual magnetism due to heating.
93. In self-excited dc generators, the residual magnetism is of the order of 2.5% of normal magnetism.
94. A dc generator beyond critical resistance will generate maximum power.
95. In a dc shunt generator, the voltage build up is generally restricted due to saturation of iron.
96. In a dc generator, the critical resistance can be increased by increasing its speed.
97. The series fields must have resistance in direct proportion to the ratings of the generators.
98. A separately excited generator is less stable in comparison to a self excited generator.
99. In a separately excited dc generator supplying rated load, the armature reaction is always present.
100. In comparison to a self excited dc generator, separately excited dc generator has better voltage regulation.
101. In case of a dc shunt generator, all the field coils are connected in series, and the combination is connected across the armature winding.
102. Critical resistance in a dc shunt generator is a function of speed.
103. DC shunt generators are most suitable for arc welding.
104. The terminal voltage of a dc shunt generator falls with the load due to armature reactance and armature leakage.
105. Shunt generator fails to excite after a severe short circuit.
106. In case of compound wound dc generators the degree of compounding may be adjusted by means of divertor which shunts the series field.
107. The essential condition for satisfactory parallel operation of two dc generators is that they should have drooping voltage characteristics.
108. Equaliser bar is necessary for parallel operation of series and over-compound dc generators.
109. DC series generators are most suitable for parallel operation.
[A.M.I.E. Sec B, Winter 1998]
110. Equalizing bus-bars are employed with parallel operation of dc shunt generators.
111. Small dc motors (up to 5 kW rating) usually have 2 poles.
112. The air gap between stator and rotor of an electric motor is kept as small as possible in order to provide stronger magnetic field.
113. In a dc motor, energy conversion would not have been possible but for production of back emf in the armature.
114. An electric current, while flowing through an electric motor produces heating as well as magnetic effects.
115. One dc motor drives another dc motor when excited, the second dc motor will run as a dc generator.
116. The generated emf and armature current are in the same direction in case of dc motors.
117. The electromagnetic torque and rotation are in the same direction in case of dc generators.
118. The emf induced in a dc motor opposes the applied voltage.
119. DC motors are still favoured in applications where wide range of speed variation is required.
120. The mechanical force developed in an electric motor acts through the iron teeth.
121. In general, dc motors are preferred where frequent starting, stopping, speed variation and reversal is required.
122. A dc motor develops unidirectional torque with the help of commutator.
123. There exists two magnetic fields in an electric rotating machine.
124. Two magnetic fields in an electric machine always try to align with each other.
125. The angle between the axis of two magnetic fields in an electric machine is called the torque angle.
126. The induced emfs in the armature of a dc generator and dc motor are basically the same.

Answers: **69.** (F), **70.** (F), **71.** (F), **72.** (F), **73.** (T), **74.** (T), **75.** (F), **76.** (T), **77.** (F), **78.** (T), **79.** (T), **80.** (T), **81.** (F), **82.** (F), **83.** (T), **84.** (T), **85.** (T), **86.** (F), **87.** (F), **88.** (T), **89.** (F), **90.** (T), **91.** (T), **92.** (T), **93.** (T), **94.** (F), **95.** (T), **96.** (T), **97.** (F), **98.** (F), **99.** (T), **100.** (T), **101.** (T), **102.** (T), **103.** (F), **104.** (F), **105.** (T), **106.** (T), **107.** (T), **108.** (T), **109.** (F), **110.** (F), **111.** (T), **112.** (T), **113.** (T), **114.** (T), **115.** (T), **116.** (F), **117.** (F), **118.** (T), **119.** (T), **120.** (T), **121.** (T), **122.** (T), **123.** (T), **124.** (T), **125.** (T), **126.** (T),

127. The direction of current flowing through the armature of a dc motor is in the direction of induced emf.
128. The equation $T\omega = ei$ holds good for both generating and motoring action.
129. With the increase in load on the generator, the electromagnetic torque developed decreases.
130. The direction of rotation of a dc motor can be reversed simply by interchanging the supply terminals.
131. In a dc motor if the brushes are given a backward shift then commutation will be improved and speed will increase.
132. In a dc motor polarity of the interpole should be same as main pole behind. **[A.M.I.E. Sec. B. Summer 1998]**
133. In comparison to shunt and compound motors, a dc series motor develop high torque at start. It is due to its comparatively stronger series field.
134. A dc shunt motor is driving a constant torque load with normal excitation. If the field current is halved then the motor will run slightly less than double the rated speed.
135. A dc shunt motor is driving a mechanical load at rated voltage with normal excitation. If the load torque is increased to double of its normal one, the speed of the motor will increase slightly.
136. When the motor is loaded, the electrical power input to the motor automatically changes to match the load.
137. A cumulatively compounded long shunt generator, when operated as a motor, it would operate as a differentially compounded long shunt motor.
138. Negative speed regulation means drop of speed with the increase in load.
139. In a dc motor the power developed by the armature is always more than the power available at the shaft.
140. In a dc series motor, at low saturations, the armature torque developed is proportional to the square of armature current.
141. If direct current is supplied through slip rings to a rectangular coil placed between two magnets, no continuous torque will be developed.
142. Electrical equivalent of mechanical power developed by the armature is equal to the power input to the motor.
143. Torque-armature current characteristic is also called the mechanical characteristic.
144. Speed-torque characteristic is also called the electrical characteristic.
145. A dc series motor is not suitable for line shaft drives.
146. The torque-armature current characteristic for a dc series motor is of the form of a parabola.
147. If a dc series motor is allowed to run at no load or at a very light load, its speed will become very high.
148. Series motors are usually directly coupled to the load.
149. DC series motors are not usually used for belt driven loads.
150. A dc series motor can be started without any load.
151. The speed of a dc series motor is independent of load.
152. DC series motor is used for traction. **[R.G.T.U. M.P., December, 2010]**
153. A dc shunt motor is quite suitable for electric traction.
154. DC shunt motors are preferred for belt driven loads.
155. DC shunt motors are used for driving constant speed air blowers.
156. In a cumulative compound dc motor the speed increases appreciably with the increase in load torque.
157. A cumulative compound dc motor is always started on load.
158. In a cumulative compound dc motor, the maximum speed is fixed by the shunt field.
159. The characteristics of compound dc motors are combination of those for dc series and shunt motors.
160. In a cumulative compound dc motor the series field winding is so connected that the flux produced by it opposes the flux created by the shunt field winding.
161. Differential compound dc motor, when started on heavy load, may start rotating in reverse direction.
162. Use of a differential compound dc motor is limited to experimental and research work.
163. In a permanent magnet dc motor field control method cannot be used for variations in speed.
164. Jogging control of a dc shunt motor is achieved by connecting an additional resistance in series with the armature circuit.
165. In armature resistance control of speed of dc motors, the back emf remains constant at all speeds.
166. The armature resistance control of speed of dc motors is economical for short duration or intermittent slowdown.
167. In Ward Leonard system, the lower limit is imposed by residual magnetism of the generator.
168. In Ward Leonard method of speed control, the direction of rotation of motor is reversed usually by reversing the connection of the generator field terminals.
169. In Ward Leonard system, the motor of the M-G set is of variable speed type.
170. The Ward Leonard system of speed control is more efficient at low speeds as there are no resistors connected in series with the armature circuit.
171. Field control method is also applicable to dc compound motors.
172. Field control method of speed control of dc motors provides relatively smooth and stepless control of speed.
173. The speed of a dc series motor can be varied by controlling the terminal voltage.
174. The field divertor method of speed control of dc series motors gives speeds lower than normal.
175. In paralleling field coil method of speed control, several speeds can be obtained by regrouping of field coils.
176. Rheostatic control method is common method of speed control of dc series motors.
177. Series-parallel control is widely used in electric traction.
178. Rheostatic control method is employed when speeds above the no-load speed is required.
179. At the starting instant when a dc motor is connected to the dc supply mains, back emf is zero and so the full supply voltage acts across the armature.
180. The three point starter of a dc motor consists of a series starting resistance divided into several sections.
181. Three point starters are not suitable for applications where speed variation by flux control is required because the motor may stop at very high speed.

Answers: **127.** (F), **128.** (T), **129.** (F), **130.** (F), **131.** (T), **132.** (T), **133.** (T), **134.** (T), **135.** (F), **136.** (T), **137.** (T), **138.** (F), **139.** (T), **140.** (T), **141.** (T), **142.** (F), **143.** (F), **144.** (F), **145.** (T), **146.** (T), **147.** (T), **148.** (T), **149.** (T), **150.** (F), **151.** (F), **152.** (T), **153.** (F), **154.** (T), **155.** (T), **156.** (F), **157.** (F), **158.** (T), **159.** (T), **160.** (F), **161.** (T), **162.** (T), **163.** (T), **164.** (T), **165.** (F), **166.** (T), **167.** (T), **168.** (T), **169.** (F), **170.** (T), **171.** (T), **172.** (T), **173.** (T), **174.** (F), **175.** (T), **176.** (T), **177.** (T), **178.** (F), **179.** (T), **180.** (T), **181.** (T),

182. Starters are used in dc machines to regulate speed.
183. The magnitude of initial high current goes on increasing as the motor picks up the speed.
184. In dc motor starters, no-volt release coil consisting of an electromagnet is connected in series with the shunt field.
185. In a 4-point starter of a dc motor the no-volt release coil is connected across the supply.
186. Drum type controller is employed with a dc motor of 10kW or more requiring frequent starting, stopping, reversing and speed control.
187. DC series motors are unsuitable for dynamic braking with large load inertia. [A.M.I.E. Sec B. Winter 1993]
188. Plugging gives better braking torque than that provided by rheostatic braking.
189. Electromechanical or friction brakes are operated by electromagnets or electric operated thyristors.
190. In rheostatic braking the connections to the armature terminals are reversed so that the motor tends to run in the opposite direction.
191. The copper losses are power dissipated in the resistance of the windings.
192. Brake test can be performed on large dc machines.
193. The indirect method of testing dc machines is suitable only for small machines.
194. In Swinburne's test, the field is so adjusted that the machine operates at the rated speed and at rated voltage.
195. Hopkinson test is a regenerative test. [A.M.I.E. Sec B. Winter 1998]
196. Field test is a regenerative test.
197. Constant losses are independent of terminal voltage and speed of the motor.
198. Amplidyne is considered to be a dc amplifier.
199. Third brush generators are usually designed for weak shunt field and a strong armature reaction field.
200. Can the metadyne be used as a constant current source? [A.M.I.E. Sec B. Winter 1998]

Answers: **182.** (F), **183.** (F), **184.** (T), **185.** (T), **186.** (T), **187.** (F), **188.** (T), **189.** (T), **190.** (F), **191.** (T), **192.** (F), **193.** (F), **194.** (T), **195.** (T), **196.** (F), **197.** (F), **198.** (T), **199.** (T), **200.** (yes).

Fill in the Blanks Type Questions

Notes: Fill in the blanks with appropriate word or words.

1. In an electromechanical energy conversion device, the developed torque depends upon stator field strength and rotor field strength and the _____ .
2. The armature copper losses are proportional to the _____ of the armature current and are about _____ to _____ of full-load losses.
3. For a particular motor, the cooling time constant is _____ than heating time constant.
4. For a particular type of motor, the heating time constant _____ with the increase in size.
5. For estimation of power rating of an electric drive, its losses can be considered to be proportional to _____ .
6. Fleming's left hand rule is applicable to dc generator/dc motor/transformer.
7. In a rotating electric machine, the developed torque will be maximum when torque angle is _____ .
8. In a rotating electric machine, when the two magnetic fields are aligned with each other, the developed torque will be _____ .
9. The output indicated on the name plate of the motor is always the output power _____ .
10. The emf induced in a coil rotating in a uniform magnetic field is maximum when the flux linkage by the coil is _____ . [A.M.I.E. Summer 1995]
11. A dc generator can be considered as a rotating amplifier/power pump/rectifier/prime mover.
12. The emf induced in a dc generator is _____ induced emf.
13. The induced voltage in a single loop reverses once each _____ revolution.
14. The polarity of a dc generator is reversed by reversing the direction of _____ .
15. In large dc generators, the magnetic field is produced by _____ .
16. The emf induced in the armature conductors of a dc generator is _____ emf.
17. The frame of a dc generator is made of _____ .
18. The yoke of a large machine is invariably made of fabricated steel because of its _____ .
19. A dc machine armature is laminated to reduce _____ loss. [A.M.I.E. Winter 1996]
20. In a dc machine the part which houses the conductors and in which emf induced is to be utilised is called the _____ .
21. The thickness of laminations used for armature core of a dc machine is of the order of _____ mm.
22. If the flux in the air gap is ϕ, then the flux in the armature core section of a dc machine is _____ .
23. The teeth in the armature of a dc machine are sometimes skewed. This is done to reduce mechanical _____ .
24. Besides armature, _____ of a dc machine are laminated.
25. The current flowing through a load connected across the two brushes fixed over the split ring will be _____ .
26. The component of a dc generator which plays vital role in providing dc is _____ .
27. In a dc generator, the current is collected from armature through _____ and brushes.
28. A commutator is made of _____ segments.
29. The brushes for commutation are made of carbon/mica/aluminium.
30. Mica is _____ than copper.
31. _____ insulation is provided between two adjacent commutator segments.
32. The thickness of mica insulation between commutator segments is _____ to _____ mm.
33. The gap between commutator assembly and armature core is to accommodate the _____ .
34. The axial slots on the armature surface are provided to accommodate the _____ .
35. The armature shaft is invariably made of _____ .

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

36. Number of coils arranged in groups is called the _____ .
37. D C machines employ _____ coil winding.
38. Lap winding is suitable for _____ current but _____ voltage generators.
39. Wave winding is suitable for _____ current but _____ voltage machines.
40. A 4-pole lap wound dc generator generates 200 V at 1,000 rpm. If this generator is now wave wound and runs at 500 rpm, the generated voltage will be _____ . [U.P. Technical Univ. First Semester 2009-10]
41. In dc machines, the field flux axis and armature mmf axis are respectively along _____ axis and _____ axis. [A.M.I.E. Sec B. Summer 2000]
42. _____ is attributed to the effect of magnetic field set up by the armature current.
43. A brush shift of 5° in a 4-pole machine means a brush shift of _____ electrical degrees.
44. Brushes are shifted to the _____ neutral axis in order to eliminate reactance voltage to be induced in the coil undergoing commutation.
45. In a dc machine, the armature reaction and the inductance of commutating coils causes over/under/linear/sinusoidal commutation.
46. Under commutation results in sparking at the _____ edge of the brush.
47. The self induced emf in the coil undergoing commutation is called the _____ voltage.
48. The interpole air gap is _____ than that under the field poles in dc machines.
49. A dc machine is provided with both interpole and compensating windings. These two windings with respect to armature circuit will be in _____ .
50. Interpole winding is connected in _____ with the armature circuit.
51. Commutation in a dc machine can be improved by increasing the _____ resistance. [A.M.I.E. Winter 1997]
52. A 200 V, 10 kW lap-wound dc generator has 10 poles and 500 conductors on its armature. If the pole face covers 80% of the pole pitch, the pole face conductors required to fully compensate for armature reaction will be _____ conductors per pole. [GATE 1997]
53. When the field coils are excited by the generator itself, it is called a _____ excited generator.
54. Series field winding consists of _____ turns of _____ wire.
55. Shunt field winding consists of _____ turns of _____ wire.
56. The armature current and field current will be equal in case of _____ wound generators.
57. The series field of a short shunt generator is excited by _____ current.
58. If the load resistance in a series wound dc generator exceeds the critical value the generator will _____ .
59. The slight curvature at the lower end of a self excited generator is due to _____ .
60. A dc series generator is provided with divertor and is delivering its rated current. If the divertor switch is opened, the terminal voltage will _____ .
61. The terminal voltage of a dc shunt generator on load will _____ slightly.
62. An external resistance added in the field circuit of a dc shunt generator will cause _____ in terminal voltage.
63. A differentially compounded dc generator is delivering full-load current at a terminal voltage of 220 V. If the series field winding is short circuited its terminal voltage will _____ . [A.M.I.E. Sec B. Summer 2000]
64. When the load resistance of a dc shunt generator is less than critical value, the generator will _____ .
65. If the shunt field is connected across the armature only in a dc compound generator. the generator is said to be _____ shunt compound dc generator.
66. The dc generator used for supplying load at quite distant from the generating station is the _____ dc generator.
67. _____ type dc generator is used for arc welding.
68. For parallel operation, the dc generators normally preferred are _____ and _____ generators.
69. A 500 V, 15 kW dc motor will draw approximately _____ amperes from supply mains.
70. The maximum end play in an electric motor is about _____ .
71. A dc motor operates on the basic principle that a current carrying conductor placed in a magnetic field experiences a _____ .
72. The back emf of dc motor is given by E_b _____ . [G.B. Technical Univ. First Semester 2010-11]
73. The voltage drop at brushes in a dc machine will be about _____ volts.
74. The dc motors are compared by their _____ regulation where as the dc generators are compared by their voltage regulation.
75. The current flowing through armature conductors of a dc motor is _____ .
76. The current drawn by a dc motor at the starting instant will be _____ .
77. The output power of any electrical motor is taken from _____ .
78. The current drawn by a 120 V dc motor of armature resistance 0.4 Ω and back emf 112 V is _____ . [Mahamaya Technical Univ. Second Semester 2010-11]
79. In case of a conductively compensated dc series motor, the compensating winding is provided in _____ with the armature winding.
80. The dc compound motors are usually _____ compound.
81. In a dc compound motor the field regulator is provided to control the _____ .
82. The direction of rotation of a dc motor is determined by Fleming's _____ hand rule.
83. The direction of rotation of a dc compound motor can be reversed by interchanging _____ connections.
84. If the flux of a dc motor approaches zero, its speed will approach _____ .
85. The speed of a dc shunt motor _____ slightly from no load to full load.
86. The efficiency of a dc motor when developing maximum power will be _____ than 50%.
87. The horse power obtained from the motor shaft is called the _____ horse power.
88. The torque developed by the armature is proportional to the product of flux per pole and _____ .
89. In a dc motor, the shaft torque is less than armature torque. This is due to _____ loss.
90. When the field of a dc motor is weakened, the speed of the motor _____ .
91. DC series motor is a _____ speed motor.
92. When an electric train is moving down a hill, the dc motor will operate as a dc _____ generator.
93. It is advisable to start a dc series motor with some load to limit the _____ .
94. The speed of a dc series motor at no load will be _____ .

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

95. When a dc cumulative compound wound motor is loaded, torque _____ and speed _____ .

96. A separately excited dc motor has to be run at 125% rated speed when delivering 50% torque. The excitation will be _____ per cent. [GATE E.E. 1991]

97. A separately excited dc motor has an armature resistance of 0.5 Ω. It runs off at 250 V dc supply drawing an armature current of 20 A at 1,500 rpm. The torque developed for an armature current of 10 A will be _____ for the same field current. [GATE E.E. 1992]

98. Flywheel is employed with dc compound motor to reduce peak demand. The compound motor should be level/cumulative/differential compound.

99. _____ motor has self load relieving properties. [U.P. Technical Univ. Second Semester 2009-10; M.T.U. Second Semester 2010-11]

100. _____ motor will be preferred for elevators. [U.P. Technical Univ. Second Semester 2009-10; M.T.U. Second Semester 2010-11]

101. DC _____ motors are preferred for hoists and cranes.

102. DC _____ motors are best suited for electric traction.

103. A dc shunt motor may be considered as a _____ speed motor.

104. The speed of a dc shunt motor with armature reaction is _____ than that with no armature reaction.

105. For the same rating a dc series motor has _____ starting torque in comparison to that of a dc shunt motor.

106. In case of a dc shunt motor, the starting torque will be _____ times the full-load torque for a starting current of 1.75 times the full-load current.

107. Speed regulation of _____ to _____ per cent can be expected in case of dc shunt motors.

108. The _____ compound motors are employed in rolling mills.

109. The _____ compound dc motors are rarely used.

110. Hoist and cranes require _____ starting torque.

111. The dc motor most suitable for applications requiring high starting torque is series/shunt/differential compound.

112. The dc motor that draws almost same power at different loads is _____ wound.

113. _____ wound dc motor has self relieving property.

114. _____ wound dc motor has almost constant speed over their full-load range.

115. On switching a dc motor to dc supply mains, it is found to rotate in the direction opposite to that for which it is designed. The motor is _____ .

116. In dc motors, field control method is used to have speeds _____ rated one.

117. Speed variation of a dc shunt motor by field flux control is suitable for constant _____ drive. (torque/power) [A.M.I.E. Sec B. Summer 1993]

118. The resistance of the field regulator of a dc shunt motor is of the order of _____ ohms.

119. A dc shunt motor is fitted with a field regulator for speed control. For a constant torque load the speed will be minimum for a regulator resistance of _____ ohms.

120. A variable resistor in series with a shunt field winding in a dc machine is called _____ . [A.M.I.E. Winter 1997]

121. In a dc motor, armature resistance control is used to provide speeds _____ rated one.

122. The armature voltage control is suitable if the dc machine is driven at constant _____ . [A.M.I.E. Summer 1997]

123. Ward Leonard control is basically a/an _____ control method.

124. Ward Leonard control provides speed control in _____ direction(s).

125. The function of the field regulator in a dc compound motor is to control the _____ current.

126. Series-parallel control of dc series motors widely used in electric traction gives a speed range of approximately _____ .

127. In series-parallel control of dc series motors, the torque produced in series arrangement will be _____ of that in parallel arrangement.

128. The field coil of a two-pole dc series motor is made up of two identical sections. In one case (*i*) two sections of the field coil are connected in series, and in another case (*ii*) the two sections are connected in parallel. If the motor takes the rated current in both the cases, then torque (*i*) : torque (*ii*) is _____ and speed (*i*) : speed (*ii*) is _____ (Neglect the effect of magnetic saturation). [GATE E.E. 1997]

129. DC shunt motor at the instant of starting when connected to dc supply mains, behaves like a _____ resistance circuit.

130. A dc motor at the starting instant takes a current _____ to _____ times the full-load current.

131. The function of a starter in a dc motor is to limit the _____ to a safer value.

132. A DOL starter is employed for starting electric motors of rating up to _____ .

133. When the starter arm reaches ON position the starting resistance is completely cut off and the motor starts running at _____ speed.

134. In a three point starter of dc motors the no-volt release coil is connected in _____ with the motor field.

135. Overload release coil in a dc motor starter carries _____ load current.

136. A two-point starter is employed for starting of a dc _____ motor.

137. A face plate starter is used for starting of a dc _____ motor.

138. _____ braking is an inherent characteristic of a dc shunt motor but it cannot be applied to dc series motors in an ordinary way.

139. The most economical method of electric braking is _____ one.

140. In dc motors, the plugging is affected by reversing the _____ terminals.

141. In plugging of a dc shunt motor, the resistance is inserted in the armature circuit to limit the _____ .

142. The electric braking system commonly used in rolling mills, elevators and printing presses is _____ .

143. In a properly designed dc generator of 5 kW capacity, the total losses may be of the order of _____ watts.

144. The armature copper losses are proportional to the square of the armature current and are about _____ to _____ of full load losses.

145. In a dc machine, armature circuit copper losses are usually around _____ per cent of output.

146. Field copper losses include copper losses occuring in shunt field, series field and _____ .

147. Field copper losses are _____ to _____ per cent of the full-load losses.

148. Mechanical losses are _____ to _____ per cent of the full-load losses.

149. The efficiency of a dc machine will be _____ when variable losses are equal to constant losses.

150. DC machines are designed to have maximum efficiency around _____ .

151. A 5 kW, 200 V dc shunt motor has an armature resistance of 1 Ω and shunt field resistance of 100 Ω. At no load the motor draws 6 A from a 200 V supply and runs at 1,000 rpm. The rotational loss of the machine is _____ W and the no-load torque is _____ Nm. [GATE E.E. 1997]

152. Brake test is performed on small dc machines for determination of _____ .
153. _____ voltage is applied while performing Swinburne's test on dc machines.
154. Fully compensated cross-field generator is called the amplidyne and undercompensated cross-field generator is called the _____ .
155. The power input to the amplidyne is of the order of _____ .
156. Metadynes should _____ be operated on open circuit.
157. Amplidynes should never be operated on _____ .
158. The output rating of the armature of a metadyne is about _____ times of that of the same armature in an ordinary dc generator.
159. The _____ type cross-field generator which has full compensation has the _____ output voltage.
160. Third brush generators are usually designed for _____ shunt field and a _____ armature reaction field.

CHAPTER 4

AC Machines

Short Answer Type Questions With Answers

Q. 1. Why does a transformer has iron core ? **[P.T.U. December 2000]**

Ans. The use of iron or steel for transformer core ensures a high permeability of the magnetic circuit and because of high permeability the magnitude of exciting current necessary to create the required flux in the core is small. The presence of steel core also causes 100% of magnetic flux created by primary to be linked with secondary.

Q. 2. Why is the efficiency of a transformer maximum among electrical equipments ? Explain. **[P.T.U. 1999]**

Ans. Owing to lack of rotating parts in a transformer, there are no friction and windage losses. The other losses such as iron losses are also comparatively small because of better magnetic material and less handling of the material. So the efficiency of transformer is maximum among electrical equipments.

Q. 3. What is one-to-one transformer ? What is its application ? **[R.G.T.U. Bhopal June 2002]**

Ans. The transformer having equal turns in primary and secondary windings is called the one-to-one transformer. Such transformers are used for isolating the load from supply.

Q. 4. Explain with reasons what happens when a power transformer is connected to dc supply of the same voltage rating ?

Ans. If a rated dc voltage is applied to the primary of the transformer, the flux produced in the transformer core will not vary but remain constant in magnitude and, therefore, there will be no self induced emf in the primary winding (which is only possible with varying flux linkage) to oppose the applied voltage and since the resistance of the primary winding is quite low, a heavy current will flow through the primary winding that may cause burning out of the primary winding.

Q. 5. What are the properties of an ideal transformer? **[G.G.S.I.P. Delhi Univ. May 2005]**

Ans. The properties of an ideal transformer are (*i*) no winding resistance (*ii*) no magnetic leakage (*iii*) no iron loss and (*iv*) zero magnetizing current *i.e.* an ideal transformer is assumed to consist of two purely inductive coils wound on a loss-free core.

Q. 6. What is the difference between an ideal and practical transformer ? **[P.T.U. January 2000]**

Ans. An *ideal transformer* is an imaginary transformer that has no winding resistance, no magnetic leakage, no iron loss and zero reluctance while a *practical transformer* is an actual transformer which operates at a particular frequency and has winding resistance, magnetic leakage, iron loss, copper loss, and magnetic reluctance.

Q. 7. The primary of a single phase transformer having a turn-ratio 1:2 is connected to a 10 V dc source while its secondary is connected to a 10 Ω resistor. What is the value of the steady state current in the resistor ? **[A.M.I.E. Sec B. Summer 1993]**

Ans. Zero.

Q. 8. What do you know about the no-load current of a transformer ?

Ans. The current drawn by primary winding of a transformer on no load is called the no-load or exciting current. It is very small in magnitude in comparison to the full-load primary current (2 to 5 per cent of full-load current). It has two components—energy component (comparatively very small) to meet the iron loss in addition to small amount of copper loss occurring in the primary winding and magnetising component relatively large to create the alternating flux in the core.

Q. 9. Does the magnetising current of a transformer lie in phase with the applied voltage ? **[A.M.I.E. Sec. B. Summer 1992]**

Ans. No; the magnetising current of a transformer lags behind the applied voltage by 90°.

Q. 10. Explain how in a transformer, as the secondary current increases, primary current also increases. **[P.T.U. May 2002]**

Ans. When the secondary current of a transformer increases, the secondary ampere-turns (N_2I_2) create more secondary flux. This increased secondary flux opposes the main flux ϕ set up by the exciting current I_0. Thus main flux ϕ is weakened momentarily by the opposing increased secondary flux ϕ_2 and, therefore, difference of applied voltage V_1 and back emf E_1 increases, consequently, more current is drawn from the source of supply flowing through the primary winding until the original value of flux ϕ restores. The extra current drawn from the

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

supply source increases the primary ampere-turns (N_1I_1') and compensates the extra secondary ampere-turns i.e. $N_1I_1' = N_2I_2$

Thus in a transformer when the secondary current increases, primary current also increases.

Q. 11. How does the leakage flux occur in a transformer ? **[P.T.U. December 2000]**

Ans. In actual practice the total flux created does not link the primary and secondary windings but is divided into three parts namely the main flux ϕ linking both the primary and secondary windings, primary leakage flux ϕ_{L_1}, linking with primary winding only and secondary leakage flux ϕ_{L_2}, linking with secondary winding only.

The flux set up by the primary or secondary which is set up in the core linking with its own turns and not linking with the other is known as *leakage* flux.

Q. 12. What is leakage reactance of transformers ? **[P.T.U. December 2003]**

Ans. Leakage fluxes of primary and secondary produce self inductances L_1 given as $\frac{N_1\phi_{L1}}{I_1}$ and L_2 given as $\frac{N_2\phi_{L2}}{I_2}$ in the respective windings i.e. primary and secondary. These inductances, in turn, produce inductive reactances X_1 given as $2\pi fL_1$ and X_2 given as $2\pi fL_2$ which cause voltage drop in respective windings lagging behind the currents I_1 and I_2 respectively by 90°. The reactances produced by leakage fluxes are called the leakage reactances.

Q. 13. What is the effect of leakage flux in a transformer ? What is meant by magnetising current ? **[P.T.U. June 2000]**

Ans. The effect of leakage flux is to develop into their respective windings emfs of self inductance which are proportional to the current, and are, therefore, equivalent in effect to the addition of an inductive coil in series with each winding. The component of no-load current used to create the flux in the transformer core is known as magnetising current.

Q. 14. Explain with reasons what happens when the primary terminals of a single phase transformer are connected to the rated ac supply while secondary terminals are short-circuited.

Ans. The transformer with secondary short-circuited becomes equivalent to a coil having an impedance equal to impedance of both windings, which is quite small. When the primary terminals of the transformer are connected to the rated ac supply, heavy current will flow through primary and secondary windings that may cause burning out of these windings.

Q. 15. Define voltage regulation of a transformer. **[UP Technical Univ. 2003-04; G.G.S.I.P. Univ. Delhi May 2005]**

Ans. Voltage regulation of a transformer is defined as the change in magnitude of terminal or secondary voltage, when full load (rated load) of specified power factor supplied at rated voltage is thrown off (reduced to no load) with primary voltage and frequency held constant, as percentage of the rated terminal voltage.

Q. 16. Is the regulation at rated load of a transformer same at 0.8 pf lag and 0.8 pf lead ? **[A.M.I.E. Sec B. Summer 1992]**

Ans. No; the regulation obtained is different at leading and lagging power factors.

Q. 17. What type of load should be connected to a transformer for getting maximum voltage regulation ? **[A.M.I.E. Sec B. Winter 1996]**

Ans. Inductive load having phase angle of $\phi = \tan^{-1}\frac{X_{eq}}{R_{eq}}$.

Q. 18. What type of load should be connected to a transformer for getting negative voltage regulation ?

Ans. Highly capacitive load.

Q. 19. Is the percentage impedance of a transformer different on the primary or on the secondary side ? **[A.M.I.E. Sec B. Summer 1992]**

Ans. No; the percentage impedance of a transformer remains the same on both sides.

Q. 20. Will the voltage regulation of a transformer based on its primary referred equivalent circuit be the same as that when the equivalent circuit is referred to the secondary ? **[A.M.I.E. Sec B. Summer 1993]**

Ans. Yes; voltage regulation will be the same if magnetising component of current is neglected.

Q. 21. On what factors does the hysteresis loss depend ? Why can this loss be assumed to be constant ? **[P.T.U. December 2000]**

Ans. Hysteresis loss depends upon the type of material, volume of the material, frequency of reversal of magnetic field and maximum value of flux density in the core of the material i.e. $P_h = \eta\,(B_{max})^{1.6} f v$ watts

Since from no-load to full-load the flux linking with the core and frequency remains constant, hysteresis loss is assumed to remain constant.

Q. 22. On what factors does the eddy current loss depend ? Why this loss can be assumed to be constant ? **[P.T.U. June 2000]**

Ans. The eddy current loss depends on the maximum value of flux density in the core and supply frequency for a given core (i.e nature of magnetic material, volume of the core, and thickness of laminations remaining unchanged). Since from no-load to full-load the flux linking with the core and frequency remain constant, the eddy current loss remains constant.

Q. 23. List out various losses that take place in a transformer. Which loss is independent of load ? **[P.T.U. June 2003]**

Ans. Iron or core losses consisting of hysteresis and eddy current losses. These losses occur in the core and yoke due to alternating flux.

Copper losses occuring in primary and secondary windings due to their resistances when the transformer is loaded.

Iron losses are independent of load, and therefore, are called the constant losses.

Q. 24. Does eddy current loss of a transformer depend on the applied voltage ? **[A.M.I.E. Sec B. Summer 1992]**

Ans. Yes, eddy current loss depends upon the applied voltage. If the transformer is operated with increased voltage but at the same frequency the eddy current loss increases due to increase in value of peak value of flux density and if applied voltage is increased with increase in frequency, the proportion of increase being the same in both, the eddy current loss increases due to increase in supply frequency.

Q. 25. If the supply frequency is doubled, which loss component in transformer will double ? **[A.M.I.E Sec B. Winter 1992]**

Ans. Due to doubling of supply frequency, the hysteresis loss component will be double.

Q. 26. What is the purpose of the markings on transformer leads ?

Ans. They are there for standardization, so that the transformer polarities may be recognizable for any type of use.

Q. 27. What is the advantage of predetermining the performance of electrical machines through open-circuit and short-circuit test data ? **[P.T.U. January 2000]**

Ans. The advantage of predetermining the performance of electrical machines through open-circuit and short-circuit test data is that we can know the behaviour and characteristics of the machine that will show during actual operating conditions and on this basis we can select the machine meeting our requirements.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 28. What is meant by equivalent circuit of a transformer?

Ans. An electrical circuit that can represent behaviour of the transformer to an approximation is called its equivalent circuit.

Q. 29. How may the iron loss be reduced to a minimum in a transformer?

Ans. The iron loss may be minimised by using steel of high silicon content for the transformer core and by using very thin laminations (0.35 to 0.5 mm thick) insulated from each other by insulating varnish or by layers of papers.

Q. 30. What are typical informations that can be had by performing open- and short-circuit tests on transformer ?

Ans. Iron and copper losses and the parameters of the equivalent circuit of the transformer can be determined from the open-circuit and short-circuit tests and so the voltage regulation and efficiency of the transformer can be determined.

Q. 31 In a transformer short circuit test, all the losses are attributed only to copper loss. Why ?

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. Since the applied voltage to the primary of transformer is very low (5 to 8% of rated voltage) in short-circuit test, the flux produced in the core is very small and, therefore, iron losses are very small and can be neglected and hence all the losses are attributed to copper losses.

Q. 32. Why copper losses are neglected in open-circuit test?

Ans. Since no current flows in the open-circuited secondary and the current in the primary will also be very small (usually 3 to 10% of full-load current), the copper losses in the open-circuit test will be so small that these can be neglected.

Q. 33. Why are iron or core losses assumed to remain constant from no load to full-load in a power transformer ?

Ans. Since iron or core losses depend on the flux density and supply frequency for a given transformer core and flux density and supply frequency remain the same from no-load to full-load, iron or core losses are assumed to remain constant from no-load to full-load.

Q. 34. Why the *lv* winding is normally short-circuited during short-circuit test ?

Ans. Voltage required for the short-circuit test is very low (about 5 percent of the rated value) and if the measurements are made, by short-circuiting hv winding, on lv side, the voltage required would be inconveniently low, while the current would often be inconveniently large.

Q. 35. What is the condition for maximum efficiency in transformer ?

[P.T.U. December 2003]

Ans. Efficiency of a transformer will be maximum on such a load at which variable loss (copper loss) becomes equal to constant loss (iron loss).

Q. 36. Is the efficiency of a transfromer same at the same load at 0.8 pf lag and 0.8 pf lead ?

Ans. Yes, the efficiency of a transformer remains the same for a given load at a given power factor irrespective of the fact whether the pf is lagging or leading.

Q. 37 When will be the ordinary efficiency of a given transformer minimum ? **[A.M.I.E. Sec B. Electrical Machines Summer 2007]**

Ans. The ordinary efficiency of a given transformer will be minimum at no load or when supplying load at zero pf.

Q. 38. What factor makes "all-day efficiency" different to "conventional" efficiency in a transformer ?

[A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. There are certain types of transformers whose performance cannot be judged by ordinary or commercial efficiency. For instance, distribution transformers are energized for 24 hours, but they deliver very light loads for major portion of the day. Thus iron or core loss occurs for the whole day but the copper loss occurs only when the transformer is loaded. The performance of such a transformer must be judged by its *all-day efficiency*, also called the *energy efficiency* or *operational efficiency* which is computed on the basis of energy consumed during the whole day (24 hours).

The all-day efficiency is defined as the ratio of energy (kWh) output over 24 hours to the energy input over the same period.

$$\textit{i.e.} \qquad \text{All-day efficiency} = \frac{\text{Output in kWh}}{\text{Input in kWh}}$$

Since the distribution transformer does not supply the rated load for the whole day so the all-day efficiency of such a transformer will be less than ordinary or commercial efficiency.

Variation of copper loss depending upon the load supplied and remaining of iron loss constant irrespective of load supplied makes the all day efficiency different from conventional efficiency of a transformer.

Q. 39. Why is laminated core used in the transformer?

[M.D. Univ. May 2003]

Ans. Laminated core is used in the transformer to reduce the eddy current loss.

Q. 40. Why is an iron-silicon alloy core used in a transformer?

[P.T.U. December 2005]

Ans. Iron-silicon alloy core is used in a transformer to ensure a high permeability of the magnetic circuit and keep the iron loss the minimum possible.

Q. 41. Why silicon content in electrical sheet steel is limited to 4.5 to 5% ? **[A.M.I.E. Sec B. Winter 1993]**

Ans. Silicon content exceeding 5% makes the sheet steel brittle and so causes problem in punchings.

Q. 42. Why is the area of yoke of a transformer usually kept 15–20% more than that of core ? **[A.M.I.E. Sec B. Winter 1994]**

Ans. By keeping yoke area 15–20% more than the core, flux density in the yoke is reduced, resulting into reduction in iron loss for the yoke.

Q. 43. What is the cause of noise in transformers ?

[A.M.I.E. Sec B. Winter 1994]

Ans. In a transformer, noise occur mainly due to loosening of stampings and mechanical forces developed during operation.

Q. 44. Why mittred core is preferred in large transformers ?

[A.M.I.E. Sec B. Winter 1993]

Ans. The iron loss and the exciting current are reduced with mittred joints because flux lines are made along the direction of grain orientation.

Q. 45. Why lv winding is placed first on the core and then hv winding in case of a core type transformer ? **[A.M.I.E. Sec B. Winter 1993]**

Ans. Placing of lv winding near the core and hv winding around the lv winding in a core type transformer reduces the amount of insulation materials required.

Q. 46. Is it possible for any voltage winding to serve as primary ?

[A.M.I.E. Sec B. Winter 1993]

Ans. Any voltage winding can serve as primary or secondary winding provided its current and voltage ratings are not exceeded.

Q. 47. Why circular coils are always preferred over rectangular coils for winding a transformer ? **[A.M.I.E. Sec B. Summer 1995]**

Ans. Circular coils are preferred for winding a transformer as they can be easily wound on machines, conductors can easily be

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

bent and winding does not bulge out due to radial forces developed during operation.

Q. 48. In what type of transformers sandwich coils are used ? What advantages are gained by the use of sandwich coils ?

[A.M.I.E. Sec B. Winter 1996]

Ans. Sandwich coils are used in shell type transformers for lv and hv windings. The advantage gained by the use of sandwich coils is very low value of leakage reactance resulting in low voltage drops and so voltage regulation.

Q. 49. Why excessive insulation is harmful to a coil. ?

[A.M.I.E. Sec B. Winter 1993]

Ans. Excessive insulation makes heat transfer poor.

Q. 50. What are the functions of transformer oil ?

[A.M.I.E. Sec B. Winter 1993]

Ans. It provides additional insulation, protects the insulation from dirt and moisture and it carries away the heat generated in the cores and coils.

Q. 51. Transformers are rated in kVA instead of kW. Why ?

[A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. Electrical apparatus or machine is usually rated at the load, which it can carry without overheating and damage to insulation *i.e.* rating of electrical machine (transformer) is governed by the temperature rise caused by its internal losses. The copper losses in transformer windings depends upon the strength of the output current and core loss on voltage and thus these losses are independent of pf and the transformers are rated in kVA instead of kW.

Q. 52. What is a 3-ϕ transformer ?

Ans. A 3-ϕ transformer is that transformer which is equivalent to three single phase transformers but wound on one core and enclosed within one common case.

Q. 53. To which vector group(s) will a star (hv side) and delta (lv side) connected transformer belong ?**[A.M.I.E. Sec B. Winter 1995]**

Ans. 3_2 and 4_2.

Q. 54. What is open Δ connection ?

[A.M.I.E. Sec B. Electrical Machines Winter 2006]

Ans. In the delta-delta connections of three single phase transformers, if one transformer is removed, the resulting connection is known as open-delta connection. Open-delta connection has the VA rating of $\frac{1}{\sqrt{3}}$ *i.e.* 0.577 times the rating of normal delta connection.

Q. 55. Secondaries of a three-phase transformer bank are connected in delta If the phase voltages are each equal to V, what emf would act around the delta if one phase were reversed.

[A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. When one phase of secondaries of a three-phase transformer bank connected in delta is reversed, the emf acting around the delta would be equal to twice the phase voltage i.e. 2 V, instead of zero voltage.

Q. 56. In a star-star connected transformer, if a delta tertiary is provided, what is the major reason? **[A.M.I.E. Sec B. Winter 1996]**

Ans. In a star-star connected transformer, a delta tertiary is provided to allow sufficient earth fault current to flow for operation of protective equipment, to suppress harmonic voltages, and to limit voltage unbalance when the main load is unsymmetrical.

Q. 57. Is it possible to connect phasor group I and phasor group II transformers in parallel ? **[A.M.I.E. Sec B. Winter 1996]**

Ans. Yes.

Q. 58. While connecting transformers in parallel, what factors must be taken into consideration ?

Ans. Their electrical characteristics such as voltage ratio, percent impedance, phase displacement, phase sequence, polarity.

Q. 59. If transformers with different electrical characteristics are connected in parallel, what will happen?

Ans. They will not share the load equally.

Q. 60. A 2-winding transformer is used to step-down the voltage from 220 V to 110 V. If an auto-transformer is used for the same purpose, what would be the ratio of copper weights in them? **[A.M.I.E. Sec B. Summer 1995]**

Ans. 0.5.

Q. 61. Why an additional central limb with an air gap is sometimes provided in welding transformers? **[A.M.I.E. Sec B. Summer 1997]**

Ans. To increase the value of leakage flux so that its leakage reactance increases.

Q. 62. How is a transformer rated ?

Ans. A transformer is specified by its kVA (or MVA) output, voltage (primary/secondary) and frequency rating.

Q. 63. What are the essential elements for generating emf in alternators ?

[Bharathiyar Univ. April 1997]

Ans. The essential elements for generating emf in alternators are prime mover, stator, rotor and exciter.

Q. 64. Why is it possible to design alternators to generate much higher voltages than dc generators ? **[A.M.I.E. Sec B. Summer 1997]**

Ans. In case of an alternator, field system is rotating and armature is stationary and it is easier to insulate stationary armature winding for very high voltage because insulation of stationary armature is not subjected to mechanical stresses due to centrifugal action and more space is available on the armature for providing more insulation as the stator is outside the rotor. In case of dc generators field is stationary and armature is rotating.

Q. 65. What type of alternators will be used (*a*) for hydraulic turbines (*b*) for steam turbines as prime-movers ?

[Madras Univ. Nov. 1996]

Ans. (*a*) Salient pole type (*b*) smooth cylindrical rotor type.

Q. 66. What is the maximum speed of a 50 Hz alternator ?

[A.M.I.E. Sec B. Winter 1994]

Ans. 3,000 rpm.

Q. 67. In an alternator, smooth rotor is used for high speeds and salient pole rotor for low speeds. Why ?

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. The salient pole type field structure is used almost entirely for low speed alternators, since it is least expensive and provides ample space for the field ampere-turns but it cannot be used for high speed alternators on account of high peripheral speed and the difficulty of obtaining sufficient mechanical strength. So non-salient pole field structure is used for high speed operation.

Q. 68. Which one of the cylindrical and salient pole alternators is more stable ? **[A.M.I.E. Sec B. Summer 1993]**

Ans. Salient-pole alternator is more stable.

Q. 69. Do we use laminations for all the iron parts of an electrical machine ? **[A.M.I.E. Sec B. Summer 1996]**

Ans. All the iron parts of an electrical machine are laminated except the end covers and outer stator frame. The laminations are used to reduce the eddy current loss.

Q. 70. Why are the poles and pole shoes laminated ?

[Bharathiyar Univ. Nov 1996]

Ans. For reducing eddy current loss.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 71. Why machines having long core length are provided with radial ventilating ducts while machines having deep cores are provided with axial cooling. [A.M.I.E. Sec B. Summer 1995]

Ans. Radial ventilating ducts provided with long core machines take away heat at faster rate. Similarly in case of deep cores axial ventilating ducts do. Otherwise the central portion of long core and the inner portion of deep core may attain a temperature higher than the permissible value.

Q. 72. What is the role of damper winding in (*a*) synchronous generator and (*b*) synchronous motor ? [A.M.I.E. Sec B. Summer 1995]

Ans. (*a*)In a synchronous generator damper winding is provided to suppress the negative sequence field and to damp the oscillations when the generator starts hunting.

(*b*) In a synchronous motor, damper winding is provided to develop starting torque so as to make the motor self starting and to develop damping torque when the machine starts hunting.

Q. 73. Why are squirrel cage bars placed in the pole faces of an alternator ? [A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. Squirrel cage bars are placed in the pole faces of an alternator in order to reduce the swinging amplitude (hunting).

Q. 74. Why rotating machines with aluminium armature coils have increased leakage reactance ? [A.M.I.E. Sec B. Winter 1996]

Ans. Rotating machines with aluminium armature coils need more space to accommodate conductors and so large size of stator slots resulting into increased leakage reactance.

Q. 75. Why are distributed windings preferred over concentrated windings ? [M.S. Univ. April 1996]

Ans. Distributed windings are preferred over concentrated windings as they (*i*) improve waveform of induced emf (*ii*) provide better utilization of core (*iii*) diminish armature reaction and (*iv*) facilitate cooling.

Q. 76. What is the necessity for chording in the armature winding of a synchronous machine ? [M.S. Univ. April 1996]

Ans. The armature winding is chorded in order to (*i*) improve the waveform of induced emf (*ii*) save copper in the coil ends due to less span and (*iii*) reduce inductance of the winding.

Q. 77. A full pitch coil in an alternator has a span of 18 slots. What should be the span if the third harmonic component of the emf is to be eliminated ? [A.M.I.E. Sec B. Summer 1997]

Ans. 12 slots.

Q. 78. What is meant by "armature reaction" of a synchronous machine? [Madras Univ. April 1997]

Ans. The effect of armature flux on the main field flux is known as armature reaction. Armature reaction has distorting effect on unity power factor, wholly demagnetising at zero power factor lagging and wholly magnetising at zero power factor leading.

Q. 79. What parameter of load influences the armature reaction of an alternator ? [A.M.I.E. Sec B. Winter 1996]

Ans. Power factor of load.

Q. 80. Does the armature mmf of an alternator delivering a capacitive load magnetise or demagnetise the main field. [A.M.I.E. Sec B. Summer 1993]

Ans. Magnetises.

Q. 81. When the load on an alternator is varied, its terminal voltage is also found to vary. Why ? [Madras Univ. April 1996]

Ans. With the variation in load on an alternator, voltage drops due to (*i*) armature resistance (*ii*) armature leakage reactance and (*iii*) on account of armature reaction vary, so its terminal voltage varies

Q. 82. Why is the short-circuit characteristic of an alternator linear? [A.M.I.E. Sec B. Summer 1993]

Ans. The short-circuit characteristic is normally a straight line through the origin because the net excitation is so small that there is no saturation in the magnetic circuit.

Q. 83. What are the effects on voltage regulation of an alternator of power factor (a) at lagging power factor and (b) leading power factor. [Madras Univ. April 1997]

Ans. The regulation of an alternator is positive and increases with the decrease in lagging power factor. The regulation of an alternator improves first with the decrease in leading power factor, becomes unity and further decrease in leading power factor makes the regulation negative and increasing.

Q. 84. Is it possible for an alternator to have full-load terminal voltage greater than the no-load terminal voltage ? [A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. Yes, it is possible for an alternator to have full-load terminal voltage greater than the no-load terminal voltage. It occurs when the load supplied by the alternator a highly capacitive i.e. the current supplied by the alternator leads the voltage.

Q. 85. Define voltage regulation of an alternator. [A.M.I.E. Sec B. Electrical Machines Summer 2005]

Ans. Voltage regulation of an alternator is defined as the increase in terminal voltage, expressed as percentage (or per unit) of the rated terminal voltage, when the load at a given power factor is thrown off, with speed and field current remaining the same.

i.e. Voltage regulation $= \frac{E_0 - V}{V}$ per unit

$= \frac{E_0 - V}{V} \times 100$ in percentage

where E_0 is no-load terminal voltage and V is the full-load terminal voltage.

Q. 86. Why does synchronous impedance method give a poorer voltage regulation ? [A.M.I.E. Sec B. Summer 1994]

Ans. In synchronous impedance method of determination of voltage regulation synchronous reactance is assumed to be constant while actually it varies with the saturation (at low saturation its value is higher because the effect of armature reaction is larger than that at high saturation). Now under short-circuit conditions, saturation is very low and, therefore, the value of synchronous impedance measured is higher than that in actual operating conditions and the regulation determined is higher than actual one.

Q. 87. Which method of regulation is called pessimistic and why ? [Bharathiyar Univ. April 1997]

Ans. Synchronous impedance or emf method of determination of voltage regulation of an alternator is pessimistic method. For reasons see answer to above question.

Q. 88. Determination of synchronous reactance of an alternator from open-circuit and short-circuit characteristics gives practically direct-axis synchronous reactance. Why is it so ? [A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. Determination of synchronous reactance of an alternator from open-circuit and short-circuit characteristics gives unsaturated value so practically direct-axis synchronous reactance.

Q. 89. What is the use of Potier triangle ? [A.M.I.E. Sec B. Winter 1996]

Ans. Potier triangle is used in determination of voltage regulation of an alternator.

Q. 90. Which is the parameter of an alternator that is found by zero power factor method ? [A.M.I.E. Sec B. Electrical Machines Summer 2007]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Leakage reactance drop, voltage drop due to armature reaction and armature reaction mmf are determined by zero pf method.

Q. 91. What are the characteristics required for Potier method of computing voltage regulation ? [Bharathidhasan Univ. Nov; 1995]

Ans. OCC, SCC and zero-power-factor full load voltage characteristic.

Q. 92. What is an air-gap line ? [M.S. Univ. April; 1996]

Ans. Tangent to OCC is called the air-gap line.

Q. 93. Two reaction theory is applied only to salient pole machines. State the reason. [M.S. Univ. Nov; 1996]

Ans. A multipolar machine with cylindrical rotor has a uniform air-gap and, therefore, its reactance remains the same, irrespective of the spatial position of rotor. But in case of salient pole machines, the air gap is not uniform and its reactance varies with the rotor position. Because of non-uniformity of the reluctance of the magnetic paths, the mmf of the armature is divided into two components viz. (*i*) a direct-acting component along the field pole axis, called the direct-axis and (*ii*) quadrature-component along the axis passing through centre of the interpolar space, called the quadrature-axis. These facts form the basis of the two-reactance theory applied to the salient pole machines.

Q. 94. In the slip test why are there fluctuations in the ammeter and voltmeter readings ? [A.M.I.E. Sec B. Electrical Machines Winter 2006]

Ans. Slip test is performed for determination of direct and quadrature axis reactances of a salient pole synchronous machine. The effective reactance offered by the machine goes on changing depends upon the position of field poles. It is found that current and voltages fluctuate at twice the slip frequency and therefore the ammeter and voltmeter readings would fluctuate.

Q. 95. Upon what factor does the power angle 'δ' depend ? [Bharathiyar Univ. April 1996]

Ans. Power angle δ depends upon supply voltage, armature current, power factor of load and quadrature component of synchronous reactance.

Q. 96. Why an alternator with low value of SCR has lower limit stability ? [A.M.I.E. Sec B. Winter 1996]

Ans. An alternator with low value of SCR has high value of X_d $\left(X_d = \frac{1}{SCR}\right)$ and, therefore, has lower stability limit because maximum power output of a machine is inversely proportional to X_d.

Q. 97. What is the effect of reducing excitation on a salient pole alternator ? What happens when E = 0 ? [A.M.I.E. Sec B. Electrical Machines Winter 2006]

Ans. When the excitation of a salient pole alternator is reduced, the voltage induced in the stator winding will be reduced. Initially the reduction in voltage is nonlinear but with larger reduction in excitation current the voltage is also reduced linearly. In case there is no field excitation i.e. E_0, the power developed due to excitation will be zero and power developed will be reluctance power.

Q. 98. Name the phenomenon giving rise to undesirable fluctuations in the synchronising power between an alternator and the bus to which it is connected. [A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. The phenomenon giving rise to undesirable fluctuations in the synchronising power between an alternator and the bus to which it is connected is referred to as *hunting*, oscillation of machine rotor about its equilibrium position.

Q. 99. What is a rotating magnetic field ?

Ans. A rotating magnetic field is that field which is constant in magnitude but whose axis of direction rotates in space like field system of a dc machine.

Q. 100. How can the direction of the stator revolving field be reversed ? [Bharathiyar Univ. April 1996]

Ans. The direction of the stator revolving field can be reversed by reversing any two of the three supply lines to the stator winding.

Q. 101. Why synchronous motors having no starting torque of their own? [U.P.S.C. I.E.S. Electrical Engineering-II, 2002]

Ans. In a 3-phase synchronous motor, armature winding is supplied power from a 3-phase supply mains while field winding is excited from a dc source. For production of torque it is essential that the relative velocity between the fields developed by armature and field windings is zero but at starting instant of a 3-phase synchronous motor, the field developed by field winding is stationary while the field produced by armature winding is a rotating magnetic field rotating at a synchronous speed of N_s given by 120*f*/P. Hence synchronous motors have no starting torque of their own.

Q. 102. What factors determine the number of poles of a synchronous motor ? [Bharathiyar Univ. Nov. 1995]

Ans. The number of poles of a synchronous motor is determined by supply frequency and speed.

Q. 103. A synchronous motor runs at N_S rpm at full load. What will be its speed if the load is reduced to half the full-load ? [A.M.I.E. Sec B. Summer 1993, Summer 1997]

Ans. N_s rpm.

Q. 104. Why a 3-phase synchronous motor will always run at synchronous speed ? [Madras Univ. April 1997]

Ans. The synchronous motor always runs at synchronous speed because there is an interlocking action between stator and rotor fields of this motor.

Q. 105. In a 3-phase synchronous motor field mmf lags the air-gap flux, then what is the position of air-gap flux vis-a-vis armature mmf ? [A.M.I.E. Sec B. Summer 1995]

Ans. It also lags.

Q. 106. Will the air-gap flux in a 3-phase synchronous motor lag or lead the armature mmf ? [A.M.I.E. Sec B. Summer 1996]

Ans. Air-gap flux will lag behind the armature mmf.

Q. 107. How the power factor of a synchronous motor is changed keeping the shaft load undisturbed ? [A.M.I.E. Sec B. Winter 1996]

Ans. By varying the field excitation.

Q. 108. Does the change in excitation affect the synchronous motor speed and power factor ? [Madras Univ. April 1996]

Ans. Change in excitation will affect the power factor (not the speed) of the synchronous motor.

Q. 109. What is the effect of increase in excitation of a synchronous motor ? [Bharathiyar Univ. April 1997]

Ans. When the excitation of a synchronous motor is increased, first power factor improves until it becomes unity and with the further increase in excitation the power factor becomes leading one and decreases.

Q. 110. Under what condition of power factor, armature mmf of a synchronous motor assists the field mmf. [A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. Under lagging power factor conditions, armature mmf assists the field mmf. This is because when the field current is smaller than normal field current, the field is weak and the motor draws the current from ac supply mains at lagging power factor so as to strengthen the field.

Q. 111. If V and E_0 be respectively the terminal voltage/phase and open-circuit emf/phase and θ is the internal angle of a

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

3-phase synchronous motor, what would be the relationship among them if the pf is to be lagging ?

[A.M.I.E. Sec B. Summer 1995]

Ans. $E_0^2 = V^2 + E_R^2 - 2VE_R\cos(\theta + \phi)$

Q. 112. What should be the relationship between power angle δ and internal angle θ for stable operation of a 3-phase synchronous motor working with constant excitation. If excitation is increased, what will happen to the power angle ?

[A.M.I.E. Sec B. Winter 1996]

Ans. Power angle δ should not exceed the internal angle θ for stable operation of a 3-phase synchronous motor.
With the increase in excitation power angle will decrease.

Q. 113. A 3-phase synchronous motor driving a constant load torque draws power from infinite bus at leading power factor. How power angle and power factor will change if the excitation is increased ? [A.M.I.E. Sec B. Summer 1996]

Ans. Both power angle and power factor will decrease.

Q. 114. A synchronous motor develops some mechanical power, even if the field is unexcited. Is it cylindrical or salient pole machine ? [A.M.I.E. Sec B. Winter 1995]

Ans. Salient pole.

Q. 115. A salient pole synchronous motor is running on no load from an infinite bus. If the field excitation is reduced to zero, what would happen to the motor ?

[A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. With excitation of salient pole synchronous motor reduced to zero, the real power will consist of reluctance power term which is independent of field excitation and the machine will remain synchronised to supply mains with the field unexcited so long as the electrical loading does not exceed reluctance power.

Q. 116. Compare the salient pole rotor and cylindrical pole rotor synchronous motor on stability point of view.

[Bharathiyar Univ. Nov. 1996]

Ans. Salient pole rotor machine is more stable than cylindrical pole rotor machine.

Q. 117. What is meant by V curves of synchronous motor ?

[Bharathiyar Univ. Nov. 1996]

Ans. The curves drawn between armature current and field current for different constant loads are known as V-curves.

Q. 118. How does the synchronous motor current change with excitation if the motor is to operate continuously at unity power factor ?

[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. When the armature current is minimum, the power factor is unity and the corresponding field current or excitation of the motor is known as normal field current or excitation of the motor for that particular load. The curve passing through points of unity pf at different loads is known as *normal field unity pf curve*. When the motor operates along this curve, armature current increases continuously with increasing load, the field current also increases but less rapidly.

Q. 119. When is a synchronous motor called as a synchronous capacitor ? [A.M.I.E. Sec B. Electrical Machines Summer 2005]

Ans. A synchronous motor operated without mechanical load with its field overexcited is referred to as a synchronous capacitor. Under such conditions, the motor draws leading current from the supply and acts as a capacitor.

Q. 120. Why are alternators put in parallel ?

[Bharathidhasan Univ. Nov. 1996]

Ans. For high efficiency of operation, reliability, convenience and economy in maintenance and repair and possibility of additions to plant capacity with the growth in load on the power station.

Q. 121. What is meant by synchronising of alternators ?

[Manonmanian Univ. Nov. 1996; Madras Univ. October 1995]

Ans. The process of connecting an alternator in parallel with another alternator or with the common bus-bars is called the synchronising.

Q. 122. A machine with a large air-gap has a higher synchronising power. Why ? [A.M.I.E. Sec B. Summer 1990]

Ans. A large air-gap offers a large reluctance to the path of the flux produced by the armature mmf and thus reduces the effect of armature reaction. This results in a small value of synchronous reactance and, therefore, a higher synchronising power because synchronising power is inversely proportional to the synchronous reactance.

Q. 123. How can the distribution of load between two alternators operating in parallel be varied ?

Ans. Distribution of load between two alternators operating in parallel can be varied by adjusting the governor control. One prime-mover governor is opened while the other is closed simultaneously so as to maintain the system frequency constant.

Q. 124. What is the effect of varying excitation of an alternator running in parallel with another alternator ?

Ans. Variation in excitation of an alternator running in parallel with another alternator causes variation in wattless component and, therefore, of reactive kVA, without affecting the sharing of the kW load or power.

Q. 125. What is meant by infinite bus-bars ?

[Madurai Kamarajar Univ. Nov. 1996]

Ans. Infinite bus-bars represent a system of large capacity whose frequency and the phase and magnitude of the voltage are not affected even if there is a variation of excitation or power of a synchronous machine connected to it.

Q. 126. Will an increase in the excitation of an alternator connected to an infinite bus increase its real power generation ?

[A.M.I.E. Sec B. Summer 1993]

Ans. No.

Q. 127. How will the power angle and power factor of a 3-phase alternator supplying power to an infinite bus at constant excitation, change if the steam input is reduced ?

[A.M.I.E. Sec B Advanced Elec. Machines Summer 1996]

Ans. Both power angle and power factor will decrease if the alternator was supplying load to the infinite bus at lagging power factor.

Q. 128. At what power angle a synchronous generator will develop maximum power ? [Bharathidhasan Univ. November 1995]

Ans. Synchronous generator will develop maximum power when power angle $\delta = \theta$, internal angle where $\theta = \text{Tan}^{-1}\dfrac{X_s}{R_e}$.

Q. 129. Do the generators driven by the steam turbines have a tendency to hunt ?

Ans. No.

Q. 130. What is meant by an induction motor ? [M.K. Univ. Nov. 1995]

Ans. An induction motor derives its name from the fact that the current in the rotor conductors is induced by the motion of rotor conductors relative to the magnetic field developed by the stator currents.

Q. 131. Why are induction motors called "asynchronous" ?

Ans. Because the rotor does not turn in synchronism with the rotating field developed by the stator currents.

Q. 132. Why closed type slots are often used for small induction motors ? [A.M.I.E. Sec B. Summer 1995]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Use of closed slots makes the reluctance more uniform, reduces exciting current and gives better power factor.

Q. 133. Why the air gap between stator core and rotor of an induction motor is made very small ?

Ans. The air gap is made as small as possible so as to produce required flux with a minimum exciting current and give leakage reactance as small as possible. This results in improved power factor.

Q. 134. Why the slots on the rotor of an induction motor are usually skewed ?

Ans. The slots on the rotor of an induction motor are usually skewed in order to obtain a uniform torque, reduce the magnetic locking of the stator and rotor, and reduce the magnetic humming noise while running.

Q. 135. Explain why the number of poles of the stator and of the rotor of an ac motor should be equal.

[U.P. Technical Univ. Electrical Machines 2001-02]

Ans. The flux set up by the stator windings is a rotating flux with a definite number of poles; operation is only possible when the number of poles is same on both (stator and rotor).

Q. 136. Which type of induction motor develops higher starting torque ?

[A.M.I.E. Sec B. Summer 1996]

Ans. Slip-ring induction motor.

Q. 137. What is the necessity of short-circuited rotor conductors in a squirrel cage induction motor ?

Ans. If the rotor conductors in a squirrel cage motor are not short-circuited, the rotor winding will be open-circuited and when the stator is connected to 3-ϕ ac supply, the rotating magnetic field will be set up in the air-gap and an emf will be induced in the rotor but no current will flow through the rotor conductors and, therefore, no torque will be developed and the rotor will remain stationary.

Q. 138. Explain what is rotating magnetic field and how this is made use of in electrical machinery ? **[P.T.U. December 2001]**

Ans. A rotating magnetic field is that which is constant in magnitude but whose axis of direction rotates in space as field system of a dc machine. When a 3-phase winding is energized by 3-phase supply, a rotating magnetic field is developed that tends the rotor of the machine to move in the direction of rotation.

The operation of ac rotating machines (such as synchronous machines and induction machines) is based on the production of rotating magnetic field.

Q. 139. State the operating conditions of the motor when the slip is either positive greater than one or negative.

[U.P. Technical Univ. Elec. Engineering First Semester 2005-06]

Ans. When the slip is positive greater than 1, the induction motor acts as a brake and it absorbs kinetic energy from the still revolving field causing its speed to fall. When the slip is negative (*i.e.* when the speed is more than synchronous speed), the induction machine operates as an induction generator and feeds power back to the supply line.

Q. 140. In case of a 3-phase induction motor why is slip always positive ? **[P.T.U. 1999]**

Ans. The induction motor cannot run at synchronous speed because at synchronous speed, there will not be relative speed between the revolving field and the rotor conductors and so the basic phenomenon will not occur to develop torque. It means that a 3-phase induction motor always run at a speed lesser than that of the field. The speed being the difference of synchronous speed, N_s and actual speed N ($N_s > N$) is, therefore, always positive.

Q. 141. Show that in induction motor, the rotor always run in the direction of stator field. **[P.T.U. December 2002]**

Ans. According to Lenz's law we know that the direction of induced emf would be in such a direction that it would try to oppose the very cause for which it is due. Because the cause producing the induced currents in the rotor conductors is the relative speed between the rotating magnetic field and stationary rotor conductors, therefore, they circulate in such a way that a torque is produced in the rotor tending to cause it to follow the rotating magnetic field and thus reducing the relative speed.

Q. 142. How does the slip vary with load ? **[P.T.U. May 2001]**

Ans. With the increase in load, the motor slows down until the relative motion between the rotor and the rotating magnetic field is just sufficient to result in the development of torque required for a particular load. Thus slip increases with the increase in load.

Q. 143. What are the main factors on which torque developed by a 3-phase induction motor depend ?

[A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. Torque developed by a 3-phase induction motor depends upon rotor resistance, standstill reactance, slip and applied voltage.

Q. 144. At what slip the torque developed in an induction motor will be maximum ? **[M.S. Univ. Nov. 1996]**

Ans. Torque developed in an induction motor will be maximum at a slip given by the ratio of rotor resistance to rotor standstill reactance. *i.e.* $s = \frac{R_2}{X_2}$.

Q. 145. What is the condition for maximum torque at starting in a 3-phase induction motor ? **[Bharathidhasan Univ. Nov. 1996]**

Ans. Torque developed in an induction motor at start will be maximum when rotor resistance equals rotor standstill reactance *i.e.* $R_2 = X_2$.

Q. 146. Is the maximum torque of a 3-phase induction motor dependent on the rotor resistance ? **[A.M.I.E. Sec B. Summer 1995]**

Ans. No, it is independent of rotor resistance.

Q. 147. What is the relationship of developed torque of a 3-phase induction motor with the supply voltage?

[A.M.I.E. Sec B. Winter 1994]

Ans. $T \propto sV^2$.

Q. 148. When the applied rated voltage per phase is reduced to one-half, what will be the starting torque of a squirrel cage induction motor in terms of its starting torque with full voltage ?

[M.K. Univ. Nov. 1996]

Ans. One-fourth of starting torque with full rated voltage.

Q. 149. How the starting torque and maximum torque vary with rotor circuit resistance ? **[U.P. Technical Univ. 2002-03]**

Ans. As the rotor resistance R_2 is increased from zero, power factor is improved but rotor impedance is increased and so the rotor current is reduced. At first, the effect of improved power factor predominates over the effect of decrease in rotor current due to increase in impedance and the starting torque, therefore, increases. But after a certain value of rotor resistance, the effect of increased impedance predominates over the effect of improved power factor and so the torque starts decreasing.

Maximum torque is independent of rotor circuit resistance.

Q. 150. Why is the V/*f* ratio kept constant while controlling the speed of a 3-phase induction motor by varying the supply frequency ?

[A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. By keeping the ratio $\frac{V}{f}$ constant, the flux density level is kept constant so that the performance of machine is not affected.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 151. If the air gap flux is kept constant, will the reduction of supply frequency affect the pull-out torque of an induction motor ?

[A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. For constant air gap flux, the supply frequency and supply voltage will have to reduced in same proportion. In such conditions the torque-speed curves are of the same shape but displaced horizontally *i.e.* the maximum developed torque (pull-out torque) remains approximately constant, but the speed at which it occurs changes in the same ratio as the supply frequency.

Q. 152. If the stator voltage and frequency of an induction motor are reduced proportionately what will be the effect on locked rotor current and torque developed ?

[A.M.I.E. Sec B. Electrical Machines Summer 2007]

Ans. When the stator voltage and frequency of an induction motor are reduced proportionately, the locked rotor current and torque developed will be reduced.

Q. 153. What are the different losses taking place in a 3-phase induction motor ? [G.G.S.I.P. Delhi Univ. May/June 2006]

Ans. Stator copper loss; stator iron loss; rotor copper loss, friction and windage losses and stray load loss.

Q. 154. Why are the iron losses in the rotor of an induction motor normally neglected ?

Ans. Because of very low frequency of emf induced in rotor.

Q. 155. How is the mechanical power output represented in the circuit model of an induction motor ? [Bharathiyar Univ. Nov. 1996]

Ans. Mechanical power output per phase is represented by a pure resistive load of equivalent resistance R_L given by the relation

$$R_L = R_2\left(\frac{1}{s} - 1\right)$$ where R_2 is the rotor circuit resistance per phase and s is the slip.

Q. 156. What are the terms air-gap power, internal mechanical power developed and shaft power ? How are these terms related with each ? [U.P.S.C. I.E.S. Electrical Engineering II 2001]

Ans. The power transferred from the stator to rotor via air-gap magnetic field *i.e.* power input to stator less stator copper and iron losses is known as air-gap power, P_g

Internal mechanical power developed P_{mech} is equal to air-gap power less the rotor copper loss.

Internal mechanical power developed less friction and windage losses is equal to the mechanical power available at shaft, known as shaft power or mechanical power output.

P_g, P_{mech}, and P_{out} are related as

$$P_g : P_{mech} : P_{out} :: 1 : (1-s) : \left(1 - s - \frac{W_f}{P_g}\right)$$

Q. 157. The induction motor can be called a generalised transformer. Explain why ? [P.T.U. May 2001]

Ans. Since the two fields set up by stator (primary) and rotor (secondary) are stationary relative to each other, so the polyphase induction motor can be considered equivalent to a transformer having an air gap, separating the iron portions of the magnetic circuit carrying the primary and secondary windings. Thus the induction motor can be called a generalized transformer.

Q. 158. The reactance of the rotor of the induction motor varies greatly between starting and running conditions. Explain why ?

[P.T.U. June 2000]

Ans. The reactance of the rotor of an induction motor is given as

$$X_2' = 2\pi f' L_2$$

where f' is the frequency of rotor current and is equal to slip multiplied by supply frequency f

i.e $f' = sf$

So $X_2' = 2\pi s f L_2 = sX_2$ where X_2 is standstill reactance of the rotor.

Since the slip s varies greatly from starting to normal running condition, rotor reactance varies greatly between starting and running conditions.

Q. 159. An induction motor can be represented by an equivalent transformer. Are their pu magnetising currents of the same order ? [A.M.I.E. Sec. B. Summer 1993]

Ans. No.

Q. 160. What is known as crawling of an induction motor ?

[A.M.I.E. Sec B. Electrical Machines Summer 2005]

Ans. The tendency of a squirrel cage induction motor to run stably at speeds as low as one-seventh of their synchronous speed is called crawling of induction motor.

Q. 161. What measure can be taken for minimizing the effect of crawling ? [A.M.I.E. Sec B. Elec. Machines Winter 1996]

Ans. Effect of crawling can be minimized by chording, skewing and integral slot winding.

Q. 162. Stator of an induction motor has full pitch coil span of 18 slots. What must be short pitch angle in degrees if 5th harmonic component of the emf is to be eliminated ?

[A.M.I.E. Sec B. Elec. Machines Summer 1996]

Ans. 36°.

Q. 163. Explain the reasons for lower power factor of low-speed, 3-phase induction motors as compared to that of high-speed motors. [A.M.I.E. Sec. B. Summer 1996]

Ans. Because of larger number of poles in low-speed 3-phase induction motors as compared to high-speed motors, magnetising current is more due to increase in leakages, which increases with the increase in number of poles. So the power factor of low-speed induction motors is poor in comparison to that for high-speed induction motors.

Q. 164. Why the power factor of a squirrel cage induction motor is low at light loads ?

Ans. The current drawn by an induction motor operating at light load is largely a magnetising current so current at light loads lags behind the applied voltage by a large angle and thus the power factor of an induction motor at light loads is quite low.

Q. 165. The magnetising current in a transformer is 2 to 5% whereas in 3-phase induction motor, it is about 25-40% of rated current. Mention the reason. [U.P. Technical Univ. 2002-03]

Ans. Owing to the air gap in an induction motor, the magnetising current is large for the induction motor as compared to that for a transformer. The friction and windage losses are also present in the induction motor. So no-load current of an induction motor is much higher than that of an equivalent transformer.

Q. 166. Why the power factor of an induction motor is low at starting ?

Ans. The rotor frequency and rotor reactance are high under starting conditions and, therefore, rotor currents lag the rotor emf by a large angle. This results in low power factor at starting.

Q. 167. Why does the induction motor operate at low pf ?

[A.M.I.E. Sec B. Electrical Machines Winter 2006]

Ans. Because of the air gap between the stator and rotor of an induction motor, the reluctance of the magnetic circuit is high. As a result an induction motor draws a large magnetising current I_m to produce the required flux in the air gap. And because of the large value of magnetising current, which is present regardless of load, the power factor of an induction motor, even at full load, is low (seldom exceeds 90%).

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

It means that induction motor operate at low pf due to large magnetising current.

Q. 168. Why the efficiency of a three phase induction motor is less than that of a transformer ? **[M.S. Univ. Nov. 1996]**

Ans. The large magnetising current, due to air gap and friction and windage losses in the induction motor are the factors which make the efficiency of the induction motor less than that of the transformer.

Q. 169. How will you improve the starting torque of a 3-phase induction motor ? **[Madras Univ. Elec. Machines II October 1995]**

Ans. The starting torque of a 3-phase induction motor can be improved by inserting external resistance in each phase of the rotor circuit, which is possible only in case of wound rotor motors.

Q. 170. What are deep bar and double cage induction motors ? **[A.M.I.E. Sec B. Electrical Machines Winter 2006]**

Ans. In deep bar motors use is made of skin effect with rotor bars caused by slot leakage fluxes. In deep bar motors, where the bars are 20-25 mm high (the depth-to-width ratio being 10 or 12 to 1) the skin effect is very strong and appreciably changes the rotor parameters. Deep bar squirrel cage induction motor develops large starting torque with reduced starting current. At normal speed the deep bar motor is a plain squirrel-cage motor with the usual resistance, but with a somewhat higher inductive reactance, owing to which the power factor, efficiency and the overload capacity of the motor are somewhat reduced.

The rotor of a double squirrel-cage motor carries two squirrel cage windings embedded in two rows of slots. The outer slots contain a high resistance and low leakage reactance winding and the inner slots contain a low resistance and high leakage reactance winding.

Thus, the outer cage has high resistance and low reactance to resistance ratio, whereas the inner cage has low resistance and large reactance-to-resistance ratio. Thus the outer cage produces high starting and accelerating torque, while the inner winding provides the running torque at good efficiency.

Q. 171. In a double cage 3 phase induction motor, the inner cage has lower resistance but higher inductance value as compared to the outer cage, why ? **[A.M.I.E. Sec B. Electrical Machines Summer 2006]**

Ans. The rotor of a double cage 3 phase induction motor carries two squirrel cage windings in two rows of slots. The outer winding bars are usually made of manganese brass while the inner winding bars are of red copper and has greater cross-section than that of outer winding, so the inner cage has lower resistance.

Since the outer cage is nearer to the air gap so its leakage reactance is smaller than that of inner cage.

Q. 172. What are the advantages and disadvantages of wound rotor over squirrel cage rotor in case of induction motor ? **[P.T.U. December 2002]**

Ans. In wound rotor external resistance can be inserted and, therefore,

(*i*) high starting torque can be obtained by inserting an external resistance of proper value in each phase of the rotor circuit and

(*ii*) adjustable speed can be obtained simply by adding external resistors in the rotor circuit.

The drawback of wound rotor over squirrel cage rotor are initial and maintenance costs are more because wound rotor needs slip-rings, brushes, short-circuiting devices etc.

Q. 173. What is meant by single phasing ? **[Madras Univ. Elec. Machines II Nov. 1996]**

Ans. The term 'single phasing' refers to operation with one stator terminal accidently disconnected (as by a blown fuse or a faulty contact on the run side of a star-delta switch).

Q. 174. Why are starters used for starting of induction motors (3-phase)? **[U.P. Technical Univ. December, 2003]**

or

What is the necessity of starter in 3-phase induction motor? **[G.G.S.I.P. Delhi Univ. May/June, 2006]**

Ans. At the starting instant, a 3-phase induction motor acts as a polyphase transformer having an air gap with a short-circuited secondary. If the motor of higher capacity (larger than 2 kW) is connected directly to the supply mains, it will draw heavy current (about 5-8 times the rated full-load current) at the starting instant which is objectionable because it will cause large voltage drop in the distribution network and thus affect adversely the operation of other electrical equipment connected to the same distribution network. Hence, to control the starting current, use of starter is essential for starting of 3-phase induction motors of larger size (rating exceeding 2 kW).

Q. 175. Why reduced voltage starting of induction motor is not always desirable ? **[A.M.I.E. Sec B. Electrical Machines Winter 2005]**

Ans. Torque of the induction motor is proportional to the square of supply voltage, therefore the starting torque when the motor is started at reduced voltage, is reduced largely and the motor cannot be started at load. So when the motor is to be started at load reduced voltage starting is not desirable.

Q. 176. How many terminals do you expect to find on the terminal box of a squirrel cage induction motor to be started by star-delta starter ?

Ans Six.

Q. 177. In what ratio line current and starting torque are reduced with star-delta starting ?

Ans. Line current and starting torque are reduced to one-third with star-delta starting.

Q. 178. What is the parameter other than the ratio of rotor current limits which decides the number of resistance sections of a slip-ring induction motor starter ? **[A.M.I.E. Sec B. Winter 1993]**

Ans. Slip at full load.

Q. 179. Rotor resistance starting is preferred to reduced voltage starting of a wound rotor induction motor. Why ? **[A.M.I.E. Sec B. Winter 1992]**

Ans. Because rotor resistance starting of a wound rotor induction motor not only reduces the starting current at the starting instant but increases the starting torque also due to improvement in power factor whereas the reduced voltage starting reduces only the starting current at the starting instant.

Q. 180. In starting slip-ring induction motor, why is rotor resistance preferred to reactance to limit the starting current inspite of the fact that the additional resistance causes loss in the system ? **[A.M.I.E. Sec B. Electrical Machines Summer 2008]**

Ans. Insertion of resistance in the rotor circuit of slip-ring induction motor not only reduces the starting current at the starting instant but increases the starting torque also due to improvement in power factor. With rotor reactance starting, the available starting torque will be much lesser than that with rotor resistance starting and losses occurring due to insertion of resistance in the rotor circuit for starting purpose will be for a short duration as resistance is finally removed when motor attains normal speed.

Q. 181. For which type of loads, induction motor with voltage controller is suitable and why ? **[A.M.I.E. Sec B. Summer 1996]**

Ans. Induction motor with voltage controller is suitable only for loads where the torque required drops off considerably with

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

the drop in speed such as for driving fans because a large change in voltage is required for a relatively small change in speed and developed torque reduces greatly with the reduction in supply voltage.

Q. 182. If the number of poles on a motor is increased to lower the speed, how will the power factor be affected ? [A.M.I.E. Sec B. Winter 1993]

Ans. Power factor will be reduced.

Q. 183. While controlling induction motor speed, how super synchronous speed is achieved ? [A.M.I.E. Sec B. Winter 1996]

Ans. Super-synchronous speed can be achieved, while controlling the speed of an induction motor, by injecting a slip frequency voltage in phase with emf induced in the rotor.

Q. 184. What will be the effect on the torque developed by an induction motor when the applied voltage is reduced to half, supply frequency remaining unchanged ?

Ans. Torque developed by an induction motor with half-rated voltage, supply frequency remaining unchanged, will be reduced to one-fourth because $T \propto V^2$ (*i.e.* square of the supply voltage).

Q. 185. What will be the effect on the torque developed by an induction motor when both the applied voltage and frequency are reduced to half ?

Ans. The torque developed by an induction motor will be reduced to one half of normal value when both the applied voltage and frequency are reduced to half because $T \propto \frac{V^2}{f}$.

Q. 186. Electric braking is accomplished in an induction motor by interchanging two stator terminals. Name the method. [A.M.I.E. Sec B. Winter 1995]

Ans. Plugging or counter-current braking.

Q. 187. Explain, the conditions under which rotor frequency is smaller/equal/greater than stator current frequency in an induction motor. [A.M.I.E. Sec B. Winter 1993]

Ans. The frequency of rotor currents is equal to slip times the frequency of the stator current. During motoring mode the slip is very small (much less than unity) and so the rotor current frequency is small than that of stator current. At standstill the slip is unity and so the rotor current frequency is equal to stator current frequency. During counter-current braking (or plugging) the slip is larger $(2 - s)$ and so the frequency of rotor currents is much larger than that of stator currents.

Q. 188. f_1 and f_2 are the stator and rotor frequencies respectively. If $f_2 > f_1$, how does the induction motor operate ? [A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. For $f_2 > f_1$ *i.e.* for rotor frequency exceeding stator frequency the induction motor will operate with counter-current braking or plugging. It is because during plugging, the slip is $(2–s)$ and so the frequency of rotor currents is much larger than that of stator currents.

Q. 189. When it is required to control the induction motor speed during deceleration, what kind of braking is preferable to employ ? [A.M.I.E. Sec B. Winter 1996]

Ans. DC dynamic braking is highly suitable for controlling the speed of the induction motor during deceleration by controlling the dc excitation.

Q. 190. What are the conditions for regenerative braking of an induction motor to be possible ? [A.M.I.E. Sec B. Summer 1996]

Ans. The driven load should drive the motor above synchronous speed but the driving torque of the load should not exceed the maximum torque, which the machine is capable to develop during regeneration.

Q. 191. What is the standard direction of rotation of an induction motor ?

Ans. Counterclockwise when looking from non-drive end of the motor.

Q. 192. How will you resolve a single pulsating field ? [Bharathidhasan Univ. Nov. 1995; Bharathiyar Univ. April 1997]

Ans. A single pulsating field can be resolved into two components of half its amplitude and rotating in opposite directions with equal speed.

Q. 193. State the principle that the double revolving field theory makes use of. [Bharathiyar Univ. Nov. 1995]

Ans. The double revolving field theory makes use of the principle that pulsating field produced in a single phase motor can be resolved into two components of half its amplitude and rotating in opposite directions with synchronous speed.

Q. 194. Is the starting torque of a single phase induction motor zero ?

Ans. Yes, the starting torque of a single phase induction motor is zero.

Q. 195. Is the torque developed by a single phase induction motor at synchronous speed zero ?

Ans. No, it is negative.

Q. 196. What is the effect of increasing rotor resistance in a single phase induction motor ?

Ans. Increase in rotor resistance of a single phase induction motor reduces its breakdown torque, lowers the efficiency and increases the slip corresponding to the maximum torque.

Q. 197. Single phase motors are usually set on rubber spring mounts. Why ? [A.M.I.E. Sec B. Electrical Machines Winter 2007]

Ans. In a single phase induction motor, pulsating torque is developed as a direct consequence of the pulsating power in a single phase circuit.

Q. 198. A single phase induction motor is provided with a main winding and an auxiliary winding. Which of the two windings should be more resistive ? [A.M.I.E. Sec B. Winter 1994]

Ans. Auxiliary winding should be more resistive.

Q. 199. In the design of resistance-start single phase induction motor the starting winding is disconnected once the slip reaches 0.25 or less. Explain. [A.M.I.E. Sec B. Summer 1993]

Ans. The starting winding of a resistance-start motor is not designed for continuous operation and so it is necessary to disconnect it from the motor circuit when the motor attains a definite speed. The starting winding is usually taken out of circuit at a speed of about 75% of synchronous speed because at this speed the torque developed by the main winding alone is greater than that developed by both windings.

Q. 200. How is the direction of rotation of a single phase induction motor reversed ? [M.K. Univ. Nov. 1996; Madras Univ. April 1997; Bharathiyar Univ. April 1997]

Ans. The direction of rotation of a single phase induction motor (split-phase type) is reversed by reversing the leads to the main or starting winding, but not both.

Q. 201. How does a capacitor-start motor differ from a resistance-start motor ?

Ans. Fundamentally the capacitor-start motor is quite similar to a resistance-start motor, except that its starting winding has a few more turns and is wound with comparatively thick wire than the starting winding of a resistance-start motor and also the external resistance, connected in series with the starting winding, is replaced by a large electrolytic capacitor.

Q. 202. What happens if the capacitor is left in the circuit of a capacitor-start single phase induction motor when it comes to its full speed ? [A.M.I.E. Sec B. Electrical Machines Winter 2005]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. In a capacitor-start single phase induction motor if the capacitor is left in the circuit even when the motor attains normal speed, the capacitor will get damaged, because capacitor used is for extremely short duty service and is guaranteed for more than 20 periods of operation per hour.

Q. 203. What happens to a capacitor-start induction motor if the auxiliary winding is left in the circuit after it has been used to start the motor ? [A.M.I.E. Sec B. Summer 1993]

Ans. The auxiliary winding of a capacitor-start induction motor is not designed for continuous operation and if left in the circuit after it has been used to start the motor, it will burn out. In addition to it, the short-duty rated electrolytic capacitor connected in series with the starting winding will also get damaged.

Q. 204. What is the advantage of using a capacitor-start motor over a resistance-start split-phase motor ? [Bharathiyar Univ. Nov. 1996]

Ans. The capacitor-start motor develops more starting torque than does an equally rated resistance-start split-phase motor with a lower in-rush current.

Q. 205. In a 2-phase capacitor motor which capacitor is of fairly high value and to what order ? [A.M.I.E. Sec B. Winter 1993]

Ans. In a 2-phase capacitor motor the starting capacitor is about 10 – 15 times as large as the running capacitor.

Q. 206. What happens when the auxiliary winding of a capacitor motor is disconnected during running condition ? [A.M.I.E. Sec B. Winter 1995]

Ans. The motor will continue running but will develop small torque. Once it stops, it will not start again.

Q. 207. Name the motor being used in a ceiling fan ? [A.M.I.E. Sec B. Summer 1996]

Ans. Split-phase capacitor type single phase induction motor.

Q. 208. What is shaded pole motor ? [A.M.I.E. Sec B. Electrical Machines Summer 2005]

Ans. Shaded-pole motor is a salient-pole, split-phase type, squirrel cage rotor single phase induction motor provided with one or more auxiliary short-circuited stator windings displaced in magnetic position from the main winding.

Q. 209. In what direction do shaded pole motors turn ?

Ans. Shaded pole motor rotates in a direction from the unshaded part of the pole to the shaded part.

Q. 210. What role do 'magnetic bridges' play in the operation of a shaded pole motor ? [A.M.I.E. Sec B. Summer 1993]

Ans. The magnetic bridges cause the flux in the shaded portion of the pole to lag behind the flux in the unshaded portion. This gives, in effect a motion of flux across the pole face and under the influence of this moving flux a starting torque is developed.

Q. 211. Which is preferable, a small or a large number of rotor slots, in case of single phase motors ? [A.M.I.E. Sec B. Summer 1996]

Ans. Large number of slots are preferable in the stator of a single phase motor.

Q. 212. Why is the normal full-load slip of a single phase induction motor higher than that of a three-phase motor ? [A.M.I.E. Sec B. Summer 1993]

Ans. The normal full-load slip of a single phase induction motor is higher than that of a 3-ϕ motor, owing to development of backward rotating field. The power is to be delivered to the backward field from the power converted into mechanical power by the forward field.

Q. 213. What happens to the speed and power factor of a single phase series motor when the load increases ? [A.M.I.E. Sec B. Summer 1995]

Ans. Speed and power factor, both, decrease with the increase in load.

Q. 214. Does the power factor of a single phase series motor increase or decrease with increasing load torque. [A.M.I.E. Sec B. Summer 1994]

Ans. The power factor of a single phase series motor decreases with the increase in load torque.

Q. 215. How many emfs act in a coil undergoing commutation in an ac series motor, and what are their phase relations ? [A.M.I.E. Sec B. Electrical Machines Winter 2005]

Ans. In an ac series motor, two emfs act in a coil undergoing commutations—one is the induced emf due to transformation and the other is due to rotation of rotor in stator field. These two emfs are in quadrature.

Q. 216. Which of the parameters of an ac series motor makes it ideally suited for traction system ? [A.M.I.E. Sec B. Electrical Machines Summer 2006]

Ans. The single phase ac series motor has practically the same operating characteristics as the dc series motor. The torque, or tractive effort, varies as the square of current and speed varies inversely as the current. This makes the ac series motor ideally suited for traction system.

Q. 217. What is a universal motor ? [M.S. Univ. April 1996]

Ans. A universal motor is a series wound motor, compensated or uncompensated, specifically designed to operate on direct or single phase alternating current of the same voltage at approximately the same speed and output.

Q. 218. Why compensating winding is provided in a universal motor for ac operation ? [A.M.I.E. Sec B. Winter 1994]

Ans. The compensating winding is provided in a universal motor for ac operation to neutralize reactance voltage set up by the alternating flux due to transformer action.

Q. 219. How can the direction of rotation of a universal motor be reversed? [A.M.I.E. Sec B. Summer 1994]

Ans. The direction of rotation of universal motor can be reversed by reversing either the field or armature leads, but not both.

Q. 220. Why are high speeds often desirable in operation of universal motors ? [Bharathiyar Univ. Nov; 1996]

Ans. Universal motors are designed for operation at high speeds (exceeding 3,500 rpm) owing to the difficulty in obtaining like performance on dc and ac at lower speeds.

Q. 221. Which single-phase motor has the poorest speed regulation? [A.M.I.E. Sec B. Winter 1993]

Ans. Single phase series motor (uncompensated type) has the poorest speed regulation.

Q. 222. Name three ways in which the speed of a universal motor can be varied. [A.M.I.E. Sec B. Winter 1993]

Ans. Resistance method, tapping field method and centrifugal mechanism method.

Q. 223. In a repulsion motor, which position of the brushes is known as the high impedance position ? [A.M.I.E. Sec B. Winter 1993]

Ans. The position at right angles to the stator poles or neutral axis is known as the high impedance position.

Q. 224. What happens when the shaft torque of a repulsion motor with two stator windings increases ? [A.M.I.E. Sec B. Winter 1992]

Ans. With the increase in torque on a repulsion motor stator current increases, and speed and power factor of the motor decreases.

Q. 225. What happens when the brush axis of a repulsion motor is aligned with its stator pole axis? [A.M.I.E. Sec B. Summer 1993]

Ans. The brushes join the point of maximum potential difference, enormous current would flow between the brushes but no torque would be developed as the torque angle would be zero. The motor will growl harshly.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 226. At around what speed (in terms of synchronous speed) commutation of a repulsion motor is best ?
[A.M.I.E. Sec B. Winter 1996]

Ans. At an approximately 80 percent of synchronous speed, the commutation of a repulsion motor is the best.

Q. 227. State whether repulsion motor has series speed-torque characteristics or shunt speed-torque characteristics.
[A.M.I.E. Sec B. Summer 1994]

Ans. Series speed-torque characteristics.

Q. 228. Can a repulsion-induction motor ever run at super-synchronous speed ?
[A.M.I.E. Sec B. 1994; 1997]

Ans. Yes; at no load.

Q. 229. Name a small size synchronous motor that abviates the need for dc excitation.
[A.M.I.E. Sec B. Winter 1992]

Ans. Reluctance motor.

Q. 230. Why the reluctance motor has low efficiency ?
[A.M.I.E. Sec B. Winter 1994]

Ans. Because of varying reluctance.

Q. 231. In a motor running at synchronous speed with no dc excitation, the load torque is independent of the rotor speed. Identify the motor.
[A.M.I.E. Sec B. Winter 1994]

Ans. Hysteresis motor.

Q. 232. Does the starting torque of a hysteresis motor have the hysteresis torque as the only component ?
[A.M.I.E. Sec B. Winter 1993]

Ans. No; eddy current torque in addition to hysteresis torque.

Q. 233. What is a stepper motor ?

Ans. A motor in which the rotor turns in discrete movements is called *a stepper motor*.

Q. 234. Where is stepper motor used ? [Bharathidhasan Univ. Nov. 1996]

Ans. Stepper motors are used in industrial situations which call for precise positioning of an object or precise control of speed without having to resort to closed-loop feedback.

Q. 235. For the same number of poles which stepper motor produces (*i*) largest stepping angle, (*ii*) smallest stepping angle ?

Ans. (*i*) Permanent magnet type —largest stepping angle
(*ii*) Variable reluctance type—smallest stepping angle.

Q. 236. What is a servomotor ?
[A.M.I.E. Sec B. Electrical Machines Summer 2005]

Ans. A servomotor is a mechanical positioner used very commonly in control circuits to position the system depending on the magnitude of error.

Q. 237. Why does an ac servomotor have high rotor resistance ?
[A.M.I.E. Sec B. Electrical Machines Summer 2008]

Ans. High rotor resistance of ac servomotor makes the torque-speed characteristics linear for various armature voltages over a wide speed range particularly near the zero speed.

Q. 238. Which types of servomotors generally lend themselves to small horse power requirements ?
[A.M.I.E. Sec B. Winter 1993]

Ans. Twophase and the shaded pole type induction motors.

Q. 239. Give one advantage of the twophase servomotor over the shaded pole type.
[A.M.I.E. Sec B. Winter 1993]

Ans. Better response to very small control signals.

Q. 240. Why are 'drag-cup-constructions' used in rotors of certain fhp machines for control purposes ?
[A.M.I.E. Sec B. Winter 1993]

Ans. In drag-cup-construction all heavy iron laminations remain stationary and only a light cup rotates, so the inertia is quite small.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The basic function of a transformer is to change
(a) the level of the voltage.
(b) the power level. (c) the power factor.
(d) the frequency. [A.M.I.E. Summer 1994]

2. In an ordinary transformer which of the following does not change
(a) voltage. (b) current.
(c) frequency. (d) all of the above.
[R.G.T.U. B.E.E. Dec. 2006]

3. The efficiency of a power transformer is around
(a) 50%. (b) 60%. (c) 80%. (d) 95%.
[A.M.I.E. Elec. Science Summer 1994]

4. In a transformer, electrical power is transferred from primary to secondary
(a) through air. (b) by magnetic flux.
(c) through insulating medium. (d) none of these.

5. The two windings of a transformer are
(a) conductively linked. (b) inductively linked.
(c) not linked at all. (d) electrically linked.

6. Transformer action requires a
(a) constant magnetic flux.
(b) increasing magnetic flux.
(c) alternating magnetic flux.
(d) alternating electric flux.

7. The flux created by the current flowing through the primary winding induces emf in
(a) primary winding only.
(b) secondary winding only.
(c) transformer core only.
(d) both primary and secondary windings.

8. The primary and secondary windings of a power transformer always have
(a) a common magnetic circuit.
(b) separate magnetic circuits.
(c) wire of same size.
(d) same number of turns.

9. The iron core in a transformer provides a _____ path to the main flux.
(a) low reluctance (b) high reluctance
(c) low resistance (d) high conductivity

10. If rated dc voltage is applied instead of ac to the primary of a transformer
(a) secondary of transformer will burn.
(b) primary of transformer will burn.
(c) secondary voltage will be excessively high.
(d) there will be no secondary voltage.

11. A transformer transforms
(a) voltage. (b) current.
(c) voltage and current. (d) frequency.
[U.P.T.U. E.E. Even Semester 2009-10]

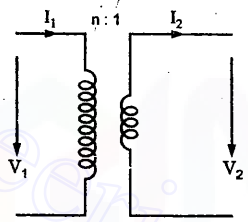
12. For an ideal transformer the windings should have
(a) maximum resistance on primary side and least resistance on secondary side.
(b) least resistance on primary side and maximum resistance on secondary side.
(c) equal resistance on primary and secondary sides.
(d) no ohmic resistance on either side.
[U.P.S.C. I.E.S. E.E.-II, 1992]

13. The core flux in transformer depends mainly on
(a) supply voltage.
(b) supply voltage and frequency.
(c) supply voltage, frequency and load.
(d) supply voltage and load but independent of frequency.
[A.M.I.E. Sec B. Elec. Machines Summer 1999]

14. When voltage is transformed from primary to secondary then it is _____.
(a) multiplied by K^2 (b) multiplied by K
(c) divided by K^2 (d) divided by K
[G.B.T.U. E.E. Even Semester 2010-11]

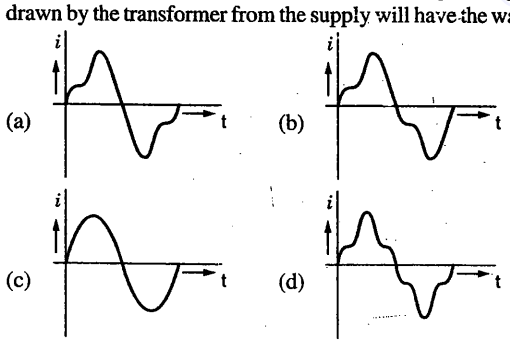
15. A transformer steps up the voltage by a factor 100. The ratio of current in the primary to that in the secondary is
(a) 1 (b) 100 (c) 0.01 (d) 0.1
[A.M.I.E. Summer 1994]

16. For an ideal transformer shown in the given figure



(a) $V_1 = nV_2, I_2 = -nI_1$ (b) $V_2 = nV_1, I_2 = -nI_1$
(c) $V_1 = nV_2, I_2 = \frac{1}{n}I_2$ (d) $V_1 = nV_2, I_2 = -\frac{1}{n}I_1$
[U.P.S.C. I.E.S. E.E.-I, 1995]

17. A single-phase air core transformer, fed from a rated sinusoidal supply, is operating at no load. The steady state magnetizing current drawn by the transformer from the supply will have the waveform



[GATE E.E., 2011]

Answers: **1.** (a), **2.** (c), **3.** (d), **4.** (b), **5.** (b), **6.** (c), **7.** (d), **8.** (a), **9.** (a), **10.** (b), **11.** (c), **12.** (d), **13.** (b), **14.** (b), **15.** (b), **16.** (a), **17.** (c),

18. If the applied voltage to a transformer primary is increased by keeping the V/f ratio fixed, then the magnetizing current and the core loss will, respectively:
(a) decrease and remain the same.
(b) increase and decrease. (c) both remain the same.
(d) remain the same and increase. [U.P.S.C. I.E.S. E.E.-II, 2006]

19. If the applied voltage of a certain transformer is increased by 50% and the frequency is reduced to 50% (assuming that the magnetic circuit remains unsaturated), the maximum core flux density will
(a) change to three times the original value.
(b) change to 1.5 times the original value.
(c) change to 0.5 times the original value.
(d) remain the same as the original value.
[U.P.S.C. I.E.S. E.E.-II, 1997]

20. The applied voltage of a certain transformer is increased by 75%; while the frequency of the applied voltage is reduced by 25%. The maximum core flux density will:
(a) increase by seven times. (b) increase by three times.
(c) reduce to one quarter. (d) remain the same.
[U.P.S.C. I.E.S. E.E.-II, 2011]

21. If the supply frequency of a transformer is increased, keeping the supply voltage constant, then
(a) both magnetising component and core loss component of current will decrease.
(b) both magnetising component and core loss component of current will increase.
(c) magnetising component of current will increase while core loss component of current will decrease.
(d) magnetising component of current will decrease while core loss component of current will increase.
[U.P.S.C. I.E.S. E.E.-II, 1996]

22. The low voltage winding of a 400/230 V single phase 50 Hz transformer is to be connected to a 25 Hz supply. In order to keep the magnetization current at the same level in both the cases the voltage at 25 Hz should be:
(a) 230 V (b) 460 V (c) 115 V (d) 65 V
[U.P.S.C. I.E.S. E.E.-II, 2003]

23. A single-phase transformer rated for 220/240 V, 50 Hz operates at no load at 220 V, 40 Hz. This frequency operation at rated voltage results in which one of the following?
(a) Increase of both eddy-current and hysteresis losses.
(b) Reduction of both eddy-current and hysteresis losses.
(c) Reduction of hysteresis loss and increase in eddy-current loss.
(d) Increase of hysteresis loss and no change in the eddy-current loss. [U.P.S.C. I.E.S. E.E.-II, 2008]

24. A 50 Hz transformer having equal hysteresis and eddy current losses at rated excitation is operated at 45 Hz at 90% of its rated voltage. Compared to rated operating point, the core losses under this condition.
(a) reduce by 10%. (b) reduce by 19%.
(c) reduce by 14.5%. (d) remain unchanged.
[U.P.S.C. I.E.S. E.E.-II, 1998; GATE E.E. 1998]

25. A single-phase transformer when supplied from 220 V, 50 Hz has eddy current loss of 50 W. If the transformer is connected to a voltage of 330 V, 50 Hz, the eddy current loss will be
(a) 168.75 W (b) 112.5 W
(c) 75 W (d) 50 W
[U.P.S.C. I.E.S. E.E.-II, 2001]

26. 1 kVA, 230 V, 50 Hz, single phase transformer has an eddy current loss of 30 watts. The eddy current loss when the transformer is excited by a dc source of same voltage will be
(a) 30 watts. (b) more than 30 W.
(c) less than 30 watts. (d) zero watt.
[A.M.I.E. Elec. Science Winter 1994]

27. At 50 Hz operation, a single phase transformer has hysteresis loss of 200 W and eddy current loss of 100 W. Its core loss at 60 Hz operation will be
(a) 432 W (b) 408 W (c) 384 W (d) 360 W
[U.P.S.C. I.E.S. E.E.-II, 1995]

28. Can a 50 Hz transformer be used for 25 Hz, if the input voltage is maintained constant at the rated value corresponding to 50 Hz?
(a) Yes, since the voltage is constant current level will not change.
(b) No, flux will be doubled which will drive the core to excessive saturation.
(c) No, owing to decreased resistance of transformer, input current will be doubled at the load.
(d) Yes, at constant voltage, insulation will not be overstressed.
[U.P.S.C. I.E.S. E.E.-II, 1993]

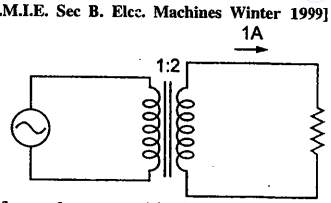
29. On no-load phasor diagram of transformer, the core loss component of the current remains in phase with
(a) no-load current. (b) primary supply voltage.
(c) core flux. (d) primary induced voltage.
[R.G.T.U. B.E.E. Dec. 2006]

30. In a transformer core, third and fifth harmonic components of fluxes are respectively 10% and 4% of the fundamental flux. The third and fifth harmonic induced emfs in the winding, in terms of the fundamental induced emfs are respectively
(a) 30%, 20% (b) 10%, 12%
(c) 50%, 20% (d) 50%, 12%
[U.P.S.C. I.E.S. E.E.-II, 2001]

31. If a sinusoidal voltage source is connected to a power transformer, its no-load current would be
(a) sinusoidal and lagging the voltage by 90°.
(b) sinusoidal and lagging the voltage by less than 90°.
(c) rich in third harmonic and its fundamental would lag the voltage by 90°.
(d) rich in third harmonic and its fundamental would lag the voltage by less than 90°. [U.P.S.C. I.E.S. E.E.-II, 1999]

32. The transformer exciting current has two components, magnetizing component and core-loss component. Neglecting impedance drop
(a) both of them are in phase with the supply voltage.
(b) the former lags the supply voltage by 90° while the latter is in phase with supply voltage.
(c) both of them lag the supply voltage by 90°.
(d) the former is in phase with the supply voltage while the latter lags the supply voltage by 90°.
[A.M.I.E. Sec B. Elec. Machines Winter 1999]

33. A single-phase transformer has a turns ratio of 1 : 2 and is connected to a purely resistive load as shown in the figure. The magnetizing current drawn is 1 A, and the secondary currents is 1 A. If core losses and leakage reactances are neglected, the primary current is



(a) 1.41 A (b) 2 A (c) 2.24 A (d) 3 A
[GATE E.E., 2010]

Answers: **18.** (d), **19.** (a), **20.** (b), **21.** (a), **22.** (c), **23.** (d), **24.** (c), **25.** (b), **26.** (d), **27.** (c), **28.** (b), **29.** (b), **30.** (a), **31.** (d), **32.** (b), **33.** (c),

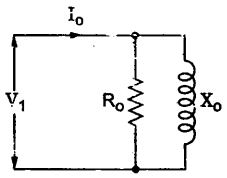
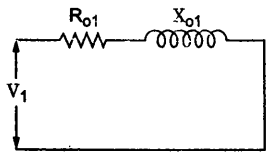
34. At which condition of the transformer the equivalent circuit will be as shown in the figure?



(a) Under short circuit.
(b) Under rated load.
(c) Under open circuit.
(d) Under load and no load.

[U.P.S.C. I.E.S. E.E.-II, 2069]

35. At which condition of the transformer the equivalent circuit will be as shown in the figure?



(a) Under short circuit.
(b) Under open circuit.
(c) Under no load.
(d) Under rated load.

[U.P.S.C. I.E.S. E.E.-II, 2009]

36. In a transformer, the exciting current will be in phase quadrature with the impressed voltage provided
(a) only the leakage impedance drop is ignored.
(b) only the core loss is ignored.
(c) both the leakage impedance drop and the core loss are ignored.
(d) only the no-load copper loss is ignored.

[A.M.I.E. Sec B. Elec. Machines Winter 1994]

37. The power factor of a power transformer on no load will be about
(a) unity. (b) 0.75 (c) 0.5 (d) 0.35

38. The power factor of a transformer on no load is poor due to
(a) magnetizing reactance of the transformer.
(b) open-circuited secondary.
(c) low primary winding resistance.
(d) low no-load current.

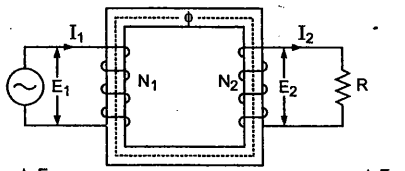
39. If in a transformer core, a material having high reluctance path but having same hysteresis loop is employed
(a) I_e will increase. (b) I_m will increase.
(c) I_m will decrease. (d) both I_m and I_e will increase.

40. Primary winding of a transformer comprises of two identical windings in parallel. If one winding is removed, magnetizing current will be
(a) halved. (b) the same.
(c) doubled. (d) increased four times.

[A.M.I.E. Sec B. Winter 1999]

41. The core flux of a practical transformer with a resistance load
(a) is strictly constant with load changes.
(b) increases linearly with load.
(c) increases as the square root of the load.
(d) decreases with increase of load. [GATE E.E. 2001]

42. Figure shows an ideal single-phase transformer. The primary and secondary coils are wound on the core as shown. Turn-ratio $N_1/N_2 = 2$. The correct phasors of voltages E_1, E_2 currents I_1, I_2 and core flux ϕ are as shown in



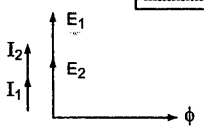


Fig. A

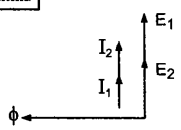

Fig. B

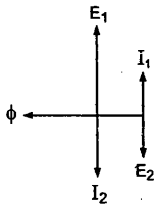

Fig. C

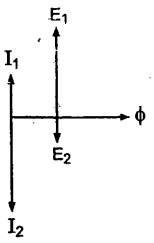

Fig. D

(a) Fig. *A*. (b) Fig. *B*.
(c) Fig. *C*. (d) Fig. *D*. [GATE E.E. 2003]

43. The inductive reactance of a transformer depends on
(a) electromotive force. (b) magnetomotive force.
(c) magnetic flux. (d) leakage flux.

[U.P.S.C. I.E.S. E.E.-II 1992]

44. The flux in transformer core
(a) increases with load. (b) decreases with load.
(c) remains constant irrespective of load.
(d) none of the above. [A.M.I.E. Winter 1997]

45. The mutual flux in a loaded transformer can be varied by varying
(a) primary current. (b) load impedance.
(c) secondary current.
(d) reluctance of the magnetic path.

46. The primary ampere-turns are counter balanced by
(a) secondary ampere-turns.
(b) primary flux. (c) increase in mutual flux.
(d) increase in secondary current.

47. In a transformer _____ decreases with the increase in leakage flux.
(a) primary induced emf
(b) secondary induced emf
(c) secondary terminal voltage
(d) none of the above.

48. Power transformed from primary to secondary depends upon
(a) number of primary turns.
(b) number of secondary turns.
(c) current transformation ratio.
(d) magnetic coupling between primary and secondary windings.

49. A transformer is supplying pure resistive (unity pf) load. The power factor on primary side will be
(a) about 0.95 (lead). (b) about 0.95 (lag).
(c) zero. (d) unity.

50. In a transformer supplying inductive load
(a) the secondary current results in equivalent primary current in phase opposition.
(b) the secondary terminal voltage is less than the secondary induced emf.
(c) the power factor on primary side will be lower than that of load.
(d) all of the above.

51. The phasor diagram of a transformer on load can be drawn only if we know
(a) equivalent circuit parameters of the transformer.
(b) load current. (c) load pf.
(d) all of the above.

52. When a transformer is operating on no load, the primary applied voltage is approximately balanced by

Answers: **34.** (c), **35.** (a), **36.** (c), **37.** (d), **38.** (a), **39.** (b), **40.** (c), **41.** (a), **42.** (d), **43.** (d), **44.** (c), **45.** (d), **46.** (a), **47.** (c), **48.** (d), **49.** (b), **50.** (d), **51.** (d), **52.** (a),

Downloaded From : www.EasyEngineering.net

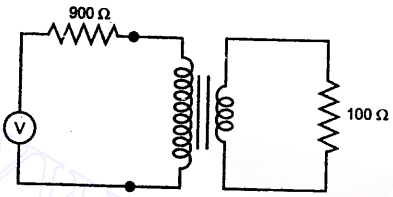
Downloaded From : www.EasyEngineering.net

(a) primary induced emf.
(b) secondary induced emf.
(c) terminal voltage across the secondary.
(d) voltage drop across the resistance and reactance.

[A.M.I.E. Summer 1996]

53. A 1 kVA, 230/100 V, single phase, 50 Hz transformer having negligible winding resistance and leakage inductance is operating under saturation, while 250 V, 50 Hz sinusoidal supply is connected to the high voltage winding. A resistive load is connected to the low voltage winding which draws a rated current. Which one of the following quantities will not be sinusoidal?
(a) Voltage induced across the lv winding.
(b) Core flux. (c) Load.
(d) Current drawn from the source. [GATE E.E. 2002]

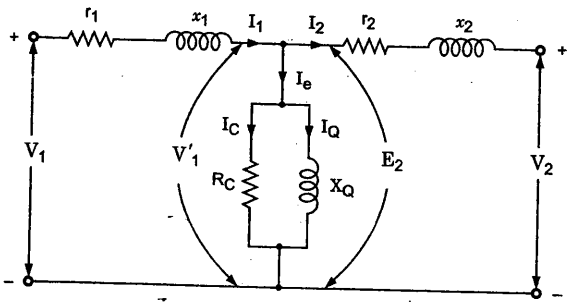
54. Consider the circuit shown in the given figure. For maximum power transfer to the load, the primary to secondary turn-ratio must be



(a) 9 : 1. (b) 3 : 1 (c) 1 : 3. (d) 1 : 9.
[U.P.S.C. I.E.S. E.E-I 1995]

55. For the purpose of analysis exact equivalent circuit of a transformer is usually replaced by an approximate equivalent circuit. In doing so errors introduced due to winding copper loss and core loss are of different nature. Due to this, the analysis by approximate equivalent circuit gives fairly satisfactory results. Under the circumstances, which one of the following statements is correct in respect of losses referred to approx. equivalent circuit as compared to exact equivalent circuit ?
(a) This accounts for somewhat lesser primary winding copper loss and less core loss.
(b) This accounts for somewhat lesser primary winding copper loss and more core loss.
(c) This accounts for somewhat greater secondary winding copper loss and less core loss.
(d) This accounts for somewhat lesser secondary winding copper loss and core loss. [U.P.S.C. I.E.S. E. E.-II 1995]

56. The exact equivalent circuit of a two-winding transformer is given in the figure. For affecting simplification, the parallel magnetising branch, consisting of R_C and X_Q is shifted to the left of the primary leakage impedance $(r_1 + jx_1)$. This simplification introduces the inaccuracy, in the neglect of



(a) Voltage drop in the primary impedance due to the secondary current.
(b) Voltage drop in the primary impedance due to the exciting current.
(c) Voltage drop in the secondary impedance due to the exciting current.
(d) Reduction in values of R_C and X_Q of the exciting current.
[U.P.S.C. I.E.S. E.E. II, 2005]

57. The equivalent circuit of a transformer has leakage reactances X_1, X'_2, and magnetizing reactance X_M. Their magnitudes satisfy
(a) $X_1 >> X'_2 >> X_M$ (b) $X_1 << X'_2 << X_M$
(c) $X_1 \approx X'_2 >> X_M$ (d) $X_1 \approx X'_2 << X_M$
[GATE E.E. 2005; U.P.S.C. I.E.S. E.E.-II, 2006]

58. In the transformer circuit mode, the core loss is represented as a
(a) series resistance. (b) series inductance.
(c) shunt resistance. (d) shunt inductance
[A.M.I.E. Sec B. Elec. Machines Winter, 1994]

59. Full-load voltage regulation of a power transformer is zero when power factor of the load is near
(a) unity and leading. (b) zero and leading.
(c) zero and lagging. (d) unity and lagging.
[U.P.S.C. I.E.S. E.E.-II, 1999]

60. In a transformer, zero voltage regulation at full load is:
(a) not possible.
(b) possible at leading power factor load.
(c) possible at lagging power factor load.
(d) possible at unity power factor load.
[GATE E.E. 2007; U.P.S.C. I.E.S. E.E.-II, 2011]

61. Positive voltage regulation is an indication of _____ load.
(a) inductive (b) capacitive
(c) either inductive or capacitive
(d) pure resistive

62. A 4 kVA, 400/200 V single-phase transformer has resistance of 0.02 pu and reactance of 0.06 pu. Its actual resistance and reactance referred to hv side, are, respectively
(a) 0.2 ohm and 0.6 ohm. (b) 0.8 ohm and 2.4 ohm.
(c) 0.08 ohm and 0.24 ohm. (d) 2 ohm and 6 ohm.
[U.P.S.C. I.E.S. E.E.-II, 2002, 2011]

63. If the percentage resistance of a power transformer for secondary side is 2.5 percent and turn ratio is 1 : 10, the percentage secondary resistance referred to primary will be
(a) 25 (b) 2.5 (c) 0.25 (d) 0.025

64. In a 3-phase, 5 kV, 5 MVA system, what is the base impedance?
(a) 5 ohms. (b) 50 ohms.
(c) 500 ohm. (d) 0.5 ohms.
[U.P.S.C. I.E.S. E.E.-II, 2008]

65. A transformer has a percentage resistance of 2% and percentage reactance of 4%. What are its regulations at power factor 0.8 lagging and 0.8 leading, respectively?
(a) 4% and – 0.8% (b) 3.2% and – 1.6%
(c) 1.6% and – 3.2% (d) 4.8% and – 0.6%
[U.P.S.C. I.E.S. E.E. II, 2008]

66. 10 kVA, 400 V/200 V single phase transformer with a resistance of 3% and reactance of 6% is supplying a current of 50 A to a resistive load. The voltage across the load is
(a) 194 V (b) 196 V (c) 198 V (d) 390 V
[U.P.S.C. I.E.S. E.E.-II, 2000; GATE E.E. 1999]

67. The losses in a transformer are :
I Copper loss
II Eddy current loss
III Hysteresis loss.

Answers: **53.** (d), **54.** (b), **55.** (b), **56.** (b), **57.** (d), **58.** (c), **59.** (a), **60.** (b), **61.** (c), **62.** (b), **63.** (b), **64.** (a), **65.** (a), **66.** (a), **67.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The constant power loss of a transformer is given by
(a) I only. (b) I and II only.
(c) II and III only. (d) I, II and III.
[U.P.S.C. I.E.S. E.E.-II, 1992]

68. In a transformer, the hysteresis and eddy current losses depend upon
I load current
II maximum flux density in the core
III type of lamination
IV supply frequency
The correct statements are
(a) I and III. (b) II and III.
(c) I and IV. (d) II and IV.

69. In a power transformer iron losses remain practically constant from no load to full load. This is because
(a) core flux remains constant.
(b) leakage flux remains constant.
(c) both (a) and (b). (d) neither (a) nor (b).

70. In a power transformer, if in place of sinusoidal wave, a peaked wave voltage is fed to the primary
(a) copper losses will be less.
(b) noise level will be reduced.
(c) iron losses will be more.
(d) iron losses will be less.

71. On which of the following factors does hysteresis loss depend?
(1) Flux density. (2) Frequency.
(3) Thickness of laminations. (4) Time.
Select the correct answer using the code given below:
(a) 2 and 3. (b) 1 and 2. (c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2007]

72. The full-load copper loss and iron loss of a transformer are 6,400 W and 5,000 W respectively. The copper loss and iron loss at half load will be, respectively
(a) 3,200 W and 2,500 W. (b) 3,200 W and 5,200 W.
(c) 1,600 W and 1,250 W. (d) 1,600 W and 5,000 W.
[U.P.S.C. I.E.S. E.E.-II, 2002, 2008]

73. If the frequency of input voltage of a transformer is increased keeping the magnitude of voltage unchanged, then
(a) both hysteresis loss and eddy current loss in the core will increase.
(b) hysteresis loss will increase but eddy current loss will decrease.
(c) hysteresis loss will decrease but eddy current loss will increase.
(d) hysteresis loss will decrease but eddy current loss will remain unchanged. [U.P.S.C. I.E.S. E.E. II 1994]

74. The total iron loss in a transformer core at normal flux density was measured at 25 Hz and at 50 Hz and was found to be 250 W and 800 W respectively. The hysteresis loss at 50 Hz would be
(a) 100 W. (b) 150 W. (c) 200 W. (d) 600 W.
[U.P.S.C. I.E.S. E.E.-I, 1999]

75. The hysteresis and eddy current loss of 1-phase transformer working on 200 V, 50 Hz supply are P_h and P_e respectively. The percentage decrease in these losses when operated on 160 V, 40 Hz supply would respectively be
(a) 32, 36 (b) 20, 36 (c) 25, 50 (d) 40, 80
[U.P.S.C. I.E.S. E.E.-II, 2001]

76. The main purpose of performing open-circuit on a transformer is to measure its
(a) copper loss. (b) core loss.
(c) total loss. (d) insulation resistance.
[R.G.T.U. B.E.E. June 2007]

77. Open-circuit test in a transformer is performed with
(a) rated transformer voltage.
(b) rated transformer current.
(c) direct current.
(d) high frequency supply. [A.M.I.E. Summer 1998]

78. The open circuit test on a transformer is usually performed by exciting the low voltage winding. This is because
(a) it draws sufficiently large no-load current which can be conveniently measured.
(b) The required power input is low.
(c) it is not advisable to work on high voltage side.
(d) the voltage required is low.

79. The open-circuit test on a transformer gives
(a) equivalent resistance and leakage reactance.
(b) magnetizing current and core loss at rated voltage.
(c) copper losses. (d) both (b) and (c).

80. In transformers, which of the following statements is valid?
(a) In an open-circuit test, copper losses are obtained while in short-circuit test, core losses are obtained.
(b) In an open-circuit test, current is drawn at high power factor.
(c) In a short-circuit, current is drawn at zero power factor.
(d) In an open-circuit test, current is drawn at low power factor. [GATE, E.E. 2006]

81. Consider the following tests:
1. Load test 2. Short-circuit test
3. OC test 4. Retardation test
Which of the above tests are to be conducted for the determination of voltage regulation of a transformer?
(a) 1 only. (b) 2 only.
(c) 2 and 3. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2009]

82. When a no-load test is carried out on hv side of 1,000/100 V single phase transformer with 100 V winding open, the wattmeter reads 110 watts. If the test is repeated on lv side with 1,000 V winding open. The wattmeter will read.
(a) 11 W (b) 110 W (c) 1.1 W (d) 1,100 W
[R.G.T.U. B.E.E. Jan; Feb. 2006]

83. It is desired to measure parameters of 230 V/115 V, 2 kVA, single-phase transformer. The following wattmeters are available in a laboratory:
W_1 : 250 V, 10 A, Low Power Factor.
W_2 : 250 V, 5 A, Low Power Factor.
W_3 : 150 V, 10 A, High Power Factor.
W_4 : 150 V, 5 A, High Power Factor.
The wattmeters used in open-circuit test and short-circuit test of the transformer will respectively be
(a) W_1 and W_2 (b) W_2 and W_4
(c) W_1 and W_4 (d) W_2 and W_3
[GATE E.E. 2008]

84. In a 100 kVA, 1100/220 V, 50 Hz single phase transformer with 2,000 turns on high-voltage side, the open-circuit test result gives 220 V, 91 A, 5 kW on low-voltage side. The core-loss component of current is, approximately
(a) 9.1 A (b) 22.7 A (c) 45.0 A (d) 91 A
[U.P.S.C. I.E.S. E.E.-II 2002]

Answers: **68.** (d), **69.** (a), **70.** (d), **71.** (b), **72.** (d), **73.** (d), **74.** (c), **75.** (b), **76.** (b), **77.** (a), **78.** (a), **79.** (b), **80.** (d), **81.** (c), **82.** (b), **83.** (d), **84.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

85. The nominal short-circuit voltage (V_{SCN}) of a transformer means the
(a) voltage across the primary terminals when the secondary terminals are short circuited.
(b) voltage appearing across the secondary terminals when they are short circuited.
(c) primary voltage when the secondary terminals are short circuited and the rated current flows through the primary winding.
(d) none of the above.

86. A 10 kVA, 400 V/200 V single phase transformer with 10% impedance draws a steady short circuit line current of
(a) 50 A (b) 150 A (c) 250 A (d) 350 A
[GATE E.E. 1999]

87. A 20 kVA, 2000/200 V, 1-phase transformer has name plate leakage impedance of 8%. Voltage required to be applied on the high-voltage side to circulate full-load current with the low-voltage winding short-circuited will be
(a) 16 V (b) 56.66 V (c) 160 V (d) 558.68 V
[U.P.S.C. I.E.S. E.E.-II, 2002]

88. In a single phase transformer, the magnitude of leakage reactance is twice that of resistance of both primary and secondary. With secondary short-circuited, the input power factor is
(a) $\frac{1}{\sqrt{2}}$ (b) $\frac{1}{\sqrt{5}}$ (c) $\frac{2}{\sqrt{5}}$ (d) $\frac{1}{3}$
[U.P.S.C. I.E.S. E.E.-II, 1999]

89. During short-circuit test, the core losses are negligible. This is because
(a) the voltage applied across the high voltage side is a fraction of its rated voltage and so is the mutual flux.
(b) the current on the lv side is very small.
(c) the power factor is high.
(d) iron becomes fully saturated.

90. While performing the open-circuit and short-circuit tests on a transformer to determine parameters the status of the low voltage (LV) and high voltage (HV) windings will be such that
(a) in OC, LV is open and in SC HV is shorted.
(b) in OC, HV is open and in SC LV is shorted.
(c) in OC, LV is open and in SC LV is shorted.
(d) In OC, HV is open and in SC HV is shorted.
[U.P.S.C. I.E.S. E.E.-II, 1996]

91. 1 kVA, 200/100 V, 50 Hz single phase transformer gave the following test results on 50 Hz:
OC (LV side) : 100 V, 20 Watts.
SC (HV side) : 5 A, 25 Watts.
It is assumed that no-load loss components are equally divided. The above tests were then conducted on the same transformer at 40 Hz. Test results were:
OC (HV) : 160 V, W_1 Watts.
SC (LV) : 10 A, W_2 Watts.
Neglecting skin effect, W_1 and W_2 will be
(a) W_1 = 16 watts, W_2 = 25 watts.
(b) W_1 = 25 watts, W_2 = 31.25 watts.
(c) W_1 = 20 watts, W_2 = 20 watts.
(d) W_1 = 14.4 watts, W_2 = 25 watts.
[U.P.S.C. I.E.S. E.E.-II, 2003]

92. Short-circuit test is performed on a transformer with a certain impressed voltage at rated frequency. If the short-circuit test is now performed with the same magnitude of impressed voltage, but at a frequency higher than the rated frequency, then
(a) the magnitude of current and power factor will both increase.
(b) the magnitude of current will decrease but the power factor will increase.
(c) the magnitude of current will increase but power factor will decrease.
(d) the magnitude of current as well as the power factor will decrease.
[U.P.S.C. I.E.S. E.E.-II, 1993]

93. For a transformer to be tested at full load conditions but consuming only losses from the mains, we do
(a) load test.
(b) open-circuit and short-circuit tests.
(c) back-to-back test.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Summer 1995]

94. The efficiency of two identical transformers under load conditions can be determined by
(a) back to back test. (b) open-circuit test.
(c) short-circuit test. (d) any of the above.
[U.P.S.C I.E.S. E.E.-II, 1992]

95. Two transformers, each having iron loss of P_i watts and full-load copper loss of P_c, are put to back to back test and full-load current is allowed to flow through the secondaries, the total input will be
(a) $2P_i$ (b) $2P_c$ (c) $P_i + P_c$ (d) $2(P_i + P_c)$

96. The efficiency of a power transformer can be determined indirectly by
(a) open-circuit test alone.
(b) short-circuit test alone.
(c) open-circuit and short-circuit tests.
(d) back-to-back test.

97. The transformer efficiency at relatively light loads is quite low. This is due to
(a) small copper losses.
(b) small secondary output.
(c) high fixed loss in comparison to the output.
(d) poor power factor.

98. The transformer efficiency, under heavy loads, is comparatively low due to
(a) large increase in copper losses in comparison to the output.
(b) large increase in iron losses.
(c) drop in power factor.
(d) none of the above.

99. The full-load copper loss and iron loss of a transformer are 6,400 W and 500 W, respectively. The above copper loss and iron loss at half load will be:
(a) 3,200 W and 250 W respectively.
(b) 3,200 W and 500 W respectively.
(c) 1,600 W and 125 W respectively.
(d) 1,600 W and 500 W respectively. [U.P.S.C. I.E.S. E.E.-II, 2011]

100. A 10 kVA, 2,500/250 single phase transformer has the following results:

O.C. Test	250 volts	0.8 amps	50 W
S.C. Test	60 volts	3 amps	45 W

Then efficiency at half-full load at 0.8 power factor will be:
(a) 98.49% (b) 97.68%
(c) 98.28% (d) 96.85%
[U.P.S.C. I.E.S. E.E.-II, 2011]

101. The efficiency of a 100 kVA transformer is 0.98 at full as well as half load. For this transformer at full-load the copper loss
(a) is less than core less. (b) is equal to core loss.
(c) is more than core loss. (d) none of the above.
[GATE E.E. 1998]

Answers: **85.** (c), **86.** (c), **87.** (c), **88.** (b), **89.** (a), **90.** (b), **91.** (d), **92.** (d), **93.** (c), **94.** (a), **95.** (d), **96.** (c), **97.** (c), **98.** (a), **99.** (d), **100.** (c), **101.** (c),

102. Transformer will operate at maximum efficiency when
(a) hysteresis loss = eddy current loss
(b) eddy current loss = copper loss
(c) copper loss = iron loss
(d) hysteresis loss = copper loss [R.G.T.U. B.E.E. June/July 2006]

103. Power transformers are designed to have maximum efficiency around _____ full load.
(a) nearly (b) 70% of
(c) 50% of (d) 25% of

104. The transformer efficiency will be maximum at a power factor of
(a) 0.8 lead. (b) unity.
(c) 0.8 lag. (d) 0.5 lag or lead.

105. If P_c and P_{sc} represent core and full-load ohmic losses respectively, the maximum kVA delivered to load corresponding to maximum efficiency is equal to rated kVA multiplied by

(a) $\frac{P_c}{P_{sc}}$ (b) $\sqrt{\frac{P_c}{P_{sc}}}$ (c) $\left(\frac{P_c}{P_{sc}}\right)^2$ (d) $\left(\frac{P_{sc}}{P_c}\right)^2$

[U.P.S.C. I.E.S. E.E.-II, 2001]

106. If P_1 and P_2 be the iron and copper losses of a transformer at full-load and the maximum efficiency is at 75% of the full-load, then what is the ratio of P_1 and P_2?

(a) $\frac{9}{16}$ (b) 10/16 (c) 3/4 (d) 3/16

[U.P.S.C. I.E.S. E.E.-II, 2006]

107. What is load at which maximum efficiency occurs in case of a 100 kVA transformer with iron loss of 1 kW and full-load copper loss of 2 kW?
(a) 100 kVA (b) 70.7 kVA
(c) 50.5 kVA (d) 25.2 kVA
[U.P.S.C. I.E.S. E.E.-II, 2008]

108. A 500 kVA transformer has constant loss of 500 W and copper losses at full load are 2,000 W. Then at what load, is the efficiency maximum?
(a) 250 kVA (b) 500 kVA
(c) 1000 kVA (d) 125 kVA
[U.P.S.C. I.E.S. E.E.-II, 2007]

109. A 2 kVA transformer has iron loss of 150 W and full-load copper loss of 250 W. The maximum efficiency of the transformer would occur when the total loss is
(a) 500 W. (b) 400 W.
(c) 300 W. (d) 275 W.
[U.P.S.C. I.E.S. E.E.-II, 1994]

110. If P_i be the iron loss and P_c be the copper loss on full load, then which of the following conditions had to be satisfied to obtain maximum efficiency at 3/4 full load?

(a) $P_c = \frac{3P_i}{4}$ (b) $P_c = \frac{4P_i}{3}$

(c) $P_c = \frac{16P_i}{9}$ (d) $P_c = \frac{9P_i}{16}$ [U.P.S.C. I.E.S. E.E.-II, 1993]

Data for Qs. 111 and 112 are given below. Solve the problems and choose the correct answers.

A 300 kVA transformer has 95% efficiency at full load 0.8 pf lagging and 96% efficiency at half load, unity pf.

111. The iron loss (P_i) and copper loss (P_c) in kW, under full load operation are
(a) $P_c = 4.12$, $P_i = 8.51$ (b) $P_c = 6.59$, $P_i = 9.21$
(c) $P_c = 8.51$, $P_i = 4.12$ (d) $P_c = 12.72$, $P_i = 3.07$
[GATE E.E. 2006]

112. What is the maximum efficiency (in%) at unity pf load?
(a) 95.1 (b) 96.2 (c) 96.4 (d) 98.1
[GATE E.E. 2006]

113. A single phase transformer has a maximum efficiency of 90% at full load and unity power factor. Efficiency at half load at the same power factor is
(a) 86.7%. (b) 88.26%. (c) 88.9%. (d) 87.8%.
[GATE E.E. 2003]

114. When a short-circuit test on a transformer is performed at 25 V, 50 Hz, the drawn current 'I_1' is at a lagging pf angle of ϕ_1. If the test is performed by 25 V, 25 Hz and the drawn current 'I_2' is at a lagging power factor angle of ϕ_2 then
(a) $I_2 > I_1$ and $\phi_2 < \phi_1$. (b) $I_2 < I_1$ and $\phi_2 < \phi_1$.
(c) $I_2 > I_1$ and $\phi_2 > \phi_1$. (d) $I_2 < I_1$ and $\phi_2 > \phi_1$.
[U.P.S.C. I.E.S. E.E.-II, 1999]

115. The all day efficiency of a distribution transformer will be high with low
(a) copper losses. (b) iron losses.
(c) operating temperature. (d) copper as well as iron losses.

116. The all-day efficiency of a transformer depends primarily on
(a) its copper loss. (b) the amount of load.
(c) the duration of load. (d) both (b) and (c).
[R.G.T.U. B.E.E. June 2007, 2008]

117. A single phase transformer is to be switched to the supply to have minimum inrush current. The switch should be closed at
(a) maximum supply voltage.
(b) zero supply voltage.
(c) $\frac{1}{\sqrt{2}}$ maximum supply voltage.
(d) $\frac{1}{2}$ maximum supply voltage. [GATE E.E. 2001]

118. The desirable properties of transformer core material are
(a) low permeability and low hysteresis loss.
(b) high permeability and high hysteresis loss.
(c) high permeability and low hysteresis loss.
(d) low permeability and high hysteresis loss.
[U.P.S.C. I.E.S. E.E.-II, 1992]

119. The use of higher flux density in the transformer design
(a) reduces the weight per kVA.
(b) increases the weight per kVA.
(c) has no relation with the weight of transformer.
(d) increases the weight per kW. [U.P.S.C. I.E.S. E.E.-II, 2003]

120. What does the use of higher flux density value in a transformer design lead to?
(a) Increase in weight per kVA.
(b) Decrease in weight per kVA.
(c) Reduced iron losses.
(d) Reduced copper losses. [U.P.S.C. I.E.S. E.E.-II, 2007]

121. The size of the transformer core depends upon
(a) frequency.
(b) permissible flux density in the core material.
(c) area of the core. (d) both (a) and (b).

122. Ferrite cores are employed in high frequency transformers due to their
(a) low resistance. (b) high resistance.
(c) low permeability. (d) high hysteresis loss.

123. What is the core loss in a high frequency ferrite core transformer used in SMPS power supply?

Answers: **102.** (c), **103.** (a), **104.** (b), **105.** (b), **106.** (a), **107.** (b), **108.** (a), **109.** (c), **110.** (c), **111.** (c), **112.** (b), **113.** (d), **114.** (a), **115.** (d), **116.** (d), **117.** (a), **118.** (c), **119.** (a), **120.** (b), **121.** (d), **122.** (b), **123.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 10% of rated power. (b) 5% of rated power.
(c) 2% of rated power. (d) 1% of rated power.
[U.P.S.C. I.E.S. E.E.-II, 2009]

124. Cores of large power transformers are made from which one of the following?
(a) Hot-rolled steel.
(b) Cold-rolled non-grain oriented steel.
(c) Cold-rolled grain oriented steel.
(d) Ferrite. [U.P.S.C. I.E.S. E.E.-II, 2008]

125. Grain oriented laminated sheet steel in transformer reduces
(a) copper loss. (b) eddy current loss.
(c) hysteresis loss. (d) none of the above.
[A.M.I.E. Sec B. Summer 1997]

126. Silicon content in iron laminations is kept within 5% as it
(a) increases hysteresis loss. (b) increases cost.
(c) makes the material brittle.
(d) reduces the curie point. [A.M.I.E. Sec B. Winter 1993]

127. The permissible flux density in cold rolled grain oriented steel is about
(a) 1.8 T (b) 2.5 T (c) 3.5 T (d) 4.5 T

128. If the iron core of a transformer is replaced by an air core, then the hysteresis losses in the transformer will
(a) increase. (b) decrease.
(c) remain unchanged. (d) become zero.
[U.P.S.C. I.E.S. E.E.-II, 2006]

129. Which of the following will improve the mutual coupling between primary and secondary circuits ?
(a) Transformer oil of high breakdown voltage.
(b) High reluctance magnetic core.
(c) Winding material of high resistivity.
(d) Low reluctance magnetic core. [U.P.S.C. I.E.S. E.E.-II, 1992]

130. In order to reduce the hysteresis loss
(a) core may be laminated.
(b) silicon steel may be used as the core material.
(c) core may be constructed with any permanent magnet material such as Alnico.
(d) core may be impregnated with varnish.
[A.M.I.E Sec B. Winter 1994]

131. Why is the core of the transformer built up of laminations ?
(a) To reduce eddy current loss.
(b) For convenience of fabrication.
(c) No specific advantage.
(d) For increasing the permeability. [U.P.S.C. I.E.S. E.E.-I, 2008]

132. When are eddy-current losses in a transformer reduced ?
(a) If laminations are thick.
(b) If the number of turns in primary winding is reduced.
(c) If the number of turns in secondary winding is reduced.
(d) If laminations are thin. [U.P.S.C. I.E.S. E.E.-II, 2008]

133. Transformer core laminations are coated with an enamel layer in order to
(a) reduce hum.
(b) attain adhesion between laminations.
(c) insulate laminations from each other.
(d) prevent corrosion of the laminations.

134. The yoke sections of transformers employing hot rolled laminations is made 15 percent more than that of core in order to
(a) reduce the copper losses.
(b) reduce the magnetizing current and iron loss in yoke.
(c) provide better cooling.
(d) all of the above.

135. The joints in the transformer core laminations are staggered so as to
(a) avoid continuous gap causing increase in magnetizing current.
(b) increase the mechanical strength of the assembled core.
(c) avoid undue humming noise.
(d) facilitate assembly of core after putting preformed coils on the core.
(e) all of the above.

136. For CRGOS mitred overlap is preferred for the core-yoke joints as it
(a) reduces the magnetizing current and also the core losses.
(b) improves the mechanical strength.
(c) reduces magnetostriction.
(d) makes better use of core space.

137. The degree of mechanical vibrations caused by core laminations in a transformer depends on
(a) size of laminations. (b) gauge of laminations.
(c) tightness of clamping. (d) all of the above.

138. The noise, in a transformer, caused by vibrations of laminations set by magnetic forces, is termed as
(a) zoom. (b) hum.
(c) buzz. (d) none of these.

139. The primary and secondary windings are interlaced for
(a) easiness of coil making. (b) reduced leakage reactance.
(c) reduced cost.
(d) uniform heating. [A.M.I.E. Sec B. Summer 1993]

140. The leakage flux of primary and secondary windings can be reduced to the minimum by
(a) winding primary and secondary coils on separate limbs.
(b) winding primary and secondary coils one upon the other coaxially.
(c) increasing the number of turns.
(d) employing low permeability magnetic material core.

141. The concentric windings are used in core type transformers with _____ winding placed next to the core.
(a) lv (b) primary
(c) hv (d) secondary

142. Low voltage windings are placed next to the core in the case of concentric windings as in this case _____ is/are reduced.
(a) hysteresis loss (b) leakage fluxes
(c) eddy current loss (d) copper loss
(e) insulation requirement

143. In a power transformer
(a) primary winding is always wound with many turns of thin wire.
(b) secondary winding is always wound with lesser number of turns of thin wire.
(c) low voltage winding is always wound with lesser number of turns of thicker wire.
(d) high voltage winding is always wound with larger number of turns of thicker wire.

144. In transformers, the primary and secondary are interlaced so that
(a) there may be maximum flux linkage between the two windings.
(b) copper is saved. (c) both (a) and (b).
(d) statement is false.

145. In a large capacity transformer, 5% of the turns at the end of hv winding are provided with extra insulation so as to provide protection

---

Answers: **124.** (c), **125.** (c), **126.** (c), **127.** (a), **128.** (d), **129.** (d), **130.** (b), **131.** (a), **132.** (d), **133.** (c), **134.** (b), **135.** (e), **136.** (a), **137.** (d), **138.** (b), **139.** (b), **140.** (b), **141.** (a), **142.** (e), **143.** (c), **144.** (a), **145.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) against corona. (b) against lightening.
(c) due to surges occurring during switching operations.
(d) all of the above.

146. When a transformer winding suffers a short circuit, the adjoining turns of the same winding experience
(a) an attractive force. (b) a repulsive force.
(c) no force. [GATE E.E. 1994]

147. Under short-circuit condition, the windings of a transformer having 5% impedance will experience a radial force
(a) 5 times of full load value.
(b) 20 times of full load value.
(c) 25 times of full load value.
(d) 400 times of full load value. [A.M.I.E. Sec B. Summer 1993]

148. Major insulation in a transformer is the insulation between the
(a) lv winding and core.
(b) lv winding and hv winding.
(c) turns of the winding turns. (d) both (a) and (b).

149. Minor insulation in a transformer is the insulation between the
(a) lv winding and core. (b) lv and hv windings.
(c) turns of the windings. (d) layers of the windings.
(e) both (c) and (d).

150. In a transformer, an insulating material may fail due to
(a) moisture. (b) dust.
(c) voids in the winding. (d) any one or more of the above.

151. The function of oil in a transformer is
(a) to provide insulation and cooling.
(b) to provide protection against lightning.
(c) to provide protection against short-circuit.
(d) to provide lubrication.
[GATE E.E. 1996; U.P.S.C. I.E.S. E.E.-II, 2003]

152. The colour of fresh dielectric oil used in transformers is
(a) dark brown. (b) pale-yellow.
(c) pale-pink. (d) white-grey.

153. The transformer oil should have
(a) low volatility. (b) high dielectric strength.
(c) good resistance to emulsion with water.
(d) low viscosity to provide good heat transfer.
(e) all of the above.

154. Transformer oil must be free from
(a) moisture. (b) sludges.
(c) gases. (d) sulphur.

155. The core and windings of a transformer are put in a steel tank in order to
(a) make it suitable for outdoor operation.
(b) provide protection against mechanical damages and provide additional cooling.
(c) improve its appearance. (d) all of the above.

156. Conservator (for transformer) is used
(a) to take up the expansion of oil due to temperature rise.
(b) to act as an oil storage.
(c) for better cooling of transformer.
(d) None of the above.
[A.M.I.E. Sec. B. Electrical Machines Summer 2004]

157. Consider the following statements relating to the constructional features of a large power transformer:
1. The conservator is used to maintain the level of oil in the transformer tank.
2. The bushing is used to protect transformer insulation against lightning voltages.
3. The Buchholz relay is an overcurrent relay.
4. Silica gel is used to absorb moisture.
Which of these statements are correct?
(a) 1, 2, 3 and 4. (b) 2 and 3.
(c) 1 and 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2003]

158. In a large power transformer, a "conservator" drum is provided above the completely oil filled transformer tank and connected to it by a short pipe. The conservator drum is linked to external air through a breather. What is the purpose of providing the conservator?
(a) To store reserve oil to make up oil losses due leakage.
(b) To prevent explosion due to rise in oil pressure inside the tank during a fault.
(c) To accommodate change in oil-level during the "load - cycle" of the transformer load.
(d) To exert additional pressure by the conservator-oil on the oil inside the main tank to prevent disintegration of oil at high temperature. [U.P.S.C. I.E.S. E.E.-II, 2007]

159. Consider the following statements regarding transformers:
1. The function of the magnetizing component of no-load current is to sustain the alternating flux in the core.
2. Short-circuit test is performed to find core losses only.
3. The function of the breather in transformer is to arrest flow of moisture when outside air enters the transformer.
Which of the statements given above are correct?
(a) 1 and 2 only. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

160. Sludge formation in transformer oil is due to which one of the following ?
(a) Ingress of dust particles and moisture in the oil.
(b) Appearance of small fragments of paper, varnish, cotton and other organic materials in the oil.
(c) Chemical reaction of transformer oil with the insulating materials.
(d) Oxidation of transformer oil. [U.P.S.C. I.E.S. E.E.-II, 2008]

161. In a power transformer, the breather is provided in order to
(a) filter transformer oil.
(b) prevent ingress of moisture with air.
(c) provide oxygen to the cooling oil.
(d) provide fresh air for increasing cooling effect.

162. The chemical used in breather of a transformer should have the quality of
(a) absorbing moisture. (b) ionizing air.
(c) cleansing the transformer oil.
(d) none of the above.

163. Malfunctioning of the Buchholz relay may be caused due to
(a) heavy external short circuits.
(b) improper breather action.
(c) dropping of oil level below the relay level during operation.
(d) excessive overheating.

164. Which of the following statements associated with Buchholz relay is not TRUE ?
(a) It is a voltage sensitive device.
(b) It is used only on oil cooled transformers.

Answers: **146.** (a), **147.** (d), **148.** (d), **149.** (e), **150.** (d), **151.** (a), **152.** (b), **153.** (e), **154.** (a), **155.** (b), **156.** (a), **157.** (c), **158.** (c), **159.** (b), **160.** (d), **161.** (b), **162.** (a), **163.** (c), **164.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) It is usually not provided on transformers of ratings below 500 kVA.
(d) Its operating time is of the order of 0.1 second.

165. A Buchholz relay is used for
(a) protection of a transformer against all internal faults.
(b) protection of a transformer against external faults.
(c) protection of a transformer against both internal and external faults.
(d) protection of induction motors. [U.P.S.C. I.E.S. E.E.-II, 2005]

166. For system voltages exceeding 66 kV, condenser bushings are preferred over non-condenser bushings because
(a) the axial stresses can be eliminated.
(b) the radial stresses can be made independent of the radial thickness of the dielectric.
(c) optimum utilization of dielectric because of uniform potential distribution results in reduction of radial and axial dimensions of the bushings.
(d) none of the above.

167. Which is the arrangement of windings in a core type single phase transformer?
(a) Half lv inside and half *hv* outside on each core limb.
(b) *Lv* on one core limb and *hv* on the other.
(c) Sandwiched *lv* and *hv* discs on each core limb.
(d) Half hv inside and half hv outside on each core limb.
[A.M.I.E. Sec B. Winter 1994]

168. For core type power transformers, both primary and secondary windings have circular coil sections, as it
(a) reduces core material requirement and so also reduces the core loss.
(b) gives the strongest mechanical shape.
(c) is easier to wind.
(d) reduces the copper requirement.

169. With stepping in construction of transformer core
(a) copper losses are reduced.
(b) copper is saved.
(c) high flux density can be achieved.
(d) mechanical strength to the core is improved.
(e) both (a) and (b).

170. A shell type transformer is commonly used as it has
(a) two magnetic paths.
(b) reduced magnetic flux leakage.
(c) reduce copper losses. (d) both (a) and (b).

171. Spiral core transformer, in which core is made up of steel strip has the advantage(s) of
(a) minimum losses. (b) lighter construction.
(c) lesser weight. (d) all of these.

172. Distribution transformers have core losses
(a) > copper loss. (b) < copper losses.
(c) = copper loss. (d) $= \frac{1}{2}$ (copper losses).

173. Distribution transformers are designed to have maximum efficiency nearly at _____ of full load.
(a) 100% (b) 70% (c) 25% (d) 10%

174. A distribution transformer is selected on the basis of
(a) voltage regulation. (b) efficiency.
(c) all day efficiency. (d) none of those.

175. The distribution transformers are designed with minimum possible iron losses. This is because
(a) the primary of a distribution transformer is energized for all the 24 hours.
(b) iron losses will cause undue heating.
(c) the iron losses may cause damage to the insulation.
(d) none of the above.

176. Which part of transformer is subjected to maximum heating ?
(a) Frame. (b) Core. (c) Winding. (d) Oil.
[R.G.T.U. B.E.E. Dec. 2006 Nov./Dec. 2007]

177. Which of the following methods is employed for cooling of power transformers of rating not exceeding 10 MVA ?
(a) Air blast cooling. (b) Natural oil cooling.
(c) Forced oil cooling. (d) Natural air cooling.

178. Natural air cooling is used for transformers of rating up to
(a) 100 kVA. (b) 500 kVA.
(c) 5-10 kVA. (d) 10 MVA.

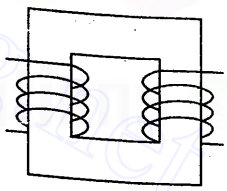
179. Addition of tubes to the transformer tank improves heat dissipation capacity because of
(a) additional cooling surface.
(b) additional dissipation by radiation only.
(c) additional dissipation by convection only.
(d) additional dissipation by radiation and convection both.
[A.M.I.E. Sec B. Summer 1993]

180. The winding used in a 3-phase shell type transformer is _____ type.
(a) circular (b) cylindrical
(c) sandwich (d) rectangular

181. The low-voltage winding of a core type transformer is subdivided into two equal halves, each of half the original width of the single winding with the high-voltage winding in between (instead of having the usual construction of low voltage winding adjacent to the core and surrounded by the high-voltage winding). Such an interlacing of coils would make the combined primary and secondary leakage reactance (in terms of the primary) nearly
(a) twice. (b) equal. (c) half. (d) one-fourth.
[U.P.S.C. I.E.S. E.E.-II, 1997]

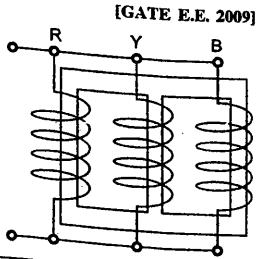
182. Transformers are rated in kVA instead of kW because
(a) load pf is often not known.
(b) kVA is fixed where kW depends on load pf.
(c) total transformer loss depends on volt-amperes.
(d) it has become customary.
[R.G.T.U. B.E.E. June 2007]

183. The single phase, 50 Hz iron core transformer in the circuit has both the vertical arms of cross-sectional area 20 cm^2 and both the horizontal arms of cross-sectional area 10 cm^2. If the two windings shown were wound instead on opposite horizontal arms, the mutual inductance will



(a) double. (b) remain same.
(c) be halved. (d) become one quarter.
[GATE E.E. 2009]

184. The three limbed non-ideal core shown in the figure has three windings with nominal inductances L each when measured individually with a single phase ac source. The inductance of the windings as connected will be



Answers: **165.** (a), **166.** (c), **167.** (a), **168.** (b), **169.** (e), **170.** (d), **171.** (d), **172.** (b), **173.** (b), **174.** (c), **175.** (a), **176.** (c), **177.** (b), **178.** (c), **179.** (a), **180.** (c), **181.** (c), **182.** (c), **183.** (c), **184.** (a),

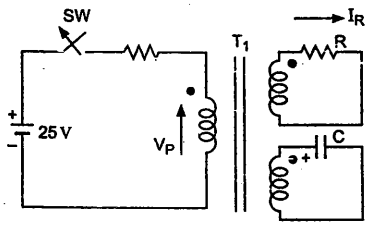
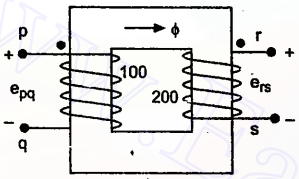
(a) very low. (b) L/3.
(c) 3L. (d) very high. [GATE E.E. 2006]

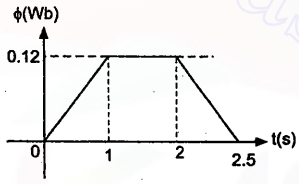
185. In the figure, transformer T_1 has two secondaries, all three windings having the same number of turns and with polarities as indicated. One secondary is shorted by a 10 Ω resistor R, and the other by a 15 mF capacitor. The switch SW is opened (t = 0) when the capacitor is charged to 5V with the left plate as positive. At ($t = 0^+$) the voltage V_p and current I_R are



(a) –25 V, 0.0 A
(b) very large voltage, very large current.
(c) 5.0 V, 0.5 A (d) –5.0 V, –0.5 A [GATE E.E. 2007]

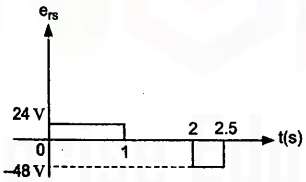
186. The core of a two-winding transformer is subjected to a magnetic flux variation as indicated in the figure.



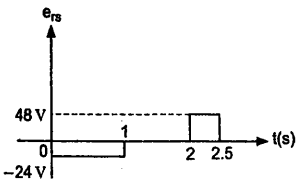


The induced emf (e_{rs}) in the secondary winding as a function of time will be of the form

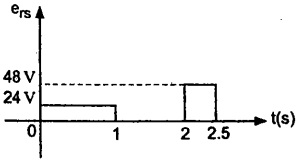
(a)



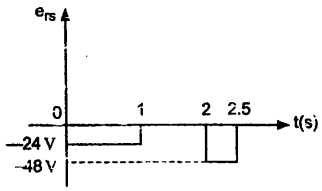
(b)



(c)



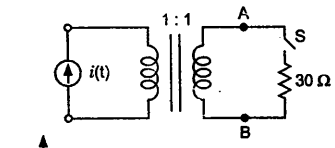
(d)

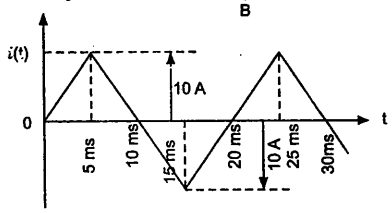


[GATE E.E. 2008]

Common Data for Questions 187 and 188

The circuit diagram shows a two-winding, lossless transformer with no leakage flux, excited from a current source, $i(t)$, whose waveform is also shown. The transformer has a magnetizing inductance of 400/π mH.





187. The peak voltage across A and B, with S open is

(a) $\frac{400}{\pi V}$ (b) 800 V (c) $\frac{4,000}{\pi V}$ (d) $\frac{800}{\pi V}$

[GATE E.E. 2009]

188. If the waveform of $i(t)$ is changed to $i(t) = 10 \sin(100 \pi t)$ A, the peak voltage across A and B with S closed is

(a) 400 V (b) 240 V (c) 320 V (d) 160 B

[GATE E.E. 2009]

189. Five limb construction is preferred over three limb construction as in this type of construction

(a) hysteresis loss is reduced.
(b) eddy current loss is reduced.
(c) magnetic reluctance of the three phase can be balanced.
(d) copper losses are reduced.

190. If the waveform of the voltage impressed on the primary of a Y-Δ bank contains 5th harmonics, what are the waveforms of the resultant voltages of the primary and secondary?

	Primary	Secondary
(a)	Peaked	Peaked
(b)	Peaked	Flat-topped
(c)	Flat-topped	Peaked
(d)	Flat-topped	Flat-topped

[U.P.S.C. I.E.S. E.E.-II, 2005]

191. Two 3-limb, 3-phase delta-star connected transformers are supplied from the same source. One of the transformers is Dy1 and the other is Dy11 connection. The phase difference between the corresponding phase voltage of the secondaries would be

(a) 0° (b) 30° (c) 60° (d) 120°

[U.P.S.C. I.E.S. E.E.-II, 1997]

192. Which three-phase connection can be used in a transformer to introduce a phase difference of 30° between its output and corresponding input line voltages ?

(a) Star- Star. (b) Star-Delta.
(c) Delta-Delta. (d) Delta- Zigzag.

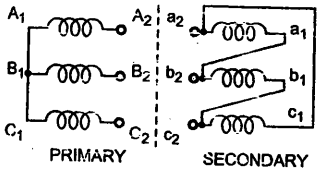
[GATE E.E. 2005; U.P.S.C. I.E.S. E.E.-II, 2006; 2011]

Answers: **185.** (d), **186.** (b), **187.** (d), **188.** (a), **189.** (c), **190.** (b), **191.** (c), **192.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

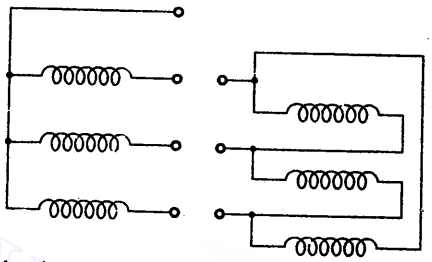
193. Three single-phase transformers are connected to form 3-phase transformer bank. The transformers are connected in the following manner:



The transformer connection will be represented by

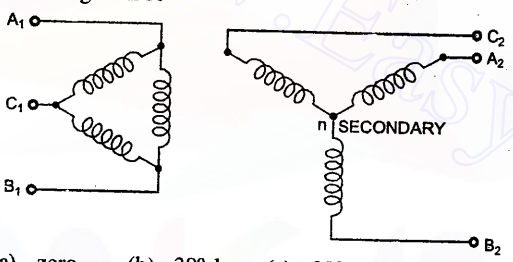
(a) Yd0 (b) Yd1
(c) Yd6 (d) Yd11 **[GATE E.E. 2008]**

194. What is the phase displacement between primary and secondary voltages for a star-delta, 3-phase transformer connection shown



(a) 30° lagging. (b) 30° leading.
(c) 0° (d) 180° **[U.P.S.C. I.E.S. E.E.-II, 2005]**

195. In a 3-phase Δ/Y transformer shown in the figure, the phase displacement of secondary line voltage with corresponding primary line voltage will be



(a) zero. (b) 30° lag. (c) 30° lead. (d) 180°
[U.P.S.C. I.E.S. E.E.-II, 1998]

196. Which of the following connection of transformer will give the highest secondary voltage ?

(a) Delta primary, delta secondary.
(b) Delta primary, star secondary.
(c) Star primary, star secondary.
(d) Star primary, delta secondary. **[U.P.S.C. I.E.S. E.E.-II, 1992]**

197. Three single phase 11,000/220 V transformers are connected to form 3-phase transformer bank. High voltage side is connected in star, and low voltage side is connected in delta. What are the voltage ratings and turn ratio of 3-phase transformer?

(a) 19,052/220 V, 50 (b) 19052/220 V, $50\sqrt{3}$
(c) 11,000/381 V, $50\sqrt{3}$ (d) 11,000/220 V, 50
[U.P.S.C. I.E.S. E.E.-I-II, 2005]

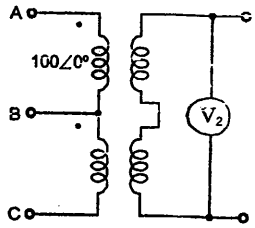
198. A delta/star transformer has a phase-to-phase voltage transformation ratio of $K\left[K = \frac{\text{delta phase voltage}}{\text{star phase voltage}}\right]$. The line-to-line voltage ratio of star/delta connections is given by

(a) $K/\sqrt{3}$ (b) K (c) $K\sqrt{3}$ (d) $\sqrt{3}/K$
[U.P.S.C. I.E.S. E.E.-II, 2002]

199. In the statement, "In a star/delta transformer, there exists a phase difference of "X" between the corresponding phases of primary and secondary "Y". "X" and "Y" stand respectively for

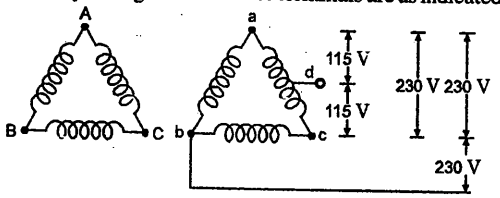
(a) 60° and voltages. (b) 60° and currents.
(c) 30° and voltages. (d) 30° and currents.
[U.P.S.C. I.E.S. E.E.-II, 2000]

200. Two single phase transformers with turn-ratios 1 and 2 respectively are connected to a 3-phase supply on the primary side as shown in the figure. The voltmeter V_2 will read

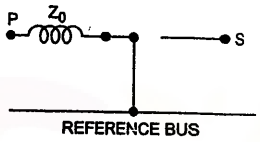


(a) 100 V (b) 173 V
(c) 200 V (d) 265 V
[UP.S.C. I.E.S. E.E. II 1998]

201. The diagram given below shows the connection of a four-wire delta bank for obtaining a 3-phase 4-wire distribution system. The secondary voltages between the terminals are as indicated.

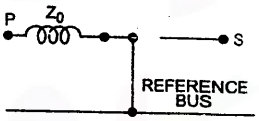


What is the voltage between the terminals b and d in the above system which the primary side is energized from an appropriate symmetrical 3-phase system?



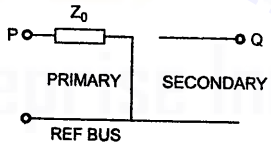
(a) $\frac{230}{\sqrt{2}}$ V (b) $\frac{230}{\sqrt{3}}$ V
(c) $115 \times \sqrt{3}$ V (d) $115 \times \sqrt{2}$ V
[U.P.S.C. I.E.S. E.E.-II, 2004]

202. A 3-phase transformer having zero-sequence impedance Z_0 has zero-sequence network as represented in the figure. The connections of its windings are



(a) star with isolated neutral-delta.
(b) star with grounded neutral-delta.
(c) delta-star with grounded neutral.
(d) delta-delta. **[U.P.S.C. I.E.S. E.E.-II, 2002]**

203.



A zero-sequence network of a 3-phase transformer is given above. Z_0 is the zero-sequence impedance of the transformer. What is the type of transformer connections ?

(a) (b) (c) (d) 
[U.P.S.C. I.E.S. E.E.-II, 2005]

Answers: **193.** (b), **194.** (a), **195.** (c), **196.** (b), **197.** (a), **198.** (d), **199.** (c), **200.** (b), **201.** (c), **202.** (b), **203.** (b),

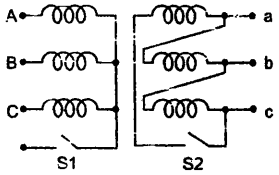
Common Data for Questions 204 and 205:



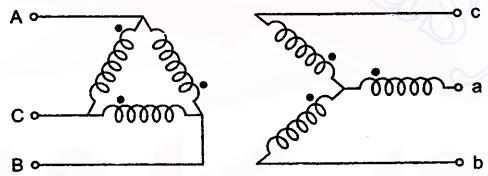
The star-delta transformer shown above is excited on the star side with balanced, 4-wire, 3-phase, sinusoidal voltage supply of rated magnitude. The transformer is under no load condition.

204. With both S_1 and S_2 open, the core flux waveform will be
(a) a sinusoid at fundamental frequency.
(b) flat-topped with third harmonic.
(c) peaky with third harmonic.
(d) none of these. **[GATE E.E. 2009]**

205. With S_2 closed and S_1 open, the current in the delta winding will be
(a) a sinusoid at fundamental frequency.
(b) flat-topped with third harmonic.
(c) only third harmonic.
(d) none of these. **[GATE E.E. 2009]**

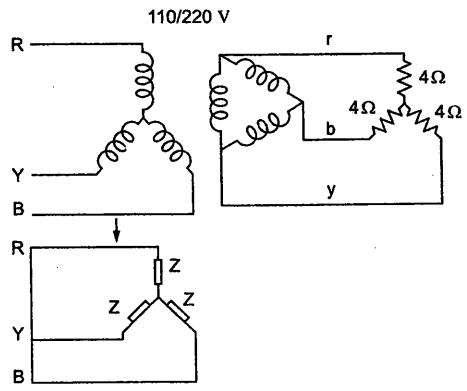
206. The resistance and reactance of a 100 kVA, 11,000/400 V, Δ-Y distribution transformer are 0.02 and 0.07 pu respectively. The phase impedance of the transformer referred to the primary is
(a) $(0.02 + j\,0.07)\ \Omega$ (b) $(0.55 + j\,1.925)\ \Omega$
(c) $(15.125 + j\,52.94)\ \Omega$ (d) $(72.6 + j\,254.1)\ \Omega$
[GATE E.E. 2004]

207. For ΔY transformer, connections and terminal markings are shown in the below figure. If 1 and 2 represents positive and negative sequence, then the correct solution in per unit values for VA_1 and VA_2 is



(a) jVa_1 and $-jVa_2$ (b) Va_1 and $-jVa_2$
(c) jVa_1 and $-Va_2$ (d) Va_1 and $-Va_2$
[U.P.S.C. I.E.S. E.E.-II, 2010]

208. A balanced star-connected and purely resistive load is connected at the secondary of a star-delta transformer as shown in the figure. The line-to-line voltage rating of the transformer is 110 V/220 V. Neglecting the non-idealities of the transformer, the impedance 'Z' of the equivalent star-connected load, referred to the primary side of the transformer, is



(a) $(3 + j0)\ \Omega$ (b) $(0.866 - j0.5)\ \Omega$
(c) $(0.866 + j0.5)\ \Omega$ (d) $(1 + j0)\ \Omega$ **[GATE E.E., 2010]**

209. If a 250 MVA, 11/400 kV three-phase power transformer has leakage reactance of 0.05 per unit on the base of 250 MVA and the primary voltage of 11 kV, then the actual leakage reactance of the transformer referred to the secondary side of 400 kV is
(a) 0.8 Ω (b) 0.0032 Ω
(c) 0.03125 Ω (d) 32.0 Ω
[U.P.S.C. I.E.S. E.E.-II, 2001]

210. A 3-phase transformer has rating of 20 MVA, 220 kV (star) –33 kV (delta) with leakage reactance of 12%. The transformer reactance (in ohms) referred to each phase of the lv delta connected side is
(a) 23.5 (b) 19.6 (c) 18.5 (d) 8.7
[GATE E.E. 2001]

211. A 3-phase alternator is connected to a Dd transformer. The hysteresis and eddy current losses of the transformer are respectively 300 W and 400 W. If the speed of the alternator is reduced by 10%, then the hysteresis and eddy current losses of the transformer will be respectively
(a) 228 W and 262.44 W. (b) 270 W and 324 W.
(c) 243 W and 360 W. (d) 270 W and 400 W.
[U.P.S.C. I.E.S. E.E.-II, 2000]

212. The percentage resistance and percentage reactance of a 10 kVA, 400 V/200 V, 3-phase transformer are 2% and 10% respectively. If the constant losses in the machine are 1%, the maximum possible percentage efficiency of the transformer is
(a) 98.32 (b) 97.25 (c) 96.85 (d) 96.12
[GATE E.E. 1999]

213. A 3-phase delta-star transformer is supplied at 6,000 V on the delta-connected side. The terminal voltage on the secondary side when supplying full-load at 0.8 lagging power factor is 415 V. The equivalent resistance and reactance drops for the transformer are 1% and 5% respectively. The turns ratio of the transformer is
(a) 14 (b) 24 (c) 42 (d) 20
[GATE E.E. 2000]

214. The windings of a Q kVA, $\frac{V_1}{V_2}$ volts, three phase Dd core type transformer are reconnected to work as a single phase transformer. The power rating and the maximum voltage ratio of the new configuration will be respectively
(a) $\frac{Q}{3}$ kVA and $\frac{V_1}{V_2}$ volts. (b) 3 Q kVA and $\frac{3V_1}{3V_2}$ volts.
(c) 2 Q kVA and $\frac{\sqrt{3}\,V_1}{\sqrt{3}\,V_2}$ volts. (d) $\frac{2}{3}$ Q kVA, $\frac{2V_1}{2V_2}$ volts.
[U.P.S.C. I.E.S. E.E.-II 2003; GATE E.E. 1999]

215. In a properly connected Y-Δ transformer, a voltmeter connected in the secondary (opening a node of delta), the voltmeter will read
(a) zero voltage. (b) line voltage of supply.
(c) phase voltage in the secondary.
(d) none of the above. **[A.M.I.E. Sec B. Winter 1993]**

216. Which of the following 3-phase connections of a transformer causes interference to the nearby communication systems ?
(a) Delta-star. (b) Star-delta.
(c) Star-star. (d) Delta-delta.

217. Three single phase transformers, each of 100 kVA rating, are connected in a closed delta arrangement. If one of them is taken out, it would be possible to load the bank in such a manner that each one is loaded to the extent of

Answers: **204.** (b), **205.** (a), **206.** (d), **207.** (d), **208.** (d), **209.** (d), **210.** (b), **211.** (b), **212.** (b), **213.** (b), **214.** (d), **215.** (a), **216.** (c), **217.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 86.6 kVA (b) 66.7 kVA
(c) 57.7 kVA (d) 33.33 kVA
[U.P.S.C. I.E.S. E.E.-II, 1993]

218. When one transformer is removed from a Δ-Δ bank of 30 kVA transformer, the capacity of the resulting 3-phase transformer in V-V connection will be:
(a) 11.5 kVA (b) 17.3 kVA
(c) 20 kVA (d) 25.9 kVA
[U.P.S.C. I.E.S. E.E.-II, 2011]

219. A Δ/Δ connected transformer is connected to V/V connected transformer. The ratio of VA rating of V/V connected transformer and Δ/Δ connected transformer is
(a) 57.7% (b) 100%
(c) 50% (d) 75% [U.P.S.C. I.E.S. E.E.-II, 2010]

220. An 11 kV/400V, 1000 kVA, Y/Y transformer is reconnected as Δ/Y with the high voltage side connected in delta. The rating for new connection will be
(a) $\frac{11}{\sqrt{3}}$ kV/400 V, 1000 kVA
(b) 11 kV/400 V, 1732 kVA
(c) $11\sqrt{3}$ kV/400 V, 1000 kVA
(d) 11 kV/400, $\sqrt{3}$ V, $\frac{1000}{\sqrt{3}}$ kVA [U.P.S.C. I.E.S. E.E.-II, 1993]

221. Scott-connections are used for
(a) single phase to three phase transformation.
(b) three phase to single phase transformation.
(c) three phase to two phase transformation.
(d) any of the above. [U.P.S.C.I.E.S. E.E.-II, 1992]

222. Scott-connected transformers can convert
(A) 3 to 2 phases. (B) 2 to 3 phases.
(C) 2 to 4 phases. (D) 3 to 4 phases.
From the above correct answer is
(a) only *B* (b) *A, B*
(c) *A, B, C* (d) *A, B, D*
[A.M.I.E. Sec B. Winter 2002]

223. In Scott-connections, the teaser transformer operates on 0.866 of its rated
(a) impedance. (b) current.
(c) voltage. (d) power.

224. In Scott connection, if the turns ratio of main transformer is K, then the teaser transformer has turns ratio of
(a) $\frac{2K}{\sqrt{3}}$ (b) $\frac{\sqrt{3}K}{2}$
(c) $\frac{K}{\sqrt{3}}$ (d) $\frac{K}{2}$ [U.P.S.C. I.E.S. E.E.-II, 2010]

225. Supply to one terminal of a delta-wye connected three phase core type transformer which is on no load fails. Assuming magnetic circuit symmetry, voltages on the secondary side will be
(a) 230, 230, 115 (b) 230, 115, 115
(c) 345, 115, 115 (d) 345, 0, 345 [GATE E.E. 1995]

226. In a transformer fed from a fundamental frequency voltage source, the source of harmonics is the
(a) overload. (b) poor insulation.
(c) iron loss. (d) saturation of core.
[U.P.S.C. I.E.S. E.E.-II, 1997]

227. Zero sequence currents can flow from a line into a transformer bank if the windings are
(a) grounded star/delta (b) delta/star.
(c) star/grounded star. (d) delta/delta.
[U.P.S.C.I.E.S. E.E.-II, 1997]

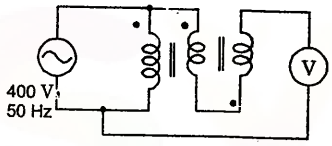
228. The harmonic currents in a power transformer does not cause increase in
(a) secondary voltage. (b) core loss.
(c) copper loss.
(d) magnetic interference with protective relays.

229. In which transformer, the tertiary winding is used ?
(a) Star-delta. (b) Delta-delta.
(c) Star-star. (d) Delta-star.

230. The magnetizing current in a transformer is rich in
(a) 3rd harmonic. (b) 5th harmonic.
(c) 7th harmonic. (d) 13th harmonic.
[GATE E.E. 1998]

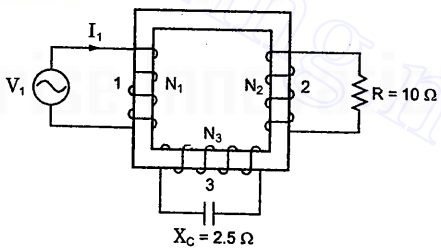
231. Which of the following statements associated with tertiary windings in star-star transformers is wrong ?
(a) It is used to suppress harmonic voltages.
(b) It is used to allow flow of earth fault current for operation of protective devices.
(c) It provides low reactance path to zero sequence currents.
(d) It facilitates supply of single phase loads.
(e) None of the above.

232. A 400 V/200 V/200 V, 50 Hz three-winding transformer is connected as shown in the figure. The reading of the voltmeter *V* will be



(a) zero V (b) 400 V
(c) 600 V (d) 800 V
[GATE E.E. 2000; 2002; A.M.I.E. Sec B. Summer 2002]

233. Figure shows an ideal three-winding transformer. The three windings 1, 2, 3 of the transformer are wound on the same core as shown. The turn-ratio $N_1 : N_2 : N_3$ is 4 : 2 : 1. A resistor of 10 Ω is connected across winding 2. A capacitor of reactance 2.5 Ω is connected across winding 3. Winding 1 is connected across a 400 V, ac supply. If the supply voltage phasor $V_1 = 400 \angle 0°$, the supply current phasor *I* is given by



(a) $(-10 + j10)$ A (b) $(-10 - j10)$ A
(c) $(10 + j10)$ A (d) $(10 - j10)$ A
[GATE E.E. 2003]

234. Maximum transient currents flow through a transformer winding when it is switched on with secondary _____ circuited and when the input voltage wave is passing through the _____ value.
(a) open, zero (b) short, zero
(c) open, maximum (d) short, maximum

Answers: **218.** (b), **219.** (a), **220.** (a), **221.** (c), **222.** (b), **223.** (c), **224.** (b), **225.** (b), **226.** (d), **227.** (a), **228.** (a), **229.** (c), **230.** (a), **231.** (e), **232.** (a), **233.** (d), **234.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

235. Which of the following conditions is/are necessary for the parallel operation of two transformers?
(a) Percentage impedance should be the same.
(b) Polarities of both secondaries should be the same.
(c) Voltage ratings should be the same.
(d) All the conditions mentioned above in (a), (b) and (c)
[U.P.S.C. I.E.S. E.E.-II, 2006]

236. Conditions for parallel operation of transformer are:
1. The same voltage ratio.
2. The same per unit impedance.
3. The same polarity.
4. The same phase sequence.
5. The relative phase displacement.
Which are the absolutely essential conditions?
(a) 1, 2, 3, 4 and 5. (b) 2, 3 and 4.
(c) 3, 4 and 5. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2011]

237. For the parallel operation of transformers, which of the following conditions must be satisfied?
(a) Same voltage ratios.
(b) Must be connected in proper polarities.
(c) R_e/X_e ratio should be the same.
(d) Same kVA rating. [U.P.S.C. I.E.S. E.E.-II, 2010]

238. For successful parallel operation of two single phase transformers, the most essential condition is that their
(a) percentage impedances are equal.
(b) polarities are properly connected.
(c) turn-ratios are exactly equal.
(d) kVA ratings are equal. [U.P.S.C. I.E.S. E.E.-II, 1994]

239. Possible three-to-three phase transformer connection for parallel operation is
(a) Δ-Y to Δ-Y (b) Δ-Δ to Δ-Y
(c) Y-Y to Δ-Y (d) Δ-Y to Y-Δ
[U.P.S.C. I.E.S. E.E.-II, 2002]

240. If the transformers operated in parallel are not connected with regard to polarity
(a) the transformers will not share the load in proportion to their kVA ratings.
(b) dead short circuit will take place.
(c) the transformer of lower rating will be out of operation.
(d) none of the above.

241. Two 3-phase transformers are to be connected for parallel operation. Which one of the following arrangements is impossible?
(a) Transformer A; primary Y; secondary Y
Transformer B; primary Δ; secondary Δ
(b) Transformer A; primary Δ; secondary Y
Transformer B; primary Δ; secondary Δ
(c) Transformer A; primary Y; secondary Δ
Transformer B: primary Δ; secondary Y
(d) Transformer A; primary Δ; secondary Δ
Transformer B; primary Δ; secondary Δ
[U.P.S.C. I.E.S. E.E.-II, 1995]

242. If all other requirements for parallel operation of transformers are fulfilled, which one of the following pairs of three-phase transformers, with the given VECTOR GROUPS, can be operated in parallel?
(a) Y*d* 1 and YY 0. (b) Y*d* 1 and DY 11.
(c) DD 6 and DY 1. (d) D*d* 0 and DY 11.
[U.P.S.C. I.E.S. E.E.-II, 1999]

243. Two transformers when operating in parallel will share the load depending upon which of the following?
(a) Magnetizing current. (b) Leakage reactance.
(c) Per unit impedance. (d) Efficiency.
[U.P.S.C. I.E.S. E.E.-II, 2007]

244. Two transformers operating in parallel will share the load depending upon their
(a) ratings. (b) leakage reactance.
(c) efficiency. (d) per unit impedance.
[U.P.S.C. I.E.S. E.E.-II, 2003]

245. Two transformers, with equal rating and negligible excitation current, connected in parallel, share the load in the ratio of their kVA ratings only, if their pu impedances (based on their own kVA) are
(a) equal.
(b) in the inverse ratio of their ratings.
(c) in the direct ratio of their ratings.
(d) pure reactive. [U.P.S.C. I.E.S. E.E.-II, 2002]

246. When two transformers of different kVA ratings are connected in parallel, they will divide the total load in proportion to their respective kVA ratings when their
(a) efficiencies are equal.
(b) equivalent impedances are equal.
(c) equivalent impedances are inversely proportional to their respective ratings.
(d) none of the above.

247. Two transformers of identical voltages but of different capacities are operating in parallel. For satisfactory load sharing
(a) impedances must be equal.
(b) per unit impedances must be equal.
(c) per unit impedances and X/R ratio must be equal
(d) impedances and X/R ratio must be equal. [GATE E.E. 1994]

248. Two single phase 100 kVA transformers, each having different leakage impedances are connected in parallel. When a load of 150 kVA at 0.8 pf lagging is applied
(a) both transformers will operate at power factor more than 0.8 lagging.
(b) both transformers will operate at power factor less than 0.8 lagging.
(c) one of transformers will operate at pf more than 0.8 lagging and other will operate at pf less than 0.8 lagging.
(d) both transformers will operate at identical power factors.
[U.P.S.C. I.E.S. E.E.-II, 1992]

249. Two single phase transformers with equal turns have impedances of $(0.5 + j3)$ ohms and $(0.6 + j10)$ ohms with respect to the secondary. If they operate in parallel, how will they share a load of 100 kW at 0.8 pf lagging ?
(a) 50 kW, 50 kW (b) 62 kW, 38 kW
(c) 78.2 kW, 21.8 kW (d) 85.5 kW, 14.5 kW
[U.P.S.C. I.E.S. E.E.-II, 1992]

250. Two single phase transformers A and B are connected in parallel, observing all requirements of a parallel operation, except that the induced voltage E_a is slightly greater than E_b; Z_{ea} and Z_{eb} being the equivalent impedances of A and B, both referred to the secondary side.

Answers: **235.** (d), **236.** (c), **237.** (b), **238.** (b), **239.** (a), **240.** (b), **241.** (b), **242.** (b), **243.** (c), **244.** (d), **245.** (a), **246.** (c), **247.** (c), **248.** (c), **249.** (c), **250.** (b),

Downloaded From : www.EasyEngineering.net

Under this operating condition with the primary bus-bars being energized, a circulating current will flow
(a) only in the secondary windings of A and B.
(b) in both the primary and secondary windings of A and B.
(c) in both the primary and secondary windings of A and B, as well as in the primary side network.
(d) in the primary and secondary windings of A and B, and boost the voltages in the secondary side of both A and B.
[U.P.S.C. I.E.S. E.E.-II, 2005]

251. If per unit impedances of two transformers connected in parallel are not equal which one of the following statements is correct?
(a) The power factor of the two transformers will be different from that of the connected load.
(b) Transformers will get overloaded.
(c) Dead short circuit occurs.
(d) The transformer with higher per unit impedance will share more load.
[U.P.S.C. I.E.S. E.E.-II, 2004]

252. Two 10 kV/440 V 1-phase transformers of ratings 600 kVA and 350 kVA are connected in parallel to share a load of 800 kVA. The reactances of the transformers, referred to secondary side are 0.0198 Ω and 0.0304 Ω respectively, (resistance negligible). The load shared by two transformers will be
(a) 484.5 kVA and 315.5 kVA.
(b) 315.5 kVA and 484.5 kVA.
(c) 533 kVA and 267 kVA.
(d) 267 kVA and 533 kVA.
[U.P.S.C. I.E.S. E.E.-II, 2002]

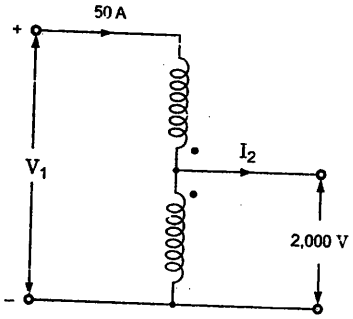
253. Two transformers are to be operated in parallel such that they share load in proportion to their kVA ratings. The rating of the first transformer is 500 kVA and its pu leakage impedance is 0.05 pu. If the rating of second transformer is 250 kVA, its pu leakage impedance is
(a) 0.20 (b) 0.10 (c) 0.05 (d) 0.025
[GATE E.E. 2006]

254. Auto transformer can do the following:
(a) Step up voltage. (b) Step down voltage.
(c) Both (a) and (b). (d) None of these.
[U.P.T.U. Even Semester 2009-10]

255. In an auto-transformer, power is transferred, through
(a) Conduction process only.
(b) Induction process only.
(c) Both conduction and induction processes.
(d) Mutual coupling.
[U.P.S.C. I.E.S. E.E.-II, 2010]

256. In an auto-transformer of voltage ratio $\frac{V_1}{V_2}$ and $V_1 > V_2$, the fraction of power transformed inductively is
(a) $\frac{V_1}{V_1 + V_2}$ (b) $\frac{V_2}{V_1}$
(c) $\frac{V_1 - V_2}{V_1 + V_2}$ (d) $\frac{V_1 - V_2}{V_1}$
[U.P.S.C. I.E.S. E.E.-II, 2000]

257. A single-phase, 10 kVA, 2000/200 V. 50 Hz transformer is connected to form an auto-transformer as shown in the figure. What are the values of V_1 and I_2, respectively?

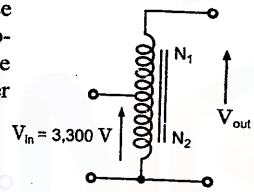


(a) 2,200 V, 55 A. (b) 2200 V, 45 A.
(c) 2000 V, 45 A. (d) 1800 V, 45 A.
[U.P.S.C. I.E.S. E.E.-II, 2005]

258. A two-winding transformer is converted into an auto-transformer. If we apply additive polarity and subtractive polarity for the connections, then the secondary voltage is 2640 V and 2160 V, respectively. What is the ratio of primary to secondary voltage of the original transformer?
(a) 66 : 54. (b) 54 : 66. (c) 10 : 1. (d) 1 : 10.
[U.P.S.C. I.E.S. E.E.-II, 2006]

259. A single phase transformer has rating of 15 kVA, 600/120 V. It is reconnected as an auto-transformer to supply at 720 V from a 600 V primary source. The maximum load it can supply is
(a) 90 kVA. (b) 18 kVA. (c) 15 kVA. (d) 12 kVA.
[U.P.S.C. I.E.S. E.E.-II, 1997]

260. A 50 kVA, 3300/230 V single phase transformer is connected as an auto-transformer shown in figure. The nominal rating of the auto-transformer will be
(a) 50.0 kVA (b) 53.5 kVA
(c) 717.4 kVA (d) 767.4 kVA



[GATE E.E. 2004]

261. An auto-transformer having a transformation ratio of 0.8 supplies a load of 10 kW. The power transformed inductively from the primary to secondary is
(a) 10 kW (b) 8 kW (c) 2 kW (d) zero.
[U.P.S.C. I.E.S. E.E.-II, 1998]

262. What is the power transferred conductively from primary to secondary of an auto-transformer having transformation ratio of 0.8 supplying a load of 3 kW?
(a) 0.6 kW (b) 2.4 kW
(c) 1.5 kW (d) 0.27 kW
[U.P.S.C. I.E.S. E.E.-II, 2009]

263. What is the power transmitted inductively in an auto-transformer which supplies a load at 161 volts with an applied primary voltage of 230 volts?
(a) 35% of the input. (b) 70% of the input.
(c) 15% of the input. (d) 30% of the input.
[U.P.S.C. I.E.S. E.E.-II, 2009]

264. Neglecting losses, if the power transformed inductively is equal to power transformed conductively in an auto-transformer, then the secondary to primary ratio of transformer is

Answers: **251.** (a), **252.** (a), **253.** (b), **254.** (c), **255.** (c), **256.** (d), **257.** (d), **258.** (c), **259.** (a), **260.** (d), **261.** (c), **262.** (b), **263.** (d), **264.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 0.5 (b) 2 (c) 1.5 (d) 1.25
[U.P.S.C. I.E.S. E.E.-II, 2010]

265. A 2 V/1 V two-winding transformer is connected as an autotransformer. Its voltage regulation as an autotransformer compared to the two-winding transformer is:
(a) the same. (b) 1.5 times.
(c) 2 times. (d) 3 times.
[U.P.S.C. I.E.S. E.E.-II, 2011]

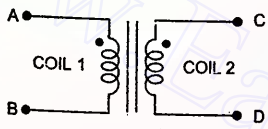
266. A two-winding 220 V/110 V, 1.5 kVA transformer is reconnected as a 220/330 V autotransformer. It is re-rated as:
(a) 3.88 kVA (b) 4.488 kVA
(c) 1.58 kVA (d) 2.258 kVA
[U.P.S.C. I.E.S. E.E.-II, 2011]

267. It is advisable to use auto-transformer if the transformation ratio is
(a) greater than 1 (b) near to 1
(c) 0.25 (d) 0.5 [U.P.S.C. I.E.S. E.E.-II, 2010]

268. A 100/10 V, 50 VA double winding transformer is converted to 100/110 V auto-transformer. The rating of the auto-transformer is
(a) 550 VA (b) 500 VA (c) 110 VA (d) 100 VA
[U.P.S.C. I.E.S. E.E.-II, 2000]

269. A 400 V/100 V, 10 kVA two-winding transformer is reconnected as an auto-transformer across a suitable voltage source. The maximum rating of such an arrangement could be
(a) 50 kVA (b) 15 kVA
(c) 12.5 kVA (d) 8.75 kVA [GATE E.E. 1999]

Statement for Linked Answer Questions 270 and 271



The figure above shows coils 1 and 2, with dot markings as shown, having 4,000 and 6,000 turns respectively. Both the coils have a rated current of 25 A. Coil 1 is excited with single phase, 400 V, 50 Hz supply.

270. The coils are to be connected to obtain a single-phase, $\frac{400}{1{,}000}$ V, auto-transformer to drive a load of 10 kVA. Which of the options given should be exercised to realize the required auto-transformer?
(a) Connect A and D; Common B.
(b) Connect B and D; Common C.
(c) Connect A and C; Common B.
(d) Connect A and C; Common D. [GATE E.E. 2009]

271. In the auto-transformer obtained in Question 270, the current in each coil is
(a) Coil-1 is 25 A and Coil-2 is 10 A.
(b) Coil-1 is 10 A and Coil-2 is 25 A.
(c) Coil-1 is 10 A and Coil-2 is 15 A.
(d) Coil-1 is 15 A and Coil-2 is 10 A. [GATE E.E. 2009]

272. In case of auto-transformers, which of the following statements are correct?
1. An auto-transformer requires less copper as compared to a conventional, 2-winding transformer of the same capacity.
2. An auto-transformer provides isolation between the primary and secondary windings.
3. An auto-transformer has less leakage reactance as compared to the conventional, 2-winding transformer of the same capacity. Select the correct answer using the codes given below:

Codes:
(a) 1, 2 and 3. (b) 1 and 2.
(c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2001]

273. A 2-winding transformer of voltage rating V_1/V_2 has the full load voltage regulation of x percent at 0.75 lagging. The auto-transformer formed by joining two windings in series and having voltage rating of $\frac{V_1}{V_1+V_2}$ will have full-load regulation of _____ percent at 0.75 pf lagging.
(a) x (b) $\frac{V_1}{V_1+V_2}x$ (c) $\frac{V_1}{V_1-V_2}x$ (d) $\frac{V_2}{V_1}x$

274. What is the efficiency of an auto-transformer in comparison to that of a two-winding transformer of the same rating?
(a) Slightly less than that of a two-winding transformer.
(b) Same as that of a two-winding transformer.
(c) More than that of a two-winding transformer.
(d) As low as 1/5th of the efficiency of a two-winding transformer.
[U.P.S.C. I.E.S. E.E.-II, 2006]

275. A single-phase 50 kVA, 250 V/500 V two winding transformer has an efficiency of 95% at full load, unity power factor. If it is reconfigured as a 500 V/750 V auto-transformer, its efficiency at its new rated load at unity power factor will be
(a) 95.752% (b) 97.851%
(c) 98.276% (d) 99.241% [GATE E.E. 2007]

276. The saving in copper achieved by converting ordinary two winding transformer into an auto-transformer is governed by the
(a) secondary load.
(b) size of core.
(c) voltage transformation ratio.
(d) none of the above.

277. The kVA rating of an isolation transformer increases when connected as an auto-transformer due to
(a) establishment of conductive link between the primary and secondary.
(b) rise in secondary terminal voltage.
(c) increase in secondary current.
(d) reduced copper losses.

278. If there is a break in a 220/110 V auto-transformer in the winding which is common to both hv as well as lv sides, then the output voltage on the *iv* side will be
(a) 110 V (b) 220 V (c) zero (d) $110\sqrt{2}$ V

279. Constant current transformer is of ____type.
(a) core (b) shell
(c) core or shell (d) none of these

280. High leakage reactance transformers are of
(a) small volt-ampere rating. (b) high volt-ampere rating.
(c) high voltage rating. (d) low voltage rating.

281. Tappings of a transformer are provided
(a) at the phase end of lv side.
(b) at the phase end of hv side.
(c) at the neutral end of hv side.
(d) at the middle of hv side. [A.M.I.E. Sec B. Summer 1993]

282. A tap changer is used on a transformer for adjusting the _____ voltage.
(a) primary (b) secondary
(c) both primary and secondary
(d) none of the above.

Answers: **265.** (d), **266.** (b), **267.** (b), **268.** (a), **269.** (a), **270.** (a), **271.** (d), **272.** (c), **273.** (b), **274.** (c), **275.** (c), **276.** (c), **277.** (a), **278.** (b), **279.** (b), **280.** (a), **281.** (d), **282.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

283. Tappings are usually provided on the hv winding of a transformer because it
(a) is easily accessible physically.
(b) has to handle low currents.
(c) has large number of turns which allows smoother variation of voltage.
(d) all of the above.

284. For off-load tap changing the best method is to use tap changers
(a) outside the tank with no selector switch.
(b) outside the tank operated by selector switches.
(c) inside the tank operated by external selector switches.
(d) inside the tank with no selector switch.

285. For on-load tap changing the best method is to employ tap-changers
(a) outside the tank operated selector switches.
(b) outside the tank with no selector switch.
(c) inside the tank with no selector switch.
(d) inside the tank operated by external selector switches.

286. In a constant voltage transformer (CVT), the output voltage remains constant due to
(a) capacitor. (b) input inductor.
(c) saturation. (d) tapped windings.
[GATE E.E. 2000]

287. The output voltage can be varied by a variac transformer over a
(a) very small range.
(b) wide range of 0 and 120 per cent of input voltage.
(c) over a range of 0 and 50 per cent.
(d) over a range of 50 and 100 per cent.

288. In a single phase induction regulator, compensating winding is provided in order to
(a) increase efficiency.
(b) reduce the voltage drop due to reactance of the secondary winding to negligible value.
(c) give wider variation of output voltage.
(d) all of the above.

289. In a single phase induction regulator, the boost will be maximum when the angle between the axes of the stator winding and the rotor winding is equal to _____ electrical degree(s).
(a) 0 (b) 45 (c) 90 (d) 180

290. In a 3-phase induction regulator, the output line voltages are in phase with the supply line voltage in
(a) maximum buck position only.
(b) maximum boost position only.
(c) both maximum boost and maximum buck positions.
(d) all positions.

291. The rating of an induction voltage regulator for regulating the voltage on a 3-phase feeder dealing with 1,000 kVA between the limits of 4,750 V and 5,250 V is
(a) 50 kVA (b) 100 kVA (c) 25 kVA (d) 50 kVA

292. A single phase induction regulator is a constant input transformer to obtain smooth variation of the output voltage by varying the
(a) ratio of turns between primary and secondary windings.
(b) frequency. (c) flux density in the core.
(d) angle between the magnetic axes of the primary and secondary windings.
[U.P.S.C. I.E.S. E.E.-II, 1998]

293. The three-phase transformers each rated at 75 MVA, 132 kV/11 kV, have the following different methods of cooling:
1. Self cooled. 2. Forced oil cooled.
3. Forced air cooled.
The correct sequence in ascending order in terms of the weights of these transformers is
(a) 1, 2, 3 (b) 2, 3, 1 (c) 3, 1, 2 (d) 3, 2, 1
[U.P.S.C. I.E.S. E.E.-II, 1998]

294. The rated secondary voltage of 220 V for a transformer means the terminal voltage of 220 V on
(a) no-load. (b) rated full load.
(c) half-full load. (d) none of these.

295. The rating of a transformer _____ when the supply frequency is increased.
(a) remains unchanged (b) decreases
(c) increases (d) none of these

296. If a 500 kVA, 200 Hz transformer is operated at 50 Hz, its kVA rating will be
(a) 2000 kVA (b) 125 kVA (c) 250 kVA (d) 1000 kVA

297. In operating a 400 Hz transformer at 50 Hz
(a) only voltage is reduced in the same proportion as the frequency.
(b) only kVA rating is reduced in the same proportion as the frequency.
(c) both voltage and kVA rating are reduced in the same proportions as the frequency.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1993]

298. Overcurrents in a transformer adversely affect
(a) insulation life. (b) mechanical stresses.
(c) both (a) and (b). (d) none of these.

299. The excessive temperature rise will cause maximum damage to
(a) winding insulation. (b) core laminations.
(c) copper windings. (d) dielectric strength of oil.

300. The most important items to be kept under constant watch during operation of transformer are
(a) oil level. (b) ambient temperature.
(c) winding temperature. (d) load.
(e) terminal voltage. (f) all of these.

301. If the drying out operation of a transformer is unduly shortened and normal voltage is applied, then there is a possibility of
(a) interturn failure. (b) winding to earth failure.
(c) excessive heating.
(d) terminal to terminal flash-over.

302. Repeated switching-in of transformers located near the generating stations may cause
(a) excessive temperature rise.
(b) mechanical distortion of the windings and subsequent turn-to-turn insulation failure.
(c) intense local eddy currents in the core.
(d) surface flash-over of the bushings.

303. In a transformer when two or more dielectrics, having different permittivities are used in series, incorrect proportioning of their thickness may result in
(a) very poor heat dissipation.
(b) very high leakage current.
(c) very high dielectric loss.
(d) failure of insulation due to excessive electric stresses.

304. Distortion of the whole core and subsequent damage to the coil insulation due to intense local eddy currents may be caused due to failure of
(a) the insulation of the winding.
(b) the insulation between the laminations.

Answers: **283.** (d), **284.** (c), **285.** (a), **286.** (c), **287.** (b), **288.** (b), **289.** (a), **290.** (c), **291.** (a), **292.** (d), **293.** (d), **294.** (b), **295.** (c), **296.** (b), **297.** (c), **298.** (c), **299.** (a), **300.** (f), **301.** (a), **302.** (b), **303.** (d), **304.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the insulation around the core damping bolts.
(d) both (b) and (c).

305. Terminal to terminal flash-over within the oil may be caused by
(a) the lining up of the conducting particles present in the oil.
(b) the moisture present in the oil.
(c) the rapidly fluctuating loads.
(d) both (a) and (b).

306. Dust should never be allowed to accumulate on the core and windings in a dry type transformer as it is likely to
(a) reduce dissipation of heat.
(b) absorb oil and grease.
(c) short circuit the windings.
(d) corrode the metal surface.

307. Alternator operates on the principle of
(a) electromagnetic induction. (b) self induction.
(c) mutual induction.
(d) self or mutual induction.

308. In a synchronous machine, if the field flux axis is ahead of the armature field axis in the direction of rotation, the machine operating is
(a) synchronous motor. (b) synchronous generator.
(c) asynchronous motor. (d) asynchronous generator.

309. The armature of an alternator
(a) is a stationary member.
(b) is a revolving member. (c) is the frame.
(d) consists of the winding into which current is induced.

310. In modern alternators, the rotating part is
(a) field system. (b) armature.
(c) armature as well as field system.
(d) none of the above.

311. The current from the stator of an alternator is taken out to the external load circuit through
(a) slip rings. (b) commutator segments.
(c) solid connections. (d) carbon brushes.

312. Which one of the following is the primary reason for placing field on rotor in an alternator?
(a) Small power in the field circuit.
(b) Insulation of high voltage is made easy on stator than on rotor.
(c) Large power in stator.
(d) Large current in stator. **[U.P.S.C. I.E.S. E.E.-II, 2004]**

313. Which type of alternator is used in hydroelectric power stations?
(a) Non-salient pole alternator.
(b) Turbo generator.
(c) Salient pole alternator. (d) Steam turbine alternator.
[U.P.S.C. I.E.S. E.E.-II, 2004]

314. Four important parameters of alternators have comparatively larger or smaller values, depending upon the type of the alternator. In comparison to a steam turbine driven alternator, a hydraulically driven machine will have which one of the following combinations?

	Number of armature conductors	Axial length of armature conductors	Number of poles	Operating Speed
(a)	Smaller	Larger	Smaller	Higher
(b)	Larger	Smaller	Larger	Lower
(c)	Larger	Larger	Smaller	Lower
(d)	Smaller	Smaller	Larger	Higher

[U.P.S.C. I.E.S. E.E.-II, 2004]

315. Consider the following statements. The synchronous generators used in thermal power stations have
1. Cylindrical rotors.
2. Slip rings and brushes.
3. Laminated rotor.
4. Stator slots in the multiples of 6.
5. 3-phase stator-connected windings.
Which of these statements are correct?
(a) 1, 2, 3 and 4 (b) 1, 2, 3 and 5
(c) 3, 4 and 5 (d) 1, 2, 4 and 5
[U.P.S.C. I.E.S. E.E.-II, 1999; A.M.I.E. Sec B. Summer 2002]

316. In a synchronous machine, the stator frame serves the purpose of
(a) holding the armature stampings in position and also in some cases for circulating cold water for cooling.
(b) insulaing the armature windings.
(c) providing path to the magnetic flux.
(d) protecting the whole machine.

317. In a synchronous machine, the stator frame is made of
(a) stainless steel. (b) CRGOS.
(c) cast iron or welded steel plates.
(d) laminated silicon steel.

318. The stater core of a synchronous machine is built up of _____ laminations.
(a) stainless steel (b) silicon steel
(c) cast iron (d) cast steel

319. The stator core stampings also have openings which make _____ ventilating ducts to provide efficient cooling.
(a) axial (b) radial
(c) axial as well as radial (d) none of the above.

320. The open slots are more commonly used in the stator of a synchronous machine as
(a) the inductance of the winding is less.
(b) they permit the placement of form wound and insulated coils giving least expensive and more satisfactory.
(c) both (a) and (b). (d) none of these.

321. The field system of an alternator is usually excited at
(a) 250/250 V dc. (b) 110/220 V ac.
(c) 3-phase, 50 Hz 400 V. (d) 230 V ac.

322. The slip rings employed in a 3-phase synchronous machine are insulated for
(a) output rated voltage. (b) low voltage.
(c) very low voltage. (d) very high voltage.

323. In a large synchronous generator, the damper winding is provided for
(a) absorption of energy of oscillations when operating in parallel with another alternator.
(b) suppression of spontaneous hunting when supplying power to a transmission line with high resistance/reactance ratio.
(c) providing a low resistance path for the currents due to unbalancing of voltages.
(d) all of the above.

324. Squirrel-cage bars placed in the rotor pole faces of an alternator help reducing hunting
(a) above synchronous speed only.
(b) below synchronous speed only.
(c) above and below synchronous speeds both.
(d) none of the above.
[A.M.I.E. Sec B. Elec. Machines Winter 1993; Summer 1997]

Answers: **305.** (d), **306.** (a), **307.** (a), **308.** (b), **309.** (d), **310.** (a), **311.** (c), **312.** (b), **313.** (c), **314.** (b), **315.** (d), **316.** (a), **317.** (c), **318.** (b), **319.** (c), **320.** (c), **321.** (a), **322.** (b), **323.** (d), **324.** (c),

Downloaded From : www.EasyEngineering.net

325. Hydro-generators are generally employed to run at _____ rpm.
(a) 500 (b) 1,000 (c) 1,500 (d) 3,000

326. In case of turbo-alternators, rotor is made of
(a) forged steel. (b) cast iron.
(c) stainless steel. (d) manganese steel.
(e) laminated silicon steel.

327. The salient pole rotors have
(a) two or four projecting poles carrying the field coils.
(b) a large number of projecting poles carrying the field coils.
(c) thick steel laminations riveted together and fixed to the rotor by a dove-tail joint.
(d) pole faces usually provided with slots for damper windings.
(e) all of the above except (a).

328. In salient pole field structure, the pole shoes cover about _____ of pole pitch.
(a) one -third (b) one half
(c) two-third (d) whole

329. Larger diameter salient pole rotors have shorter axial length because
(a) it occupies much less space.
(b) it saves lot of copper in stator winding.
(c) it reduces weight of the rotor.
(d) number of conductors held in large circumference of rotor is very large and so they need not be long.

330. In a salient pole synchronous machine, the air gap is
(a) uniform under the whole pole shoe.
(b) least under the middle of the pole shoe and increases outwards.
(c) largest under the middle of the pole shoe and decreases outwards.
(d) least at one end of the pole shoe and increases to the maximum value at the other end. **[U.P.S.C. IE.S. E.E.-II 2004]**

331. The number of poles on turbo-alternator is usually
(a) 2 (b) 4 (c) 6 (d) 8
[R.G.T.U. B.E.E. Nov./Dec. 2007]

332. To obtain sinusoidal flux distribution, chamfering of poles is done in
(a) salient-pole alternators only.
(b) smooth cylindrical pole alternators only.
(c) both of the above. (d) none of these.

333. The salient pole rotors are not suitable for high speed turbo-generators due to
(a) excessive bearing friction.
(b) undesirable mechanical oscillations.
(c) high centrifugal force and windage loss.
(d) large eddy current losses.

334. In turbo-alternators, smooth cylindrical rotors have very long axial length because it
(a) reduces friction and windage loss.
(b) reduces centrifugal force.
(c) number of conductors being less, they have to be necessarily long for generating the required voltage.
(d) none of the above.

335. Cylindrical rotor alternators use _____ ducts for efficient cooling.
(a) only radial (b) only axial
(c) both radial and axial (d) none of the above

336. In cylindrical rotor _____ portion of rotor is wound.
(a) one-third (b) two-third
(c) one-half (d) whole

337. The maximum possible speed at which an alternator can be driven to generate 50 Hz and 4,000 V is
(a) 4,000 rpm. (b) 3,600 rpm.
(c) 3,000 rpm. (d) 1,500 rpm.
[A.M.I.E. E. Science, Winter 1994]

338. Two mechanically coupled alternators deliver power at 50 Hz and 60 Hz respectively. The highest speed of the alternators is
(a) 3,600 rpm. (b) 3,000 rpm.
(c) 600 rpm. (d) 500 rpm.
[U.P.S.C. I.E.S. E.E.-II, 1994]

339. A three-phase 50 Hz, 11 kV and 37.5 MW at 0.9 p.f. capacity synchronous generator has its stator bore diameter of 765 cm and an axial core length of 80 cm. For which power plant this generator is suitable?
(a) Thermal coal fired plant. (b) Hydroelectric power plant.
(c) Nuclear power plant. (d) Pumped storage power plant.
[U.P.S.C. I.E.S. E.E.-II, 2009]

340. The most appropriate operating speeds in rpm of generators used in Thermal, Nuclear and Hydropower plants would respectively be
(a) 3000, 300 and 1500 (b) 3000, 3000 and 300
(c) 1500, 1500 and 3000 (d) 1000, 900 and 750
[U.P.S.C. I.E.S. E.E-II, 1994]

341. The aircraft alternators are designed to generate emf of high frequency of 400 Hz in order to
(a) reduce the bulk. (b) compensate for high speeds.
(c) make the systems free from external disturbances.
(d) all of the above.

342. Armature winding is one in which
(a) emf is induced by the leakage flux.
(b) emf is induced by the main or working flux.
(c) working or main flux is created by the field current.
(d) working or main flux is created by the armature current.

343. Armature winding in ac machines
(a) is always closed one. (b) is always open one.
(c) may be either closed one giving delta connections or open one giving star connections.

344. The stator of modern alternators are wound for _____ phase groups.
(a) 180° (b) 120° (c) 60° (d) 240°

345. Concentrated winding has
(a) one coil per phase.
(b) two coils per phase.
(c) one coil per pair of poles per phase.
(d) one coil side per pole pair per phase.

346. For a two layer winding the number of stator slots is equal to the number of
(a) poles. (b) conductors.
(c) coil sides. (d) coils.

347. For a concentrated winding the polar group of each phase is _____ electrical degrees apart.
(a) 360 (b) 180 (c) 120 (d) 60

348. Consider the following statements regarding the design of the distributed armature winding in a 3-phase alternator:
1. It reduces the phase belt harmonics.
2. It increases utilization of armature iron and copper.
3. It increases rigidity and mechanical strength of the winding.
4. It reduces copper in the overhang of the winding.

Answers: **325.** (a), **326.** (a), **327.** (e), **328.** (c), **329.** (d), **330.** (b), **331.** (a), **332.** (a), **333.** (c), **334.** (c), **335.** (c), **336.** (b), **337.** (c), **338.** (c), **339.** (b), **340.** (b), **341.** (a), **342.** (b), **343.** (c), **344.** (c), **345.** (c), **346.** (d), **347.** (a), **348.** (c),

Downloaded From : www.EasyEngineering.net

Which of these statements are correct?
(a) 1, 3 and 4. (b) 2, 3 and 4.
(c) 1, 2 and 3. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2000]

349. The windings for an alternator are
I. 36 slots, 4-poles, span 1 to 3
II. 72 slots, 6-poles, span 1 to 10
III. 96 slots, 6-poles, span 1 to 12
The windings having pitch factor of more than 0.9 are
(a) I and II only. (b) II and III only.
(c) I and III only. (d) I, II and III.
[U.P.S.C. I.E.S. E.E.-II, 1992]

350. Distributed winding is preferred over concentrated winding as it
(a) reduces noise.
(b) reduces the machine size.
(c) reduces the amount of copper required.
(d) improves the generated emf waveform and adds rigidity and mechanical strength to the winding.

351. In a synchronous alternator, which of the following coils will have emf closer to sine wave form ?
(a) Concentrated winding in full pitch coils.
(b) Concentrated winding in short pitch coils.
(c) Distributed winding in full pitch coils.
(d) Distributed winding in short pitch coils.
[U.P.S.C. I.E.S. E.E.-II, 1992]

352. If the space flux distribution is non-sinusoidal, emf induced in the distributed winding will be
(a) more sinusoidal in comparison to the flux distribution.
(b) less sinusoidal in comparison to the flux distribution.
(c) of the same shape as that of flux distribution.
(d) none of the above.

353. The armature winding of a 2-pole, 3-phase alternator for each phase is distributed in a number of slots per phase. The rms value of the voltage per phase is less than the rms value of the voltage per coil multiplied by the number of coils in series because the
(a) rms value of the voltage in different coils of the phase is different.
(b) equal rms voltages in different coils of the phase has mutual phase difference.
(c) maximum values of the induced voltages in different coils of the phase are different.
(d) different coils of the phase pass through different saturated regions of the magnetic circuit. [U.P.S.C. I.E.S. E.E.-II, 1993]

354. Consider the following statements:
The effects of slot harmonics are effectively reduced by
1. skewing the slots. 2. fractional slot winding.
3. short-chorded winding. 4. distributed winding.
Of these statements
(a) 1 and 2 are correct. (b) 2, 3 and 4 are correct.
(c) 1, 3 and 4 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1998]

355. The short-pitch winding is preferred over full-pitch winding for an alternator because it
(a) gives improved waveform of the induced emf as the distorting harmonics can be reduced or totally eliminated.
(b) reduces the inductance of the winding.
(c) increases total induced emf.
(d) both (a) and (b).

356. Chording and distribution of armature windings for ac machines results in
(a) reduction in air gap mmf harmonics.
(b) reduction in fundamental component or induced emf.
(c) increase in fundamental component of induced emf.
(d) reduction in noise and machine size.
(e) both (a) and (b).

357. Harmonics in the emf generated in an alternator can be reduced by
(a) skewing the slots.
(b) chamfering the salient pole tips.
(c) using distributed winding.
(d) all of the above.

358. Skew of rotor bar eliminates
(a) the effect of space harmonics.
(b) the entire effect of crawling.
(c) magnetic noise.
(d) virbration due to unequal force developed on rotor.
[A.M.I.E. Sec B. Electrical Machines Winter 1996]

359. The emf generated due to nth harmonic component of flux in an alternator will be _____ the fundamental emf in magnitude.
(a) less than (b) more than
(c) equal to

360. 4 pole star-connected alternator running at 1,500 rpm have 72 slots with 10 conductors per slot. The number of turns per phase and slot angle is
(a) 120 turns and 20 degrees. (b) 100 turns and 10 degrees.
(c) 120 turns and 10 degrees. (d) 100 turns and 20 degrees.
[R.G.T.U. B.E.E. Jan./Feb. 2006]

361. The stator of a 3-phase, 6-pole a c machine has 45 slots. The stator winding has 45 coils with a coil span of 6 slots. What type of winding will be selected for this machine?
(a) Double-layer, fractional slot, short-pitched winding.
(b) Single-layer, fractional slot, short-pitched winding.
(c) Single-layer, integral slot, full-pitch winding.
(d) Double-layer, fractional slot, full-pitch winding.
[U.P.S.C. I.E.S. E.E.-II, 2008]

362. Distributed winding and short chording employed in ac machines will result in
(a) increase in emf and reduction in harmonics.
(b) reduction in emf and increase in harmonics.
(c) increase in both emf and harmonics.
(d) reduction in both emf and harmonics. [GATE E.E. 2008]

363. To eliminate rth harmonic from the induced emf in a phase of a synchronous machine the pitch of the coil must be
(a) $\frac{r-1}{r}$ th fraction of full pitch.
(b $\frac{2r-1}{r}$ th fraction of full pitch.
(c) $\frac{r}{r+1}$ th fraction of full pitch.
(d) $\frac{2r}{r+1}$ th fraction of full pitch. [A.M.I.E. Sec B. Winter 1996]

364. It is desirable to eliminate 5th harmonic voltage from the phase voltage of an alternator. The coils should be short pitched by an electrical angle of
(a) 30° (b) 36° (c) 72° (d) 18°
[GATE E.E. 2001]

365. In a synchronous generator, a divided winding rotor is preferable to a conventional winding rotor because of
(a) higher efficiency.
(b) increased steady-state stability limit.

Answers: **349.** (b), **350.** (d), **351.** (d), **352.** (a), **353.** (b), **354.** (b), **355.** (d), **356.** (e), **357.** (d), **358.** (a), **359.** (a), **360.** (c), **361.** (a), **362.** (d), **363.** (a), **364.** (b), **365.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) higher short-circuit ratio.
(d) better damping. [U.P.S.C. I.E.S. E.E.-II, 1997]

366. A 4-pole 3-phase, double layer winding is housed in a 36 slot stator for an ac machine with 60° phase spread. Coil span is 7 slot pitches. Number of slots in which top and bottom layers belong to different phases is
(a) 24 (b) 18 (c) 12 (d) 0
[GATE E.E. 2003]

367. In an alternator, if m is the number of slots per pole per phase and g is the slot pitch angle, then the breadth or the distribution factor for the armature winding is

(a) $\dfrac{\sin \gamma/2}{m \sin \dfrac{m\gamma}{2}}$ (b) $\dfrac{\sin\left(\dfrac{m\gamma}{2}\right)}{m \sin\left(\dfrac{\gamma}{2}\right)}$

(c) $\dfrac{m \sin \gamma/2}{\sin m\gamma/2}$ (d) $\dfrac{\sin\left(\dfrac{m\gamma}{2}\right)}{\sin\left(\dfrac{\gamma}{2}\right)}$

[U.P.S.C. I.E.S. E.E.-II, 2001]

368. A 3-phase, 4-pole alternator has 48 stator slots carrying the 3-phase distributed winding. Each coil of the winding is short chorded by one slot pitch. The winding factor is given by

(a) $\frac{1}{16}\cot(7.5°)$ (b) $\frac{1}{8}\cot(7.5°)$

(c) $\dfrac{1}{16 \sin(7.5°)}$ (d) $\cos(7.5°)$

[U.P.S.C. I.E.S. E. E. II, 1995; A.M.I.E. Sec B. Summer 2002]

369. In a cylindrical rotor synchronous machine, the phasor addition of stator and rotor mmfs is possible because
(a) two mmfs are rotating in opposite directions.
(b) two mmfs are rotating in same direction at different speeds.
(c) two mmfs are stationary with respect to each other.
(d) one mmf is stationary and the other mmf is rotating.
[U.P.S.C. I.E.S. E.E.-II, 2001]

370. Three phase alternators are invariably connected in star so as to
(a) reduce the size of stator conductors used.
(b) increase the terminal voltage.
(c) reduce magnetic losses. (d) all of the above.

371. The stator winding of an alternator is normally connected in star to eliminate the _____harmonic component of the voltage waveform
(a) third (b) fifth (c) seventh
[A.M.I.E. Sec B. Winter 1994]

372. If the dimensions of all the parts of a synchronous generator, and the number of field and armature turns are doubled, then the generated voltage will change by a factor of
(a) 1 (b) 2 (c) 4 (d) 8
[U.P.S.C. I.E.S. E.E.-II, 1998]

373. The armature of a single phase alternator is completely wound with T single turn coils distributed uniformly. The induced voltage in each turn is 2 V (rms). The emf of the whole winding is
(a) 2 T volts. (b) 1.11 T volts.
(c) 1.414 T volts. (d) 1.273 T volts. [GATE E.E. 1998]

374. Consider the following statements:
EMF induced per phase in an alternator depends on
1. Frequency.
2. Number of turns per phase.
3. Pitch factor.
4. Distribution factor.
Which of the above statements is/are correct?
(a) 1 only. (b) 1, 2, 3 and 4.
(c) 2 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2009]

375. In a 3-phase star-connected generator, if the fundamental and the third harmonic rms voltages in each phase are respectively V_1 and V_3, the line voltage of the generator will be

(a) $\sqrt{3(V_1^2 + V_3^2)}$ (b) $\sqrt{3}\,V_1$

(c) $\sqrt{3}\left(V_1 + \dfrac{V_3}{3}\right)$ (d) $\sqrt{V_1^2 + \dfrac{V_3^2}{3}}$

[U.P.S.C. I.E.S. E.E.-II, 1999]

376. A 3-phase alternator is wound with a 60 degree phase-spread armature windings and develops 300 kVA. If the armature is reconnected utilizing all the coils for single phase operation with a phase spread of 180 degrees, the new rating of the machine is
(a) 100 kVA (b) 200 kVA
(c) 250 kVA (d) 300 kVA [GATE E.E. 1999]

377. The angle between induced emf and terminal voltage on no-load for a single phase alternator is
(a) 180° (b) 90° (c) 0° (d) none of these.

378. The 5th space harmonics in the mmf developed by balanced fundamental frequency armature currents rotate at _____ times the synchronous speed with respect to the field.
(a) 5/6 (b) 6/5 (c) 5/4 (d) 5/7

379. The seventh space harmonics in the mmf produced by balanced fundamental frequency armature currents rotate at _____ times the synchronous speed with respect to the field.
(a) 5/7 (b) 8/7 (c) 6/7 (d) 7/6

Data for Q. 380 and Q. 381 are given below. Solve the problems and choose the correct answers.

A 4 pole, 50 Hz, synchronous generator has 48 slots in which a double layer winding is housed. Each coil has 10 turns and is short pitched by an angle to 36° electrical. The fundamental flux per pole is 0.025 Wb

380. The line-to-line induced emf (in volts), for a three phase star connection is approximately
(a) 808 (b) 888 (c) 1,400 (d) 1,538
[GATE E.E. 2006]

381. The fifth harmonic component of phase emf (in volts), for a three phase star connection is
(a) 0 (b) 269 (c) 281 (d) 808
[GATE E.E. 2006]

382. The phase sequence of a three-phase alternator will reverse if
(a) the field current is reversed keeping the direction of rotation same.
(b) the field current remains the same but the direction of rotation is reversed.
(c) the field current is reversed and the number of poles is doubled.
(d) the number of poles is doubled without reversing the field current.
[GATE E.E. 2000]

383. A 500 MW 3-phase Y-connected synchrnous generator has a rated voltage of 21.5 kV at 0.85 pf. The line current when operating at full load rated conditions will be

Answers: **366.** (a), **367.** (b), **368.** (b), **369.** (c), **370.** (b), **371.** (a), **372.** (c), **373.** (d), **374.** (b), **375.** (a), **376.** (b), **377.** (c), **378.** (b), **379.** (c), **380.** (c), **381.** (a), **382.** (b), **383.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 13.43 kA (b) 15.79 kA
(c) 23.25 kA (d) 27.36 kA [GATE E.E. 2004]

384. Power factor of an alternator driven by constant prime mover input can be changed by changing its
(a) Speed. (b) Load.
(c) Field excitation. (d) Phase sequence.
[U.P.S.C. I.E.S. E.E.-II, 2010]

385. How can the reactive power delivered by a synchronous generator be controlled?
(a) By changing the prime mover input.
(b) By changing the excitation.
(c) By changing the direction of rotation.
(d) By changing the prime mover speed.
[U.P.S.C. I.E.S E.E.-II, 2007]

386. The rating of the prime mover driving an alternator is determined entirely by its _____ rating.
(a) voltage (b) current (c) kW output (d) speed

387. When an alternator designed for operation at 60 Hz is operated at 50 Hz
(a) kVA rating will increase in the ratio of 1.2.
(b) operating voltage will reduce in the ratio of 5/6.
(c) operating voltage will increase in the ratio of 1.2
(d) operating voltage will reduce in the ratio of $\left(\frac{5}{6}\right)^{2}$.

388. The rating of a synchronous machine is usually governed by its
(a) speed. (b) temperature rise.
(c) weight. (d) none of these.

389. The flux set up by the armature current, which does not cross the air gap and takes a different path is called the _____ flux.
(a) leakage (b) main
(c) cross-magnetizing (d) demagnetizing

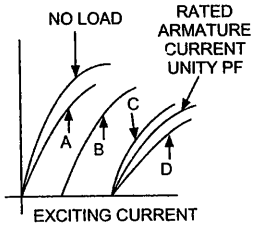
390. The magnitude of leakage flux depends on
(a) the magnitude of armature current.
(b) phase angle between armature current and terminal voltage.
(c) air gap thickness. (d) both (a) and (b).

391. A 3-phase alternator rated at 50 MVA, 22 kV has a synchronous reactance per phase of 5 pu on its thermal rating. The pu value of this reactance on a base of 100 MVA and 220 kV is
(a) 25 pu (b) 12.5 pu (c) 1 pu (d) 0.1 pu
[U.P.S.C. I.E.S E.E.-II, 1999]

392. A 3-phase 50 MVA, 10 kV generator has reactance of 0.2 ohm per phase. Hence the per-unit value of the reactance on a base 100 MVA 25 kV will be
(a) 1.25 (b) 0.625 (c) 0.032 (d) 0.32
[U.P.S.C. I.E.S. E.E.-II, 2002]

393. Three generators rated 100 MVA, 11 kV have an impedance of 0.15 pu each. If in the same plant, these generators are being replaced by a single equivalent generator, the effective impedance of equivalent generator will be
(a) 0.05 pu (b) 0.15 pu (c) 0.25 pu (d) 0.45 pu.
[U.P.S.C. I.E.S E.E-II, 2001]

394. Figure shows the magnetization curves of an alternator at rated armature current, unity power factor and also at no load. The magnetization curve for rated armature current, 0.8 power factor leading is given by
(a) curve A (b) curve B
(c) curve C (d) curve D



[GATE E.E. 2001]

395. Leakage reactance of the armature of a salient pole synchronous machine which varies with the position of rotor is due to leakage flux
(a) of end connections.
(b) which comes out of slot teeth, crosses the air-gap and enters the pole faces.
(c) which remains within the slot.
(d) none of the above.

396. In a synchronous generator
(a) the armature mmf leads the air-gap flux and air-gap flux leads the field mmf.
(b) the armature mmf leads the air gap flux and the air-gap flux lags behind the field mmf.
(c) the armature mmf lags behind the air gap flux and air- gap flux lags behind the field mmf.
(d) the armature mmf lags behind the air-gap and air-gap flux leads the field mmf.

397. Armature reaction effect is/are _____ on the main field flux.
(a) distorting (or cross-magnetizing) as well as demagnetizing.
(b) only assisting (c) only demagnetizing
(d) only distorting

398. The armature reaction effect in a synchronous machine depends on
(a) load current. (b) power factor of the load.
(c) speed of the machine. (d) both (a) and (b).

399. In a synchronous generator, the effect of cross-magnetization is to make the generated voltage
(a) truely sinusoidal. (b) non-sinusoidal.
(c) free from harmonics. (d) none of these.

400. In an alternator, the armature mmf will be in phase with the main field flux only when the load is purely
(a) resistive. (b) inductive.
(c) capacitive.

401. In an alternator, the armature reaction is considered to be equivalent to a fictitious
(a) reactance. (b) resistance.
(c) impedance. (d) admittance.

402. A synchronous generator is feeding a zero power factor (lagging) load at rated current. The armature reaction is
(a) magnetizing. (b) demagnetizing.
(c) cross-magnetizing. (d) ineffective. [GATE E.E. 2006]

403. Armature reaction AT of a synchronous generator supplying power at rated voltage with zero power factor lagging is
(a) Magnetizing (b) Demagnetizing
(c) Cross-magnetizing
(d) Both magnetizing and cross-magnetizing
[U.P.S.C. I.E.S. E.E.-II, 2010]

404. The synchronous reactance is the
(a) reaction due to armature reaction of the machine.
(b) reactance due to leakage flux.
(c) combined reactance due to leakage flux and armature reaction.
(d) reactance either due to armature reaction or leakage flux.
[U.P.S.C. I.E.S. E.E. II 2003]

405. Drop in terminal voltage of an alternator due to armature reaction is countered by
(a) damper winding. (b) effect of saliency.
(c) increased prime mover output.
(d) automatic voltage regulator.
[A.M.I.E. Sec B. Electrical Machines Winter 1994]

Answers: **384.** (c), **385.** (b), **386.** (c), **387.** (b), **388.** (b), **389.** (a), **390.** (d), **391.** (d), **392.** (c), **393.** (a), **394.** (c), **395.** (b), **396.** (c), **397.** (a), **398.** (d), **399.** (b), **400.** (c), **401.** (a), **402.** (b), **403.** (b), **404.** (c), **405.** (d),

406. The saturated synchronous reactance of an alternator is _____ its unsaturated synchronous reactance.
(a) more than (b) less than
(c) equal to (d) none of these

407. In an alternator, short-circuit current is limited by the
(a) saturated synchronous impedance.
(b) unsaturated synchronous impedance.
(c) either of the above. (d) none of these.

408. What does the SCR (short-circuit ratio) of a synchronous machine yield ?
(a) $\frac{1}{X_s \text{ (unsaturated) pu}}$ (b) $\frac{1}{X_s \text{ (unsaturated) in Ohm}}$
(c) $\frac{1}{X_s \text{ (adjusted) pu}}$ (d) $\frac{1}{X_s \text{ (adjusted) in Ohm}}$
[U.P.S.C. I.E.S E.E.-II, 2007]

409. A field excitation of 20 A in a certain alternator results in an armature current of 400 A in short circuit and a terminal voltage of 2,000 V on open circuit. The magnitude of the internal voltage drop within the machine at a load current of 200 A is
(a) 1 V (b) 10 V (c) 100 V (d) 1,000 V
[GATE.E.E. 2009]

410. A 100 kVA, 415 V (line), star-connected synchronous machine generates rated open circuit voltage of 415 V at a field current of 15 A. The short-circuit armature current at a field current of 10 A is equal to the rated armature current. The per unit saturated synchronous reactance is
(a) 1.731 (b) 1.5 (c) 0.666 (d) 0.577
[GATE E.E. 2007]

411. When the load (inductive) is thrown off, the terminal voltage will
(a) increase. (b) decrease.
(c) remain unchanged. (d) none of these.

412. As the leading power factor of the load of an alternator decreases, the magnitude of generated voltage required to give rated terminal voltage
(a) increases. (b) decreases.
(c) remains unchanged.

413. In a synchronous generator delivering lagging power factor load
(a) the excitation emf leads terminal voltage by the power angle.
(b) the excitation emf lags the terminal voltage by the power angle.
(c) excitation emf leads the terminal voltage by the power factor angle.
(d) none of the above. [A.M.I.E. Sec B. Electrical Machines Summer 1995]

414. The power factor on which an alternator operates depends on the
(a) speed of the prime-mover.
(b) nature of the load being supplied.
(c) armature losses. (d) copper losses.

415. Unbalanced 3-phase stator currents cause
(a) vibrations. (b) heating of rotor.
(c) double frequency currents in the rotor.
(d) all of the above.

416. A 1000 kVA, 6.6 kV, 3-phase star-connected cylindrical pole synchronous generator has a synchronous reactance of 20 Ω. Neglect armature resistance and consider operation at full load and unity power factor.
(*i*) The induced emf (line-to-line) is close to
(a) 5.5 kV (b) 7.2 kV (c) 9.6 kV (d) 12.5 kV
(*ii*) The power (or torque) angle is close to
(a) 13.9° (b) 18.3° (c) 24.6° (d) 33.0°
[GATE E.E. 2005]

417. A 500 kVA, 1,100 V, 50 Hz Y-connected 3 phase alternator has stator resistance of 0.1 Ω/phase and synchronous impedance of 1.5 Ω/phase. The alternator is supplying full load at unity power factor. The induced emf per phase for this condition is
(a) 769 V (b) 832 V (c) 692 V (d) 935 V
[U.P.S.C. I.E.S. E.E.-II, 2007]

418. The regulation of an alternator is given as
(a) $\frac{V - E_0}{V} \times 100$ (b) $\frac{E_0 - V}{V} \times 100$
(c) $\frac{V}{E_0} \times 100$ (d) $\frac{E_0 - V}{E_0} \times 100$

419. Regulation of an alternator supplying resistive or inductive load is
(a) always +ve. (b) always –ve.
(c) either of the above or zero.
(d) none of the above.

420. A leading pf load on an alternator implies that its voltage regulation shall be
(a) positive. (b) negative.
(c) zero. (d) any one of these.
[A.M.I.E. Electrical Science Summer 1994]

421. The effect of leading power factor on the voltage regulation of an alternator is
(a) increasing in nature. (b) decreasing in nature.
(c) maintained at constant value.
(d) oscillating in nature. [A.M.I.E. Sec B. Winter 1996]

422. The leakage reactance of a three-phase alternator is determined by performing
(a) open-circuit and zero power factor tests.
(b) zero power factor and slip tests.
(c) open- and short-circuit tests.
(d) short-circuit and slip tests. [U.P.S.C. I.E.S. E.E.-II, 2003]

423. The 'synchronous impedance method' of finding the voltage regulation of a cylindrical rotor alternator is generally considered as
(a) a pessimistic method because saturation is not considered.
(b) an optimistic method because saturation is not considered.
(c) a fairly accurate method even if power factor is not taken into account while determining synchronous impedance.
(d) a fairly accurate method when power factor is taken into account while determining synchronous impedance.
[U.P.S.C. I.E.S. E.E.-II, 2002]

424. The regulation obtained by synchronous impedance method is always higher than actual value because
(a) synchronous reactance is assumed variable while it is not.
(b) effective armature resistance is assumed constant.
(c) synchronous reactance is assumed constant while it is not.
(d) field current is increased to give short-circuit current about twice of full-load current.

425. The short-circuit characteristic of an alternator is
(a) always linear. (b) always nonlinear.
(c) either of (a) or (b). (d) none of these.

426. Under short-circuit conditions, the power factor of an alternator is
(a) unity. (b) almost zero lagging.
(c) almost zero leading. (d) none of the above.

Answers: **406.** (b), **407.** (b), **408.** (c), **409.** (d), **410.** (a), **411.** (a), **412.** (b), **413.** (a), **414.** (b), **415.** (d), **416.** (i) (b), (ii) (c), **417.** (a), **418.** (b), **419.** (a), **420.** (d), **421.** (b), **422.** (a), **423.** (a), **424.** (c), **425.** (a), **426.** (b),

Downloaded From : www.EasyEngineering.net

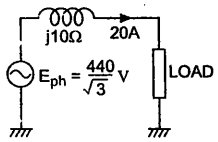
Downloaded From : www.EasyEngineering.net

427. The zero power factor characteristic for the Potier diagram can be obtained by loading the alternator using
(a) lamp load. (b) synchronous motor.
(c) water load. (d) dc motor.
[U.P.S.C. I.E.S. E.E.-II, 1999]

428. Modern alternators are designed to have poor regulation as it
(a) increases the value of short-circuit current.
(b) limits the value of short-circuit current.
(c) increases the efficiency of operation.
(d) both (a) and (c).

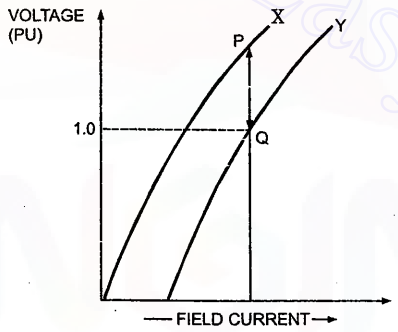
429. A single-phase, 2,000 V alternator has armature resistance and reactance of 0.8 ohms and 4.94 ohms respectively. The voltage regulation of the alternator at 100 A load at 0.8 leading power-factor is
(a) 7% (b) −8.9% (c) 14% (d) 0%
[GATE E.E. 2000]

430. A star-connected 440 V, 50 Hz alternator has per phase synchronous reactance of 10 Ω. It supplies a balanced capacitive load current of 20 A, as shown in the per phase equivalent circuit of figure. It is desirable to have zero voltage regulation. The load power factor should be



(a) 0.82 (b) 0.47 (c) 0.39 (d) 0.92
[GATE E.E. 2001]

431. Curves *X* and *Y* in the figure denote open-circuit and full-load zero power factor (*Z* pf) characteristics of a synchronous generator. *Q* is a point on the *Z* pf characteristic at 1.0 pu voltage. The vertical distance *PQ* in the figure gives the voltage drop across



(a) synchronous reactance. (b) magnetising reactance.
(c) Potier reactance. (d) leakage reactance.
[GATE E.E. 2003]

432. The phasor diagram by ASA method gives
(a) reliable results for both regulation and power angle of a salient pole synchronous generator.
(b) reliable result for power angle but erroneous result for regulation.
(c) reliable result for regulation but erroneous result for power angle.
(d) erroneous results for both regulation and power angle of a salient-pole synchronous generator.

433. Armature reaction mmf and leakage reactance of a synchronous machine are determined by
(a) open-circuit and short-circuit tests.
(b) open-circuit and zero pf tests.
(c) open-circuit test only. (d) zero pf test only.

434. Consider the following:
1. EMF 2. Reversal
3. MMF 4. Direct
Which methods among these are for the determination of voltage regulation of an alternator?
(a) 1, 2, 3 and 4. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

435. Consider the following:
1. LPF method. 2. EMF method.
3. ZPF method. 4. MMF method.
Which of the above methods are correct for determination of voltage regulation of an alternator?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 2 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2009]

436. Which one of the following methods would give higher than actual value of regulation of an alternator?
(a) ZPF method. (b) MMF method.
(c) EMF method. (d) ASA method.
[U.P.S.C. I.E.S. E.E.-II, 1998]

437. Which one of the following methods gives more accurate result for determination of voltage regulation of an alternator?
(a) MMF method.
(b) Synchronous impedance method.
(c) Potier triangle method.
(d) American Institution Standard method.
[U.P.S.C. I.E.S. E.E.-II, 2004]

438. The four methods of calculation of voltage regulation of a 3-phase alternator are
1. EMF method.
2. Saturated synchronous reactance method.
3. New ASA method. 4. MMF method.
The correct sequence of the ascending order of the values of regulation obtained by these methods is
(a) 3, 4, 2, 1 (b) 4, 3, 1, 2
(c) 3, 4, 1, 2 (d) 4, 3, 2, 1
[U.P.S.C. I.E.S. E. E. II 1993]

439. A synchronous motor is operated from a bus voltage of 1.0 pu and is drawing 1.0 pu zero power factor leading current. Its synchronous reactance is 0.5 pu. What is the excitation emf of the motor?
(a) 2.0. (b) 1.5. (c) 1.0. (d) 0.5.
[U.P.S.C. I.E.S. E.E.-II, 2005]

440. By slip test on a 3-phase synchronous generator the maximum and minimum impressed voltages per phase are found to be V_{max} and V_{min} respectively whereas the maximum and minimum phase currents are found to be I_{max} and I_{min} respectively. The values of the direct axis synchronous reactance X_d and quadrature axis synchronous reactance X_q are given as
(a) $X_d = \frac{V_{max}}{I_{min}}$; $X_q = \frac{V_{min}}{I_{max}}$
(b) $X_d = \frac{V_{max}}{I_{min}}$; $X_q = \frac{V_{min}}{I_{min}}$
(c) $X_d = \frac{V_{max}}{I_{min}}$; $X_q = \frac{V_{max}}{I_{max}}$
(d) $X_d = \frac{V_{min}}{I_{max}}$; $X_q = \frac{V_{max}}{I_{min}}$

441. In the measurement of X_d, X_q (in ohms), following data are obtained by the slip test on a salient pole machine
I_d max = 10 A I_d min = 6.5 A
V_d max = 30 V V_d min = 25 V

Answers: **427.** (b), **428.** (b), **429.** (b), **430.** (a), **431.** (a), **432.** (c), **433.** (b), **434.** (d), **435.** (b), **436.** (c), **437.** (c), **438.** (d), **439.** (d), **440.** (a), **441.** (b),

Which one of the following is correct?

(a) $X_d = 3\ \Omega, X_q = 3.86\ \Omega$ (b) $X_d = 4.615\ \Omega, X_q = 2.5\ \Omega$

(c) $X_d = 3\ \Omega, X_q = 2.5\ \Omega$ (d) $X_d = 4.61\ \Omega, X_q = 3.86\ \Omega$

[U.P.S.C. I.E.S. E.E.-II, 2005]

442. Which one of the following statements is not correct in respect of synchronous machines?

(a) In salient pole machines, the direct-axis synchronous reactance is greater than the quadrature axis synchronous reactance.

(b) The damper bars help the motor to self start.

(c) Short-circuit ratio is the ratio of field current required to produce the rated voltage on open circuit to the rated armature current.

(d) The V-curve of a synchronous motor represents the variation in armature current with field excitation at a given output power. [U.P.S.C. I.E.S. E.E.-II, 2006; GATE E.E. 2005]

443. Slip test is performed to determine

(a) slip.

(b) direct-axis reactance and quadrature axis reactance.

(c) positive-sequence reactance and negative-sequence reactance.

(d) sub-transient reactance. [U.P.S.C. I.E.S. E.E.-II, 1999]

444. For maximum current during slip test on a synchronous machine, the armature mmf aligns along

(a) *d*-axis. (b) *q*-axis.

(c) 45° to *d*-axis. (d) 45° to *q*-axis.

[U.P.S.C. I.E.S. E.E.-II, 2002]

445. The results of a slip test for determining direct-axis (X_d) and quadrature-axis (X_q) reactances of a star-connected salient pole alternator are given below:

Phase values: $V_{max} = 108$ V; $V_{min} = 96$ V;

$I_{max} = 12$ A; $I_{min} = 10$ A.

Hence the two reactances will be

(a) $X_d = 10.8\ \Omega$ and $X_q = 8\ \Omega$

(b) $X_d = 9\ \Omega$ and $X_q = 9.6\ \Omega$

(c) $X_d = 9.6\ \Omega$ and $X_q = 9\ \Omega$

(d) $X_d = 8\ \Omega$ and $X_q = 10.8\ \Omega$ [U.P.S.C. I.E.S. E.E.-II, 2002]

446. While conducting a "slip" test for determination of direct- and quadrature-axis synchronous reactance X_d and X_q of salient pole synchronous machine, the rotor of the machine is run with a slip '*s*' and stator supply frequency '*f*'. The frequency of

1. voltage induced across open-field terminals
2. envelope of armature terminal voltage
3. envelope of armature current and
4. armature current

will be respectively

(a) *sf*, *sf*, *sf* and *f*. (b) *sf*, *f*, *sf* and *f*.

(c) *f*, *sf*, *f* and *sf*. (d) *f*, $(1 - s)f$, $(2 - s)f$ and *sf*.

[U.P.S.C. I.E.S. E.E.-II, 1997]

447. In which one of the following is reluctance power developed?

(a) Salient pole alternator.

(b) Non-salient pole alternator.

(c) Squirrel cage induction motor.

(d) Transformer. [U.P.S.C. I.E.S. E.E.-II, 2006]

448. Which is the value of load angle when the power output of a salient pole synchronous generator is maximum?

(a) 0° (b) 45° (c) 90° (d) none of the above.

[U.P.S.C. I.E.S. E.E.-II, 2006]

449. The two-reaction phasor diagram of a salient pole synchronous generator is considered, where

I_a = armature current per phase

X_L = armature leakage reactance per phase

X_d = direct-axis synchronous reactance

X_q = quadrature-axis synchronous reactance and

V = generator terminal voltage, taken as reference.

The voltage in-phase with the direct-axis will be the phasor sum of

(a) $V + I_a R_a + I_a X_L$ (b) $V + I_a R_a + I_a X_d$

(c) $V + I_a R_a + I_a X_q$ (d) $V + I_a R_a + I_a (X_d + X_q)$

[U.P.S.C. I.E.S. E.E.-II, 1999]

450. Higher synchronous reactance is preferred in the present day alternators, because one can have

(a) reduced subtransient current.

(b) reduced harmonic currents.

(c) reduced transient currents.

(d) higher voltage regulation with load. [GATE E.E. 1999]

451. When a 3-phase alternator is suddenly short-circuited at its terminals, the initial value of short-circuit current is limited by which one of the following:

(a) Subtransient reactance X''_d.

(b) Transient reactance X'_d.

(c) Synchronous reactance X_S.

(d) Sum of X''_d, X'_d and X_S. [U.P.S.C. I.E.S. E.E.-II, 2004]

452. X_d, X'_d and X''_d are steady-state *d*-axis synchronous reactance, transient *d*-axis reactance and subtransient *d*-axis reactance of a synchronous machine respectively. Which of the following statements is true?

(a) $X_d > X'_d > X''_d$ (b) $X''_d > X'_d > X_d$

(c) $X'_d > X''_d > X_d$ (d) $X_d > X''_d > X'_d$

[GATE E.E. 2001]

453. An alternator with higher value of SCR has

(a) poor voltage regulation and lower stability limit.

(b) better voltage regulation and higher stability limit.

(c) poor voltage regulation and higher stability limit.

(d) better voltage regulation and low stability limit.

[A.M.I.E. Sec B. Winter 1994]

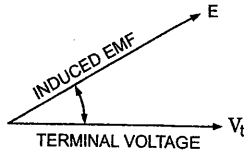
454. A 3-ϕ alternator has negligible stator resistance. A short-circuit test is conducted on this alternator. At a particular speed a field current of I_{f1} is required to drive the rated armature current. If the speed of the alternator is reduced to half, the field current required to maintain rated armature current

(a) would be equal to I_{f1}. (b) would be equal to $2\ I_{f1}$.

(c) would be equal to $\frac{I_{f1}}{2}$.

(d) cannot be predicted due to insufficient data. [GATE 1993]

455. The phasor diagram of a synchronous machine connected to an infinite bus is shown in the figure:



The machine is acting as a

(a) generator and operating at a lagging power factor.

(b) generator and operating at a leading power factor.

(c) motor operating at a leading power factor.

(d) motor and operating at a lagging power factor.

[U.P.S.C. I.E.S. E.E.-II, 1999]

Answers: **442.** (c), **443.** (b), **444.** (b), **445.** (a), **446.** (a), **447.** (a), **448.** (d), **449.** (b), **450.** (c), **451.** (a), **452.** (a), **453.** (b), **454.** (d), **455.** (b),

456. A round rotor synchronous generator has a leakage reactance of 10%, armature reaction reactance of 90% and negligible armature resistance. With the machine initially running at rated speed and terminal voltage of 1.0 pu, a 3-phase short-circuit is applied. The sustained armature current will be
(a) 1.25 pu (b) 1.11 pu (c) 1.0 pu (d) 0.9 pu
[U.P.S.C. I.E.S. E.E.-II, 1993]

457. Which one of the following is the correct statement?
(a) The armature current upon symmetrical 3-phase short-circuit of a synchronous machine (armature resistance is negligible) constitutes q-axis current only.
(b) The armature current upon symmetrical 3-phase short-circuit of a synchronous machine (armature resistance is negligible) constitutes d-axis current only.
(c) The armature current upon symmetrical 3-phase short-circuit of a synchronous machine (armature resistance is negligible) has both d-axis and q-axis component.
(d) Short circuit current cannot be divided into d- and q-axes components. [U.P.S.C. I.E.S. E.E.-II, 2007]

458. A 50 Hz alternator is rated 500 MVA, 20 kV, with $X_d = 1.0$ per unit and $X''_d = 0.2$ per unit. It supplies a purely resistive load of 400 MW at 20 kV. The load is connected directly across the generator terminals when a symmetrical fault occurs at the load terminals. The initial rms current in the generator in per unit is
(a) 7.22 (b) 6.4 (c) 3.22 (d) 2.2
[GATE E.E. 2001]

459. The direct axis reactance X_d of a synchronous generator is given as 0.4 pu based on the generator's name plate rating of 10 kV, 75 MVA. The base for calculation is 11 kV, 100 MVA. What is the pu value of X_d on the new base?
(a) 0.279 (b) 0.578 (c) 0.412 (d) 0.44
[U.P.S.C. I.E.S. E.E.-II, 2005]

460. The direct axis and quadrature axis reactances of a salient pole alternator are 1.2 p.u. and 1.0 p.u. respectively. The armature resistance is negligible. If this alternator is delivering rated kVA at upf and at rated voltage then its power angle is
(a) 30° (b) 45°
(c) 60° (d) 90° [GATE E.E., 2011]

461. If the excitation of a 3-phase alternator operating on infinite bus bars is changed, which one of the following shall alter?
(a) Active power of machine.
(b) Reactive power of machine.
(c) Terminal voltage of machine.
(d) Frequency of machine. [U.P.S.C. I.E.S. E.E.-II, 2008]

462. A 3-phase synchronous generator with constant steam input supplies power to an infinite bus at a lagging power factor. If the excitation is increased
(a) both power angle and power factor decrease.
(b) both power angle and power factor increase.
(c) the power angle decreases while power factor increases.
(d) the power angle increases while power factor decreases.
[U.P.S.C. I.E.S. E.E.-II, 2005]

463. A turbo-alternator set feeds power to a 3-phase constant voltage, constant frequency bus. If the steam supply to the set is cut off, then the set will
(a) continue to run at rated speed in the same direction.
(b) continue to run at a reduced speed in the same direction.
(c) run at rated speed in the reverse direction.
(d) come to stop. [U.P.S.C I.E.S. E.E.-II 1998]

464. A stand alone engine driven synchronous generator is feeding a partly inductive load. A capacitor is now connected across the load to completely nullify the inductive current. For this operating condition
(a) the field current and fuel input have to be reduced.
(b) the field current and fuel input have to be increased.
(c) the field current has to be increased and fuel input left unaltered.
(d) the field current has to be reduced and fuel input left unaltered. [GATE E.E. 2003]

465. The mmf produced by single phase winding is
(a) pulsating and rotating with constant speed.
(b) pulsating and stationary.
(c) constant in amplitude and stationary.
(d) constant in amplitude and rotating.

466. A polyphase field is
(a) pulsating and stationary. (b) pulsating and rotating.
(c) constant in amplitude and rotating at synchronous speed.
(d) constant in amplitude and stationary in space.

467. When a balanced 3-phase distributed type armature winding is carrying 3-phase, balanced currents, the strength of the resultant rotating magnetic field is
(a) three times the amplitude of each constituent pulsating magnetic field.
(b) equal to the amplitude of each constituent pulsating magnetic field.
(c) half the amplitude of each constituent pulsating magnetic field.
(d) one and half times the amplitude of each constituent of pulsating magnetic field. [U.P.S.C. I.E.S. E.E.-II, 1994]

468. A synchronous generator has its field winding on the rotor and armature winding on the stator. When running under steady state conditions its air gap field is
(a) stationary with respect to stator.
(b) rotating at synchronous speed with respect to rotor.
(c) rotating at synchronous speed against the direction of rotor rotation.
(d) rotating at synchronous speed in the direction of rotor rotation.
[A.M.I.E. Electrical Science Winter 1994]

469. Synchronous motors generally have
(a) salient pole rotor. (b) smooth cylindrical rotor.
(c) either salient pole or smooth cylindrical rotor.
(d) none of the above.

470. Number of slip-rings in a 3-phase synchronous motor will be
(a) 0 (b) 1 (c) 2 (d) 3 or 4.
[A.M.I.E. Sec B. Electrical Machines Summer 1996]

471. Electromagnetic force or torque developed in any physical system tends to
(a) increase both the field energy and co-energy at constant current.
(b) reduce both the field energy and co-energy at constant current.
(c) reduce reluctance. (d) reduce inductance.
(e) reduce permanence. (f) both (a) and (c).

472. An ideal synchronous motor has no starting torque because the
(a) rotor is made up of salient poles.
(b) relative velocity between the stator and the rotor mmfs is zero.

Answers: **456.** (c), **457.** (b), **458.** (c), **459.** (d), **460.** (b), **461.** (b), **462.** (a), **463.** (a), **464.** (d), **465.** (b), **466.** (c), **467.** (d), **468.** (d), **469.** (a), **470.** (c), **471.** (f), **472.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) relative velocity between the stator and rotor mmfs is not zero.
(d) rotor winding is highly reactive. [U.P.S.C. I.E.S. E.E.-II, 1998]

473. In a synchronous motor
(a) the rotor mmf and stator mmf are stationary with respect to each other.
(b) rotor mmf rotates slightly faster in comparison to stator mmf.
(c) stator mmf rotates slightly faster than rotor mmf.
(d) none of the above.

474. A synchronous machine is revolving armature and stationary field type. Under steady running conditions, the air gap field
(a) rotates at synchronous speed with respect to stator.
(b) rotates at synchronous speed in the direction of rotation of rotor.
(c) remains stationary with respect to stator.
(d) remains stationary with respect to rotor.

475. In a synchronous machine, if the armature field axis is ahead of the field flux axis in the direction of rotation the machine operating is
(a) synchronous motor. (b) synchronous generator.
(c) asynchronous motor. (d) asynchronous generator.

476. In a synchronous machine if the axis of the field flux coincides with that of armature flux, the machine
(a) will operate smoothly without any vibration.
(b) is said to be floating.
(c) is operating as a synchronous generator.
(d) is operating as a synchronous motor.

477. In a 3-phase synchronous motor the magnitude of field flux
(a) remains constant at all loads.
(b) varies with load. (c) varies with speed.
(d) varies with power factor.

478. In a 3-phase synchronous motor
(a) the field mmf leads the air gap flux and air-gap flux leads the armature mmf.
(b) the armature mmf leads the air-gap flux and air-gap flux leads the field mmf.
(c) the armature mmf leads the air-gap flux and air-gap flux lags behind the field mmf.
(d) none of the above.

479. What is the angle between the induced voltage and supply voltage of a synchronous motor under running condition?
(a) Zero. (b) Greater than zero but $\leq 90°$.
(c) Between 90° and 180°. (d) > 180. [U.P.S.C. I.E.S. E.E.-II, 2007]

480. The flux per pole in a synchronous motor with the field circuit ON and the stator disconnected from the supply is found to be 25 m Wb. When the stator is connected to the rated supply with the field excitation unchanged, the flux per pole in the machine is found to be 20 m Wb while the motor is running on no load. Assuming no-load losses to be zero, the no-load current by the motor from the supply
(a) lags behind the supply voltage.
(b) leads the supply voltage.
(c) is in phase with the supply voltage.
[GATE E.E. 2002; A.M.I.E. Sec B. Summer 2002]

481. The relative speed between the magnetic fields of stator and rotor under steady state operation is zero for
(a) a dc machine. (b) an induction machine.
(c) a synchronous machine. (d) all the above machines.
[A.M.I.E. Electrical Science Summer 1994]

482. A 3-phase synchronous motor has
(a) high starting torque. (b) no starting torque.
(c) low starting current. (d) low starting torque.
[U.P.S.C. I.E.S. E.E.-II, 2003]

483. A 10 pole, 25 Hz alternator is directly coupled to and is driven by 60 Hz synchronous motor. What is the number of poles for the synchronous motor?
(a) 48 (b) 12 (c) 24 (d) 16
[U.P.S.C. I.E.S. E.E.-II, 2007]

484. A 3-phase synchronous motor needs dc supply for excitation
(a) continuously. (b) at the starting instant only.
(c) of stator. (d) none of these.

485. The coupling magnetic field reaction with _____ system(s) is essential for extracting energy from an electrical system.
(a) mechanical (b) electrical
(c) both electrical and mechanical

486. The armature current of a synchronous motor on no load
(a) leads the applied voltage by 90°.
(b) lags behind the applied voltage by 90°.
(c) is in phase will applied voltage.
(d) zero.

487. As the load is increased on a synchronous motor, its speed
(a) decreases. (b) increases.
(c) remains constant and additional load is supplied by shift in relative position of the rotor with respect to stator rotating magnetic field.
(d) remains constant for some time and then falls abruptly.

488. The synchronous motor meets increase in load by taking more armature current as
(a) the rotor pole falls back relative to the stator pole causing an increase in motor current.
(b) the back emf decreases causing an increase in motor current.
(c) rotating field is strengthened causing an increase in motor current.
(d) none of the above.

489. A synchronous motor is operating with normal excitation. With the increase in load the armature current drawn from the supply main increases due to
(a) increase in back emf. (b) fall in motor speed.
(c) increase in resultant voltage across the armature.
(d) increase in power factor.

490. The resultant voltage acting across the armature circuit of a synchronous motor (E_r) is the _____ of induced emf in the armature circuit (E_b) and supply voltage V.
(a) arithmetic sum. (b) arithmetic difference.
(c) phasor difference. (d) phasor sum.

491. The magnitude of emf induced in the armature of a synchronous motor (E_b) depends upon
(a) supply voltage. (b) rotor excitation.
(c) rotor speed. (d) flux density.
(e) all of the above.

492. The phase of emf induced in the armature of a synchronous motor (E_b) depends upon
(a) rotor speed. (b) load.
(c) both load and speed. (d) none of the above.

493. In a synchronous motor, the synchronizing power comes into action when

Answers: **473.** (a), **474.** (c), **475.** (a), **476.** (b), **477.** (a), **478.** (b), **479.** (c), **480.** (b), **481.** (d), **482.** (b), **483.** (c), **484.** (a), **485.** (b), **486.** (a), **487.** (c), **488.** (a), **489.** (c), **490.** (c), **491.** (b), **492.** (b), **493.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) rotor speed either exceeds or falls below the synchronous speed.
(b) rotor speed is equal to synchronous speed.
(c) rotor speed falls below the synchronous speed.
(d) rotor speed exceeds the synchronous speed.

494. Synchronizing power of a synchronous motor varies
(a) directly as synchronous reactance, X_s.
(b) directly as the square of the synchronous reactance, X_s^2.
(c) inversely as the synchronous reactance, $1/X_s$.
(d) none of the above.

495. The coupling angle or load angle of a synchronous motor is defined as the space angle between the
(a) rotor and stator poles of the same polarity.
(b) rotor and stator poles of opposite polarity.
(c) rotor and stator teeth. (d) none of the above.

496. The torque angle δ is defined as the space angle between
(a) stator field axis and resultant field axis.
(b) rotor field axis and resultant field axis.
(c) stator field axis and rotor field axis.
(d) stator field axis and mutual field axis.

497. The value of load angle for a synchronous motor depends mainly upon its
(a) excitation. (b) load.
(c) speed. (d) supply voltage.

498. The total steady state torque to drive the synchronous motor and the load at synchronous speed is known as _____ torque.
(a) reluctance (b) pull-out
(c) synchronous (d) average

499. Electromagnetic torque is present in rotating machines when
(a) stator winding carries current.
(b) rotor winding carries current.
(c) both stator and rotor windings carry current.
(d) none of the above.

500. In a synchronous motor electromagnetic power varies
(a) directly as applied voltage.
(b) directly as square of the applied voltage.
(c) inversely as applied voltage.
(d) none of the above.

501. The interaction torque in a synchronous motor depends upon
(a) stator field strength alone.
(b) rotor field strength alone.
(c) torque angle alone.
(d) all of the above *i.e.* on stator field and rotor field strengths and torque angle.

502. The breakdown torque of a synchronous motor varies as
(a) applied voltage V (b) V^2
(c) $\frac{1}{V}$ (d) $\sqrt{V}$

503. Higher the applied voltage
(a) higher will be the stator flux.
(b) higher will be the pull-in torque.
(c) lower will be the stator flux.
(d) lower will be pull-in torque.
(e) both (a) and (b), (f) both (a) and (d).

504. The operation of a 3-phase synchronous motor operating on constant excitation across infinite bus will not be stable if power angle δ
(a) exceeds internal angle θ. (b) is less than θ.
(c) exceeds θ/2. (d) is less than θ/2.

505. A 3-phase synchronous motor will operate on lagging power factor till
(a) open-circuit voltage per phase E_0 exceeds V sin θ.
(b) $E_0 < V \sin \theta$ (c) $E_0 < V$
(d) $E_0 \sin \theta < V$

506. A 3-phase synchronous motor connected to an infinite bus-bar, with constant excitation, is driving a certain load and operating at leading power factor. If the shaft load is reduced,
(a) the load angle will increase.
(b) the load angle will decrease.
(c) power factor will increase.
(d) power factor will decrease.
(e) both load angle and power factor will decrease.

507. A synchronous motor is suppiying a load at unity pf. If the load on the motor is increased keeping its excitation and terminal voltage constant, the power factor
(a) will remain the same. (b) will become leading.
(c) will become lagging. (d) none of the above.
[A.M.I.E. Sec B. Electrical Machines Summer 1994]

508. When does a synchronous motor operate with leading power factor current?
(a) While it is underexcited. (b) While it is critically excited.
(c) While it is overexcited. (d) While it is heavily loaded.
[U.P.S.C. I.E.S. E.E.-II, 2007]

509. A threes-phase synchronous motor connected to ac mains is running at full load and unity power factor. If its shaft load is reduced by half, with field current held constant, its new power factor will be
(a) unity. (b) leading. (c) lagging.
(d) dependent on machine parameters. [GATE E.E. 2007]

510. A 3-phase synchronous motor connected to an infinite bus is operating at half-full load with normal excitation. When the load on the synchronous motor is suddenly increased
(a) its speed will first decrease and then become synchronous.
(b) its speed will first increase and then become synchronous.
(c) its speed will fluctuate around synchronous speed and then become synchronous.
(d) its speed will remain unchanged. [U.P.S.C. I.E.S. E.E-II, 1994]

511. A synchronous generator connected to an infinite bus is over-excited. Considering only the reactive power, from the point of view of the system, the machine acts as
(a) capacitor. (b) inductor.
(c) resistor. (d) none of the above.
[GATE E.E. 1998]

512. A synchronous machine connected to a power system grid bus-bar is operating as a generator. To make the machine operate as a motor, the
(a) direction of rotation is to be reversed.
(b) phase-sequence is to be changed.
(c) field excitation is to be decreased.
(d) mechanical input is to be less than the losses at the shaft.
[U.P.S.C. I.E.S. E.E.-II, 1993]

513. A salient pole synchronous motor is running on no load. If its excitation is made off, it will
(a) continue running at synchronous speed.
(b) continue running but at a speed slightly less than synchronous one.
(c) stop. (d) none of these.

Answers: **494.** (c), **495.** (b), **496.** (c), **497.** (b), **498.** (c), **499.** (c), **500.** (a), **501.** (d), **502.** (a), **503.** (f), **504.** (a), **505.** (b), **506.** (e), **507.** (c), **508.** (c), **509.** (b), **510.** (c), **511.** (a), **512.** (d), **513.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

514. What is the effect of the field failure of salient pole synchronous motor connected with infinite bus?
(a) Reduce motor torque and speed.
(b) Not charge motor torque and speed.
(c) Stop the motor.
(d) Reduce motor torque but motor will continue to run at synchronous speed. [U.P.S.C. I.E.S. E.E.-II, 2009]

515. A salient pole synchronous motor continues running even if its excitation current is reduced to zero. This is due to
(a) rotating magnetic field of stator.
(b) rotating magnetic field of rotor.
(c) magnetization of rotor salient poles by stator magnetic field.
(d) interlocking action between stator and rotor rotating magnetic fields.

516. When the excitation of normally operating unloaded salient-pole synchronous motor suddenly gets disconnected, it continues to run as a
(a) Scharge motor. (b) Spherical motor.
(c) Switched-reluctance motor.
(d) Variable-reluctance motor. [U.P.S.C. I.E.S. E.E.-II, 2002]

517. A smooth cylindrical synchronous motor will always stop when
(a) excitation winding gets disconnected.
(b) load varies. (c) supply voltage fluctuates.
(d) supply frequency varies.

518. The speed of a synchronous motor can be varied by varying its
(a) excitation. (b) supply voltage.
(c) supply frequency. (d) load.

519. For a 3-phase, 4-pole, 50 Hz synchronous motor the frequency, pole number and the load torque are all halved. The motor speed will be
(a) 375 rpm. (b) 75 rpm.
(c) 1,500 rpm. (d) 3,000 rpm.
[A.M.I.E. Electrical Science Winter 1993]

520. A synchronous motor with comparatively large air gap gives
(a) higher stability limit.
(b) high synchronizing power making the machine less sensitive to load variations.
(c) both (a) and (b). (d) none of these.

521. In a 3-phase synchronous motor, the magnitude of back emf set up in the stator depends on
(a) rotor excitation. (b) supply voltage.
(c) rotor speed. (d) load on motor.

522. The magnitude of counter or back emf in a synchronous motor
(a) is always less than supply voltage.
(b) is always more than supply voltage.
(c) is always equal to supply voltage.
(d) may be either equal to or less than or more than supply voltage.

523. In a synchronous motor the excitation voltage on no load is approximately equal to the applied voltage. This will happen
(a) when developed torque is maximum.
(b) with zero excitation. (c) with 100% excitation.
(d) none of the above.

524. Which motor can conveniently operate at lagging as well as leading power factor ?
(a) Squirrel cage induction motor.
(b) Wound rotor induction motor.
(c) Synchronous motor. (d) DC shunt motor.
[A.M.I.E. Electrical Science Summer 1995]

525. At constant load, the magnitude of armature current drawn by a synchronous motor is large for
(a) low excitation. (b) high excitation.
(c) both low and high values of field excitation.
(d) 100% excitation.

526. Variation in dc excitation of a synchronous motor causes variation in
(a) speed of motor. (b) power factor.
(c) armature current.
(d) both armature current and power factor.

527. A synchrnous motor, connected to an infinite bus, is working at a leading power factor. Its excitation emf E_f and terminal voltage V_f are related as under
(a) $E_f > V_t$ and E_f lags V_t (b) $E_f < V_t$ and E_f lags V_t
(c) $E_f > V_t$ and E_f leads V_t (d) $E_f < V_t$ and E_f leads V_t
[A.M.I.E. Sec B. Elec. Machines Summer 2002]

528. If the field of a synchronous motor is underexcited, the power factor will be
(a) lagging. (b) leading.
(b) unity. (d) more than unity.
[U.P.S.C. I.E.S. E.E.-II, 2003]

529. A synchronous motor is operating on no load at unity power factor. If the field current is increased, the power factor will become
(a) leading and the current will decrease.
(b) lagging and the current will increase.
(c) lagging and the current will decrease.
(d) leading and the current will increase.
[U.P.S.C. I.E.S. E.E.-II, 1998]

530. A three-phase, salient pole synchronous motor is connected to an infinite bus. It is operated at no load at normal excitation. The field excitation of the motor is first reduced to zero and then increased in the reverse direction gradually. Then the armature current
(a) increases continuously.
(b) first increases and then decreases steeply.
(c) first decreases and then increases steeply.
(d) remains constant.
[GATE E.E., 2011]

531. A 3-phase synchronous motor is operating at a given load. If an increase in excitation reduces the armature current, it can be concluded that the motor is
(a) operating at lagging power factor and absorbing reactive power from the mains.
(b) operating at leading power factor and delivering reactive power to the mains.
(c) either (a) or (b). (d) none of these.

532. A synchronous motor installed at the end of a transmission line is operating at lagging power factor. With the fall in supply voltage, the power factor of the synchronous motor will
(a) go down. (b) improve.
(c) remain unchanged. (d) none of these.

533. A synchronous motor operates at 0.8 pf lagging. If the field current of the motor is continuously increased
(a) the power factor decreases upto a certain value of the field current and there-after it increases.
(b) the armature current increases upto a certain value of the field current and thereafter it decreases.
(c) the power factor increases upto a certain value of field current and thereafter it decreases.
(d) the armature current decreases upto a certain value of field current and there after it increases.
(e) both (c) and (d).
[GATE E.E. 1993]

Answers: **514.** (d), **515.** (c), **516.** (d), **517.** (a), **518.** (c), **519.** (c), **520.** (c), **521.** (a), **522.** (d), **523.** (c), **524.** (c), **525.** (c), **526.** (d), **527.** (c), **528.** (a), **529.** (d), **530.** (b), **531.** (a), **532.** (b), **533.** (e),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

534. Stability of a synchronous motor _____ with the increase in excitation.
(a) increases (b) decreases (c) remains unaffected

535. Armature reaction in a synchronous motor at rated voltage and zero power factor (lead) is
(a) magnetising. (b) cross-magnetising.
(c) both magnetising and cross-magnetising.
(d) demagnetising. [A.M.I.E. Sec B. Elec. Machines Winter 1994]

536. The torque angle of a synchronous machine operating from a constant voltage bus, is usually defined as the space angle between
(a) rotor mmf wave and stator mmf wave.
(b) rotor mmf wave and resultant flux density wave.
(c) stator mmf wave and resultant flux density wave.
(d) stator mmf wave and resultant mmf wave. [gate E.E. 1992]

537. A synchronous motor on load draws a current at a leading power factor angle ϕ. If the internal power angle _____ which is the phase angle between the excitation emf and the current in the phasor diagram is ψ, then the air-gap excitation mmf lags behind the armature mmf.

(a) ψ (b) $\frac{\pi}{2}+\psi$ (c) $\frac{\pi}{2}-\psi$ (d) $\psi+\phi$

[GATE E.E. 1995]

538. A synchronous motor will deliver maximum power when
(a) load angle is equal to internal angle θ.
(b) input power factor is unity.
(c) load angle is 45°.
(d) load angle is 0°. [A.M.I.E. Sec B Elec. Machines Winter 1996]

539. A synchronous motor with negligible armature resistance runs at a load angle of 20° at the rated frequency. If supply frequency is increased by 10%, keeping other parameters constant, the new load angle will be
(a) 16° (b) 18° (c) 20° (d) 22°
[U.P.S.C. I.E.S. E.E.-II, 1999]

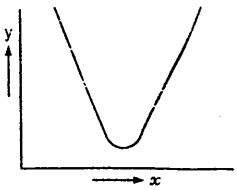
540. The power developed by a synchronous motor for constant supply voltage and constant excitation will be maximum when load angle δ is
(a) 90° (b) 0°
(c) slightly less than 90°. (d) slightly more than 90°.

541. Which of the following graphs represents the speed-torque characteristic of a synchronous motor ?

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2003]

542. For a given developed power, a synchronous motor operating from a constant voltage and constant frequency supply, will draw the minimum and maximum armature currents, I_{min} and I_{max} respectively, corresponding to
(a) I_{min} at unity pf, but i_{max} at zero pf.
(b) I_{max} at unity pf, but I_{min} at zero pf.
(c) both I_{min} and I_{max} at unity pf.
(d) both I_{min} and I_{max} at zero pf. [U.P.S.C. I.E.S. E.E.-II, 1997]

543. In the 'V' curve shown in the figure for a synchronous motor, the parameter of x and y coordinates are, respectively
(a) armature current and field current.
(b) power factor and field current.
(c) armature current and torque.
(d) torque and field current.



[U.P.S.C. I.E.S. E.E.-II 2001]

544. An inverted V-curve of synchronous motor shows the variation of
(a) power factor and dc excitation at constant load.
(b) supply voltage and field current at constant excitation.
(c) power factor and supply voltage during hunting.
(d) supply voltage and excitation current at constant load.
[U.P.S.C. I.E.S. E.E.-II, 1992]

545. A synchronous motor operating at rated voltage draws 1.0 pu current at 1.0 power factor. The machine parameters are synchronous reactance 1.0 pu; armature resistance negligible. Apart from supplying this rated power, if the motor has to supply an additional reactive power of 0.8 pu, then the field current has to be increased by
(a) 42% (b) 46% (c) 52% (d) 69%
[U.P.S.C. I.E.S. E.E.-II, 1996]

Statement for Linked Answer Questions 546 and 547

A synchronous motor is connected to an infinite bus at 1.0 pu voltage and draws 0.6 pu current at unity power factor. Its synchronous reactance is 1.0 pu and resistance is negligible.

546. The excitation voltage (E) and load angle (δ) will respectively be
(a) 0.8 pu and 36.86° lag. (b) 0.8 pu and 36.86° lead.
(c) 1.17 pu and 30.96° lead. (d) 1.17 pu and 30.96° lag.
[GATE E.E. 2008]

547. Keeping the excitation voltage same, the load on the motor is increased such that the motor current increases by 20%. The operating power factor will become
(a) 0.995 lagging. (b) 0.995 leading.
(c) 0.791 lagging. (d) 0.848 leading. [GATE E.E. 2008]

548. Synchronous capacitor is
(a) an ordinary static capacitor bank.
(b) an overexcited synchronous motor driving mechanical load.
(c) an overexcited synchronous motor without mechanical load.
(d) none of the above.
[A.M.I.E. Sec B. Electrical Machines Winter 1993; Summer 1997]

549. An induction motor and synchronous motor are connected to a common feeder line. To operate the feeder line at unity pf, the synchronous motor should be
(a) underexcited. (b) overexcited.
(c) normally excited.
(d) disconnected from the common terminals.
[U.P.S.C. I.E.S. E.E.-II 2000]

550. Synchronous condensers, when operated at power factor ranging from lagging through unity to leading for voltage control, are called the
(a) voltage boosters. (b) synchronous reactors.
(c) mechanical synchronisers. (d) none of the above.

Answers: **534.** (a), **535.** (d), **536.** (a), **537.** (d), **538.** (a), **539.** (c), **540.** (c), **541.** (a), **542.** (a), **543.** (a), **544.** (a), **545.** (b), **546.** (c), **547.** (d), **548.** (c), **549.** (b), **550.** (b),

Downloaded From : www.EasyEngineering.net

551. The power factor of a synchronous motor
(a) improves with increase in excitation and may even become leading at higher excitation.
(b) decreases with increase in excitation.
(c) is independent of excitation.
(d) increases with loading for a given excitation.
[U.P.S.C. I.E.S. E.E.-II, 2002]

552. A 3-phase induction motor draws 1,000 kVA at a pf of 0.8 lag. A synchronous condenser is connected in parallel to draw an additional 750 kVA at a power factor of 0.6 lead. The pf of the total load supplied by the mains is
(a) unity. (b) 0.707 lead.
(c) 0.6 lag. (d) zero. [U.P.S.C. I.E.S. E.E.-II 2003]

553. Synchronous condenser means
(a) a synchronous motor with capacitor connected across terminals to improve pf.
(b) a synchronous motor operating at full load with leading pf.
(c) an overexcited synchronous motor partially supplying mechanical load, and also improving pf of the system to which it is connected.
(d) an overexcited synchronous motor operating at no load with leading pf used in large power stations for improvement of pf.
[U.P.S.C. I.E.S. E.E.-II 2001]

554. Which of the following devices can be used as a phase advancer ?
(a) 3-phase induction motor squirrel cage type.
(b) 3-phase induction motor slip-ring type.
(c) Synchronous motor working at leading power factor.
(d) Synchronous motor working at lagging power factor.
[U.P.S.C. I.E.S. E.E.-II 1996]

555. The phenomenon of oscillation of the rotor of a synchronous motor about its equilibrium position corresponding to new load on sudden throwing off or increasing of load is called the
(a) swinging. (b) crawling.
(c) hunting. (d) none of these.

556. A 3-phase synchronous motor hunts due to
(a) fluctuating load. (b) fluctuating supply voltage.
(c) excessive field current. (d) faulty connections.
(e) either fluctuating load or fluctuating supply voltage.

557. In a synchronous motor hunting can be reduced to minimum possible by
(a) providing damper winding in the rotor pole faces.
(b) using a flywheel.
(c) designing the motor for adequate synchronizing power.
(d) any of the above methods.

558. The damper windings also called the squirrel cage windings or damper grids
(a) are provided in a synchronous motor to make it self-starting and to prevent hunting.
(b) consists of short-circuited copper bars embedded in the field pole faces of a synchronous motor.
(c) are provided on the stator of a synchronous motor for improving the power factor.
(d) both (a) and (b).

559. In a synchronous machine, damper windings are used to
(a) help in starting as a motor.
(b) run it as an induction motor.
(c) help in starting as a motor and to reduce hunting.
(d) increase efficiency. [U.P.S.C. I.E.S. E.E.-II 2000]

560. During hunting of synchronous motor
(a) negative phase sequence currents are generated.
(b) harmonics are developed in the armature circuit.
(c) damper bar develops torque.
(d) field excitation increases. [GATE E.E. 1996]

561. When a synchronous motor is running at synchronous speed, the damper winding produces
(a) damping torque. (b) eddy current torque.
(c) torque aiding the developed torque.
(d) no torque. [U.P.S.C. I.E.S. E.E.-II, 1997]

562. In a synchronous motor when the rotor speed exceeds the synchronous speed during hunting
(a) the damper bars develop synchronous motor torque.
(b) the damper bars develop induction motor torque.
(c) the damper bars develop induction generator torque.
(d) harmonics are produced in the armature circuit.
(e) negative sequence currents are generated.

563. A pony motor is basically a
(a) small induction motor. (b) dc series motor.
(c) dc shunt motor. (d) double winding ac/dc motor.
[A.M.I.E. Sec B. Elec. Machines Summer 1996]

564. The synchronous motor can be started by
(a) providing damper winding in its rotor circuit.
(b) coupling it with a dc compound motor.
(c) coupling it with a small ac induction motor called the pony motor.
(d) any of the above methods.

565. The number of poles on a pony motor employed for starting of a 3-phase synchronous motor should be _____ that on the synchronous motor.
(a) equal to (b) more than
(c) lesser than (d) none of these

566. When a synchronous motor is started, the field winding is energized
(a) in the very beginning.
(b) when the motor attains a speed slightly less than the synchronous speed.
(c) after the motor has attained the synchronous speed and synchronized.
(d) any time.

567. A 3-phase synchronous motor provided with damper winding is started as a 3-phase
(a) synchronous motor. (b) synchronous alternator.
(c) induction motor. (d) induction generator.

568. A cylindrical rotor synchronous motor is switched on to the dc supply with its field windings shorted on themselves. It will
(a) not start.
(b) start but not run at synchronous speed.
(c) start as an induction motor and then run as a synchronous motor.
(d) start and run as a synchronous motor. [GATE E.E. 1996]

569. If the field winding of a synchronous motor is short circuited and the motor stator is connected to 3-phase ac supply through an auto-transformer, the motor will
(a) start and run as a 3-phase induction motor.
(b) crawl. (c) hunt. (d) not start.
(e) start and run as a 3-phase synchronous motor.

570. While starting a synchronous motor its field winding should be
(a) kept open. (b) short circuited.
(c) connected to a dc source.
(d) none of the above.
[A.M.I.E. Sec B. Advanced Elec. Machines Winter 1994]

Answers: **551.** (a), **552.** (a), **553.** (d), **554.** (c), **555.** (c), **556.** (e), **557.** (d), **558.** (d), **559.** (c), **560.** (c), **561.** (d), **562.** (c), **563.** (a), **564.** (d), **565.** (c), **566.** (b), **567.** (c), **568.** (b), **569.** (a), **570.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

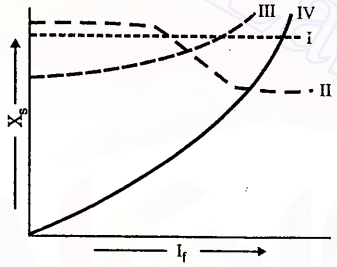
571. When a salient pole 3-phase synchronous motor is started by induction motor action and its field is connected across a field discharge resistance, starting torque is developed by
(a) reluctance torque due to saliency of the rotor.
(b) eddy current and hysteresis torque in pole faces.
(c) induction motor torque in field and damper windings.
(d) all of the above.

572. Which of the following methods is employed for starting a 3-phase synchronous motor ?
(a) Star-delta starter. (b) Damper winding.
(c) Resistance starter in the stator circuit.
(d) Damper winding in conjunction with a star-delta starter or an auto-transformer starter.

573. While starting a 3-phase synchronous motor by induction motor action, very high emf is induced in the field winding. The damage to the insulation of field winding and slip-rings can be avoided by
(a) splitting the field winding in several sections.
(b) short circuiting the field winding through field discharge resistance.
(c) either (a) or (b). (d) none of these.

574. Synchronous motors are inherently not self-starting motors as
(a) the direction of instantaneous torque on the rotor reverses after each half cycle.
(b) there is no slip.
(c) the stator does not produce revolving magnetic field.
(d) it has no starting winding.

575. In figure given below, the characteristic that corresponds to the variation of a synchronous reactance of a synchronous motor with field current is



(a) curve I. (b) curve II.
(c) curve III. (d) curve IV. [GATE E.E. 1996]

576. Electrical machines (ac) should have proper _____ in order to limit the operating temperature.
(a) voltage rating (b) current rating
(c) speed (d) kW rating

577. During short-circuit test on a synchronous motor _____ is/are short circuited.
(a) armature terminals (b) field terminals
(c) all stator phase windings
(d) one of the stator phase winding

578. The rotor copper losses of a synchronous motor are met by
(a) armature input. (b) dc source.
(c) ac supply mains. (d) none of these.

579. The efficiency of a properly designed synchronous machine is of the order of
(a) 60% (b) 80% (c) 92% (d) 99%

580. A 440 V, 3-phase, 10 pole and 50 Hz synchronous motor delivering a torque of $\frac{50}{\pi}$ Nm, delivers a power of:
(a) 50 W (b) 500 W
(c) 1000 W (d) 2000 W
[U.P.S.C. I.E.S. E.E.-II, 2011]

581. The negative phase sequence in a 3-phase synchronous motor exists when the motor is
(a) underloaded. (b) overloaded.
(c) supplied with unbalanced voltage.
(d) hot. [U.P.S.C. I.E.S. E.E.-II, 1992]

582. In case one phase of a 3-phase synchronous motor is short-circuited the motor will
(a) not start.
(b) run at $\frac{2}{3}$ of synchronous speed.
(c) run with excessive vibrations.
(d) take less than the rated load.
[A.M.I.E. Sec B. Elec. Machines Summer 1996]

583. A synchronous motor may fail to pull into synchronism owing to
(a) excessive load. (b) low excitation.
(c) high friction. (d) any of these.

584. Which of the following is not the advantage of a synchronous motor ?
(a) High operation efficiency.
(b) Operation over a wide range of power factor—from lagging to leading.
(c) It can always be adjusted to operate at unity power for optimum efficiency and economy.
(d) Its rotor has 2 slip-rings.
(e) Operation at constant speed from no-load to full load.

585. Which of the following is not the disadvantage of a synchronous motor ?
(a) Its torque is less sensitive to variations in supply voltage.
(b) DC excitation is required.
(c) It has tendency to hunt.
(d) Its starting under load is not possible.
(e) It is unsuitable for line shaft drive in a small workshop.

586. Which of the following synchronous motors has cost comparable to that of an induction motor ?
(a) High kW output high speed.
(b) High kW output low speed.
(c) Low kW output low speed.
(d) Low kW output high speed.

587. A 3-phase synchronous motor is widely used for
(a) power factor improvement.
(b) control of voltage at the end of a transmission line.
(c) high torque loads.
(d) fluctuating loads. (e) both (a) and (b).

588. Synchronous motors are not used
(a) in power houses and substations in parallel to bus-bars for pf correction.
(b) in factories having a large number of induction motors and other power apparatus operating at lagging power factor, for pf improvement.
(c) for driving electric trains, cranes, machine tools and line shaft drives.
(d) in rubber mills, textile mills, cement factories, mining industries and other big industries for power applications.
(e) for driving continuously operating and constant speed equipment such as centrifugal pumps, fans, blowers, ammonia and air compressors, motor generator sets etc.

Answers: **571.** (d), **572.** (d), **573.** (c), **574.** (a), **575.** (b), **576.** (b), **577.** (a), **578.** (b), **579.** (c), **580.** (c), **581.** (c), **582.** (d), **583.** (d), **584.** (d), **585.** (a), **586.** (b), **587.** (e), **588.** (c),

589. The alternators are operated in parallel because it
(a) increases the reliability of supply.
(b) makes the repairing economical and convenient.
(c) is easy to instal an additional unit as and when required.
(d) all of the above.

590. Which of the following conditions are to be satisfied for proper synchronization of alternators?
1. Equal terminal voltage. 2. Same frequency.
3. Same phase sequence. 4. Same kVA rating.
5. Same phase displacement

Select the correct answer using the code given below:
(a) 1, 3 and 4 only. (b) 1, 2, 4 and 5 only.
(c) 2, 3, 4 and 5 only. (d) 1, 2, 3 and 5 only.
[U.P.S.C I.E.S. E.E.-II, 2008]

591. Which one of the following is not a necessary condition to be satisfied for synchronising an incoming alternator to an already operating alternator?
(a) Same voltage magnitude.
(b) Same frequency.
(c) Same prime mover speed.
(d) Same phase sequence. [U.P.S.C. I.E.S. E.E.-II 2004]

592. What are the conditions to be satisfied for alternator to be synchronised with an incoming supply?
1. Equal voltage. 2. Equal frequency.
3. Same power rating. 4. Same phase sequence.
Select the correct answer using the code given below:
(a) 2, 3 and 4. (b) 3 and 4.
(c) 1, 2 and 3. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II 2005]

593. Which of the following methods used for synchronising of 3-phase synchronous generators is considered best one ?
(a) Three dark lamp method.
(b) two-bright and one dark lamp method.
(c) Synchroscope. (d) none of these.

594. While synchronising a 3-phase alternator to the bus-bar the paralleling switch should be closed
(a) just before the pointer reaches the vertical position when moving in the fast direction.
(b) just after the pointer passes the vertical position when moving in the fast direction.
(c) when pointer indicates fast position.
(d) when pointer indicates slow position.

595. The two-bright and one dark lamp method is used for
(a) determination of phase sequence.
(b) synchronising of 3-phase alternators.
(c) synchronising of single phase alternators.
(d) transfer of load.

596. Desirable feature for successful parallel operation of two alternators is that both should have
(a) same resistance. (b) same reactance.
(c) high reactance in comparison to resistance.
(d) low reactance in comparison to resistance.

597. Two alternators are operating in parallel. For taking one of the alternators out from the system
(a) load shared by this alternator is transferred to the other by adjusting the power fed to the prime mover before opening OCB.
(b) power fed to the prime-mover is stopped.
(c) OCB is switched off.
(d) load connected to the bus-bar is reduced.

598. Synchronising current means
(a) the total current supplied to the load by the alternators operating in parallel.
(b) the current supplied by the synchronous generator.
(c) the current circulating in the local circuit of two alternators operating in parallel which brings the alternators in synchronism once they are out of it.
(d) none of the above.

599. If the voltage of one of the two machines operating in parallel suddenly falls
(a) both the machines will stop.
(b) the machine whose voltage has suddenly decreased, will stop.
(c) the synchronous torque will come into operation to restore synchronism.
(d) none of the above.

600. Synchronising torque will come into operation whenever
(a) there is a difference in the magnitude of voltages.
(b) there is a phase difference in the voltages.
(c) there is a frequency difference between the two voltages.
(d) excitation of one of the alternators is changed.
(e) in all of the above cases.

601. The electrical stiffness of a synchronous generator connected to a very large grid can be increased by
(a) increasing the excitation or power angle of the machine.
(b) reducing the excitation or the synchronous reactance of the machine.
(c) increasing the synchronous reactance of the machine.
(d) operating the generator at a much lower MW level compared to the steady state limit. [U.P.S.C. I.E.S. E.E.-II 2002]

602. Two alternators A and B are sharing an inductive load equally. If the excitation of alternator A is increased
(a) alternator B will deliver more current and alternator A will deliver less current.
(b) alternator B will deliver less current and alternator A will deliver more current.
(c) both will continue to share load equally.
(d) both will deliver more current. [U.P.S.C. I.E.S. E.E.II-1992]

603. Two similar synchronous generators are working in parallel to supply a common load demand with identical excitations and steam supplies to their prime movers. Now, if the steam supply to the prime mover of one of the generators is increased compared to the other, with field excitation kept unchanged, then
(a) its active power component will remain the same but the reactive power contribution will increase.
(b) its active power will decrease while the reactive power will increase.
(c) both active and reactive components of power will increase.
(d) its active power contribution will increase but reactive power contributions of both will remain unchanged.
[U.P.S.C. I.E.S. E.E.-II, 1993]

604. When two alternators are operating in parallel, if the power input to one of the alternators is cut off, the alternator will
(a) continue to run as a synchronous motor rotating in the same direction.
(b) continue to run as a synchronous motor rotating in opposite direction.
(c) stop running.
(d) get damaged due to burning of stator and rotor windings.

Answers: **589.** (d), **590.** (d), **591.** (c), **592.** (d), **593.** (c), **594.** (a), **595.** (b), **596.** (c), **597.** (a), **598.** (c), **599.** (c), **600.** (e), **601.** (c), **602.** (b), **603.** (d), **604.** (a),

605. Two 3-phase Y-connected alternators are to be paralleled to a set of common busbars. The armature has a per phase synchronous reactance of 1.7 Ω and negligible armature resistance. The line voltage of the first machine is adjusted to 3,300 V and that of the second machine is adjusted to 3,200 V. The machine voltages are in phase at the instant they are paralleled. Under this condition, the synchronising current per phase will be
(a) 16.98 A (b) 29.41 A (c) 33.96 A (d) 58.82 A
[GATE E.E. 2004]

606. Two generators rated 200 MW and 400 MW having governor droop characteristics of 4% and 5% respectively are operating in parallel. If the generators operate at no load at 50 Hz, the frequency at which they would operate with a total load of 600 MW is
(a) 48.50 Hz (b) 47.69 Hz (c) 46.82 Hz (d) 49.04 Hz
[U.P.S.C. I.E.S. E.E.-II, 2002]

607. Two alternators each having 4% speed regulation are working in parallel. Alternator 1 is rated 12 MW and alternator 2 is rated 8 MW. When the total load is 10 MW, the load shared by alternators 1 and 2 would be respectively
(a) 4 MW and 6 MW. (b) 6 MW and 4 MW.
(c) 5 MW and 5 MW. (d) 10 MW and zero.
[U.P.S.C. I.E.S. E.E.-II, 2000]

608. The following data pertain to two alternators working in parallel and supplying a total load of 80 MW:
Machine 1 : 40 MVA with 5% speed regulation.
Machine 2: 60 MVA with 5% speed regulation.
The load sharing between machine 1 and 2 will be

	P1	P2
(a)	48 MW	32 MW
(b)	40 MW	40 MW
(c)	30 MW	50 MW
(d)	32 MW	48 MW [U.P.S.C. I.E.S. E.E.-II, 1997]

609. An infinite bus-bar has
(a) constant voltage. (b) constant frequency.
(c) infinite voltage. (d) both (a) and (b).

610. If the excitation of an alternator connected to an infinite bus-bar is changed, keeping the power input to its prime mover unchanged, its _____ will change.
(a) kW output (b) power-factor
(c) kVA output (d) kVAR output
(e) all of the above except kW output.

611. A 3-phase, 11 kV, 5 MVA alternator has synchronous reactance of 10 Ω per phase. Its excitation is such that the generated emf is 14 kV. If the alternator is connected to infinite bus bar, the maximum output at the given excitation is
(a) 15,400 kW (b) 8,000 kW
(c) 6,200 kW (d) 5,135 kW
[U.P.S.C. I.E.S. E.E.-II, 2010]

612. A stationary alternator should not be connected to the live bus-bar because
(a) it is likely to operate as a synchronous motor.
(b) it will get short circuited.
(c) it will reduce bus-bar voltage.
(d) all of the above.

613. A 3-phase synchronous generator with constant power input is supplying electrical power to an infinite bus at a lagging power factor. If its excitation is reduced
(a) both power factor and power angle will increase.
(b) both power factor and power angle will decrease.
(c) power factor will improve but power angle will decrease.
(d) power angle will increase but power factor will decrease.

614. An alternator connected to an infinite bus, for a given excitation, will develop maximum electromagnetic power when the power angle δ and internal angle θ are related as
(a) $\delta = 180° - \theta$ (b) $\delta = \theta$
(c) $\delta = 180° - \frac{\theta}{2}$ (d) $\delta = 180° - 2\theta$

615. If the prime mover of an alternator supplying load to an infinite bus is suddenly shutdown, then it will
(a) stop.
(b) continue to run as an alternator.
(c) continue to run as a synchronous motor in the reverse direction.
(d) continue to run as a synchronous motor in the same direction.
[A.M.I.E. Sec B. Elec. Machines Summer 1994; 1997]

616. A salient-pole synchronous generator connected to an infinite bus will deliver maximum power at a power angle of
(a) $\delta = 0$ (b) $\delta = 90°$ (c) $\delta = 45°$ (d) $\delta = 45°$

617. A salient pole synchronous generator delivering power to an infinite bus through a reactive tie line reaches its steady state stability limit. What is the power angle of the generator relative to the infinite bus voltage reference?
(a) Greater than 90 degrees.
(b) Equal to 90 degrees.
(c) Less than 90 degrees.
(d) Zero. [U.P.S.C. I.E.S. E.E.-II, 2009]

618. A large ac generator supplying power to an infinite bus, has a sudden short circuit occurring at its terminals. Assuming the prime mover input and the voltage behind the transient reactance to remain constant immediately after the fault, the acceleration of the generator rotor is
(a) inversely proportional to the moment of inertia of the machine.
(b) inversely proportional to the square of the voltage.
(c) directly proportional to the square of the short-circuit current.
(d) directly proportional to the short-circuit power.
[U.P.S.C. I.E.S. E.E.-II, 1994]

619. Four identical alternators each rated for 20 MVA, 11 kV having a subtransient reactance of 16% are working in parallel. The short-circuit level at the bus-bars is
(a) 500 MVA (b) 400 MVA
(c) 125 MVA (d) 80 MVA
[U.P.S.C. I.E.S. E.E.-II, 1996]

620. A power station consists of two synchronous generators A and B of ratings 250 MVA and 500 MVA with inertia 1.6 pu and 1 pu respectively on their own base MVA ratings. The equivalent per unit inertia constant for the system on 100 MVA common base is
(a) 2.6 (b) 0.615 (c) 1.625 (d) 9.0
[GATE E.E. 1998]

621. A loss-less cylindrical rotor synchronous generator is floating on the system bus-bar after being properly synchronised and is running at no-load. Now, if the prime mover is acting as a mechanical load on the machine, then
(a) the torque developed by the machine will act in the same direction as the prime mover torque.

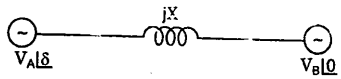
Answers: **605.** (a), **606.** (b), **607.** (b), **608.** (d), **609.** (d), **610.** (e), **611.** (a), **612.** (b), **613.** (a), **614.** (a), **615.** (d), **616.** (b), **617.** (c), **618.** (a), **619.** (a), **620.** (d), **621.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) the torque developed by the machine will act in the opposite direction to that of the prime mover torque.
(c) the machine rotor would fall-back and the induced emf would lag behind the terminal voltage.
(d) the machine rotor would overspeed and the induced emf would lead the terminal voltage. [U.P.S.C. I.E.S. E.E.-II, 2006]

622. Two identical synchronous machines A and B, running at the same speed, are linked through an inductor, as shown



Machine A will supply active and reactive power to machine B when δ is
(a) positive and $V_A < V_B$ (b) negative and $V_A > V_B$
(c) negative and $V_A < V_B$ (d) positive and $V_A > V_B$
[U.P.S.C I.E.S. E.E.-II, 2008]

623. An induction motor works with
(a) dc only. (b) ac only.
(c) ac and dc both. (d) none of these.
[A.M.I.E. Summer 1994]

624. The polyphase induction motors are, by a very considerable margin, the most widely used ac motors as
(a) these are cheaper in cost, simple and rugged in construction and require little maintenance.
(b) they are capable of operation under a wide range of power factors both leading and lagging.
(c) they have maximum efficiency and maximum starting torque.
(d) they have very good speed regulation.

625. Which of the following statements associated with polyphase induction motor is/are correct ?
(a) It can run in one direction only.
(b) It is simply a transformer whose magnetic circuit is separated by an air gap into two relatively movable portions, one carrying the primary and other the secondary winding.
(c) It needs more maintenance than that required by a dc shunt motor.
(d) It is more costly than a dc shunt motor of the same output rating.

626. The stator frame in an induction motor is used to
(a) hold the armature stampings in position.
(b) ventilate the armature.
(c) protect the whole machine.
(d) provide return path for the flux.

627. The frame of an induction motor is made of
(a) aluminium. (b) silicon steel.
(c) closed grained cast iron. (d) stainless steel.
(e) bronze.

628. The stator core of a 3-phase induction motor is laminated in order to reduce the
(a) eddy current loss. (b) hysteresis loss.
(c) both eddy current and hysteresis loss.
(d) weight of the stator. (e) windage and frictional losses.

629. Use of fractional pitch winding
(a) results in reduced leakage reactance.
(b) results in reduced axial length of the machine.
(c) makes it stiffer. (d) all of the above.

630. If all the stator coils of an induction motor are connected for the same magnetic polarity, there will be formed an equal number of
(a) rotor poles with same polarity.
(b) rotor poles with opposite polarity.
(c) consequent poles with opposite polarity.
(d) consequent poles with same polarity.

631. The induction motor shaft should be
(a) hollow. (b) stiff. (c) flexible. (d) any of these.

632. The induction motor shaft is made of
(a) mild steel. (b) cast iron.
(c) high speed steel. (d) stainless steel.
(e) aluminium.

633. Induction motors normally use diecast aluminium rotor because aluminium is
(a) cheaper in cost. (b) lighter in weight.
(c) easy to cast owing to its low melting point and is easily available.
(d) of low resistivity.

634. In a 3-phase squirrel cage induction motor
(a) rotor conductors are short circuited through end rings.
(b) rotor conductor ends are short circuited through slip rings.
(c) rotor conductors are kept open.
(d) none of the above.

635. The squirrel cage rotor of a 6-pole induction motor can be used for _____ induction motor.
(a) only 6-pole (b) 6 or 12 pole
(c) any number of poles in an
(d) none of the above

636. The squirrel cage induction motors are provided with blades in order to
(a) facilitate cooling of rotor.
(b) balance the rotor dynamically.
(c) eliminate noise. (d) none of these.

637. The rotor of a 3-phase wound rotor induction motor is provided with
(a) single phase-winding. (b) three phase winding.
(c) heavy copper or aluminium bars placed in rotor slots.
(d) heavy short-circuited end rings.

638. In a 3-phase slip-ring induction motor, the rotor winding terminals are brought out through slip rings to
(a) connect extra resistance across them during starting.
(b) connect them either in star or in delta as per need.
(c) connect to 3-phase ac supply.
(d) close the rotor circuit externally.

639. The rotor winding for a 3-phase slip-ring induction motor having delta-connected stator must be connected in
(a) delta. (b) star.
(c) delta or star according to need.
(d) none of the above.

640. In a 3-phase slip-ring induction motor, brushes are connected to
(a) external star-connected resistors.
(b) dc supply. (c) 3-ϕ ac supply.
(d) equalizing coils.

641. In a 3-phase wound rotor induction motor the short-circuit gear is used to short circuit the
(a) stator phases of the motor.
(b) rotor at slip rings.
(c) starting resistances in the starter.
(d) none of the above.

Answers: **622.** (d), **623.** (b), **624.** (a), **625.** (b), **626.** (a), **627.** (c), **628.** (a), **629.** (d), **630.** (c), **631.** (b), **632.** (a), **633.** (c), **634.** (a), **635.** (c), **636.** (a), **637.** (b), **638.** (a), **639.** (b), **640.** (a), **641.** (b),

642. Uneven gap in an induction motor is likely to cause
(a) heating of motor. (b) unbalancing of motor shaft.
(c) both (a) and (b). (d) none of these.

643. A smaller air gap in a polyphase induction motor helps to
(a) reduce the chance of crawling.
(b) increase the starting torque.
(c) reduce the chance of cogging.
(d) reduce the magnetizing current. [U.P.S.C. I.E.S. E.E.-II, 2004]

644. In an induction motor, if the air gap is increased
(a) its speed will reduce. (b) its efficiency will improve.
(c) its power factor will reduce.
(d) its breakdown torque will reduce.
[U.P.S.C. I.E.S. E.E.-II, 2004]

645. Which of the following parameters in an induction motor influences the magnetizing reactance to the maximum extent?
(a) Axial length of the rotor stack.
(b) Axial length of the stator stack.
(c) Radial length of air gap. (d) Number of slots on the stator.
[U.P.S.C I.E.S. E.E.-II, 2006]

646. In an induction motor, the air gap flux density is usually kept low so as to
(a) improve efficiency. (b) improve power factor.
(c) reduce machine cost. (d) none of the above.

647. Which of the following statements about a squirrel induction cage motor is incorrect ?
(a) It has no commutator and no slip ring.
(b) It is provided with cage rotor which is simple, robust and almost instrucible in construction.
(c) It has high starting torque.
(d) Almost 90 percent of induction motors are of this type.

648. A wound rotor induction motor can be distinguished from squirrel cage induction motor by
(a) presence of slip rings. (b) size of frame.
(c) shaft diameter. (d) any of the above.

649. For induction motors normally
(a) the stator winding is connected to ac supply and the rotor winding is short circuited.
(b) the rotor winding is connected to ac supply and the stator winding is short circuited.
(c) both of the stator and rotor windings are connected to ac supply.
(d) stator winding is connected to ac supply and rotor winding to dc supply.

650. A 3-phase, 4-pole squirrel cage induction motor has 36 stator and 28 rotor slots. The number of phases in the rotor is
(a) 3 (b) 9 (c) 7 (d) 8
[GATE E.E. 2000]

651. The rotor slots are slightly skewed in squirrel-cage induction motor to
(a) increase the strength of rotor bars.
(b) reduce the magnetic hum and locking tendency of rotor.
(c) economise on the copper to be used.
(d) provide ease of fabrication. [U.P.S.C. I.E.S. E.E.-II, 2003]

652. Skewing of the rotor in a three-phase squirrel-cage induction motor reduces
(a) noise, parasitic torque, starting torque and pull-out torque.
(b) noise and parasitic torque, but increases starting torque and pull-out torque.
(c) noise and pullout torque, but increases parasitic torque and starting torque.
(d) noise, parasitic torque and starting torque, but increases pull-out torque. [U.P.S.C. I.E.S. E.E.-II, 2001]

653. Consider the following statements:
Skewing of rotor slots in a 3-phase induction motor (cage rotor) may
1. introduce additional leakage reactance.
2. eliminate slot harmonics.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C I.E.S. E.E.-II, 2008]

654. Which one of the following is the correct statement:
In a 3-phase induction motor, the resultant flux is of a constant nature and is
(a) equal to ϕ_m, where ϕ_m is maximum flux due to any phase.
(b) 1.5 times maximum value of flux due to any phase.
(c) $\sqrt{3}/2$ times maximum value flux due to any phase.
(d) $3\phi_m$. [U.P.S.C. I.E.S. E.E.-II, 2007]

655. The principle of operation of a 3-phase induction motor is almost similar to that of
(a) synchronous motor.
(b) repulsion start induction motor.
(c) transformer with a shorted secondary.
(d) capacitor-start induction motor. [R.G.T.U. B.E.E. June 2007]

656. The rotor of a 3-phase induction motor rotates in the same direction as that of stator rotating field. This can be explained by
(a) Faraday's laws of electromagnetic induction.
(b) Lenz's law. (c) Newton's laws of motion.
(d) Fleming's right hand rule.

657. The relative speed between stator and rotor fluxes is equal to
(a) synchronous speed, N_S. (b) rotor speed, N.
(c) zero. (d) N_S—N.

658. Stator flux induces emf in the rotor bars
(a) rotating at synchronous speed around stator.
(b) constant in magnitude.
(c) magnitude depending upon the load on the motor.
(d) none of the above.

659. The rotor circuit of an induction motor under operating condition is
(a) always closed. (b) always open.
(c) may be open or closed depending upon the loading conditions.

660. The 3-phase induction motor with rotor circuit open will
(a) run normally. (b) get overheated.
(c) not run. (d) make noise.

661. If any two leads from slip rings are interchanged in a 3-phase induction motor, the motor will
(a) continue running in the same direction as before.
(b) run in a direction opposite to previous one.
(c) not run. (d) get damaged.

662. Two of the supply terminals to a 3-phase induction motor get interchanged during reconnection after normal maintenance. When switched on to supply, the motor will
(a) rotate in the same direction as before maintenance.
(b) rotate in direction opposite to that before maintenance.
(c) not start at all. (d) get heated and damaged.

663. The direction of rotation of a 3-phase induction motor can be reversed by

Answers: **642.** (c), **643.** (d), **644.** (c), **645.** (c), **646.** (b), **647.** (c), **648.** (a), **649.** (a), **650.** (a), **651.** (b), **652.** (a), **653.** (c), **654.** (b), **655.** (c), **656.** (b), **657.** (c), **658.** (c), **659.** (a), **660.** (c), **661.** (a), **662.** (b), **663.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) transposing any two leads from supply.
(b) transposing any two leads from slip-rings.
(c) transposing all the three leads from the supply.
(d) disconnecting any one phase.

664. The rotor of an induction motor rotates in the direction of the rotation of stator field in order to
(a) reduce the relative speed between the rotating stator field and the stationary rotor conductors.
(b) oppose the rotor current.
(c) increase the relative speed between the rotating stator field and stationary rotor conductors.
(d) none of the above.

665. The rotor of an induction motor never runs at synchronous speed, because then the relative speed between the rotating flux and rotor will be
(a) maximum and hence, torque will be maximum.
(b) maximum and hence, torque will be zero.
(c) zero and hence, torque will be maximum.
(d) zero and hence, torque will be zero.
[A.M.I.E. Sec. B. Elec. Machines Summer 2004]

666. The voltage actually used for setting up of the useful flux in the air gap of 3-phase induction motor is
(a) = applied voltage. (b) > applied voltage.
(c) < applied voltage. (d) = rotor induced emf.
[U.P.S.C. I.E.S. E.E.-II, 2006]

667. Synchronous speed is defined as the speed at which the
(a) stator magnetic field rotates.
(b) rotor rotates on no load. (c) rotor rotates on full load.
(d) none of the above.

668. If N_s is the synchronous speed, N is the rotor speed and s is the slip then relation is
(a) $N_s = (1 - s)\,N$ (b) $N = sN_s$
(c) $N = (s - 1)\,N_s$ (d) None of these.
[G.B.T.U. Even Semester 2010-11]

669. The maximum possible speed of a 3-phase squirrel cage induction motor running at a slip of 4% is
(a) 2,880 rpm. (b) 3,000 rpm.
(c) 1,440 rpm. (d) 960 rpm.

670. A three-phase 6 pole, 50 Hz, induction motor is running at 5% slip. What is the speed of the motor?
(a) 850 rpm. (b) 900 rpm.
(c) 950 rpm. (d) 1000 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2009]

671. At the instant of starting, the per unit slip of the 3-phase induction motor is
(a) 0.05 (b) 0.1 (c) 1.0 (d) 0.5
[R.G.T.U. B.E.E. Nov/Dec. 2007]

672. A balanced 3-phase induction motor runs at slip s. If ω_s is its synchronous speed, what is the relative speed between the stator mmf and rotor mmf ?
(a) $s\omega_s$ (b) $(1 - s)\omega_s$ (c) ω_s (d) zero
[U.P.S.C I.E.S. E.E.-II, 2008]

673. A three-phase 440 V, 6 pole, 50 Hz, squirrel cage induction motor is running at a slip of 5%. The speed of stator magnetic field with respect to rotor magnetic field and speed of rotor with respect to stator magnetic field are
(a) zero, –50 rpm (b) zero, 950 rpm
(c) 1,000 rpm, –50 rpm (d) 1,000 rpm, 950 rpm
[GATE E.E., 2011]

674. An 8 pole alternator runs at 750 rpm. It supplies power to a 6 pole induction motor which has a full load slip of 3%. The full load speed of the motor is
(a) 1,050 rpm. (b) 970 rpm.
(c) 960 rpm. (d) 1250 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2007]

675. What is the operating slip of a 400 V, 50 Hz, 6-pole, 3-phase induction motor, while the speed is 936 rpm with a 400 V, 48 Hz, 3-phase supply ?
(a) 0.036 (b) 0.064 (c) 0.025 (d) 0.075
[U.P.S.C. I.E.S. E.E.-II, 2008]

676. The rotor of a three phase, 5 kW, 400 V, 50 Hz, slip ring induction motor is wound for 6 poles while its stator is wound for 4 poles. The approximate average no load steady state speed when this motor is connected to 400 V, 50 Hz supply is
(a) 1,500 rpm. (b) 500 rpm.
(c) 0 rpm. (d) 1,000 rpm. [GATE E.E. 2002]

677. If the full-load speed of a 6-phase, 50 Hz induction motor is 950 rpm, what is its half-load speed nearly equal to ?
(a) 1,000 rpm. (b) 450 rpm.
(c) 1,900 rpm. (d) 975 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2007]

678. The direction of rotation of a 3-phase induction motor is clockwise when it is supplied with 3-phase sinusoidal voltage having phase sequence *A-B-C*. For counterclockwise rotation of the motor, the phase sequence of the power supply should be
(a) B-C-A (b) C-A-B
(c) A-C-B (d) B-C-A and C-A-B
[GATE E.E. 2004]

679. The mmf produced by the current of a 3-phase induction motor
(a) rotates at the speed of rotor in the air gap.
(b) is standstill with respect to stator mmf.
(c) rotates at slip speed with respect to stator mmf.
(d) rotates at synchronous speed with respect to rotor.
[U.P.S.C. I.E.S. E.E.-II, 2000]

680. The mmf produced by the rotor currents of a 3-phase induction motor
(a) rotates at the speed of rotor in the air gap.
(b) is at standstill with respect to stator mmf.
(c) rotates at slip speed with respect to stator mmf.
(d) rotates at synchronous speed with respect to rotor.
[U.P.S.C. I.E.S. E.E.-II, 2010]

681. A 6-pole, 50 Hz wound rotor induction motor when supplied at the rated voltage and frequency with slip-rings open circuited, developed a voltage of 100 V between any two slip rings. If the rotor is driven by an external means at 1,000 rpm opposite to the direction of stator field, the frequency of voltage across slip rings will be
(a) zero. (b) 50 Hz (c) 100 Hz (d) 200 Hz
[U.P.S.C. I.E.S. E.E.-II, 2000]

682. In an induction motor the slip will be negative when
(a) stator magnetic field and rotor rotate in opposite directions.
(b) rotor rotates at a speed less than synchronous speed and in the direction of rotation of stator field.
(c) rotor rotates at a speed more than synchronous speed and in the direction of rotation of stator field.
(d) none of the above.

683. A 3-phase induction motor is operating at slip s. If its two supply leads are interchanged, then its slip at that instant will be
(a) $2 - s$ (b) $2 + s$ (c) $1 + s$ (d) $1 - s$

Answers: **664.** (a), **665.** (d), **666.** (a), **667.** (a), **668.** (d), **669.** (a), **670.** (c), **671.** (c), **672.** (d), **673.** (a), **674.** (b), **675.** (c), **676.** (c), **677.** (d), **678.** (c), **679.** (b), **680.** (b), **681.** (c), **682.** (c), **683.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

684. The speed of rotating field due to rotor currents relative to rotor surface in an induction motor is
(a) N_s (b) $s N_s$ (c) N (d) s N

685. The relationship between rotor frequency f_2, slip s and the stator supply frequency f_1 is given by
(a) $f_1 = s f_2$ (b) $f_2 = s f_1$
(c) $f_2 = f_1(1-s)$ (d) $f_2 = \sqrt{sf}$
[A.M.I.E. Sec B. Elec. Machines Summer 1995]

686. What is the frequency of rotor current of a 50 Hz induction motor operating at 2% slip ?
(a) 1 Hz (b) 100 Hz (c) 2 Hz (d) 50 Hz
[U.P.S.C. I.E.S. E.E.-II, 2007]

687. An induction motor having 8 poles runs at 727.5 rpm. If the supply frequency is 50 Hz, the emf in the rotor will have a frequency of
(a) 1.5 Hz (b) 48.5 Hz (c) 5.15 Hz (d) 75 Hz
[U.P.S.C. I.E.S. E.E.-II, 2003]

688. A 6-pole, 3-phase alternator running at 1,000 rpm supplies to an 8-pole, 3-phase induction motor which has a rotor current of frequency 2 Hz. The speed at which the motor operates is
(a) 1,000 rpm. (b) 960 rpm.
(c) 750 rpm. (d) 720 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2002]

689. A voltmeter gives 120 oscillations per minute when connected to the rotor of an induction motor. The frequency is 50 Hz. The slip of the motor is
(a) 2% (b) 4% (c) 5% (d) 25%
[U.P.S.C. I.E.S. E.E.-II, 1995, 2000]

690. The frequency of rotor currents at standstill is equal to
(a) zero (b) $2f$ (c) f (d) sf

691. The rotor of a 4-pole, 50 Hz, 3-phase slip-ring induction motor runs in clockwise direction when its stator terminals 1,2,3 are connected to supply terminals A, B, C respectively. If 1,2,3, are connected to A, C, B, respectively of supply terminals and rotor runs in a clockwise direction at synchronous speed, then the frequency of induced emf across the open-circuited rotor terminals is
(a) 50 Hz (b) zero (c) 25 Hz (d) 100 Hz
[A.M.I.E. Elec. Science Winter 1993]

692. In a slip-ring induction motor, the frequency of rotor currents can be measured with a
(a) galvanometer. (b) wattmeter
(c) dc moving coil millivoltmeter.
(d) none of the above.

693. A centre zero ammeter connected in the rotor circuit of a 6-pole, 50 Hz induction motor makes 30 oscillations in one minute. The rotor speed is
(a) 970 rpm. (b) 990 rpm. (c) 1010 rpm. (d) 1030 rpm.
[U.P.S.C. I.E.S. E.E.-II, 1995]

694. For an induction motor under operating condition, the emf induced/phase in rotor circuit is _____ its standstill rotor induced emf per phase.
(a) equal to (b) s times (c) $(1-s)$ times (d) 1/s times.

695. A 3-phase star-connected induction motor is connected to 400 V, 50 Hz ac supply. If the stator to rotor turn ratio is 2, the standstill rotor induced emf per phase is
(a) 115.5 V (b) 231 V (c) 346.5 V (d) 200 V

696. In a 3-phase 50 Hz induction motor the voltage between the slip-rings at standstill is 50 V. At full load the slip is 0.04. The voltage between slip rings at full load is
(a) 50 V (b) 2 V (c) 20 V (d) 5 V
[R.G.T.U. B.E.E. Jan/Feb. 2006]

697. The direction of rotor current produced in an induction motor can be determined by
(a) Lenz's law. (b) induction law.
(c) Fleming's right hand rule.
(d) Fleming's left hand rule.

698. In case of an induction motor the leakage flux is more in comparison to that of a transformer. This is due to
(a) revolving rotor.
(b) air gap between rotor and stator.
(c) higher flux densities in induction motor.
(d) none of the above.

699. In an induction motor the phase reactance is _____ in comparison to phase resistance.
(a) quite high (b) very small
(c) slightly high (d) almost same

700. In a 3-phase induction motor reactance under running condition is less than its standstill value. This is due to reduction in
(a) rotor inductance. (b) stator magnetic flux.
(c) frequency of rotor emf.
(d) mutual flux linking the stator and rotor.

701. In an induction motor under running condition, the rotor reactance per phase is _____ its standstill phase reactance.
(a) s times (b) equal to (c) 1/s times (d) (1-s) times

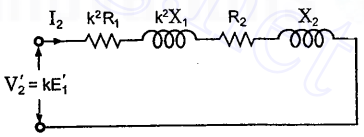
702. If E_2 is the standstill rotor phase emf, I_2 is the standstill rotor phase current and $\cos\phi_2$ is the rotor power factor then torque developed by a 3-phase induction motor varies as
(a) $E_2 I_2$ (b) $E_2 I_2 \cos\phi_2$
(c) $E_2 I_2/\cos\phi_2$ (d) $E_2/I_2 \cos\phi_2$

703. The torque developed by a 3-phase induction motor is approximately proportional to
(a) $\sqrt{s}$ (b) s^2 (c) s (d) $1/s$

704. Insertion of resistance in the rotor circuit of an induction motor to develop a given torque causes _____ in rotor current.
(a) almost no change (b) increase
(c) decrease (d) none of these

705. In an induction motor if the flux density is reduced to one-half of its normal value then the torque will
(a) reduce to one half. (b) reduce to one-fourth.
(c) remain unchanged. (d) increase four times.

706. For a more accurate analysis of the torque-slip relationship, the equivalent circuit of a 3-phase induction motor for running condition is



to be derived from the given standstill condition:
K = ratio of transformation
$E_1 = V_1$ (applied voltage - $I_\mu X_L$)
At running condition, if the two reactances in the equivalent circuit are denoted by A and B, then the values of A and B will be
(a) K^2R_1 and R_2 (b) sK^2R_1 and R_2
(c) K^2R_1 and sR_2 (d) sK^2R_1 and sR_2
[U.P.S.C. I.E.S. E.E.-II, 1998]

Answers: **684.** (b), **685.** (b), **686.** (a), **687.** (a), **688.** (d), **689.** (b), **690.** (c), **691.** (d), **692.** (c), **693.** (b), **694.** (b), **695.** (a), **696.** (b), **697.** (c), **698.** (b), **699.** (a), **700.** (c), **701.** (a), **702.** (b), **703.** (c), **704.** (a), **705.** (a), **706.** (a),

Downloaded From : www.EasyEngineering.net

707. A balanced three-phase voltage is applied to star-connected induction motor, the phase to neutral voltage being V. The stator resistance, rotor resistance referred to the stator, stator leakage reactance, rotor leakage reactance referred to the stator, and the magnetizing reactance are denoted by r_s, r_r, x_s, x_r and X_m, respectively. The magnitude of the starting current of the motor is given by

(a) $\frac{V}{\sqrt{(r_s + r_r)^2 + (x_s + x_r)^2}}$ (b) $\frac{V}{\sqrt{r_s^2 + (x_s + X_m)^2}}$

(c) $\frac{V}{\sqrt{(r_s + r_r)^2 + (X_m + x_r)^2}}$ (d) $\frac{V}{\sqrt{r_s^2 + (X_m + x_r)^2}}$

[GATE E.E., 2010]

708. The torque developed in an induction motor is nearly proportional to

(a) $\frac{1}{V}$ (b) V

(c) V^2 (d) none of these

[U.P.T.U. Even Semester 2009-10]

709. If a 400 V, 50 Hz star-connected, 3-phase squirrel cage induction motor is operated from a 400 V, 75 Hz supply, the torque that the motor can now provide while drawing rated current from the supply

(a) reduces. (b) increases.
(c) remains the same.
(d) increases or reduces depending upon the rotor resistance.

[GATE E.E. 2002]

710. For a constant torque load, the supply voltage of a squirrel cage induction motor is reduced by a factor of $\frac{1}{\sqrt{2}}$, its rotor current is modified by a factor

(a) 2 (b) $\frac{1}{\sqrt{2}}$ (c) $\sqrt{2}$ (d) none.

[A.M.I.E. Sec. B. Elec. Machines Summer 1999]

711. The starting torque of a 3-phase induction motor varies as

(a) V^2 (b) V (c) $\sqrt{V}$ (d) $\frac{1}{V}$

712. The starting torque of a squirrel cage induction motor is

(a) very large. (b) very low.
(c) slightly more than full-load torque.
(d) zero.

713. For achieving high starting torque and high operation efficiency an induction motor should have _____ rotor circuit resistance at starting and _____ circuit resistance under operating condition.

(a) high, low (b) low, high
(c) high, high (d) low, low

714. In a 3-phase slip-ring induction motor high starting torque is achieved by

(a) increasing supply voltage V.
(b) increasing supply frequency *f*.
(c) connecting a capacitor across the motor terminals.
(d) connecting a star-connected resistance across the slip-ring terminals of the motor.

715. When the applied voltage per phase is reduced to one-half, the starting torque of a three-phase squirrel cage induction motor becomes

(a) 1/2 of the initial value. (b) 1/4 of the initial value.
(c) twice of the initial value. (d) 4 times of the initial value.

[U.P.S.C. I.E.S. E.E.-II, 2006]

716. In a 3-phase induction motor, the starting torque will be maximum when

(a) $R_2 = \frac{1}{X_2}$ (b) $R_2 = X_2$

(c) $R_2 = X_2^2$ (d) $R_2 = \sqrt{X_2}$

717. in a 3-phase induction motor, the maximum torque

(a) is independent of rotor circuit resistance.
(b) varies as rotor resistance.
(c) varies as the square of rotor resistance.
(d) varies inversely as rotor circuit resistance.

718. In a 3-phase induction motor, if stator impedance is neglected, then the slip at maximum torque is equal to

(a) $=\frac{x_2}{r_2}$ (b) $\frac{r_2}{x_2}$ (c) $=\sqrt{\frac{r_2}{x_2}}$ (d) $\sqrt{\frac{x_2}{r_2}}$

719. For a slip-ring induction motor, if the rotor resistance is increased, then

(a) starting torque and efficiency increase.
(b) starting torque decreases but efficiency increases.
(c) starting torque increases but efficiency decreases.
(d) starting torque and efficiency decrease.

[U.P.S.C. I.E.S. E.E.-II, 2005]

720. An induction motor has a rotor resistance of 0.002 ohm/phase. If the resistance is increased to 0.004 ohm/phase then the maximum torque will

(a) reduce to half. (b) increase by 100%.
(c) increase by 200%. (d) remain unaltered.

[U.P.S.C. I.E.S. E.E.-II, 1993]

721. In an induction motor, maximum torque varies as

(a) $\frac{V}{X_2}$ (b) $\frac{V^2}{X_2}$ (c) $\frac{V}{R_2}$ (d) $\frac{V}{X_2^2}$

722. Breakdown torque of a 3-phase induction motor of negligible stator impedance is

(a) directly proportional to the rotor resistance.
(b) inversely proportional to the rotor resistance.
(c) directly proportional to the reactance.
(d) inversely proportional to the rotor leakage reactance.

[U.P.S.C. I.E.S. E.E.-II, 1993, 2008]

723. Which one of the following statements is correct in respect of an induction motor?

(a) The maximum torque will depend on rotor resistance.
(b) Although the maximum torque does not depend on rotor resistance, yet the speed at which maximum torque is produced depends on rotor resistance.
(c) The maximum torque will not depend on standstill rotor reactance.
(d) The slip of induction motor decreases as torque increases.

[U.P.S.C. I.E.S. E.E.-II 2003]

724. In a 3-phase induction motor, the torque developed is maximum when the rotor circuit resistance per phase is equal to

(a) rotor leakage reactance per phase at standstill.
(b) slip times the rotor leakage reactance per phase at standstill.
(c) stator resistance per phase.
(d) stator leakage reactance per phase. [U.P.S.C. I.E.S. E.E.-II 2004]

725. A 4-pole, 50 Hz, 3-phase induction motor has blocked rotor reactance per phase which is four times the rotor resistance per phase. The speed at which maximum torque develops is

(a) 1,125 rpm. (b) 1,500 rpm.
(c) 1,050 rpm. (d) 1,210 rpm.

[U.P.S.C. I.E.S. E.E.-II, 2006]

Answers: **707.** (a), **708.** (c), **709.** (a), **710.** (c), **711.** (a), **712.** (c), **713.** (a), **714.** (d), **715.** (b), **716.** (b), **717.** (a), **718.** (b), **719.** (c), **720.** (d), **721.** (b), **722.** (d), **723.** (b), **724.** (b), **725.** (a),

726. The supply voltage to an induction motor is reduced by 10%. By what percentage, approximately, will the maximum torque decrease?
(a) 50% (b) 10% (c) 20% (d) 40%
[U.P.S.C. I.E.S. E.E.-II, 2004]

727. A 3-phase induction motor is driving a constant torque load of 1 pu at 5% slip. It has a maximum torque of 2 pu at 10% slip. Torque-speed variation in stable zone is assumed to be linear. For a stable operation of the motor, the minimum per unit supply voltage is approximately
(a) 0.25 (b) 0.50 (c) 0.707 (d) 0.80
[U.P.S.C. I.E.S. E.E.-II, 1999]

728. If the rotor circuit resistance is increased in an induction motor, the maximum torque will occur at
(a) lower speed. (b) high speed.
(c) the same speed. (d) none of these.

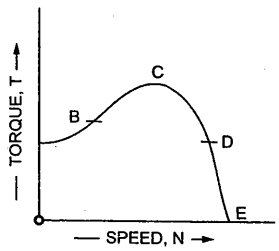
729. Beyond the point of maximum torque any further increase in load will cause
(a) increase in torque developed and so the motor will run at a high speed.
(b) no change in the torque developed and so the motor will run at the same speed as before.
(c) decrease in torque developed and the motor will slow down.
(d) increase in current drawn from the supply mains resulting in damage to it.

730. The torque-slip characteristic of a polyphase induction motor becomes almost linear at small values of slip, because in this range of slips
(a) the effective rotor circuit resistance is very large compared to the rotor reactance.
(b) the rotor resistance is equal to the stator resistance.
(c) the rotor resistance is equal to the rotor reactance.
(d) the rotor resistance is equal to the stator reactance.
[U.P.S.C. I.E.S. E.E.-II, 1993]

731. In a 3-phase induction motor if the leakage reactance is reduced by using open slots
(a) starting torque and starting current will decrease but power factor will increase.
(b) starting torque and starting current both will increase but power factor will decrease.
(c) pull-out torque will decrease.
(d) starting current will increase but starting torque will decrease.
[A.M.I.E. Sec B. Elec. Machine Design Winter 1996]

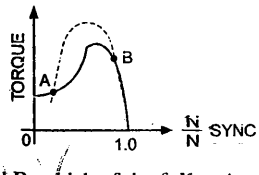
732. An increase in rotor circuit reactance of a 3-phase induction motor will
(a) reduce starting torque as well as maximum torque.
(b) increase starting torque as well as maximum torque.
(c) increase starting torque and reduce maximum torque.
(d) increase maximum torque and reduce starting torque.

733. In the torque-speed characteristic of an induction motor shown in the figure given below, stable region is



(a) AB (b) BC (c) CD (d) DE

734. A 3-phase squirrel cage induction motor supplied from a balanced 3-phase source drives a mechanical load. The torque-speed characteristics of the motor (solid curve) and of the load (dotted curve) are shown.



Of the two equilibrium points A and B, which of the following options correctly describes the stability of A and B?
(a) A is stable B is unstable. (b) A is unstable B is stable.
(c) Both are stable. (d) Both are unstable.
[GATE E.E. 2009]

735. The torque-slip characteristic of an induction motor is approximately a/an
(a) straight line. (b) rectangular parabola.
(c) parabola. (d) hyperbola.

736. Stable operation of an induction motor is
(a) between zero slip and unity slip.
(b) between 0.5 slip and 0.95 slip.
(c) between zero slip and slip corresponding to maximum torque.
(d) between slip corresponding to maximum torque and unity slip.

737. With the increase in load on a squirrel cage induction motor
(a) stator current increases. (b) power factor improves.
(c) slip increases.
(d) the torque developed by the motor increases till it becomes equal to the load torque.
(e) all of the above.

738. Whenever any polyphase induction motor is loaded
(a) motor speed decreases.
(b) stator flux cuts the rotor bars more rapidly.
(c) emf induced in the rotor as well as its frequency increases.
(d) current in rotor bars increases.
(e) all of the above.

739. A three-phase squirrel cage induction motor has a starting torque of 150% and a maximum torque of 300% with respect to rated torque at rated voltage and rated frequency. Neglect the stator resistance and rotational losses. The value of slip for maximum torque is
(a) 13.48% (b) 16.42%
(c) 18.92% (d) 26.79% [GATE E.E. 2007]

740. What is the ratio of starting torque and maximum torque of a 3- phase, 50 Hz, 4 pole induction motor for a maximum torque at 1,200 rpm?
(a) 0.421 (b) 0.384
(c) 0.6 (d) 0.5 [U.P.S.C. I.E.S. E.E.-II, 2009]

741. The losses that occur in an induction motor are
(a) stator copper loss. (b) stator iron loss.
(c) rotor copper loss. (d) windage and friction losses.
(e) all of the above.

742. In a 3-phase induction motor iron loss mainly occurs in
(a) stator and rotor. (b) rotor core and rotor teeth.
(c) stator core and stator teeth.
(d) stator winding.

743. Iron loss in the rotor of a 3-phase induction motor is negligible. This is due to
(a) very low frequency of emf induced in the rotor.
(b) very low emf induced in the rotor.
(c) very low flux density in rotor parts.
(d) the fact that the rotor core is laminated.
(e) constant magnitude of flux linking the rotor core.

Answers: **726.** (c), **727.** (c), **728.** (a), **729.** (c), **730.** (a), **731.** (b), **732.** (a), **733.** (d), **734.** (b), **735.** (b), **736.** (c), **737.** (e), **738.** (e), **739.** (d), **740.** (b), **741.** (e), **742.** (c), **743.** (a),

744. Rotor input of a three phase induction motor is equal to
(a) input to motor–stator copper and iron losses.
(b) mechanical power developed—windage and friction losses.
(c) input to motor — windage and friction losses.
(d) input to motor – stator iron losses —windage and friction losses.

745. In an induction motor, what is the ratio of rotor copper loss and rotor input ?
(a) $1/s$ (b) s (c) $(1-s)$ (d) $s/(1-s)$
[U.P.S.C I.E.S. E.E.-II, 2007]

746. For an induction motor, operating at slip s, the ratio of gross power output to air gap power is equal to
(a) $(1-s)^2$ (b) $(1-s)$
(c) $\sqrt{(1-s)}$ (d) $(1-\sqrt{s})$ [GATE E.E. 2005]

747. The rotor power output of a 3-phase induction motor is 15 kW. The rotor copper losses at a slip of 4% will be
(a) 600 W (b) 625 W (c) 650 W (d) 700 W
[U.P.S.C. I.E.S. E.E.-II, 2001]

748. The power input to a 415 V, 50 Hz, 6 pole 3-phase induction motor running at 975 rpm is 40 kW. The stator losses are 1 kW and friction and windage losses total 2 kW. What is the efficiency of motor?
(a) 92.5% (b) 92%
(c) 90% (d) 88%
[GATE E.E., 2010; U.P.S.C. I.E.S. E.E.-II, 2009]

749. A 400 V, 15 kW, 4-pole, 50 Hz Y-connected induction motor has full-load slip of 4%. The output torque of the machine at full load is
(a) 1.66 Nm (b) 95.5 N
(c) 99.47 Nm (d) 624.73 Nm [GATE E.E. 2004]

750. A 400 V, 50 Hz, 30 hp three-phase induction motor is drawing 50 A current at 0.8 power factor lagging. The stator and rotor copper losses are 1.5 kW and 900 W respectively. The friction and windage losses are 1,050 W and the core losses are 1,200 W. The air-gap power of the motor will be
(a) 23.06 kW (b) 24.11 kW
(c) 25.01 kW (d) 26.21 kW [GATE E.E. 2008]

751. In induction motor, air gap power is 10 kW and mechanically developed power is 8 kW. What are the rotor ohmic losses?
(a) 1 kW (b) 3 kW (c) 2 kW (d) 0.5 kW
[U.P.S.C I.E.S. E.E.-II, 2007]

752. What is the rotor copper loss of a 3-phase 550 volt, 50 Hz, 6 poles induction motor developing 4.1 kW at the shaft with mechanical loss of 750 W at 970 rpm?
(a) 175 W (b) 150 W
(c) 100 W (d) 250 W
[U.P.S.C. I.E.S. E.E.-II, 2009]

753. The synchronous watt is
(a) the torque which under synchronous speed would develop a power of 1 watt or power input to rotor in watts.
(b) shaft output in watts. (c) input power to stator.
(d) the unit of ratings of synchronous machines.

754. The no-load current in an induction motor is _____ in comparison to that of a power transformer.
(a) much lower (b) much higher
(c) slightly less (d) slightly more

755. The equivalent circuit per phase of a three phase transformer is similar to that of a three phase induction motor but the transformer does not develop any torque. This is due to
(a) insufficient voltage. (b) low supply frequency.
(c) non-fulfilment of condition of space condition of winding.
(d) none of the above.

756. In a 3-phase induction motor, the variable mechanical load is represented electrically by a variable _____ only.
(a) inductance (b) capacitance
(c) resistance (d) any of these

757. An induction motor has rotor resistance R_r, standstill rotor induced voltage E_{ss}, and stator to rotor effective turn-ratio of m. In an equivalent circuit of this machine, the rotor circuit resistance is shown as m^2R_r/s, where s is the slip. This implies that the value of the equivalent rotor circuit voltage will be
(a) E_{ss}. (b) sE_{ss}. (c) mE_{ss}. (d) $m\,s\,E_{ss}$.
[U.P.S.C. I.E.S. E. E.-II, 1993]

758. The stator referred resistance in the equivalent circuit of an induction motor, representing mechanical output is
(a) $\frac{r_2'}{s}$ (b) $r_2'\left(\frac{1}{s}-1\right)$ (c) $\frac{r_2}{s}$ (d) $r_2^2\left(\frac{1}{s}-1\right)$
[A.M.I.E. Sec B. Elec. Machines Winter 1994]

759. If the load on an induction motor is increased from no load to full load, its slip and the power factor will, respectively:
(a) decrease, decrease. (b) decrease, increase.
(c) increase, decrease. (d) increase, increase.
[U.P.S.C. I.E.S. E.E.-II, 2006]

760. The output power of a 3-phase induction motor will be maximum when the equivalent load resistance is equal to the standstill leakage _____ of the motor.
(a) impedance, Z_1' (b) reactance, X_1'
(c) resistance (d) capacitance

761. The power factor of an induction motor operating at no load will have a value around
(a) 0.9 lag. (b) 0.2 lead. (c) 0.2 lag. (d) 0.9 lead.
[U.P.S.C. I.E.S. E.E.-II, 2010]

762. The power factor of an induction motor at full load is likely to be
(a) unity. (b) 0.85 lead. (c) 0.85 lag. (d) 0.5 lag.

763. The power factor of a 3-phase induction motor is likely to be maximum when it will operate at
(a) full load. (b) no-load. (c) maximum slip.
(d) maximum torque.

764. The power factor of a lightly loaded induction motor is quite low because
(a) the current drawn is largely a magnetising current due to air gap.
(b) of the current due to air gap.
(c) the current drawn is largely a magnetising component due to laminated core.
(d) the current drawn is largely an energy component due to laminated core.

765. In a 3-phase induction motor when the load is increased from light load
(a) rotor pf increases but stator pf decreases.
(b) stator pf increases but the rotor pf decreases.
(c) both stator and rotor pf increase.
(d) both stator and rotor pf decrease.

Answers: **744.** (a), **745.** (b), **746.** (b), **747.** (b), **748.** (c), **749.** (c), **750.** (c), **751.** (c), **752.** (b), **753.** (a), **754.** (b), **755.** (c), **756.** (c), **757.** (c), **758.** (b), **759.** (d), **760.** (a), **761.** (c), **762.** (c), **763.** (a), **764.** (a), **765.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

766. An induction motor always operates on lagging power factor. This is due to
(a) stator reactance. (b) rotor leakage reactance.
(c) the large reactive lagging magnetizing current essential to produce the magnetic flux.
(d) all of the above.

767. Open-circuit test is usually conducted on
(a) slip-ring motors. (b) wound rotor motors.
(c) either of (a) and (b). (d) none of these.
[U.P.T.U. Even Semester 2009-10]

768. In which of the following tests to be conducted on induction motors, reduced voltage is applied.
(a) Blocked rotor test. (b) No-load test.
(c) Both (a) and (b). (d) None of these.

769. Blocked rotor test of an induction motor corresponds, in case of a transformer, to
(a) full load. (b) half-full load.
(c) no load. (d) short-circuit operation.
[A.M.I.E. Elec. Science Summer 1994]

770. No-load test on a 3-phase induction motor was conducted at different supply voltages and a plot of input power versus voltage was drawn. This curve was extrapolated to intersect the y-axis. This intersection point yields
(a) core loss. (b) stator copper loss.
(c) stray load loss. (d) friction and windage loss.
[GATE E.E. 2003]

771. What is the shunt resistance component in equivalent circuit obtained by no-load test of an induction motor representative of?
(a) Windage and frictional losses only.
(b) Core losses only.
(c) Core, windage and frictional losses.
(d) Copper losses. [U.P.S.C. I.E.S. E.E.-II, 2005; GATE E.E. 2003]

772. Under no-load condition, if the applied voltage to an induction motor is reduced from the rated voltage to half the rated value.
(a) the speed decreases and the stator current increases.
(b) both the speed and the stator current decrease.
(c) the speed and the stator current remain practically constant.
(d) there is negligible change in the speed but the stator current decreases. [GATE E.E. 2005]

773. The core losses, and friction and windage losses in case of an induction motor are determined from the _____ test.
(a) no-load (b) blocked rotor
(c) load (d) stator resistance

774. Short-circuit test is performed on an induction motor to determine
(a) short-circuit current under rated voltage.
(b) equivalent resistance and reactance.
(c) transformation ratio. (d) power factor on short-circuit.
(e) all of the above.

775. Circle diagram is employed to determine the performance of a/an
(a) synchronous motor. (b) induction motor.
(c) dc motor. (d) transformer.

776. The power scale of circle diagram of an induction motor is determined from _____ test data only.
(a) open circuit (b) stator resistance
(c) short-circuit (d) slip

777. In the circle diagram of an induction motor the diameter of the circle represents the
(a) rotor current. (b) line voltage.
(c) operating torque. (d) maximum torque.

778. Circle diagram of an induction motor can be used to determine its
(a) power factor. (b) efficiency.
(c) output. (d) slip.
(e) all of the above.

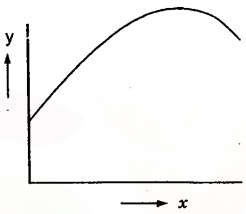
779. Which one of the following is correct statement?
The output line in an induction motor circle diagram is the line joining the tip of the
(a) no load current phasor to the point corresponding to slip = 0.
(b) no load current phasor to the point corresponding to slip = 1.
(c) short circuit current phasor to the point corresponding to slip = 1.
(d) short circuit current phasor to the point corresponding to slip = 0. [U.P.S.C. I.E.S. E.E.-II, 2007]

780. A 3-phase, 10 kW, 400 V, 4-pole, 50 Hz, star-connected induction motor draws 20 A on full load. Its no-load and blocked rotor test data are given below:

No-load test :	400 V	6 A	1,002 W
Blocked rotor test :	90 V	15 A	762 W

Neglecting copper loss in no-load test and core loss in blocked rotor test, estimate motor's full-load efficiency.
(a) 76%. (b) 81%. (c) 82.4%. (d) 85%.
[GATE E.E. 2006]

781. Consider the following curve:



Which of the following characteristics of the induction motor is represented by the above curve?

	x-axis	y-axis
(a)	Output	pf
(b)	Speed	pf
(c)	Load	efficiency
(d)	Speed	torque

[U.P.S.C. I.E.S. E.E.-II, 2004]

782. If the rotor power factor of a 3-phase induction motor is 0.866, the spatial displacement between the stator magnetic field and the rotor magnetic field will be
(a) 30° (b) 90° (c) 120° (d) 150°
[U.P.S.C. I.E.S. E.E.-II, 2000]

783. A 3-phase induction motor when started picks up speed but runs stably at about half the normal speed. This is because of
(a) unbalance in the supply voltages.
(b) non-sinusoidal nature of the supply voltage.
(c) stator circuit asymmetry.
(d) rotor circuit asymmetry. [U.P.S.C. I.E.S. E.E.-II, 1998]

784. An induction motor is said to be crawling when
(a) it runs at one-seventh of rated speed.
(b) it accelerates too fast.
(c) it is subjected to fluctuating loads.
(d) it is started on full load.

785. Zero sequence impedance of a 3-phase cage induction motor is due to
(a) stator circuit 3rd time harmonic.
(b) stator circuit 3rd space harmonic.
(c) rotor circuit 3rd time harmonic.
(d) rotor circuit 3rd space harmonic. [U.P.S.C. I.E.S. E.E.-II, 1998]

786. The stator of a 6-pole, 3-phase induction motor is fed from a 3-phase 50 Hz supply which contains a pronounced fifth time harmonic. The speed of the fifth space harmonic field produced by the fifth time harmonic in the stator supply will be

---

Answers: **766.** (d), **767.** (c), **768.** (a), **769.** (d), **770.** (d), **771.** (b), **772.** (b), **773.** (a), **774.** (e), **775.** (b), **776.** (c), **777.** (a), **778.** (e), **779.** (b), **780.** (b), **781.** (a), **782.** (c), **783.** (b), **784.** (a), **785.** (b), **786.** (d),

Downloaded From : www.EasyEngineering.net

(a) 200 rpm. (b) 1,500 rpm.
(c) 1,000 rpm. (d) 5,000 rpm.
[U.P.S.C. I.E.S. E.E.-II, 2000]

787. The synchronous speed for the seventh space harmonic mmf wave of a 3-phase, 8-pole, 50 Hz induction machine is
(a) 107.14 rpm in forward direction.
(b) 107.14 rpm in reverse direction.
(c) 5,250 rpm in forward direction.
(d) 5,250 rpm in reverse direction. [GATE E.E. 2004]

788. An induction motor when started on load does not accelerate upto full speed but runs at 1/7th of the rated speed. The motor is said to be
(a) locking. (b) plugging. (c) crawling. (d) cogging.
[U.P.S.C. I.E.S. E.E.-II, 2001]

789. The presence of a dominant 7th harmonic in the winding distribution of a 3-phase, 6-pole, 50 Hz induction motor may cause the motor to crawl at a speed of about
(a) 750 rpm. (b) 500 rpm. (c) 242 rpm. (d) 143 rpm.
[U.P.S.C. I.E.S. E.E.-II, 1993]

790. Crawling in an induction motor is due to
(a) time harmonics in supply.
(b) slip ring rotor.
(c) space harmonics produced by winding currents.
(d) insufficient starting torque. [U.P.S.C. I.E.S. E.E.-II, 1999]

791. The crawling in the induction motor is caused by
(a) improper design of stator laminations.
(b) low voltage supply. (c) high loads.
(d) harmonics developed in motor. [U.P.S.C. I.E.S. E.E.-II, 2003]

792. The phenomenon of crawling in a 3-phase induction motor may be due to
(a) unbalanced supply voltage.
(b) 7th space harmonics of air-gap field.
(c) 7th time harmonics of voltage wave.
(d) 5th space harmonics. [U.P.S.C. I.E.S. E.E.-II, 1998]

793. In an induction motor, when the number of stator slots is equal to an integral multiple of rotor slots,
(a) there may be a discontinuity in torque-slip characteristics.
(b) a high starting torque will be available.
(c) the maximum torque will be high.
(d) the machine will fail to start. [U.P.S.C. I.E.S. E.E.-II, 2003]

794. Crawling of induction motor occurs due to
(a) harmonic synchronous torques.
(b) harmonic induction torques.
(c) vibration torques. (d) both (a) and (b).

795. Presence of 5th harmonics in induction motor causes
(a) cogging. (b) crawling.
(c) small reverse braking torque.
(d) hunting.

796. The cogging occurs in induction motors due to
(a) harmonic induction torques.
(b) harmonic synchronous torques.
(c) vibration torques. (d) both (a) and (b).

797. Cogging of induction motors occurs at
(a) high voltage and when the number of stator teeth and rotor teeth are equal.
(b) high voltage and when the number of stator teeth and rotor teeth are not equal.
(c) low voltage and when the number of stator teeth and rotor teeth are equal.
(d) low voltage and when the number of stator teeth and rotor teeth are not equal.

798. Cogging and crawling are phenomenon associated with
(a) cage induction machines and they are essentially the same.
(b) squirrel cage induction machines, the former during starting and the latter at a fraction of its rated speed.
(c) squirrel cage induction machines, the former at a fraction of its rated speed and the latter during starting.
(d) wound rotor induction machines and they are reduced by skewing, chording and distribution of windings.
[U.P.S.C. I.E.S. E.E.-II, 1995]

799. In an induction motor, if the air gap is increased
(a) speed will reduce. (b) efficiency will improve.
(c) power factor will be lowered.
(d) breakdown torque will reduce. [GATE E.E. 1996]

800. If two induction motors A and B are identical except that the air-gap of motor 'A' is 50% greater than that of motor 'B' then
(a) the no-load power factor of A will be better than that of B.
(b) the no-load power factor of A will be poorer than that of B.
(c) the core losses of A will be more than those of B.
(d) the operating flux of A will be smaller than that of B.
[U.P.S.C. I.E.S. E.E.-II, 1997]

801. An increase in number of poles of an induction motor results in
(a) decrease in maximum pf. (b) increase in maximum pf.
(c) no change in maximum pf. (d) cannot be predicted.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

802. Increase in length of air gap in an induction motor causes
(a) decrease in power factor.
(b) decrease in pulsation losses.
(c) increase in ampere-turns required to produce same flux density in the air gap.
(d) all of the above.

803. An induction motor with larger number of slots has _____ overload capacity.
(a) low (b) large
(c) no effect on (d) none of these.

804. The 3-phase induction motor provided with open slots has
(a) reduced leakage reactance.
(b) increased starting current, starting torque and breakdown torque.
(c) better pf. (d) improved efficiency.
(e) both (a) and (b).

805. Semiclosed or totally closed slots are used in induction motors essentially to
(a) improve pull-out torque.
(b) increase pull-out torque.
(c) increase efficiency.
(d) reduce magnetizing current and improve power factor.
[U.P.S.C. I.E.S. E.E.-II, 1994]

806. The stator of a small (up to 5 hp) induction motor is provided with
(a) open slots with parallel teeth.
(b) open slots with tapered teeth.
(c) semi-closed slots with parallel teeth.
(d) totally closed slots with parallel teeth.

807. "Cogging" in induction motor occurs when
(a) number of stator teeth – number of rotor teeth = odd number.

Answers: **787.** (a), **788.** (c), **789.** (d), **790.** (c), **791.** (d), **792.** (b), **793.** (d), **794.** (d), **795.** (c), **796.** (b), **797.** (c), **798.** (b), **799.** (c), **800.** (b), **801.** (a), **802.** (d), **803.** (b), **804.** (e), **805.** (d), **806.** (c), **807.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) number of stator teeth – number of rotor teeth = even number.
(c) number of stator teeth – number of rotor teeth = 0.
(d) number of stator teeth – number of rotor teeth = negative number. [U.P.S.C. I.E.S. E.E.-II, 1992]

308. To avoid cogging in a squirrel cage induction motor the following stator slot (Z_1) and rotor slot (Z_2) combination must be avoided
(a) $Z_1 = Z_2$ (b) $Z_1 - Z_2 = 2P + 1$
(c) $Z_1 - Z_2 = 3P + 1$ (d) $Z_1 - Z_2 = 3P - 1$
[A.M.I.E. Sec B. Elec. Machine Design Summer 1997]

309. In a 3-phase induction motor, the stator slots are
(a) equal to rotor slots.
(b) exact multiple of rotor slots.
(c) not exact multiple of rotor slots.
(d) none of the above.

310. In a 3-phase induction motor, the number of slots on stator is not kept an exact multiple of the number of rotor slots because it
(a) facilitates cooling.
(b) avoids magnetic locking between stator field and rotor.
(c) improves efficiency. (d) improves pf.

311. The difference between the number of stator slots and that of rotor slots in an induction motor should not be equal to P, 2P or 5P. It is essential in order to avoid
(a) synchronous cusps. (b) crawling.
(c) magnetic locking. (d) noise and vibrations.

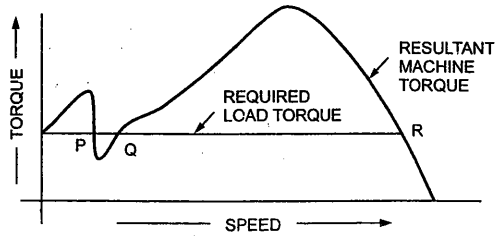
312. In induction machines, it is usually a standard practice to employ
(a) integral-slot winding with full pitch coils.
(b) integral slots winding with chorded coils.
(c) fractional slot winding with fractional pitch coils.
(d) fractional slot winding with full pitch coils.

313. The rotor slots in a 3-phase induction motor are kept inclined. This phenomenon is known as
(a) skewing. (b) crawling.
(c) cogging. (d) none of these.

314. In an induction motor, skewing of rotor bars reduces
(a) eddy currents and copper requirement.
(b) noise, vibrations and synchronous cusps.
(c) both (a) and (b). (d) none of these.

315. Skew of rotor bar eliminates
(a) the effect of space harmonics.
(b) the entire effect of crawling.
(c) magnetic noise.
(d) vibration due to unequal force developed on rotor.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

316. The required load torque line intersects the resultant torque-speed characteristic of a 3-phase squirrel cage induction motor at points P, Q and R as shown in the figure. Which is/are the stable operating point(s)?



(a) P and Q. (b) Q and R.
(c) P and R. (d) Only R.
[U.P.S.C. I.E.S. E.E.-II, 2006]

317. Which of the following statements regarding skewing of rotor bars in a squirrel cage induction motor are correct ?
1 It prevents cogging.
2 It produces more uniform torque.
3 It increases starting torque.
4. It reduces motor 'hum' during its operation.
Select the answer using the codes given below
(a) 2, 3, 4. (b) 1, 2, 3.
(c) 1, 3, 4. (d) 1, 2, and 4.
[U.P.S.C. I.E.S. E.E.-II, 1997]

318. Jogging of an induction motor is
(a) energizing a motor once or repeatedly to have small movements for mechanisms.
(b) a process of synchronisation.
(c) a method of braking. (d) none of the above.

319. In 3-phase induction motors, sometimes copper bars are placed deep in the rotor. It is done in order to improve
(a) efficiency. (b) starting torque.
(c) power factor. (d) none of these.

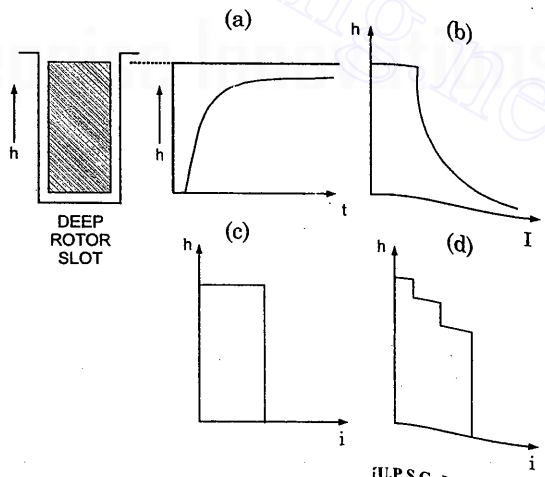
320. In a squirrel cage induction motor high starting torque is achieved by using
(a) high resistance in series with the rotor circuit.
(b) low resistance across the rotor circuit.
(c) double cage rotor. (d) none of these.

321. The outer cage of a double squirrel rotor consists of
(a) manganese brass. (b) red copper.
(c) bronze. (d) steel.

322. In double cage induction motor the inner cage has
(a) high resistance and high leakage reactance.
(b) high resistance and low leakage reactance.
(c) low resistance and high leakage reactance.
(d) low resistance and low leakage reactance.

323. In the equivalent circuit of a double-cage induction motor, the two rotor cages can be considered
(a) to be in parallel. (b) to be in series-parallel.
(c) to be in series. (d) to be in parallel with stator.
[U.P.S.C I.E.S. E.E.-II, 2008]

324. The deep bar rotor of an induction motor is considered equivalent to a double cage rotor for the purpose of starting and performance. At the time of starting, the current distribution in the deep bar rotor slot will be as shown



[U.P.S.C. I.E.S. E.E.-II, 1998]

Answers: **308.** (a), **309.** (c), **310.** (b), **311.** (a), **312.** (b), **313.** (a), **314.** (b), **315.** (a), **316.** (c), **317.** (c), **318.** (a), **319.** (b), **320.** (c), **321.** (a), **322.** (c), **323.** (a), **324.** (a),

825. The advantage of the double squirrel-cage induction motor over single cage rotor is that its
(a) efficiency is higher. (b) power factor is higher.
(c) slip is larger. (d) starting current is lower.
[U.P.S.C. I.E.S. E.E.-II 2001]

826. In a double squirrel cage induction motor, the resistance of upper cage is _____ that of inner cage.
(a) equal to (b) 4 to 5 times of
(c) one-fourth of (d) none of these.

827. Motor A has shallow and wider slots. Motor B has deeper and narrow slots. If both are 3-phase 400 V, 50 Hz, 1440 rpm induction motors. It can be concluded that
(a) Motor A has more starting torque as compared to motor B.
(b) Motor B has more starting torque as compare to motor A.
(c) Motor A has more pull-out torque as compared to motor B.
(d) Motor B has more pull-out torque as compared to motor A.
[U.P.S.C. I.E.S. E.E.-II, 1992]

828. The deep-bar rotors or double cage rotors are employed to
(a) increase starting torque. (b) improve efficiency.
(c) increase pull-out torque. (d) reduce rotor core loss.

829. During starting of a double cage induction motor, the current induced in the rotor
(a) flows mostly through the lower cage.
(b) flows mostly through the upper cage.
(c) is equally divided between the two windings.
(d) none of the above.

830. Squirrel cage induction motors have the advantages of
(a) cheaper in initial as well as in maintenance costs.
(b) nearly constant speed, high overload capacity, simple starting arrangement and high power factor.
(c) lower copper losses and higher operation efficiency.
(d) all of the above.

831. Squirrel cage induction motors have the disadvantages of
(a) higher starting current and poor starting torque.
(b) high sensitivity to fluctuations in supply voltage and low power factor at light-load.
(c) no possibility of speed regulation.
(d) all of the above.

832. Slip-ring induction motors have the advantages of
(a) high starting torque and high overload capacity.
(b) nearly constant speed.
(c) low starting current in comparison to squirrel cage induction motor.
(d) all of the above.

833. Slip-ring motors have the disadvantages of
(a) low efficiency and low power factor in comparison to squirrel cage induction motors.
(b) low power factor at light load.
(c) sensitivity to fluctuations in supply voltage.
(d) all of the above.

834. For high starting torque, the most suitable 3-phase induction motor is _____ induction motor.
(a) slip-ring (b) squirrel cage
(c) double cage (d) deep bar squirrel cage

835. Which of the following ac motor is widely used ?
(a) Squirrel cage induction motor.
(b) Slip-ring induction motor.
(c) Double cage induction motor.
(d) Synchronous motor.

836. A squirrel cage induction motor is not favoured when _____ is the main consideration.
(a) initial cost (b) maintenance cost
(c) high starting torque
(d) higher efficiency and higher power factor

837. A slip-ring induction motor is recommended for applications requiring
(a) high starting torque. (b) variable speed operation.
(c) frequent starting, stopping and reversing operations.
(d) all of the above features.

838. Induction motors, over synchronous motors, have the advantages of
(a) being self starting.
(b) having no requirement for dc excitation.
(c) possibility of speed control to small extent.
(d) simplicity and lower cost.
(e) all of the above.

839. Unbalanced 3-phase voltage supply to an induction motor causes excessive heating of
(a) rotor. (b) stator.
(c) rotor shaft. (d) none of these.

840. Unbalanced supply voltage given to a 3-phase, delta-connected induction motor will cause
(a) zero sequence currents. (b) less heating of motor.
(c) negative sequence component current.
(d) all the above.
[GATE E.E. 1996]

841. Single phase preventer
(a) suppresses negative sequence currents.
(b) compensates for voltage drops.
(c) provides protection in the event of non-availability of one of the phases.
(d) none of the above.

842. An induction motor is fed from a balanced three phase supply at rated voltage and frequency through a bank of three single phase transformers connected in delta-delta. One unit of the bank develops fault and is removed. Then
(a) single phasing will occur and the machine fails to start.
(b) single phasing will not occur but the motor terminal voltages will become unbalanced and the machine can be loaded to the extent of 57.7% of its rating.
(c) the machine can be loaded to the extent of 57.7% of its rating with balanced supply at its terminals.
(d) the machine can be loaded to the extent of $66\frac{2}{3}$ % of its rating with balanced supply at its terminals.
[GATE E.E. 1995]

843. If a 3-phase induction motor is started when one of the phases is not available, then the motor
(a) will hum but not start.
(b) will continue to operate satisfactorily on load below 57.7% of rated load if brought up to speed by some external means.
(c) will operate under reduced load but usually with considerable vibrations in case of wound rotor motor is brought up to speed by some external means.
(d) start and operate at a lower speed.
(e) all of the above except (d).

844. If one of the 3-phases of supply to an induction motor fails, may be due to any reason, when the motor is running normally, the motor will

Answers: **825.** (d), **826.** (b), **827.** (b), **828.** (a), **829.** (b), **830.** (d), **831.** (d), **832.** (d), **833.** (d), **834.** (a), **835.** (a), **836.** (c), **837.** (d), **838.** (e), **839.** (a), **840.** (c), **841.** (c), **842.** (a), **843.** (e), **844.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) continue running at the same speed if it was running on light load.
(b) continue running but will draw more current if it was operating at rated load.
(c) stop and carry heavy current causing permanent damage to the windings if it was operating overloaded.
(d) all of the above.

845. Consider the following statements:
In a 3-phase induction motor connected to a 3-phase supply; if one of the lines suddenly gets disconnected, then the
1. motor will come to a standstill.
2. motor will continue to run at the same speed with line current unchanged.
3. motor will continue to run at a slightly reduced speed with increase in line current.
4. rotor current will have both of sf and $(2-s)f$ component frequencies where s is the slip and f is the supply frequency.

Of these statements
(a) 1 and 4 are correct. (b) 1 and 2 are correct.
(c) 3 and 4 are correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1995]

846. Increase in supply voltage to a 3-phase induction motor will not cause
(a) decrease in input current and so reduction in copper losses.
(b) increase in torque.
(c) decrease in speed as well as in core loss.
(d) operating temperature abnormally higher owing to increase in core loss.

847. Decrease in supply voltage to a 3 phase induction motor will not cause
(a) any difficulty in accelerating the load.
(b) increase in torque.
(c) decrease in speed as well as in core loss.
(d) increase in stator as well as rotor currents.
(e) operating temperature abnormally high owing to increase in copper loss.

848. A 3-phase induction motor is operating at its rated torque. If the supply voltage falls to 75% of its normal value,
(a) the motor will get heated up to inadmissible extent after some time.
(b) the motor will stop. (c) the slip will decrease.
(d) the stator and rotor current will decrease.

849. A squirrel cage induction motor having a rated slip of 4% of full-load has a starting torque same as the full-load torque. Which one of the following statements is correct? The starting current is
(a) equal to the full-load current.
(b) twice the full-load current.
(c) four times the full-load current.
(d) five times the full-load current. [U.P.S.C. I.E.S. E.E.-II, 2004]

850. An induction motor having full-load torque of 60 Nm when delta connected develops a starting torque of 120 Nm. For the same supply voltage, if the motor is changed to star-connection, the starting torque developed will be
(a) 40 Nm (b) 60 Nm (c) 90 Nm (d) 120 Nm
[GATE E.E. 1996]

851. A 3-phase, 480 V, 60 Hz induction motor is to be operated at 50 Hz supply. The most satisfactory supply voltage for the machine would be
(a) 480 V (b) 400 V (c) 600 V (d) 440 V

852. If a 3-phase 350 V, 50 Hz, 1440 rpm induction motor is operated on 420 V, 60 Hz supply, then the torque will
(a) increase. (b) decrease.
(c) remain unchanged. (d) none of these.

853. The starting torque of an induction motor varies as
(a) f (b) $\frac{1}{f^2}$ (c) $\frac{1}{f}$ (d) f^2

854. With the increase in supply frequency _____ decrease(s).
(a) starting current (b) starting torque
(c) full load current (d) maximum running torque
(e) starting and full load currents and starting and maximum running torque

855. This size of a high speed motor is _____ in comparison to that of a low speed motor for the same kW output.
(a) smaller (b) larger
(c) almost the same (d) unpredictable

856. Which of the following induction motors will operate on the lowest value of power factor?
(a) 7.5 kW, 950 rpm. (b) 7.5 kW, 1440 rpm.
(c) 15 kW, 950 rpm. (d) 15 kW, 1440 rpm.

857. For starting a 3-phase induction motor _____ winding is to be connected to 3-phase ac supply.
(a) rotor (b) stator
(c) both stator and rotor (d) none

858. The starting current of a 3-phase induction motor is about _____ of its full-load rated current.
(a) half (b) twice
(c) 5 to 7 times (d) 15 to 20 times

859. The purpose of the starter is to
(a) limit the starting current. (b) limit the speed.
(c) protect against over voltage.
(d) produce back emf. [R.G.T.U. B.E.E. Nov/Dec; 2007]

860. The following starting method for an induction motor is inferior from the point of view of poor starting torque per ampere of the line current drawn
(a) Direct-on-line starting.
(b) Auto transformer method of starting.
(c) Series inductor method of starting.
(d) Star-delta method of stating. [GATE E.E. 1999]

861. Direct-on-line starter can be used for small capacity _____ induction motors.
(a) squirrel cage (b) wound rotor
(c) squirrel cage and wound rotor both types of

862. For starting a small induction motor DOL starter is used in place of iron clad triple-pole (ICTP) switch as it
(a) provides protection against overload and undervolt.
(b) reduces the starting current.
(c) increases the starting torque.
(d) improves the power factor and efficiency.

863. Induction motors, when directly switched on across their normal rated supply voltage, the torque developed at starting is about _____ of their full load torque.
(a) half (b) 1.5 to 2.5 times
(c) 5 times (d) 10 times

864. Under which of the following starting methods, an induction motor draws largest starting current ?

Answers: **845.** (c), **846.** (c), **847.** (b), **848.** (a), **849.** (d), **850.** (a), **851.** (b), **852.** (c), **853.** (b), **854.** (e), **855.** (a), **856.** (a), **857.** (b), **858.** (c), **859.** (a), **860.** (c), **861.** (c), **862.** (a), **863.** (b), **864.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Star-delta starting. (b) Auto-transformer starting.
(c) Direct-on-line starting. (d) Reduced voltage starting.

865. _____ starter is used for starting a 3-phase induction motor that needs frequent starting and operating in forward and reverse directions.
(a) Direct-on-line (b) Star-delta
(c) Auto-transformer (d) Reduced voltage

866. The starting current of a 3ϕ induction motor is 5 times the rated current, while the rated slip is 4%. The ratio of starting torque to full-load torque is
(a) 0.06 (b) 0.8 (c) 1.0 (d) 1.2
[U.P.S.C I.E.S. E.E.-II, 2002]

867. A squirrel cage induction motor having a rated slip of 2% on full-load has a starting torque of 50% of full-load torque. The starting current is
(a) two times the full-load current.
(b) four times the full-load current.
(c) five times the full-load current.
(d) equal to the full-load current. [U.P.S.C. I.E.S. E.E.-II, 2010]

868. The starting current of an induction motor is 5 times the full-load current while the full-load slip is 4%. What is the ratio of starting torque to full-load torque?
(a) 0.6 (b) 0.8
(c) 1.0 (d) 1.2 [U.P.S.C. I.E.S. E.E.-II, 2009]

869. A 3-phase induction motor is started by direct-on-line (DOL) switching at the rated voltage. If the starting current drawn is 6 times the full-load current, and the full-load slip is 4%, then the ratio of the starting developed torque to the full-load torque is approximately equal to
(a) 0.24 (b) 1.44 (c) 2.40 (d) 6.00
[GATE E.E. 2005]

870. A 3-phase, 4 pole, 400 V, 50 Hz, star-connected induction motor has following circuit parameters

$r_1 = 1.0\ \Omega,\ r'_2 = 0.5\ \Omega,\ x_1 = x'_2 = 1.2\ \Omega,\ x_m = 35\ \Omega$

The starting torque when the motor is started direct-on-line is (use approximate equivalent circuit model)
(a) 63.6 Nm (b) 74.3 Nm (c) 190.8 Nm (c) 222.9 Nm
[GATE E.E. 2006]

871. With DOL start of an induction motor the heating during acceleration of inertia load is proportional to
(a) slip at maximum torque. (b) maximum torque.
(c) stored kinetic energy.
(d) electromagnetic power developed on the rotor.
[A.M.I.E. Sec B. Winter 1996]

872. Primary series resistors are employed in the stator for starting a 3-phase squirrel cage induction motor to
(a) increase the starting torque.
(b) improve the pf and efficiency of the motor.
(c) reduce voltage applied across the motor terminals.
(d) increase the motor speed.

873. For starting 3-phase squirrel cage induction motors reactors are preferred over resistors as the reactors
(a) incur less power loss and effectively reduce the applied voltage to the motor.
(b) increase the starting torque.
(c) improve the power factor at start.
(d) all of the above.

874. If the applied voltage across a 3-phase induction motor is reduced to x times, the starting current and starting torque will be reduced to _____ and _____ times respectively.
(a) x, x (b) x, x^2 (c) x^2, x (d) x^2, x^2

875. A 3-phase squirrel-cage induction motor is started by means of a star/delta switch. What is the starting current of the motor?
(a) 3 times the current with direct on line starting.
(b) $\frac{1}{3}$ times the current with direct on line starting.
(c) $\frac{1}{\sqrt{3}}$ times the current with direct on line starting.
(d) $\sqrt{3}$ times the current with direct on line starting.
[U.P.S.C I.E.S. E.E.-II, 2008]

876. The starting current and torque of three phase induction motor on direct line starting is 30 Amp and 300 Nm respectively. What are the corresponding values with star-delta starter?
(a) 10 A and 100 Nm. (b) 30 A and 300 Nm.
(c) 17.32 A and 173.2 Nm. (d) 30 A and 173.3 Nm.
[U.P.S.C. I.E.S. E.E.-II, 2009]

877. In auto-transformer starting of a 3-phase induction motor, if the tapping used is x then the starting line current and starting torque will be _____ and _____ times respectively with direct-on-line starting.
(a) x, x (b) x, x^2 (c) x^2, x^2 (d) x^2, x

878. A starting torque of 80 Nm is developed in an induction motor by an auto-transformer starter with a tapping of 30%. If the tapping of auto transformer starter is 60%, then what is the starting torque?
(a) 40 Nm. (b) 160 Nm. (c) 240 Nm. (d) 320 Nm.
[U.P.S.C. I.E.S. E.E.-II, 2005]

879. For the purpose of starting an induction motor, Y/Δ switch is an equivalent to an auto-transformer of ratio
(a) 33.3% (b) 57.7% (c) 73.2% (d) 100%
[U.P.S.C. I.E.S. E.E.-II 2002]

880. Consider the following statements:
Star-delta starter is used in 3-phase induction motor because it
1. prevents heating of the motor windings.
2. ensures permissible minimum starting current.
3. is regulated by electricity authorities.
4. ensures smooth run-up to full load. Of these statements.
(a) 1, 2 and 3 are correct. (b) 2, 3 and 4 are correct.
(c) 1, 3 and 4 are correct. (d) 1 and 2 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1998]

Common Data for Questions 881, 882 and 883:

A three phase squirrel cage induction motor has a starting current of seven times the full-load current and full-load slip of 5%.

881. If an auto-transformer is used for reduced voltage starting to provide 1.5 per unit starting torque, the auto-transformer ratio (%) should be
(a) 57.77% (b) 72.56% (c) 78.25% (d) 81.33%
[GATE E.E. 2007]

882. If a star-delta starter is used to start this induction motor, the per unit starting torque will be
(a) 0.607 (b) 0.816 (c) 1.225 (d) 1.616
[GATE E.E. 2007]

883. If a starting torque of 0.5 per unit is required then the per unit starting current should be
(a) 4.65 (b) 3.75 (c) 3.16 (d) 2.13
[GATE E.E. 2007]

884. Which of the following starting methods cannot be used for starting star-connected as well as delta-connected 3-phase induction motor ?
(a) Direct-on-line. (b) Star-delta.
(c) Auto-transformer. (d) Line resistance.

Answers: **865.** (a), **866.** (c), **867.** (c), **868.** (c), **869.** (b), **870.** (a), **871.** (d), **872.** (c), **873.** (a), **874.** (b), **875.** (b), **876.** (a), **877.** (c), **878.** (d), **879.** (b), **880.** (a), **881.** (c), **882.** (b), **883.** (c), **884.** (b),

885. The starting torque of a 3-phase slip-ring induction motor can be increased by connecting an external resistance in the
(a) rotor circuit. (b) stator circuit.
(c) supply circuit. (d) both (a) and (b).

886. For slip-ring induction motors, rotor resistance starting is preferred over reduced voltage starting because it
(a) limits the speed. (b) limits the starting current.
(c) increases the starting torque.
(d) improves the starting power factor.
(e) limits starting current, increases starting torque and also improves starting power factor.

887. Which of the following starting methods cannot be used for starting a 3-phase squirrel cage induction motor ?
(a) Star-delta. (b) Auto-transformer.
(c) Rotor-resistance. (d) Line resistance.
(e) Direct-on-line.

888. In case of 3-phase slip-ring induction motor, as the rotor resistance is increased, the starting torque
(a) increases. (b) decreases.
(c) increases upto a certain value of resistance and then remains constant.
(d) increases upto a certain value of resistance and then decreases. [A.M.I.E. Sec B. Winter 1995]

889. A 3-phase slip-ring induction motor having negligible stator impedance drives a constant torque load. If an additional resistance is included in the rotor circuit, what does the motor experience?
(a) Increase in both the stator current and the slip.
(b) No change in the stator current and increase in the slip.
(c) Increase in the ststor current and no change in the slip.
(d) Decrease in the stator current and increase in the slip. [U.P.S.C I.E.S. E.E.-II, 2008]

890. An induction motor can run at synchronous speed if it is operated
(a) on no-load. (b) on full load.
(c) with emf injected in the rotor circuit.
(d) on voltage higher than the rated voltage.

891. The speed regulation of a 3-phase induction motor at full load is about
(a) 4% (b) 8% (c) 15% (d) 25%

892. The speed of an induction motor depends on
(a) number of stator poles. (b) stator supply frequency.
(c) input voltage to stator. (d) all of the above.

893. Smooth speed control can be achieved by
(a) rotor resistance control only.
(b) rotor slip power control only.
(c) variation of supply frequency only.
(d) both rotor slip power control and variation of supply frequency.

894. The speed of a slip-ring three phase induction motor can be controlled from the rotor side by
(a) changing the supply voltage.
(b) changing the supply frequency.
(c) rheostatic control. (d) changing the number of poles. [U.P.S.C. I.E.S. E.E.-II, 2008]

895. Which of the following methods are suitable for the speed control of squirrel cage induction motors?
1. Voltage control. 2. Rotor resistance control.
3. Frequency control. 4. Pole changing method.
Select the correct answer using the codes given below:
(a) 2, 3 and 4. (b) 1, 3 and 4.
(c) 1, 2 and 3. (d) 2 and 4. [U.P.S.C. I.E.S. E.E.-II, 2005]

896. A 3-phase induction motor fed from a 3-phase voltage regulator is suitable for driving loads whose torque is
(a) constant irrespective of speed.
(b) inversely proportional to the square of the speed.
(c) directly proportional to the square of the speed.
(d) inversely proportional to speed. [U.P.S.C. I.E.S. E.E.-II. 1998]

897. Synchronous speed of an induction motor can be increased by
(a) reducing mechanical friction.
(b) increasing supply voltage.
(c) increasing number of poles.
(d) increasing supply frequency. [A.M.I.E. Winter 1997]

898. In a variable speed induction motor drive $\frac{V}{f}$ is kept constant over a wide range of its frequency variation. The motor operates in the following mode :
(a) constant power mode. (b) constant torque mode.
(c) variable power and variable torque mode.
(d) constant slip mode. [A.M.I.E. Sec B. Summer 1993]

899. In ac motor control $\frac{V}{f}$ is kept constant to
(a) make maximum use of the magnetic circuit.
(b) make minimum use of the magnetic circuit.
(c) maximize the current drawn.
(d) make the power constant. [A.M.I.E. Sec B. Summer 1994]

900. While operating on variable frequency supplies, the ac motor requires variable voltage as well in order to
(a) protect the insulation. (b) avoid the effect of saturation.
(c) improve the capabilities of the inverter.
(d) protect the thyristor from $\frac{dv}{dt}$. [U.P.S.C. I.E.S. E.E.-II, 1993]

901. A variable frequency induction motor is operated at constant V/*f* ratio. It has the following features over wide speed range regarding motor magnetising current (I_m) and maximum torque (T_m) respectively:
(a) Variable I_m constant T_m
(b) Constant I_m, constant T_m
(c) Constant I_m, variable T_m
(d) Variable I_m, variable T_m [A.M.I.E. Sec B. Winter 1998]

902. In a 3-phase induction motor, if supply voltage and frequency are reduced by the same ratio, then slip at which maximum torque occurs is
(a) more and maximum torque T_{em} remains constant.
(b) more and T_{em} decreases.
(c) less and T_{em} decreases.
(d) less and T_{em} increases. [A.M.I.E. Sec B. Summer 2000]

903. An ac induction motor is used for a speed control application. It is driven from an inverter with a constant V/*f* control. The motor name plate details are as follows:
V : 415 V Ph : 3
f : 50 Hz N : 2,850 rpm
The motor is run with the inverter output frequency set at 40 Hz, and with half the rated slip. The running speed of the motor is
(a) 2,400 rpm. (b) 2,280 rpm.
(c) 2,340 rpm. (d) 2,790 rpm. [GATE E.E. 2003]

904. The speed of a 4-pole induction motor is controlled by varying the supply frequency while maintaining the ratio of supply voltage to supply frequency (V/*f*) constant. At rated frequency of 50 Hz and

Answers: **885.** (a), **886.** (e), **887.** (c), **888.** (d), **889.** (d), **890.** (c), **891.** (a), **892.** (d), **893.** (d), **894.** (c), **895.** (b), **896.** (c), **897.** (d), **898.** (b), **899.** (a), **900.** (b), **901.** (b), **902.** (a), **903.** (c), **904.** (c),

Downloaded From : www.EasyEngineering.net

rated voltage of 400 V its speed is 1,440 rpm. Find the speed at 30 Hz, if the load torque is constant.
(a) 882 rpm. (b) 864 rpm. (c) 840 rpm. (d) 828 rpm.
[GATE E.E. 2006]

905. A 3-phase induction motor is driving a constant torque load at rated voltage and frequency. If both voltage and frequency are halved, following statements relate to new condition if stator resistance, leakage reactance and core loss are ignored.
P. The difference between synchronous speed and actual speed remains the same.
Q. The air gap flux remains same.
R. The stator current remains same.
S. The pu slip remains same.
Among the above, correct statements are
(a) All. (b) P, Q and R.
(c) Q, R and S. (d) P and S. [GATE E.E. 2003]

906. The absolute speed of magnetic field in space of a 3-phase rotor fed induction motor is
(a) synchronous speed N_s. (b) rotor speed N_r.
(c) $(N_s - N_r)$. (d) $(N_s + N_r)$.
[U.P.S.C. I.E.S. E.E.-II, 1996]

907. Line voltage control is used only with small squirrel cage motors driving fans and blowers as
(a) it reduces pull-out torque.
(b) the range of speed control is limited.
(c) both (a) and (b). (d) none of these.

908. The speed of a slip-ring induction motor cannot be controlled by
(a) rotor resistance control. (b) pole changing method.
(c) concatenation or cascade operation.
(d) rotor slip power control.

909. Consequent pole technique employed for speed control of induction motors involves changing of the
(a) slip. (b) supply frequency.
(c) number of poles. (d) any of these.

910. For the applications requiring speed ratio other than 2 : 1, the speed control can be affected by varying the number of stator poles employing
(a) multiple stator winding.
(b) pole amplitude modulation technique.
(c) consequent pole technique.
(d) any of the above.

911. Rotor resistance speed control used for 3-phase slip-ring induction motors has the drawbacks of
(a) reduced starting torque.
(b) lower efficiency and poor speed regulation.
(c) both (a) and (b). (d) none of these.

912. In rotor resistance control method, _____ with the increase in speed.
(a) torque increases (b) torque decreases
(c) slip increases (d) losses increase

913. Consider the following statements regarding speed control of induction motors by means of external rotor resistors :
1. Regulation in speed is accompanied by reduced efficiency.
2. With a large resistance in the rotor circuit, the speed would vary considerably with variation in torque.
3. The method is very complicated.
The disadvantages of such a method of speed control would include
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 1,2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 1997]

914. A wound rotor induction motor runs with a slip of 0.03 when developing full-load torque. Its rotor resistance is 0.25 Ω per phase. If an external resistance of 0.5 Ω per phase is connected across slip-rings, what is the slip for full load torque?
(a) 0.03. (b) 0.06. (c) 0.09. (d) 0.1.
[U.P.S.C. I.E.S. E.E.-II, 2005]

915. The injected emf in the rotor of induction motor must have
(a) the same frequency as the stator slip frequency.
(b) the same phase as the rotor emf.
(c) a high value for satisfactory speed control.
(d) the same phase as the rotor emf and a high value for satisfactory speed control. [U.P.S.C. I.E.S. E.E.-II, 2003]

916. In rotor resistance control of induction motor, the hardness of speed torque characteristic
(a) increases. (b) decreases.
(c) remains same. [A.M.I.E. Sec B. Winter 1996]

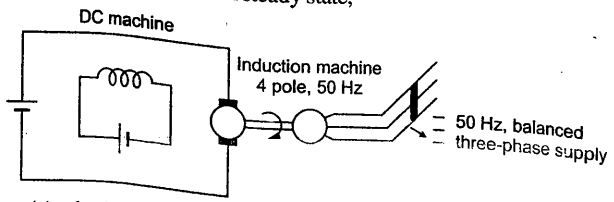
917. The method that gives continuous speed control of a slip-ring induction motor is
(a) rotor resistance control.
(b) secondary foreign voltage control.
(c) concatenation or cascade operation.
(d) line voltage control.

918. In case of voltage injection method of speed control, the injected emf should be of
(a) supply frequency (f) (b) slip frequency (sf)
(c) $(1 - s)f$ (d) $(2 - s)f$
[A.M.I.E. Sec B. Winter 1995]

919. When will a slip-ring induction motor run at super synchronous speed?
(a) If a voltage is injected in the rotor circuit in phase opposition to the rotor induced emf.
(b) If an emf is injected in the rotor circuit in phase with the rotor induced emf.
(c) If motor is coupled with active load.
(d) If motor is coupled with passive load.
[U.P.S.C. I.E.S. E.E.-II, 2009]

920. A voltage source inverter is used to control the speed of a three-phase, 50 Hz, squirrel cage induction motor. Its slip for rated torque is 4%. The flux is maintained at rated value. If the stator resistance and rotational losses are neglected, then the frequency of the impressed voltage to obtain twice the rated torque at starting should be
(a) 10 Hz (b) 5 Hz
(c) 4 Hz (d) 2 Hz [GATE E.E., 2007]

921. A separately excited dc machine is coupled to a 50 Hz, three-phase, 4-pole induction machine as shown in the figure. The dc machine is energized first and the machines rotate at 160 rpm. Subsequently the induction machine is also connected to a 50 Hz, three-phase source, the phase sequence being consistent with the direction of rotation. In steady state,



(a) both machines act as generators.
(b) the dc machine acts as a generator, and the induction machine acts as a motor.

Answers: **905.** (b), **906.** (c), **907.** (c), **908.** (b), **909.** (c), **910.** (b), **911.** (b), **912.** (b), **913.** (a), **914.** (c), **915.** (a), **916.** (b), **917.** (b), **918.** (b), **919.** (a), **920.** (c), **921.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the dc machine acts as a motor, and the induction machine acts as a generator.
(d) both machines act as motors. [GATE E.E., 2010]

922. Speeds higher than synchronous speed can be had by
(a) line voltage control. (b) rotor slip power control.
(c) rotor resistance control. (d) frequency control.

923. Slip-changing method of speed control can be used in case of
(a) slip-ring induction motors only.
(b) squirrel cage induction motors only.
(c) squirrel cage as well as slip-ring induction motors.
(d) none of the above.

924. Cascade method of speed control involves the use of two coupled induction motors. The necessary condition for speed control is that
(a) both the motors are of the wound rotor type having the same number of poles.
(b) both the motors are of the squirrel cage rotor type having different number of poles.
(c) one motor is of the slip-ring type but both the motors have the same number of poles.
(d) one motor is of the slip-ring type and the two motors have different number of poles. [U.P.S.C. I.E.S. E.E.-II, 1993]

925. At sub-synchronous speeds, in Kramer system, the electrical power fed to the auxiliary commutator machine at slip frequency is
(a) dissipated as heat.
(b) converted into mechanical power and supplied to the driven shaft.
(c) converted into electrical energy at line frequency and returned back to the supply mains.
(d) none of the above.

926. At sub-synchronous speed, in Scherbius system, the electrical power supplied to the auxiliary commutator machine at the slip frequency is
(a) dissipated as heat.
(b) converted into mechanical power and supplied to the driven shaft.
(c) converted into electrical energy at line frequency and returned back to the supply mains.
(d) none of the above.

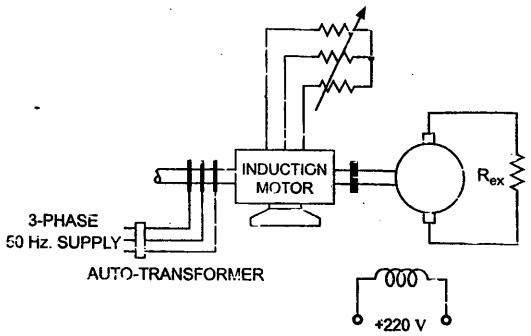
927. In a slip power recovery scheme for a 3-phase induction motor, if slip power is
(a) returned to supply, constant power drive is obtained.
(b) added to the main shaft, constant power drive is obtained.
(c) subtracted from the main shaft, constant torque drive is obtained.
(d) obtained from the supply, constant torque drive is obtained.
[A.M.I.E. Sec B. Summer 2000]

928. A three phase, wound rotor induction motor is to be operated with slip energy recovery in the constant torque mode, when it delivers an output power P_0 at slip s. Then theoretically, the maximum power that is available for recovery at the rotor terminals, is equal to

(a) P_0 (b) $P_0 s$ (c) $\frac{P_0}{(1-s)}$ (d) $\frac{P_0 s}{(1-s)}$
[GATE E.E. 2000]

Statement for Linked Answer Questions 929 and 930

A 3-phase, 440 V, 50 Hz, 4 pole, slip ring induction motor is fed from the rotor side through an auto transformer and the stator is connected to a variable resistance as shown in the figure.



The motor is coupled to a 220 V, separately excited dc generator feeding power to fixed resistance of 10 Ω. Two wattmeter method is used to measure the input power to induction motor. The variable resistance is adjusted such that motor runs at 1,410 rpm and the following readings were recorded $W_1 = 1{,}800$ W, $W_2 = -200$ W.

929. The speed of rotation of stator magnetic field with respect to rotor structure will be
(a) 90 rpm in the direction of rotation.
(b) 90 rpm in the opposite direction of rotation.
(c) 1,500 rpm in the direction of rotation.
(d) 1,500 rpm in the opposite direction of rotation.
[GATE E.E. 2008]

930. Neglecting all losses of both the machines, the dc generator power output and the current through resistance (R_{ex}) will respectively be
(a) 96 W, 3.10 A (b) 120 W, 3.46 A
(c) 1,504 W, 12.26 A (d) 1,880 W, 13.71 A
[GATE E.E. 2008]

931. The stator and the rotor of a 3-phase, 4-pole wound rotor induction motor are excited respectively from a 50 Hz and 30 Hz source of appropriate voltage. Neglecting all losses, what is/are the possible no-load speed/speeds at which the motor would run?
(a) 1,500 rpm and 900 rpm.
(b) 2,400 rpm and 600 rpm.
(c) 2,400 rpm only. (d) 600 rpm only.
[U.P.S.C. I.E.S. E.E.-II, 2005]

932. A 3-phase squirrel cage induction motor has a full-load efficiency of 0.8 and a maximum efficiency of 0.9. It is operated at a slip of 0.6 by applying a reduced voltage. The efficiency of the motor at this operating point is
(a) less than 0.4. (b) greater than 0.6.
(c) in the range of 0.8 ± 0.1.
(d) none of the above. [GATE E.E. 1998]

933. During plugging of an induction motor
(a) phase sequence is reversed.
(b) a dc source is connected to stator.
(c) one phase is open circuited.
(d) power is fed back to mains.
[A.M.I.E. Sec B. Summer 2002; Winter 2003]

934. In dynamic braking of 3-phase induction motors
(a) the supply terminals of any two stator phases are interchanged.
(b) any two stator terminals are earthed.
(c) the stator terminals are switched over to a dc source from the ac supply.
(d) a dc voltage is injected in the rotor circuit.

935. In a 3-phase induction motor, the regenerative braking occur when
(a) the load is lowered by a hoisting machine.
(b) the load is raised by a hoisting machine.

Answers: **922.** (b), **923.** (a), **924.** (d), **925.** (b), **926.** (c), **927.** (b), **928.** (b), **929.** (a), **930.** (c), **931.** (b), **932.** (c), **933.** (a), **934.** (c), **935.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the number of poles is reduced in a pole-changing motor.
(d) the motor speed falls due to overload.

936. The stator of a $\frac{2}{4}$ pole changing cage motor is initially wound for 2-poles. The reconnection of the stator winding to 4-poles through a change over switch, while the motor is running would result in
(a) constant torque drive. (b) constant hp drive.
(c) plugging to standstill.
(d) regenerative braking to half the original speed.
[U.P.S.C. I.E.S. E.E.-II, 1992]

937. If a squirrel cage induction motor runs slow, the probable cause could be
(a) low voltage. (b) overload.
(c) shorted stator coils. (d) one phase open.
(e) open stator coils. (f) any of these.

938. If a squirrel cage induction motor run hot, the probable cause could be
(a) uneven air gap. (b) overload.
(c) low supply frequency. (d) any of these.

939. If an induction motor hums during starting up, the possible cause could be
(a) open circuit. (b) unequal phase resistance.
(c) inter-turn short circuit on rotor.
(d) any of the above.

940. Three phase induction motor should preferably be mounted on
(a) wooden structure. (b) PVC platform.
(c) solid concrete foundation.
(d) rigid steel structure. (e) either (c) and (d).

941. The large sized induction motors are protected against overload by
(a) high-voltage fuses. (b) automatic cutouts.
(c) thermal or magnetic relays.
(d) rewirable fuses.

942. The insulating materials employed for motor windings are classified according to
(a) motor kW output rating. (b) level of temperature rise.
(c) controller size. (d) overload protection available.

943. The factor(s) to be considered in selection of motor is/are
(a) voltage rating of the motor.
(b) kW output rating of the motor.
(c) speed and frame enclosure size.
(d) bearings and protection provided.
(e) all of the above.

944. A 3-phase wound rotor induction motor, when started with load connected to its shaft, was found to start but settle down at about half synchronous speed. If the rotor winding as well as stator winding were star-connected, the cause of the malfunctioning could be attributed to
(a) one of the stator phase winding being short-circuited.
(b) one of the supply fuses being blown.
(c) one of the rotor phase being open-circuited.
(d) two of the rotor phases being open-circuited.
[U.P.S.C. I.E.S. E.E.-II, 1997]

945. Armature short-circuits can be detected and identified by _____ test(s).
(a) growler (b) bar-to-bar
(c) voltage drop (d) any of these

946. In which of the following aspects induction generator does not differ from a synchronous generator ?
(a) It does not need dc excitation.
(b) Its stator is different in construction from that of a synchronous generator.
(c) It only generates when its stator is connected to the mains of constant frequency.
(d) No synchronising is required.
(e) The frequency generated is independent of its speed.

947. Induction generators deliver power at
(a) leading power factor only.
(b) lagging power factor only.
(c) leading as well as lagging power factor.
(d) unity power factor only.

948. In a self excited induction generator, to keep the frequency of generated voltage constant with the increase in load, the speed of the induction machine should be
(a) increased. (b) decreased.
(c) maintained less than the rated synchronous speed.
(d) maintained more than the rated synchronous speed.
[U.P.S.C. I.E.S. E.E.-II, 1995]

949. A 3-phase induction motor runs at super synchronous speed. For self excitation the machine
(a) draws real power from the mains.
(b) draws reactive power from the mains.
(c) feeds reactive power to the mains.
(d) generates emf at the expense of residual magnetism.
[A.M.I.E. Sec B. Elec. Machines Winter 1994]

950. Consider the following statements; If a 3-phase squirrel cage induction machine operates at a slip of - 0.05 (*i.e.* minus 0.05), then the machine will
1. draw electrical power from the mains.
2. draw mechanical power through the shaft.
3. deliver electrical power to the mains.
Of these statements
(a) 1,2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1996]

951. Which of the following is not the advantage of an induction generator ?
(a) It does not hunt or drop out of synchronism.
(b) It is simple and rugged in construction, cheaper in cost and needs little maintenance.
(c) It delivers only leading current.
(d) When short circuited it delivers little or no sustained power.

952. Which of the following is not the disadvantage of an induction generator ?
(a) It cannot be operated independently.
(b) When short circuited it delivers little or no sustained power.
(c) It can deliver only leading current.
(d) none of the above.

953. An 8-pole wound rotor induction motor operating at 60 Hz supply is driven at 1,800 rpm by a prime mover in the opposite direction of the revolving field. The rotor current frequency is
(a) 60 Hz. (b) 120 Hz.
(c) 180 Hz. (d) none of the above.
[A.M.I.E. Sec B. Elec. Machines Winter 1993, Summer 1997]

954. A 3-phase induction machine draws active power 'P' and reactive power 'Q' from the grid. If it is operated as a generator, P and Q will respectively be
(a) positive and negative. (b) negative and negative.
(c) positive and positive. (d) negative and positive.
[U.P.S.C. I.E.S. E.E.-II 1998; A.M.I.E. Sec B. Winter 2003]

Answers: **936.** (d), **937.** (f), **938.** (d), **939.** (d), **940.** (e), **941.** (c), **942.** (b), **943.** (e), **944.** (c), **945.** (d), **946.** (b), **947.** (a), **948.** (a), **949.** (b), **950.** (c), **951.** (c), **952.** (b), **953.** (c), **954.** (d),

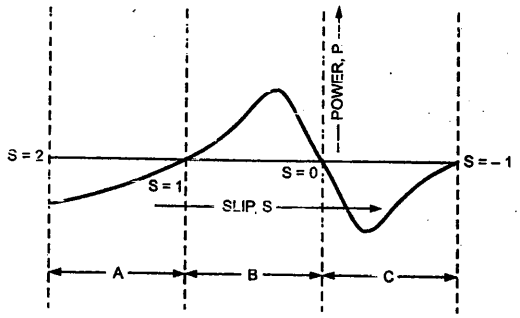
955.



The power-slip characteristics of a 3-phase induction machine, shown in the figure, has three regions of operations:
A- Braking region B- Motor region C- Generator region
Which of these are correctly represented in the given figure?
(a) A and B. (b) B and C.
(c) A and C. (d) A, B and C.
[U.P.S.C. I.E.S. E.E.-II, 1993]

956. In a 3-phase induction machine, motoring, generating and braking operations take place in the range of slip "s" given by
(a) motoring: $1 > s > 0$; generating : $0 > s > -1$; braking : $s > 1$.
(b) motoring : $s > 1$; generating $1 > s > 0$; braking ; $0 > s > -1$.
(c) motoring: $s > 1$; generating $0 > s > -1$ braking : $1 > s > 0$.
(d) motoring: $0 > s > -1$; generating : $s > 1$; braking : $1 > s > 0$. [U.P.S.C. I.E.S. E.E.-II, 1994]

957. In a 3-phase induction machine, motoring, generating and braking operations take place in the range of slip "S" is
(a) $1 > s > 0$, $0 > s > -2$ and $s > 1$
(b) $s > 1$, $1 > s > -1$ and $0 > s > -1$
(c) $s > 1$, $0 > s > -1$ and $1 > s > 0$
(d) $0 > s > -1$, $s > 1$ and $1 > s > 0$ [U.P.S.C. I.E.S. E.E.-II, 2010]

958. Which of the following statements about synchronous-induction motors is incorrect?
(a) It is basically a wound rotor induction motor with fewer and larger slots on rotor.
(b) It has a very small air gap as expected in a plain induction motor.
(c) It is connected to 3-phase ac supply on stator side and to dc on rotor side.
(d) It starts as an induction motor and runs as a synchronous motor.
(e) It is provided with a heavy rotor winding.

959. The synchronous impedance of a synchronous-induction motor is much larger than that of a synchronous motor due to
(a) its larger air gap.
(b) presence of damper bars in it.
(c) its less magnetic reluctance.
(d) supply of dc excitation to its 3-phase rotor.

960. Synchronous-induction motors
(a) are used where high starting torque is required.
(b) can be operated on full load on any desired pf.
(c) are very often installed alongwith other induction motors in order to improve the overall power factor of the system.
(d) have been made for rating up to 30,000 kW.
(e) all of the above statements regarding synchronous induction motors are correct.

961. The secondary of a linear induction motor normally consists of a
(a) concentrated single phase winding.
(b) distributed single phase winding.
(c) solid conducting plate.
(d) distributed three phase winding.

962. Linear induction motor is used in
(a) traction. (b) magnetic attraction.
(c) mechanical workshops. (d) textile mills.

963. A Schrage motor is a variable speed commutator type three phase induction motor and has three windings,
(a) all the three windings located in stator.
(b) all the three windings located in rotor.
(c) two windings in rotor and one winding in stator.
(d) two windings in stator and one winding on rotor.

964. The primary winding of a Schrage motor is located
(a) in stator. (b) in lower part of the rotor.
(c) in upper part of the rotor.
(d) partly in stator and partly in rotor.

965. For starting a Schrage motor, 3-phase supply is connected to
(a) rotor via slip-rings.
(b) secondary winding via brushes.
(c) regulating windings.
(d) stator windings as in an ordinary induction motor.

966. Which of the following statements about Schrage motor is incorrect?
(a) it gives normally speed range of 3 to 1 but much speed ranges upto 15 to 1 and higher may also be obtained.
(b) It is cheaper than the slip-ring induction motor.
(c) Its efficiency is higher than that of a slip-ring induction motor at all speeds except synchronous speed and is very much high at lower speeds.
(d) While operating exactly at synchronous speed it behaves, in a sense, like a synchronous motor with compensating winding functioning as a dc exciter.

967. Which of the following statements associated with a Schrage motor is/are correct ?
(a) The magnitude of the slip frequency voltage injected into the secondary circuit depends upon the spacing between the two sets of brushes, and the phase depends on their angular position with respect to centre of the rotor winding.
(b) When the two sets of brushes of each phase are making contact with the same commutator bar, the secondary is short-circuited and the motor operates as an ordinary induction motor.
(c) Its power factor can be varied by rocking the brushes as a whole round the commutator.
(d) all of the above.

968. A 3-phase slip-ring induction motor is fed from the rotor side with stator winding short circuited. The frequency of the currents in the short-circuited stator is
(a) slip frequency. (b) supply frequency.
(c) frequency corresponding to rotor speed.
(d) zero. [GATE E.E. 1993]

969. A 3-phase induction motor is fed from a balanced 3-phase supply on the rotor side, short-circuiting the stator terminals. The speed of the rotating magnetic field is
(a) zero. (b) equal to rotor speed.
(c) equal to synchronous speed.
(d) equal to slip speed. [A.M.I.E. Sec B. Winter 1994]

970. In particular motor there is a stator phase winding and a short-circuited rotor winding. The motor runs as synchronous speed but does not necessitate any dc excitation. The motor is a

Answers: **955.** (d), **956.** (a), **957.** (a), **958.** (b), **959.** (c), **960.** (e), **961.** (c), **962.** (a), **963.** (c), **964.** (b), **965.** (a), **966.** (b), **967.** (d), **968.** (a), **969.** (d), **970.** (c),

(a) 3-phase induction motor.
(b) 3-phase synchronous motor.
(c) 3-phase reluctance motor.
(d) hysteresis motor. [A.M.I.E. Sec B. Elec. Machines Summer 1994]

971. The motor that requires the most complicated arrangement for speed control is
(a) dc shunt motor.
(b) squirrel cage induction motor.
(c) stator supplied 3-phase commutator motor.
(d) rotor supplied 3-phase commutator motor.

972. When the stators of two slip-ring induction motors are fed from a common 3-phase ac supply in parallel and the rotor windings are connected in opposition, they are called
(a) power selsyns. (b) position selsyns.
(c) power synchros. (d) position synchros.

973. Position synchros normally have _____ phase stator winding and _____ phase rotor winding.
(a) three, single (b) single, three
(c) three, three (d) single, single

974. Phase advancers are employed with large induction motors to
(a) regulate their speeds. (b) reduce copper losses.
(c) improve power factor. (d) reduce noise and vibrations.

975. Which of the following statements about a phase advancer is incorrect?
(a) It is a particular type of ac exciter which may be connected in the rotor circuit of an induction motor to improve power factor.
(b) It uses the principle of injection through slip-rings of the motor a current leading with regard to the rotor voltage.
(c) It resembles with an induction motor in construction.
(d) Its kVA capacity needs be only 5% or less of kVA correction affected in the main supply circuit.
(e) it has compensating windings on the stator to ensure good commutation.

976. Single phase ac motors are used in largest number. This is due to
(a) their great variety of useful services in the home, office, the factory, in business establishment and on the farm.
(b) their wide applications in automatic control devices of various types.
(c) lower cost. (d) both (a) and (b).

977. A dual voltage single phase ac motor can be operated on either
(a) 230 or 400 V. (b) 30 or 400 V
(c) 115 or 230 V. (d) 160 or 320 V.

978. Single phase ac motors are classified on the basis of
(a) construction. (b) starting methods.
(c) size. (d) rpm.
(e) both construction and starting methods.

979. In a single phase ac induction motor
(a) stator is supplied with single phase ac.
(b) rotor is supplied with single phase ac.
(c) rotor is a cage rotor. (d) rotor is a wound rotor.
(e) both (a) and (c).

980. The rotor slots in an induction motor are, usually not kept parallel to the shaft as it
(a) helps the rotor teeth to remain under the stator teeth.
(b) helps in reducing the tendency of the rotor teeth to remain under the stator teeth.
(c) improves pf. (d) improves efficiency.

981. A single phase induction motor is
(a) self starting. (b) not self starting.
(c) self starting with the help of an auxiliary winding.
(d) none of the above.

982. Double revolving field theory is based on the idea that pulsating field produced in single phase motors can be resolved into two components of _____ its amplitude and rotating in _____ direction with synchronous speed.
(a) half, same (b) half, opposite
(c) $\frac{1}{\sqrt{2}}$ times of, same (d) $\sqrt{2}$ times, opposite

983. When a single phase induction motor is excited with single phase ac voltage, the magnetic field set up is equivalent to
(a) two fields, rotating in opposite directions with different speeds.
(b) two fields, rotating at synchronous speed in opposite directions.
(c) two fields, rotating at synchronous speed.
(d) two fields, rotating in the same direction but at different speeds. [U.P.S.C. I.E.S. E.E.-II 2004]

984. A single phase induction motor with only the main winding excited would exhibit the following response at synchronous speed
(a) Rotor current is zero.
(b) Rotor current is non-zero and is at slip frequency.
(c) Forward and backward totaling fields are equal.
(d) Forward rotating field is more than backward rotating field. [GATE E.E. 2003]

985. A single phase induction motor is running at N rpm. Its synchronous speed is N_s. If its slip with respect to forward field is s, what is the slip with respect to the backward field?
(a) s (b) $-s$ (c) $(1 - s)$ (d) $(2 - s)$ [U.P.S.C. I.E.S. E.E.-II, 2006]

986. In case of a split-phase motor, the phase shift between currents in the two windings is around
(a) 30° (b) 70° (c) 90° (d) 120° [GATE E.E. 1996]

987. An 8-pole, 50 Hz single phase induction motor is running at 690 rpm. Its slip w.r.t. forward field is (in pu)
(a) + 0.08 (b) + 1.92 (c) − 0.08 (d) 1.00 [A.M.I.E. Sec B. Elec. Machines Summer 1999]

988. An 8-pole single phase induction motor is running at 690 rpm. What is its slip with respect to forward and backward fields, respectively?
(a) 0.08, 2.0 (b) 0.08, 1.92
(c) 1.92, 0.08 (d) 2.0, 0.08 [U.P.S.C. I.E.S. E.E.-II, 2007]

989. A 230 V, 50 Hz, 4 pole, single-phase induction motor is rotating in the clockwise (forward) direction at a speed of 1,425 rpm. If the rotor resistance at standstill is 7.8 Ω, then the effective rotor resistance in the backward branch of the equivalent circuit will be
(a) 2 Ω (b) 4 Ω (c) 78 Ω (d) 156 Ω [GATE E.E. 2008]

990. In a comparative study of the torque-slip characteristic of a balanced polyphase induction motor and that of a single phase induction motor, it is found that for zero slip
(a) the torque for the former is zero and has a non-zero negative value for the latter.
(b) the torque has a non-zero positive value on the former and has a non-zero negative value on the latter.

Answers: **971.** (b), **972.** (a), **973.** (a), **974.** (c), **975.** (c), **976.** (d), **977.** (c), **978.** (e), **979.** (e), **980.** (b), **981.** (c), **982.** (b), **983.** (b), **984.** (d), **985.** (d), **986.** (a), **987.** (a), **988.** (b), **989.** (b), **990.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the torque is zero on both of the characteristics.
(d) the torque has non-zero positive value on both of the characteristics.

991. A rotating magnetic field is produced by current in two windings displaced by 90 electrical degrees. This is the principle of
(a) phase sequence. (b) phase splitting.
(c) phase timing. (d) none of these.

992. In an induction motor
(a) stator current, stator flux and rotor emf are in phase.
(b) Rotor current and rotor flux are in phase and both lag behind the rotor emf by 90°.
(c) Rotor current, rotor flux and rotor emf are in phase.
(d) both (a) and (b) are correct.

993. Field created by rotor currents is at right angle to the field created by stator currents and is so called the crossfield. The crossfield is _____ stator field at actually operating speeds.
(a) somewhat weaker than (b) somewhat stronger than
(c) of the same strength as that of
(d) any of the above

994. In comparison to three phase induction motors, single phase induction motors have
(a) lower efficiency. (b) lower pf.
(c) poor speed regulation. (d) more slip at full load.
(e) all of the above.

995. The torque developed by a single phase induction motor drops to zero at
(a) synchronous speed.
(b) a speed slightly above synchronous speed.
(c) a speed slightly below synchronous speed.
(d) none of the above.

996. The no-load current of a single phase induction motor is around _____ % of full load current.
(a) 10 (b) 20 (c) 40 (d) 80

997. The power factor at which single phase induction motors usually operate is
(a) 0.7 lag. (b) 0.8 lag. (c) 0.7 lead. (d) unity.

998. Which of the following tests are performed on single phase ac motors ?
(a) Stator winding resistance test.
(b) Blocked rotor test. (c) No-load test.
(d) All of the above.

999. Single phase induction motors are made self starting by
(a) increasing rotor resistance.
(b) using an external starting device.
(c) providing an additional winding on the stator called the auxiliary winding.
(d) any of the above methods.

1000. The two windings provided on the stator of a single phase induction motor, one main winding and the other auxiliary winding are connected
(a) in parallel. (b) in series.
(c) either in series or in parallel depending on the design of the motor.
(d) through inductive coupling.

1001. The stator winding of a single phase induction motor is splitted into two parts in order to
(a) improve efficiency. (b) improve power factor.
(c) develop starting torque. (d) increase speed.

1002. In a single phase induction motor
(a) both the main and auxiliary windings are placed on stator.
(b) both the main and auxiliary windings are placed on rotor.
(c) main winding is placed on stator and auxiliary winding on rotor.
(d) auxiliary winding is placed on stator and main winding on rotor.

1003. Phase splitting can be accomplished in a single phase induction motor
(a) only by adding a capacitor in series with the auxiliary winding.
(b) only by causing the auxiliary winding to have high reactance.
(c) only by causing the auxiliary winding to have low resistance.
(d) by any one of the above three methods.
[A.M.I.E. Sec B. Elec. Machines Winter 1994]

1004. Which of the following statements associated with split–phase motors is incorrect ?
(a) Auxiliary winding is wound of fine wire and is placed in the top of the slots to give high resistance and low reactance.
(b) Main winding has low resistance and high reactance.
(c) Main winding current and auxiliary winding current are 90° out of phase.
(d) Torque developed is proportional to sine of the angle between main winding and auxiliary winding currents.
(e) Starting winding is connected through centrifugal switch.

1005. In a split-phase motor the ratio of number of turns on auxiliary winding to that on main winding is
(a) unity. (b) less than one.
(c) more than one. (d) two.

1006. Why is a centrifugal switch used in a single-phase induction motor?
(a) To protect the motor from overloading.
(b) To improve the starting performance of the motor.
(c) To cut off the starting winding at an appropriate instant.
(d) To cut in the capacitor during running conditions.
[U.P.S.C. I.E.S. E.E.-II, 2008]

1007. Centrifugal switch fitted on the rotor will operate when
(a) rotor speed reaches its rated condition.
(b) rotor speed exceeds 70 per cent of its rated value.
(c) rotor speed exceeds synchronous speed.
(d) rotor speed exceeds 40 per cent of its rated value.
[A.M.I.E. Sec B. Winter 1996]

1008. The torque-speed characteristic of two phase induction motor is largely affected by
(a) voltage. (b) speed.
(c) $\frac{X}{R}$ ratio. (d) supply frequency.
[U.P.S.C. I.E.S. E.E.-II, 1992]

1009. Which of the following statement(s) about split–phase motors is/are correct ?
(a) Its starting torque is 1.5 to 2 times of full-load running torque.
(b) Its starting current is about 7 times of full-load current.
(c) Main winding and auxiliary winding currents are about 30° out of phase.
(d) all of the above.

1010. The direction of rotation of a split–phase induction motor can be reversed by reversing the connections to the supply of
(a) auxiliary winding only. (b) main winding only.
(c) either (a) or (b).
(d) both (a) and (b) simultaneously.

1011. The capacitor in a capacitor-start induction run ac motor is connected in series with

Answers: **991.** (b), **992.** (d), **993.** (a), **994.** (e), **995.** (c), **996.** (c), **997.** (a), **998.** (d), **999.** (c), **1000.** (a), **1001.** (c), **1002.** (a), **1003.** (d), **1004.** (c), **1005.** (b), **1006.** (c), **1007.** (b), **1008.** (c), **1009.** (d), **1010.** (c), **1011.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) starting winding. (b) running winding.
(c) squirrel cage winding. (d) compensating winding.
[R.G.T.U. B.E.E. June, 2007]

1012. A single phase induction motor is provided with a 3-phase slip-ring rotor connected to starting resistances. The motor would
(a) not start.
(b) result in more starting torque.
(c) produce no difference in the starting torque.
(d) run at half the synchronous speed.
[A.M.I.E. Sec B. Winter 2003]

1013. In a single phase induction motor driving a fan load, the reason for having a high resistance rotor is to achieve
(a) low starting torque. (b) quick acceleration.
(c) high efficiency. (d) reduced size. [GATE E.E. 2005]

1014. Capacitor in a single-phase induction motor is used for
(a) improving the power factor.
(b) improving the starting torque.
(c) starting the motor.
(d) reducing the harmonics. [U.P.S.C. I.E.S. E.E.-II, 2002]

1015. For a single phase capacitor start induction motor which of the following statements is valid?
(a) The capacitor is used for power factor improvement.
(b) The direction of rotation can be changed by reversing the main winding terminals.
(c) The direction of rotation cannot be changed.
(d) The direction of rotation can be changed by interchanging the supply terminals. [GATE E.E. 2006]

1016. The capacitor usually used on 1440 rpm, 50 Hz capacitor–start induction motor is of electrolytic type and _____ capacity.
(a) 10 μF (b) 100 μF (c) 350 μF (d) 800 μF

1017. A capacitor selected for capacitor–start induction motor should be rated for
(a) peak voltage. (b) rms voltage.
(c) average voltage. (d) none of these.

1018. The capacitor employed in a capacitor–start induction motor has no
(a) voltage rating. (b) polarity marking.
(c) dielectric rating. (d) definite capacitance value.

1019. The value of capacitor for a capacitor–start induction motor is determined by its
(a) speed. (b) efficiency.
(c) starting torque. (d) power factor.

1020. The phase–split in a capacitor–start induction motor can be adjusted to approximately 90° by
(a) selecting capacitor employed in the auxiliary winding of correct value.
(b) adjusting the reactance of the main winding.
(c) adjusting the supply voltage.
(d) choosing correct number of turns of the auxiliary winding.

1021. Which one of the following capacitor-start split-phase motor will have the largest value of capacitance ?
(a) $\frac{1}{2}$ hp; 3,450 rpm. (b) $\frac{1}{4}$ hp; 1,725 rpm.
(c) $\frac{1}{2}$ hp; 1,140 rpm. (d) $\frac{3}{4}$ hp; 1,140 rpm.
[U.P.S.C. I.E.S. E.E.-II, 1993]

1022. A capacitor-start single phase induction motor is used for
(a) easy to start loads. (b) medium start loads.
(c) hard to start loads. (d) any type of start loads.
[U.P.S.C. I.E.S. E.E.-II, 2005]

1023. The capacitor start motor like resistance start motor, has the auxiliary winding disconnected by means of a centrifugal switch as the motor picks up speed. This is necessary because
(a) the capacitance that gives the largest starting torque is about four times too big for the best running conditions.
(b) if the capacitor is used only for starting, it can be electrolytic type which is much smaller and cheaper than the paper capacitor required for continuous operation.
(c) both (a) and (b). (d) none of these.

1024. In comparison to a resistance start motor, the capacitor start motor has
(a) high starting torque (about double).
(b) low starting current (about half).
(c) high running torque.
(d) larger phase difference between two winding currents.
(e) more number of turns on auxiliary winding.
(f) all of the above statements except (c) are correct.

1025. A capacitor start induction motor is switched on to supply with its capacitor replaced by an inductor of equivalent reactance. The motor will
(a) not start at all. (b) start and run slowly.
(c) start and run at rated speed.
(d) start with humming noise.

1026. If the capacitor of a capacitor start induction motor is short circuited, the motor will
(a) start. (b) not start.
(c) burn. (d) start with jerks.

1027. If the capacitor of a capacitor start induction motor fails to open when it picks up the speed,
(a) the motor will stop.
(b) the auxiliary winding will get damaged.
(c) the capacitor will get damaged.
(d) the main winding will get damaged.

1028. Capacitor-start capacitor-run induction motor is basically a _____ motor.
(a) two phase (b) ac series
(c) commutator (d) synchronous

1029. In a capacitor-start capacitor-run induction motor
(a) oil impregnated paper of small value and continuous rating is connected in series with the main winding.
(b) larger value electrolytic short duty capacitor is connected in series with auxiliary winding through a centrifugal switch.
(c) low value oil impregnated paper capacitor is connected in series with the auxiliary winding through a centrifugal switch.
(d) both (a) and (b).

1030. In a capacitor-start capacitor-run single phase induction motor, the value of capacitor connected in series with starting winding is approximately—times that of capacitor connected in the main or running winding.
(a) $\frac{1}{3}$ (b) 3 (c) $\frac{1}{2}$ (d) twice

1031. A single phase, 230 V, 50 Hz, 4-pole, capacitor-start induction motor has the following standstill impedances.
Main winding $Z_m = 6.0 + j\,4.0\ \Omega$
Auxiliary winding, $Z_a = 8.0 + j\,6.0\ \Omega$
The value of the starting capacitor required to produce 90° phase difference between the currents in the main and auxiliary windings will be
(a) 176.84 μF. (b) 187.24 μF.
(c) 265.26 μF. (d) 280.86 μF. [GATE E.E 2004]

Answers: **1012.** (b), **1013.** (b), **1014.** (c), **1015.** (b), **1016.** (c), **1017.** (a), **1018.** (b), **1019.** (c), **1020.** (a), **1021.** (d), **1022.** (c), **1023.** (c), **1024.** (f), **1025.** (a), **1026.** (b), **1027.** (c), **1028.** (a), **1029.** (d), **1030.** (b), **1031.** (a),

Downloaded From : www.EasyEngineering.net

1032. In a capacitor-start and run 1-phase induction motor, starting capacitor C_1 and permanent capacitor C_2 are as under:
(a) C_1 : electrolytic type; C_2 : paper type.
(b) C_1 : elcctrolytic type; C_2 : mica type.
(c) C_1 : mica type; C_2 : electrolytic type.
(d) C_1 : paper type; C_2 : electrolytic type.
[A.M.I.E. Sec B. Winter 2003]

1033. Which one of the following statements regarding a capacitor-start, capacitor-run single phase induction motor is correct?
(a) One of the capacitors is in the circuit during starting and both are in the circuit during running.
(b) Both the capacitors are in the circuit during starting and one of them in the circuit during running.
(c) Both the capacitors are in the circuit during starting and running.
(d) One of the capacitor is in the circuit during starting and other is in the circuit during running.
[U.P.S.C. I.E.S. E.E.-II, 1999]

1034. As compared to capacitor start motors two capacitor type induction motors have
(a) better power factor and better efficiency.
(b) constant torque and so quite operation.
(c) greater overload capacity.
(d) high starting torque. (e) all of the above.

1035. Two capacitor type induction motors have the main drawback of
(a) high cost. (b) low power factor.
(c) pulsating torque. (d) poor starting torque.

1036. Two capacitor type single phase induction motor is generally coupled with the air-conditioner compressor because it
(a) is cheaper. (b) is quite in operation.
(c) has higher running torque.
(d) has low starting as well as running currents.

1037. In a ceiling fan employing permanent capacitor motor
(a) secondary winding surrounds the primary winding.
(b) primary winding surrounds the secondary winding.
(c) both are usual arrangements.
(d) none of the above.

1038. In comparison to resistance start induction motor the permanent capacitor motor
(a) is more expensive. (b) has better power factor.
(c) has better starting torque. (d) all of the above.

1039. In comparison to capacitor-start capacitor-run motor the permanent capacitor motor has
(a) simple construction and low cost.
(b) poor power factor. (c) poor starting torque.
(d) all of the above.

1040. Which of the following statements regarding permanent capacitor motor is false ?
(a) It does not have a centrifugal switch.
(b) It does not have a starting winding and a squirrel cage rotor.
(c) Its auxiliary winding is designed for continuous rating.
(d) It is more sensitive to voltage variations due to its poor running torque.

1041. Capacitor-start and capacitor-run motors are used in
(a) hoists. (b) rolling mills.
(c) mining. (d) refrigerator.
[A.M.I.E. Sec B. Summer 1998]

1042. In a shaded pole motor the phase splitting is achieved by placing a shading coil at the slot cut around the
(a) larger part of the pole. (b) smaller part of the pole.
(c) both the parts of the pole.
(d) any of the above.

1043. In a shaded pole motor, the rotating field is developed by using
(a) salient poles. (b) a capacitor.
(c) shading coils. (d) damper winding.

1044. Shaded pole motor is provided with
(a) laminated salient poles and a squirrel cage rotor.
(b) a commutator. (c) a capacitor.
(d) a centrifugal switch.

1045. In a shaded-pole motor, shading coils are used to
(a) reduce winding losses. (b) reduce friction losses.
(c) produce rotating magnetic field.
(d) protect against sparking. [U.P.S.C. I.E.S. E.E.-II, 1992]

1046. In a shaded-pole induction motor, the rotor runs from the
(a) shaded portion to the unshaded portion of the pole while the flux in the former leads that of the latter.
(b) shaded portion to the unshaded portion of the pole while the flux in the former lags that in the latter.
(c) unshaded portion to the shaded portion while the flux in the former leads that in the latter.
(d) unshaded portion to the shaded portion while the flux in the former lags that in the latter. [U.P.S.C. I.E.S. E.E.-II 2001]

1047. Consider the following statements regarding fractional horse power shaded pole motor;
1. Its direction of rotation is from unshaded to shaded portion of the poles.
2. Its direction of rotation is from shaded to unshaded portion of the poles.
3. It can remain stalled for short periods without any harm.
4. It has a very poor power factor.
Of these statements
(a) 1,3 and 4 are correct. (b) 2,3 and 4 are correct.
(c) 2 and 4 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1997]

1048. Which of the following are the features of a shaded pole motor?
1. Salient pole stator. 2. Uniform air gap.
3. Two stator windings one of which is a short-circuited ring.
4. Squirrel cage rotor.
Select the correct answer using the codes given below:
Codes:
(a) 1 and 4. (b) 2 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 1998]

1049. Which of the following statements associated with shaded pole induction motor is incorrect ?
(a) It is one of the simplest and cheapest single phase induction motor.
(b) It has squirrel cage type rotor.
(c) It has high operating efficiency.
(d) It has laminated salient poles each provided with its own exciting coil.
(e) It is built in very small ratings (say upto 40 W).

1050. In a shaded pole induction motor, locked rotor current is _____ full-load current.
(a) less than (b) equal to
(c) slightly more than (d) several times the

Answers: **1032.** (a), **1033.** (b), **1034.** (e), **1035.** (a), **1036.** (d), **1037.** (a), **1038.** (d), **1039.** (d), **1040.** (b), **1041.** (d), **1042.** (b), **1043.** (c), **1044.** (a), **1045.** (c), **1046.** (c), **1047.** (a), **1048.** (a), **1049.** (c), **1050.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1051. The direction of rotation of a shaded pole induction motor
(a) cannot be reversed unless there is a provision for shifting of shading coil from one half to the other half of the pole.
(b) can be reversed by interchanging main winding terminals.
(c) can be reversed by interchanging the supply terminals.
(d) can be reversed by open-circuiting the shading rings.

1052. The speed of single phase induction motors can be controlled by
(a) varying the applied voltage to the stator winding.
(b) varying the number of poles on the stator.
(c) either (a) or (b). (d) none of these.

1053. The wattage rating for a ceiling motor will be in the range
(a) 50 to 250 W. (b) 250 to 500 W.
(c) 50 to 150 W. (d) 10 to 20 W.
[A.M.I.E. Sec B. Elec. Machines Summer 1996]

1054. The type of single-phase induction motor having the highest power factor at full load is
(a) shaded pole type. (b) split-phase type.
(c) capacitor- start type. (d) capacitor-run type.
[GATE E.E. 2004]

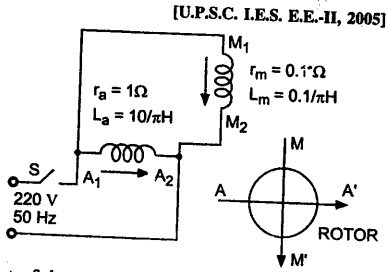
1055. In various types of split-phase 1-phase induction motors, the starting torques produced are in the following descending order
(a) Capacitor-split, resistor-split, shaded pole.
(b) Capacitor-split, shaded-pole, resistor split.
(c) Resistor-split, capacitor-split, shaded pole.
(d) Shaded pole, resistor-split, capacitor-split.
[A.M.I.E. Sec B. Summer 2000]

1056. Consider the following types of single phase motors:
1. Capacitor start induction motor.
2. Capacitor start and run induction motor.
3. Permanent split capacitor motor.
4. Shaded pole motor.
The correct sequence of these in the ascending order of magnitude of starting torque is
(a) 1-2-3-4. (b) 2-3-4-1. (c) 3-4-2-1. (d) 4-3-2-1.
[U.P.S.C. I.E.S. E.E.-II, 2003]

1057. Consider the following single-phase motors
I Capacitor start motor II Capacitor start and run motor
III Permanent split capacitor motor
IV Shaded pole motor
The correct sequence of the increasing order of their cost is
(a) IV, III, II, I. (b) IV, III, I, II.
(c) III, IV, II, I. (d) III, IV, I, II.
[U.P.S.C. I.E.S. E.E.-II, 1993]

1058. In hand tool applications, which one of the following single-phase motors is used?
(a) Shaded pole motor. (b) Capacitor start motor.
(c) Capacitor run motor. (d) AC series motor.
[U.P.S.C. I.E.S. E.E.-II, 2005]

1059. A 200 V, 50 Hz, single-phase induction motor has the following connection diagram and winding orientations shown. MM′ is the axis of the main stator winding (M_1M_2) and AA′ is that of the auxiliary winding (A_1A_2). Directions of the winding axis indicate direction of flux when currents in the windings are in the directions shown. Parameters of each winding are indicated. When switch S is closed, the motor



(a) rotates clockwise. (b) rotates anticlockwise.
(c) does not rotate.
(d) rotates momentarily and comes to a halt. [GATE E.E. 2009]

1060. A dc shunt motor does not operate on ac due to
(a) low resistance of armature circuit.
(b) high resistance of field circuit.
(c) high inductance of field circuit.
(d) reversal of polarity. [A.M.I.E. Sec B. E. Machines Winter 1994]

1061. A dc series motor is accidently connected to single phase ac supply. The torque produced will be
(a) of zero average value. (b) oscillating.
(c) steady and unidirectional.
(d) pulsating and unidirectional. [U.P.S.C. I.E.S. E.E.-II, 2002]

1062. A 230 V dc series motor is connected to a 230 V ac supply
(a) the motor will vibrate violently.
(b) the motor will run with less efficiency and more sparking.
(c) the motor will not run. (d) the fuse will be blown.
[U.P.S.C. I.E.S. E.E.-II, 1998]

1063. If a dc series motor is operated on ac supply, it
(a) will not start at all.
(b) will start and run but will have poor performance such as excessive sparking, poor efficiency and poor power factor.
(c) will get damaged due to burning of its windings.
(d) will run at excessively high speed.

1064. The operation of an ordinary dc series motor when operated on ac, would not be satisfactory. The reason(s) is/are
(a) excessive eddy-current losses in the field core and yoke due to alternation in field flux.
(b) heavy sparking due to induced voltages and currents in the armature coils short-circuited by the brushes while undergoing commutation.
(c) abnormal voltage drop and low power factor due to inductance of the field winding.
(d) non-uniform torque due to reversal of field and armature currents every half cycle.
(e) all of the above.

1065. AC series motors are built with as few field turns as possible to reduce
(a) flux. (b) eddy current losses.
(c) reactance. (d) speed.

1066. AC series motors in comparison to dc series motors do not have
(a) lesser number of field turns.
(b) larger number of armature conductors.
(c) larger number of poles with lesser flux per pole.
(d) wider air gap. (e) brushes of smaller width.

1067. AC series motors in comparison to dc series motors do not have
(a) all parts of magnetic circuits laminated.
(b) multi-turn armature coils.
(c) very short air gap. (d) single turn armature coils.

1068. In a large sized ac series motor, the inductive effects of armature and field cause
(a) serious commutation difficulties.
(b) heavy iron losses.
(c) low power factor. (d) all of the above.

1069. Which of the following statements associated with an ac series motor is/are incorrect ?

Answers: **1051.** (a), **1052.** (c), **1053.** (c), **1054.** (d), **1055.** (a), **1056.** (d), **1057.** (b), **1058.** (d), **1059.** (b), **1060.** (c), **1061.** (d), **1062.** (b), **1063.** (b), **1064.** (e), **1065.** (c), **1066.** (d), **1067.** (b), **1068.** (d), **1069.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Its speed falls with the increase in load torque.
(b) Its power factor deceases with the increase in load torque.
(c) Its torque-speed characteristic is similar to that of a dc shunt motor.
(d) Its torque-speed characteristic is similar to that of a dc series motor.

1070. In an ac series motor
(a) the starting current is about 2.5 times of full load current.
(b) the starting torque is about 4 times of full load torque.
(c) power factor varies from 0.9 to 0.95 lagging.
(d) all of the above.

1071. In an ac series motor, compensation winding is provided to
(a) neutralize the armature mmf.
(b) improve commutation and reduce sparking at the brushes.
(c) reduce reactance drop.
(d) reduce armature heating and vibrations.
(e) all of the above except (d).

1072. AC series motors are preferably operated on low voltage and low frequency because
(a) low operating voltage reduces the inductance.
(b) lower operating frequency reduces reactance and iron loss and improves commutation.
(c) both (a) and (b). (d) none of these.

1073. In an ac series motor, power factor is improved by
(a) increasing the inductance of armature and field windings.
(b) reducing the inductance of armature and field windings.
(c) increasing the supply voltage.
(d) both (a) and (c).

1074. In an ac series motor, commutation is improved by
(a) reducing the number of armature conductors.
(b) providing commutating poles.
(c) providing commutating poles and shunting winding of each of these poles with a non-inductive resistance.
(d) increasing field winding turns.

1075. In ac series motors armature coils are usually connected to commutator
(a) through resistors. (b) through inductors.
(c) through capacitors. (d) solidly.

1076. For improvement of commutation in ac series motors shunted commutating poles are commonly used and commutating pole windings are shunted by a
(a) non-inductive resistor to make the commutating pole current to lead the main current.
(b) non-inductive resistor to make the commutating pole current to lag behind the main current.
(c) reactor to make the commutating pole current to lag behind the main current.
(d) given statements are false.

1077. A universal motor is one which has
(a) constant speed. (b) constant output.
(c) capability of operating both on ac and dc with comparable performance.
(d) maximum efficiency.

1078. Which of the following statements associated with universal motor is incorrect ?
(a) It is a series connected commutator motor.
(b) It is a constant speed motor.
(c) Its armature is of same construction as ordinary series motor.
(d) Like all series motors, its no-load speed is very high.
(e) It is usually built into the device it drives.

1079. A universal motor runs at
(a) higher speed with dc supply and with less sparking.
(b) higher speed with ac supply and with less sparking.
(c) same speed with both ac and dc supplies.
(d) higher speed with ac supply but with increased sparking at the brushes. **[U.P.S.C.I.E.S. E. E.-II, 1994]**

1080. Speed of the universal motor is
(a) dependent on frequency of supply.
(b) proportional to frequency of supply.
(c) independent of frequency of supply.
(d) none of the above. **[A.M.I.E. Sec B. Elec. Machines Winter 1993].**

1081. Direction of rotation of a universal motor can be reversed by
(a) interchanging the brush leads.
(b) interchanging the supply terminals.
(c) either (a) or (b). (d) none of these.

1082. The speed of a universal motor is usually reduced by using
(a) V-belts. (b) gearing.
(c) chains. (d) brakes.

1083. The speed of a universal motor can be controlled by
(a) introducing a variable resistance in series with the motor.
(b) tapping the field at various points.
(c) centrifugal mechanism.
(d) all of the above steps. **[U.P.S.C. I.E.S. E.E.-II, 1993]**

1084. In a universal motor the most common cause(s) of brush sparking is/are
(a) open armature winding. (b) shorted armature winding.
(c) shorted field winding. (d) high commutator mica.
(e) all of the above.

1085. Under no load operating condition, the speed of a universal motor is limited by
(a) windage and friction. (b) armature reaction
(c) armature weight. (d) supply frequency.

1086. The armature reaction in a large sized universal motor is neutralized by
(a) shifting the brushes.
(b) connecting a compensating winding in series with the armature.
(c) increasing the number of armature coils.
(d) using low resistance brushes.

1087. In case of a high speed universal motor _____ needs maximum attention.
(a) air gap (b) end play
(c) balancing of rotor (d) insulation of rotor

1088. In universal motors, normally the ratio of width of brushes to the width of commutator segments is
(a) 2 : 1 (b) 1 : 1 (c) 1 : 2 (d) 4 : 1

1089. Repulsion motor
(a) receives its armature current by induction.
(b) is similar to a series motor except that rotor and stator windings are inductively coupled.
(c) can be directly switched on to supply line.
(d) has high starting torque and high speed on no load.
(e) all of the above.

1090. A repulsion motor is equipped with
(a) slip rings. (b) centrifugal switch.
(c) commutators and brushes.
(d) all of the above.

Answers: **1070.** (d), **1071.** (e), **1072.** (c), **1073.** (b), **1074.** (c), **1075.** (a), **1076.** (b), **1077.** (c), **1078.** (b), **1079.** (a), **1080.** (c), **1081.** (a), **1082.** (b), **1083.** (d), **1084.** (e), **1085.** (a), **1086.** (b), **1087.** (c), **1088.** (a), **1089.** (e), **1090.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1091. In a repulsion motor
(a) stator usually carries a distributed winding similar to the main winding of an ordinary single phase induction motor.
(b) the rotor or armature is similar to a dc motor armature with a drum type winding connected to the commutator.
(c) the brushes fixed directly opposite to each other are connected to each other or short-circuited.
(d) the speed is function of load.
(e) all of the above.

1092. The commutation of repulsion motor is at its best
(a) during starting.
(b) when runs near synchronous speed.
(c) when runs at 50% of synchronous speed.
(d) when runs at 150% of synchronous speed.
[A.M.I.E. Sec B. Advanced Elec. Machines Winter 2001]

1093. Which of the following statements associated with repulsion motor is wrong ?
(a) Its direction of rotation depends upon the position of brushes.
(b) Its characteristics are similar to those of series motor.
(c) Its power factor is high.
(d) It is used where sturdy motor with large starting torque and adjustable but constant speed is required.

1094. In a repulsion motor, commutator provides a means of connecting the
(a) stator windings. (b) armature windings.
(c) starting winding. (d) none of these.

1095. In a repulsion motor the brushes are connected
(a) to the external supply.
(b) to each other or short-circuited.
(c) to the stator winding. (d) none of the above.

1096. Cross-connecting of commutator bars in repulsion motors reduces circulating currents caused due to
(a) unequal air gaps between the stator and rotor.
(b) shorted stator winding. (c) shorted brushes.
(d) all of these.

1097. In repulsion motors, brush angle with respect to magnetic axis is kept
(a) 0° to 15° (b) 15° to 45°
(c) 90° (d) 180°

1098. The torque-speed characteristic of a repulsion motor resembles which of the following dc motor characteristic ?
(a) Separately excited. (b) Shunt.
(c) Series. (d) Compound. [GATE E.E. 1996]

1099. In a single-phase repulsion motor power factor is
(a) always leading. (b) high at low speed.
(c) high at high speed. (d) always unity.
[A.M.I.E. Sec B. Elec. Machines Summer 19996]

1100. In a repulsion motor by shifting the brush position
(a) speed and direction of rotation can be controlled.
(b) only speed can be controlled.
(c) speed, torque and direction of rotation can be controlled.
(d) only torque can be controlled by varying the speed at constant output power. [A.M.I.E. Sec B. Elec. Machines Winter 1996]

1101. In a repulsion motor, if the angle of brush shift α from low impedance position is increased from 0 to 45° with constant current supply, then
(a) speed and power factor decrease but torque increases.
(b) speed and torque increase but pf decreases.
(c) speed, pf and torque increase.
(d) speed and pf increase but torque decreases.
[A.M.I.E. Sec B. Summer 2002]

1102. In a repulsion motor, torque developed will be zero when brush axis is at ___ electrical degrees to the field axis.
(a) 0 (b) 90
(c) 45 (d) both(a) and (b)

1103. In a repulsion motor speed control is affected by varying the
(a) impressed voltage. (b) position of brushes.
(c) supply frequency. (d) either (a) or (b).

1104. Direction of rotation of a repulsion motor is reversed by
(a) interchanging the supply leads.
(b) shifting the brushes round the commutator.
(c) either (a) or (b). (d) none of these.

1105. In a compensated repulsion motor, an additional stator winding is provided in order to
(a) improve power factor.
(b) provide better speed regulation.
(c) increase the output. (d) improve mechanical balance.
(e) both (a) and (b).

1106. A repulsion start induction motor operates as an induction motor when
(a) commutator segments are short circuited.
(b) brushes are short-circuited.
(c) stator is short-circuited.
(d) short-circuiting device is disconnected.

1107. The short-circuiting device in a repulsion start induction motor operates by
(a) magnetic attraction. (b) centrifugal force.
(c) circulating currents. (d) none of the above.

1108. The repulsion start induction motor has the advantage(s) of
(a) high starting torque (2.5 to 4.5 times of full-load torque).
(b) low starting current (about 3.5 times of full-load current).
(c) low cost, high efficiency and good power factor.
(d) both (a) and (b).

1109. Which of the following statements regarding repulsion start induction motor is/are correct ?
(a) It runs below synchronous speeds on all loads.
(b) It needs more maintenance of commutator and other mechanical devices.
(c) It makes quite a bit noise on starting.
(d) It starts as a repulsion motor with its brushes set to give maximum torque.
(e) all of the above.

1110. Repulsion induction motor has
(a) single phase winding on its stator.
(b) two separate windings on its rotor in common slots.
(c) squirrel cage rotor and two separate windings on stator in common slots.
(d) both (a) and (b).

1111. In a repulsion induction motor, the rotor has a
(a) squirrel cage winding with rotor bars permanently short-circuited and placed at the bottom of the slots.
(b) repulsion winding similar to dc armature winding placed over the squirrel cage winding.
(c) repulsion winding placed at the bottom of slots and squirrel cage winding placed above the repulsion winding.
(d) both (a) and (b).

1112. Which of the following statements regarding repulsion induction motor is wrong ?
(a) At start squirrel cage winding does not produce any torque.

Answers: **1091.** (e), **1092.** (b), **1093.** (c), **1094.** (b), **1095.** (b), **1096.** (a), **1097.** (b), **1098.** (c), **1099.** (c), **1100.** (c), **1101.** (a), **1102.** (d), **1103.** (d), **1104.** (b), **1105.** (e), **1106.** (a), **1107.** (b), **1108.** (d), **1109.** (e), **1110.** (d), **1111.** (d), **1112.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) At start and at low speeds, major part of the torque is developed by repulsion winding.
(c) At rated load it almost runs at synchronous speed.
(d) It employes centrifugally operated mechanism for short-circuiting the commutator.

1113. The repulsion induction motor has
(a) fairly good speed regulation.
(b) starting torque 2.25 to 3 times the full-load torque.
(c) starting current 3 to 4 times the full-load current.
(d) all of the above.

1114. The repulsion induction motor does not have the drawback of
(a) higher cost. (b) careful maintenance.
(c) poor starting torque. (d) tendency of sparking.

1115. Single phase synchronous motors
(a) are self starting motors. (b) do not need dc excitation.
(c) operate at constant speed.
(d) are built for a wider range of output.
(e) all of the above.

1116. Which of the following motors is not a synchronous motor ?
(a) Hysteresis. (b) Repulsion.
(c) Inductor. (d) Reluctance.

1117. Single phase induction motor built with a variable air gap and without dc excitation is called the ____ motor.
(a) reluctance (b) hysteresis
(c) repulsion (d) split phase

1118. A single phase reluctance motor
(a) has salient pole rotor structure and runs at subsynchronous speed.
(b) has salient pole rotor structure and runs at super-synchronous speed.
(c) has salient pole rotor structure and runs at synchronous speed.
(d) has non-salient pole rotor structure and runs at synchronous speed. **[A.M.I.E. Sec B. Elec. Machines Winter 1994]**

1119. Reluctance torque is the
(a) torque developed in a given synchronous motor as a function of field excitation and the sine of the torque angle.
(b) torque developed by salient pole synchronous or synchronous induction motors due to variations in air gap produced by armature reaction.
(c) torque developed by non-salient pole asynchronous motor.
(d) torque developed by none of the above.
[A.M.I.E. Sec B. Elec. Machines Winter 1993; Summer 1997]

1120. Reluctance motor
(a) is a self starting motor. (b) runs at constant speed.
(c) needs no dc excitation for its rotor.
(d) starts as an induction motor and runs as a synchronous motor.
(e) all of the above.

1121. In a reluctance motor, when the load increases to an extent that it cannot maintain synchronous speed, it will
(a) fall out of synchronism and come to rest.
(b) run as an induction motor.
(c) draw excessive armature current and burn out.
(d) become unstable.

1122. For a reluctance type motor, if the stator magnetic field angular velocity is ω and the actual rotor angular velocity is ω_r, then which of the following equations is satisfied if the average electromagnetic torque is not zero?
(a) $\omega = \omega_r/2$ (b) $\omega = \omega_r$
(c) $\omega = 2\omega_r$ (d) $\omega = 4\omega_r$
[U.P.S.C. I.E.S. E.E.-II, 2004]

1123. The torque of a reluctance motor can be effectively increased by
(a) increasing reluctance of the magnetic circuit along the direct axis.
(b) decreasing reluctance of the magnetic circuit along the quadrature axis.
(c) increasing the ratio of quadrature axis reluctance to direct-axis reluctance.
(d) decreasing the ratio of quadrature axis reluctance to direct-axis reluctance. **[U.P.S.C. I.E.S. E.E.-II, 2001]**

1124. Hysteresis motor is a
(a) synchronous induction motor.
(b) single phase induction motor.
(c) single phase synchronous motor without any salient pole and without dc excitation.
(d) single phase synchronous motor with salient poles and without dc excitation.

1125. Hysteresis motor operates on the principle of
(a) hysteresis loss. (b) eddy current loss.
(c) electromagnetic induction.
(d) magnetization of rotor.

1126. The rotor of a hysteresis motor is made of magnetic material having area of hysteresis loop
(a) large. (b) very small.
(c) medium. (d) any of the above.
[A.M.I.E. Sec B. Winter 2001]

1127. The rotor of a hysteresis motor is built up of
(a) cast iron sheet.
(b) a group of specially hardened steel rings.
(c) thin silicon steel laminations.
(d) thin μ-metal laminations.

1128. In an hysteresis motor, the rotor core must have
(a) retentivity. (b) susceptibility.
(c) resistivity. (d) none of these.

1129. A hysteresis motor
(a) is a self starting motor. (b) is a constant speed motor.
(c) does not need dc excitation.
(d) all of the above.

1130. In a single phase hysteresis motor
(a) starting torque is caused by both eddy current and hysteresis while the running torque is caused by hysteresis.
(b) starting as well as running torques are caused by both eddy current and hysteresis.
(c) starting torque is caused by only eddy current while running torque is caused by only hysteresis.
(d) starting as well as running torques both are caused by only hysteresis. **[A.M.I.E. Sec B. Elec. Machines Winter 1994]**

1131. A hysteresis motor
(a) has high starting torque due to its high rotor hysteresis loss.
(b) is extremely quite in operation due to absence of teeth and winding on rotor.
(c) accelerates from rest to full speed almost instantaneously.
(d) all of the above.

1132. Hysteresis motors are used for Hi-Q record players because of their
(a) constant (synchronous) speed.
(b) extremely steady torque.

Answers: **1113.** (d), **1114.** (c), **1115.** (e), **1116.** (b), **1117.** (a), **1118.** (c), **1119.** (b), **1120.** (e), **1121.** (b), **1122.** (b), **1123.** (c), **1124.** (c), **1125.** (a), **1126.** (a), **1127.** (b), **1128.** (a), **1129.** (d), **1130.** (a), **1131.** (d), **1132.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) insensitivity to supply voltage fluctuations.
(d) non-dependence on centrifugal switch requirement.
[U.P.S.C. I.E.S. E.E.-II, 1998]

1133. The main reason for using a hysteresis motor for high quality tape recorders and record players is that
(a) its speed is constant (synchronous).
(b) it develops extremely steady torque.
(c) it requires no centrifugal switch.
(d) its operation is not affected by mechanical vibrations.
[U.P.S.C. I.E.S. E.E.-II, 1995]

1134. A fluctuating voltage supply is detrimental to a refrigerator motor but not to a ceiling fan, although both are single phase induction motors because, the refrigerator motor
(a) is made more robust than the fan motor.
(b) is subjected to short duty cycle but the fan motor is subjected to continuous duty.
(c) is enclosed in a sealed unit while the fan motor is open to the environment.
(d) load is constant, but the fan motor load is voltage dependent.
[U.P.S.C. I.E.S. E.E.-II, 1993]

1135. A ceiling fan uses
(a) capacitor motor.
(b) capacitor-start capacitor run motor.
(c) capacitor start motor. (d) universal motor.
[A.M.I.E. Sec B. Summer 2003]

1136. Ceiling fan is
(a) three phase IM. (b) single phase IM.
(c) single phase synchronous motor.
(d) none of these. [U.P.T.U. Even Semester, 2009-10]

1137. The washing machines generally employ
(a) single phase series motor.
(b) resistance split-phase motor.
(c) shaded-pole motor. (d) hysteresis motor.
[A.M.I.E. Sec B. Summer 2004]

1138. The electric motor generally used in household food mixers is
(a) universal motor. (b) shaded pole motor.
(c) capacitor start motor. (d) none of the above.
[A.M.I.E. Sec B. Winter 2001]

1139. For toys, the preferred motor is
(a) shaded-pole motor. (b) capacitor motor.
(c) reluctance motor. (d) universal motor.
[A.M.I.E. Sec B. Elec. Machines Winter 2003]

1140. Which of the following motors is suitable for timing and control purposes?
(a) Reluctance motor. (b) Series motor.
(c) Repulsion motor. (d) Hysteresis motor.
[A.M.I.E. Sec B. Summer 2003]

1141. In which single phase motor, the motor has no teeth or winding?
(a) Split-phase motor. (b) Reluctance motor.
(c) Hysteresis motor. (d) Universal motor.
[R.G.T.U. B.E.E. Jan/Feb; 2007, Nov/Dec; 2007]

1142. If a single phase motor fails to start but gives humming noise, this may be due to
(a) low voltage. (b) high voltage.
(c) shorted stator winding. (d) blown fuses.

1143. If a single phase motor fails to start, it may be due to
(a) blown fuses.
(b) open-circuit in auxiliary winding.
(c) open-circuit in main winding.
(d) any of the above causes.

1144. When a ceiling fan using a capacitor run motor is switched on, it hums but does not run. When it is driven by some external means it runs in the direction in which it was made to run. The probable cause is
(a) open-circuited capacitor. (b) blown fuses.
(c) short-circuited capacitor. (d) any of the above.

1145. If a single phase induction motor runs at a speed lower than the rated one, the most likely defect is
(a) improper size fuses.
(b) wornout bearings or low voltage or overload.
(c) open-circuit in the winding.
(d) short-circuit in the winding.

1146. An electric motor gets overheated. This may be due to
(a) overloading. (b) shorted stator winding.
(c) worn-out or dry bearings.
(d) low or high voltage. (e) any of the above.

1147. If the centrifugal switch fails to open when the motor attains 70 to 80 per cent of synchronous speed, it would result in
(a) overloading of main winding.
(b) damage to centrifugal switch.
(c) overheating of auxiliary winding due to continuous flow of current and may get damaged.
(d) none of the above.

1148. The running winding of a single phase motor is found earthed on testing. The most probable location of ground fault is at the
(a) end connection. (b) end terminals.
(c) slot edge where coil enters or comes out of the slot.
(d) anywhere on the winding inside a slot.

1149. Burning out of windings is due to
(a) open-circuited capacitor.
(b) short-circuited capacitor.
(c) capacitor of improper rating.
(d) none of the above.

1150. An open in the centrifugal switch circuit gives an indication of
(a) open winding. (b) shorted winding.
(c) grounded winding. (d) none of these.

1151. Starting or auxiliary winding of a single phase motor used in a refrigerator is disconnected from the circuit by
(a) centrifugal switch. (b) magnetic relay.
(c) thermal relay. (d) any of the above.

1152. Which of the following motors are used in largest number ?
(a) Fractional horse power motors.
(b) 3-phase induction motors.
(c) DC shunt motors. (d) Synchronous motors.

1153. Which of the following is not the induction motor ?
(a) Squirrel cage. (b) Slip-ring.
(c) Reluctance. (d) Double cage.

1154. Which of the following types of motors are not the induction motors ?
(a) Repulsion motors. (b) Split phase motors.
(c) Shaded pole motors.
(d) Repulsion start induction motors.

1155. Which of the following types of motors are not the commutator motors ?
(a) AC series motors. (b) Reluctance motors.
(c) Universal motors. (d) Repulsion motors.
(e) Repulsion -induction motors.

1156. Which of the following types of ac motors are synchronous type ?
(a) Reluctance motors. (b) Hysteresis motors.
(c) Universal motors. (d) both (a) and (b).

Answers: **1133.** (b), **1134.** (d), **1135.** (a), **1136.** (b), **1137.** (b), **1138.** (a), **1139.** (a), **1140.** (a), **1141.** (c), **1142.** (c), **1143.** (d), **1144.** (a), **1145.** (b), **1146.** (e), **1147.** (c), **1148.** (c), **1149.** (b), **1150.** (a), **1151.** (b), **1152.** (a), **1153.** (c), **1154.** (a), **1155.** (b), **1156.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1157. Which of the following motors does not use a centrifugal switch ?
(a) Shaded pole motor. (b) Split phase motor.
(c) Capacitor-start capacitor run motor.
(d) Repulsion start induction motor.

1158. Which single phase induction motor has the lowest speed ?
(a) Shaded pole. (b) Universal.
(c) Hysteresis. (d) Repulsion.

1159. For speeds higher than say 3000 rpm, the machine used is
(a) induction motor. (b) synchronous motor.
(c) universal motor. (d) none of the above.
[A.M.I.E. Sec B. Elec. Machines Summer 1995]

1160. The stator and rotor pole number may be different in a
(a) pole changing induction motor.
(b) reluctance motor. (c) repulsion motor.
(d) synchronous motor. [U.P.S.C. I.E.S. E.E.-II, 1993]

1161. Which of the following motors is relatively free from mechanical and magnetic vibrations and give least noise ?
(a) Shaded pole motor. (b) Universal motor.
(c) Hysteresis motor. (d) Reluctance motor.

1162. Which of the following motor is preferred for tape recorder ?
(a) Shaded pole motor. (b) Hysteresis motor.
(c) Two-value capacitor motor.
(d) Universal motor. [A.M.I.E. Sec B. Elec. Machines Summer 1996]

1163. AC servomotor is basically a
(a) universal motor. (b) capacitor motor.
(c) 2-phase induction motor. (d) 3-phase induction motor.

1164. Two stator windings of ac servomotors are oriented _____ electrical degrees apart.
(a) 90 (b) 60 (c) 120 (d) 180

1165. Consider the following statements regarding ac servomotor:
1. The torque-speed curve has negative slope.
2. It is sensitive to noise.
3. The rotor has high resistance and low inertia.
4. It has slow acceleration.
Which of the following are the characteristics of ac servomotor as control component?
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 2 and 4.
[U.P.S.C I.E.S. E.E.-I, 2002]

1166. An ac servomotor (2-phase induction motor) has a motor with
(a) high resistance winding.
(b) very small diameter to reduce inertia.
(c) very small axial length to reduce inertia.
(d) both (a) and (b). (e) both (a) and (c).

1167. The drag cup rotor is employed in a two phase induction motor to give
(a) low inertia. (b) high inertia.
(c) low torque. (d) high torque.

1168. AC servomotor has the drawback of
(a) commutation problem. (b) low starting torque.
(c) poor reliability. (d) all of these.

1169. Given that D=rotor diameter and L=axial length, a high performance a c servomotor is characterized by
(a) large D, large L. (b) large D, small L.
(c) small D, small L. (d) small D, large L.
[U.P.S.C.I.E.S. E.E.-II, 1993]

1170. Which one of the following statements is not true for an ac servomotor ?
(a) Has low inertia rotor. (b) Is a single phase motor.
(c) Has slip torque characteristic as straight line with negative slope.
(d) Reference voltage frequency is high compared to signal frequency. [A.M.I.E. Sec B Control Systems Winter 1994]

1171. For stability of an ac servomotor
(a) a negative slope on the torque speed curve is necessary.
(b) linearized torque-speed curve is essential.
(c) the ratio of the rotor reactance to rotor resistance should be high. [A.M.I.E. Sec B Control Theory Summer 1993]

1172. If a conventional motor is used for servoapplications, the system becoms unstable due to
(a) large diameter of rotor. (b) small axial length of rotor.
(c) low resistance of rotor. (d) high resistance of rotor.

1173. While a 2-phase ac servomotor is in operation, if the voltage across the control field winding becomes zero, then the motor has a tendency to run as a single phase induction motor. To prevent this
(a) rotor having high mass moment of inertia is used for such a motor.
(b) drag cup type of light rotor and high resistance is preferred.
(c) a low resistance is used.
(d) the number of turns in the control field winding used is less than the main reference winding. [U.P.S.C. I.E.S. E.E.-II, 1993]

1174. A linear servomotor must have
(a) high rotor resistance. (b) high rotor reactance.
(c) a large air gap.
(d) both high rotor resistance and reactance.
[U.P.S.C. I.E.S. E.E.-II, 2005]

1175. A two-phase servomotor develops maximum torque at
(a) forward speed of one-half of the synchronous speed.
(b) backward speed of one-half of the synchronous speed.
(c) synchronous speed.
(d) a speed of twice the synchronous speed.
[U.P.S.C. I.E.S. E.E.-II, 1999]

1176. Ratio of the rotor reactance X to the rotor resistance R for a 2-phase servomotor
(a) is equal to that of a normal induction motor.
(b) is less than that of a normal induction motor.
(c) is greater than that of a normal induction motor.
(d) may be less or greater than that of a normal induction motor. [GATE E.E 2000]

1177. A stepper motor is a _____ device.
(a) hydraulic (b) pneumatic
(c) electromechanical

1178. The input to a stepper motor is in the form of
(a) frictional force. (b) electric pulses.
(c) mechanical inertia. (d) viscous damping force.

1179. The rotor of a stepper motor has
(a) no windings. (b) no commutator.
(c) no brushes. (d) all of the above.
[A.M.I.E. Sec B. Summer 2004]

1180. In a stepper motor, the detent torque means
(a) minimum of the static torque with the phase winding excited.
(b) maximum of the static torque with the phase winding excited.
(c) minimum of the static torque with the phase winding unexcited.
(d) maximum of the static torque with the phase winding unexcited. [GATE E.E. 2008]

1181. For a given stepper motor, the following torque has the highest numerical value
(a) Detent torque. (b) Pull-in torque.
(c) Pull-out torque. (d) Holding torque.
[GATE E.E. 2004]

Answers: **1157.** (a), **1158.** (a), **1159.** (c), **1160.** (b), **1161.** (c), **1162.** (b), **1163.** (c), **1164.** (a), **1165.** (c), **1166.** (d), **1167.** (a), **1168.** (b), **1169.** (d), **1170.** (b), **1171.** (a), **1172.** (c), **1173.** (b), **1174.** (a), **1175.** (a), **1176.** (b), **1177.** (c), **1178.** (b), **1179.** (d), **1180.** (c), **1181.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1182. Which one among the following has the highest numerical value in a stepper motor?
(a) detent torque. (b) Holding torque.
(c) Dynamic torque. (d) Ripple torque.
[U.P.S.C. I.E.S. E.E.-II, 2006]

1183. Switched reluctance motor means
(a) salient pole synchronous motor without excitation winding.
(b) a stepper motor with salient poles.
(c) synchronous motor with salient poles on stator and rotor.
(d) a stepper motor with closed loop control and with rotor position sensor. [U.P.S.C. I.E.S. E.E.-II, 2001]

1184. The following motor definitely has a permanent magnet rotor:
(a) DC commutator motor. (b) Brushless dc motor.
(c) Stepper motor. (d) Reluctance motor.
[GATE E.E. 2004]

1185. The motor which can produce uniform torque from standstill to synchronous speeds is
(a) universal motor. (b) stepper motor.
(c) reluctance motor. (d) hysteresis motor.
[A.M.I.E. Sec B. Summer 2004]

1186. For a 1.8°, 2-phase bipolar stepper motor, the stepping rate is 100 steps/second. The rotational speed of the motor in rpm is
(a) 15 (b) 30 (c) 60 (d) 90
[GATE E.E. 2004]

1187. A 1.8° step, 4-phase stepper motor has a total of 40 teeth on 8 poles of stator. The number of rotor teeth for this motor will be
(a) 40 (b) 50 (c) 100 (d) 80
[GATE E.E. 2000]

1188. A stepping motor has four concentric coils on its 4-pole stator. It has an unwound variable reluctance motor with 5 teeth. The step angle for this motor is
(a) 36° (b) 18° (c) 9° (d) 72°
[A.M.I.E. Sec B. Summer 2000]

1189. Stepper motors are mostly used for
(a) high power requirements.
(b) control system applications.
(c) very high speed of operation.
(d) very low speed of operation. [U.P.S.C. I.E.S. E.E.-II, 2002]

1190. Stepper motors are widely used because of
(a) wide speed range. (b) large rating.
(c) no need for field control.
(d) compatibility with digital systems. [U.P.S.C. I.E.S. E.E.-II, 2002]

1191. Which one of the following types of motors is most suitable for a computer printer drive?
(a) Reluctance motor. (b) Hysteresis motor.
(c) Shaded pole motor. (d) Stepper motor.
[U.P.S.C. I.E.S. E.E.-II 2004; GATE E.E. 1996]

1192. The output of a stepper motor is in the form of
(a) linear movements. (b) angular movements.
(c) either (a) or (b). (d) none of the above.

1193. A 3 ϕ, 3 stack, variable reluctance step motor has 20 poles on each rotor and stator stack. The step angle of this step motor is
(a) 3° (b) 6° (c) 9° (d) 18°
[GATE E.E. 2007]

1194. Group I lists different applications and group II lists the motors for these applications. Match the application with most suitable motor and choose the right combination among the choices given thereafter.

Group I		Group II
P	Food mixer	1. PMDC motor
Q	Cassette tape recorder induction motor	2. Single phase induction motor
R	Domestic water pump induction motor	3. Universal motor
S	Escalator	4. Three-phase induction motor
		5. DC series motor
		6. Stepper motor

(a) P-3, Q-6, R-4, S-5. (b) P-1, Q-3, R-2, S-4.
(c) P-3, Q-1, R-2, S-4. (d) P-3, Q-2, R-1, S-4.
[GATE E.E. 2003]

1195. _____ motor is usually employed in motor-generator sets.
(a) Squirrel cage induction (b) Slip-ring induction
(c) Synchronous (d) Commutator

1196. Motor-generator set does not suffer from the drawback of
(a) difficulty in control of output voltage.
(b) high cost. (c) poor efficiency.
(d) requirement of more space.

1197. The rotor of motor-convertor is wound for
(a) single phase. (b) 3 phases.
(c) 6 phases. (d) 12 phases.
(e) 9 or 12 phases.

1198. In a motor-convertor, induction machine acts as
(a) a motor only. (b) a convertor only.
(c) a transformer only.
(d) both as motor and as transformer.

1199. In a motor-convertor the commutator machine acts as
(a) a generator only. (b) a convertor only.
(c) both as generator and as convertor.
(d) as a transformer only.

1200. The motor-convertor does not suffer from the drawback of
(a) lower speed. (b) commutation problem.
(c) higher cost. (d) none of these.

1201. A rotary convertor combines the functions of
(a) an induction motor and a dc shunt generator.
(b) an induction motor and a dc series generator.
(c) a synchronous motor and a dc series generator.
(d) a synchronous motor and a dc shunt or compound generator.

1202. In a rotary convertor armature currents are
(a) dc only. (b) ac only. (c) partly ac and partly dc.

1203. In a rotary convertor, ac and dc armature powers will be equal only when ____ losses. are negligible and power factor is ____ .
(a) electrical; 1 (b) mechanical; 1
(c) electrical and mechanical; 1
(d) electrical and mechanical; 0.5

1204. Which of the following statements regarding ratios of line voltages and line currents on the ac side to that on the dc side of a synchronous convertor is true ?
(a) Both line voltage ratio as well as line current ratio decrease with the increase in number of phases.
(b) Both line voltage ratio as well as line current ratio increase with the increase in number of phases.
(c) Line voltage ratio increases but current ratio decreases with the increase in number of phases.
(d) Line voltage ratio decreases but current ratio increases with the increase in number of phases.

1205. In a rotary convertor, the copper losses are less in comparison to those of a dc generator of the same size. This is due to
(a) neutralization of dc component by ac component.
(b) negligible dc currents. (c) low operating speed.
(d) all of the above.

Answers: **1182.** (b), **1183.** (d), **1184.** (c), **1185.** (d), **1186.** (b), **1187.** (b), **1188.** (b), **1189.** (b), **1190.** (d), **1191.** (d), **1192.** (c), **1193.** (b), **1194.** (c), **1195.** (c), **1196.** (a), **1197.** (e), **1198.** (d), **1199.** (c), **1200.** (b), **1201.** (d), **1202.** (c), **1203.** (c), **1204.** (a), **1205.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1206. Which one of the following statements regarding the position of minimum copper loss in a phase of rotary convertor is true ?
(a) The position of minimum copper loss is in the middle of the phase whatever may be the power factor.
(b) The position of minimum copper loss varies with the variation in power factor and this position is displaced from the middle of the phase by the power factor angle.
(c) The position of minimum copper loss is the tapping point whatever may be the power factor.
(d) None of the above.

1207. A single phase transformer has primary to secondary turns ratio of 20. Three such transformers are used for three-to-six phase conversion by double-star method. If the output line voltage is 400 V, then the primary line voltage is
(a) 8 kV (b) 16 kV (c) 12 kV (d) 20 kV
[A.M.I.E. Sec B. Winter 2002]

1208. The magnitude of each of the voltage phasors represented by the sides of a regular hexagon in a 6-phase system produced by double star connection of the secondaries of transformers is _____ times the voltage of each secondary winding.
(a) 0.5 (b) 1.0 (c) 0.866 (d) $\sqrt{3}$

1209. The magnitude of each of the voltage phasors represented by the sides of a regular hexagon in a 6-phase system produced by diametral connection of the secondaries of transformers is _____ times the voltage of each secondary winding.
(a) $\sqrt{3}$ (b) 0.866 (c) 0.5 (d) 1.0

1210. In a 12-phase star delta-double star connection, voltage of each secondary star phase is ___ times the voltage on each side of the voltage polygon of 12 sides.
(a) 2.0 (b) 1.0 (c) $\frac{0.5}{\sin 15^\circ}$ (d) $\frac{0.5}{\sin 10^\circ}$

1211. In a 12-phase double chord connection, voltage of each chord is _____ times the voltage on each side of the voltage polygon of 12 sides.
(a) 0.866 cosec 12° (b) 2 sin 75°
(c) sine 75° cosec 15° (d) 0.866 cosec 15°

1212. When a rotary convertor is started by means of a small auxiliary motor, its power rating must be
(a) more than the dc output of the convertor.
(b) more than the ac input to the convertor.
(c) slightly more than the value of friction and windage losses at rated speed.
(d) one third of dc output of the convertor.

1213. Voltage control in a rotary convertor is affected by
(a) introducing series reactance in supply leads.
(b) induction regulator. (c) varying field excitation.
(d) varying resistance in the circuit.
(e) either (a) or (b).

1214. _____ method provides automatic and smooth voltage control over a wide range.
(a) Synchronous booster control
(b) Series reactance control (c) Induction regulator control
(d) Tap changer control

1215. By connecting reactances at the slip-ring leads of a rotary convertor operating at a leading power factor, the output dc voltage can be raised if
(a) the pf is made less leading by reducing the excitation.
(b) the pf is made more leading by increasing the excitation.
(c) the pf is made more leading by reducing the excitation.
(d) the pf is made less lagging by increasing the excitation.

1215. Which one of the following voltage control methods does reduce the convertor efficiency and output as the pf departs from unity ?
(a) Induction regulator method.
(b) Series reactance control method.
(c) Synchronous booster control method.
(d) Tap-changer control method.

1217. In comparison to mercury arc rectifiers metal rectifiers
(a) operate on low temperatures.
(b) can operate on high voltages.
(c) can operate on high loads.
(d) give poor voltage regulation.

1218. The metal rectifiers are preferred over tube rectifiers as
(a) they are mechanically stronger.
(b) they do not need any voltage for filament heating.
(c) both (a) and (b). (d) none of these.

1219. Lesser the number of anodes in mercury arc rectifier
(a) more smoother will be the output.
(b) less smoother will be the output.
(c) output smoothness will have no effect.
(d) none of the above.

1220. Reactor is introduced in the ignition circuit of a mercury arc rectifier to limit
(a) wave ripples. (b) circuit voltage.
(c) circuit current. (d) none of these.

1221. The voltage drop at anode in a mercury arc rectifier is due to
(a) energy expended in overcoming the electrostatic field in the neighborhood of the anode.
(b) expenditure of energy in ionization.
(c) self restoring property of mercury.
(d) all of the above.

1222. The voltage drop in arc primarily depends on
(a) arc temperature. (b) arc length.
(c) purity of mercury. (d) all of the above.

1223. _____ depends upon loading in a mercury arc rectifier.
(a) Anode drop. (b) Cathode drop.
(c) Drop in arc itself.
(d) Both anode and cathode drops.

1224. In a 3-phase bridge rectifier fed from a star-connected secondary winding of a transformer, let the voltage to the neutral of the A-phase (phase sequence A, B, C) be $V_m \sin \omega t$. At the instant when the voltage of A-phase is maximum, the output voltage at the rectifier terminals will be
(a) $\frac{V_m}{\sqrt{2}}$ (b) V_m (c) $1.5\, V_m$ (d) $\sqrt{3}\, V_m$
[U.P.S.C. I.E.S. E.E.-II, 1997]

1225. For an n-pulse rectifier, the rms value of the ac current is related to the dc load current as
(a) $I_{rms} = \frac{I_d}{n}$ (b) $I_{rms} = \frac{I_d}{\sqrt{n}}$
(c) $I_{rms} = I_d$ (d) $I_{rms} = \frac{2}{\pi} I_d$
[U.P.S.C. I.E.S. Elec. Engg. II, 1995]

Answers: **1206.** (b), **1207.** (a), **1208.** (b), **1209.** (c), **1210.** (c), **1211.** (c), **1212.** (c), **1213.** (e), **1214.** (a), **1215.** (b), **1216.** (b), **1217.** (a), **1218.** (c), **1219.** (b), **1220.** (c), **1221.** (a), **1222.** (b), **1223.** (c), **1224.** (b), **1225.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

1226. In a polyphase mercury arc rectifier the utility factor is given as

(a) $\frac{\sqrt{2}\, m\sqrt{m}}{\pi} \sin\frac{\pi}{m}$ (b) $\frac{\sqrt{2}\, m}{\pi} \sin\frac{\pi}{m}$

(c) $\frac{\sqrt{2m}}{\pi} \sin\frac{\pi}{m}$ (d) $\frac{2}{\pi} \sin\frac{\pi}{m}$

1227. Utility factor is maximum for _____ phase rectifier.
(a) single (b) three (c) six (d) twelve

1228. Overlap in a mercury arc rectifier
(a) depends upon the angle of overlap.
(b) increases the output voltage.
(c) reduces the output voltage.
(d) simply changes the power factor.

1229. Interphase transformers are used to
(a) avoid commutation problem.
(b) remove the evil effect of overlap.
(c) start the spark. (d) all of the above.

1230. In a grid control of mercury arc rectifier when grid is made positive relative to cathode then electrons _____ on their way to anode.
(a) accelerate (b) decelerate
(c) any of (a) and (b) (d) none of these.

1231. In phase shift control the control is carried out by varying the _____ of grid voltage.
(a) magnitude (b) polarity
(c) phase (d) any of the above.

1232. In a phase-shift control, the phase shift between anode and grid voltages can be achieved by means of
(a) an induction regulator. (b) a synchronous motor.
(c) a synchronous generator.
(d) any of the above.

1233. The most advantageous number of anodes for a mercury arc rectifier is six, if more than six anodes are used, then
(a) voltage regulation will increase.
(b) the cost increases rapidly without a comparative increase in output.
(c) power factor falls. (d) all of the above.

1234. When the firing angle of a single phase, fully controlled rectifier feeding constant dc current into a load is 30°, the displacement power factor of the rectifier is

(a) 1 (b) 0.5 (c) $\frac{1}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{2}$

[GATE E.E. 1998]

Answers: **1226.** (c), **1227.** (b), **1228.** (c), **1229.** (b), **1230.** (a), **1231.** (c), **1232.** (a), **1233.** (b), **1234.** (a).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): Transformer is not used in a dc line.
(R): Losses in the dc circuit are not negligible.
[U.P.S.C. I.E.S. E.E.-II, 2004]

2. (A) : Both the efficiency and regulation of a 3-winding ideal transformer are 100%.
(R): Flux leakage and the magnetic reluctance of the magnetic core in an ideal transformer are zero. Moreover, losses are absent in ideal transformers. [U.P.S.C. I.E.S. E.E.-II, 2008]

3. (A): A transformer on open-circuit takes some energy from the mains even if the output power is zero.
(R): At no-load the energy input is required to meet no-load copper losses in primary and iron losses in the core.

4. (A): In a transformer, open-circuit (OC) test is conducted from low voltage side and short-circuit (SC) test is conducted from high voltage side.
(R): OC test gives iron loss and SC test gives copper loss.
[U.P.S.C. I.E.S. E.E.-II, 2010]

5. (A): The distribution transformers are designed for minimum core losses.
(R): Primary winding of distribution transformer are energized throughout the day. [U.P.S.C. I.E.S. E.E.-II, 2002]

6. (A): Nowadays cold rolled steel is used almost exclusively inspite of its high cost.
(R): Cold rolled steel has high permeability and lower losses at given flux density.

7. Two transformer banks, one connected in Y-Δ and the other in Δ-Y, both designed for the same line voltage on the primary and secondary sides are to be operated in parallel.
(A): When the primary voltages are the same in both groups, the secondary line voltages of Δ-Y bank lag 60° behind the corresponding secondary voltages of the Y-Δ bank, and parallel operation is not possible.
(R): The primary line terminal connections for the Δ-Y bank have not been rotated backward by 240° to make the secondary line voltages of both the groups in phase.
[U.P.S.C. I.E.S. E.E.-II, 1995]

8. (A): If two transformers with different $\frac{X}{R}$ ratios are operated in parallel, one of the transformers becomes overheated when full kVA output is drawn from them.
(R): The impedance triangles are not identical in shape when two transformers having different voltage ratings are operated in parallel. [U.P.S.C. I.E.S. E.E.-II, 2011]

9. (A): Δ-connected tertiary windings tend to act as an automatic feedback control system.

Answers: **1.** (b), **2.** (d), **3.** (a), **4.** (b), **5.** (a), **6.** (a), **7.** (d), **8.** (c), **9.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): In the event of unbalanced secondary load currents, both secondary and primary load voltages are restored to their normal phase magnitude and angle. [U.P.S.C. I.E.S. E.E.-II, 2004]

10. (A): Large synchronous machines are constructed with armature winding on stator.
(R): Stationary armature winding would have reduced armature reactance. [U.P.S.C. I.E.S. E.E.-II, 2007]

11. (A): AC armature windings are short chorded by selecting value of coil span more than the pole pitch.
(R): Short chording is done to eliminate harmonics in the induced emf. [U.P.S.C. I.E.S. E.E.-II, 2008]

12. (A): Distributed winding gives the emf of improved waveform.
(R): With distributed windings certain distorting harmonics can be altogether eliminated and harmonic emfs are reduced.

13. (A): Distributed winding results in efficient cooling.
(R): With distributed winding high current density in the copper can be adopted due to even distribution of copper over the surface of the armature resulting in even distribution of copper loss.

14. (A): Frequency of the system is the same, for synchronously connected machines.
(R): Frequency can be controlled by synchronous generators only. [U.P.S.C. I.E.S. E.E.-II, 2010]

15. (A): In a certain case of load change, an alternator became unstable and pulled out.
(R): In an alternator, damper winding is present.
[U.P.S.C. I.E.S. E.E.-II, 2011]

16. 40 MW water turbine is coupled to a 50 MVA 3-phase ac generator rated for 0.8 lagging power factor operation. The losses of the generator are negligible. It is required to deliver a load of 30 MW at 0.5 pf leading by the set.
(A): The set cannot deliver the load.
(R): The turbine will be overloaded. [U.P.S.C. I.E.S. E.E.-II, 1996]

17. (A): The per unit impedance of a synchronous machine is the reciprocal of the short-circuit ratio of the machine.
(R): For the computation of the short-circuit ratio, the field excitation to generate rated voltage on open circuit should be read from the open-circuit characteristic of the machine.
[U.P.S.C. I.E.S. E.E.-II, 1999]

18. (A): The short-circuit ratio (SCR) of a three-phase alternator should be high.
(R): A high value of SCR will decrease the value of voltage regulation and will increase the maximum power output.
[U.P.S.C. I.E.S. E.E.-II, 2003]

19. (A): For a 3-phase alternator operating on leading pf at full load, the terminal voltage may be more than the no-load induced emf.
(R): At leading power factor, the effect of armature reaction is demagnetizing. [U.P.S.C. I.E.S. E.E.-II, 2008]

20. (A): In a cylindrical rotor synchronous machine, the armature reaction flux Φ_a is in phase with the armature current I_a, but in salient pole machine Φ_a is not in phase with I_a.
(R): The reluctances along the direct axis and the quadrature axis being different, the ratios of the mmfs and the respective fluxes in the two cases are not equal.
[U.P.S.C. I.E.S. E.E.-II, 1998]

21. (A): On supplying 2-phase voltages to balanced two-phase windings (two identical windings in space quadrature), a rotating field is developed.
(R): The amplitude of rotating field is 1.5 times that of each phase. [U.P.S.C. I.E.S. E.E.-II, 2000]

22. (A): A synchronous motor is not inherently self starting.
(R): At standstill the rotor of a synchronous motor is subjected to alternate forces of repulsion and attraction.
[U.P.S.C. I.E.S. E.E.-II, 2010]

23. (A): When a synchronous motor is operating on an infinite bus-bar at a leading power factor, an increase in the field current causes an increase in the armature current.
(R): At leading power factors, the excitation voltage of the motor is more than its terminal voltage. The increase in field current causes an increase in the excitation voltage of the motor and thereby an increase in the voltage drop across the synchronous reactance of the motor. [U.P.S.C. I.E.S. E.E.-II, 1995]

24. (A): If the load requirement of a synchronous motor exceeds the pullout torque, the synchronous motor action is lost.
(R): Rotor and stator fields are no longer stationary with respect to each other. [U.P.S.C. I.E.S. E.E.-II, 2004]

25. (A): A synchronous motor operating from constant voltage and constant frequency source has a substantially constant resultant air-gap flux.
(R): If the dc field current in this motor can set up the required resultant air-gap flux, the lagging reactive volt-amperes drawn from a c source is zero. [U.P.S.C. I.E.S. E.E.-II, 2004]

26. (A): In a salient pole synchronous motor, the angular displacement of rotor per unit change of power is less than that for a similar cylindrical rotor machine.
(R): A reluctance torque is developed in the salient pole machine due to the effect of direct axis flux on the damper winding.
[U.P.S.C. I.E.S. E.E.-II, 1997]

27. (A): While running on light load a salient pole synchronous machine can continue to operate on infinite bus-bars even if its excitation fails.
(R): A salient pole machine developes reluctance power due to the variable reluctance offered by the salient poles.
[U.P.S.C. I.E.S. E.E.-II, 2011]

28. (A): The diameter of the shaft of synchronous condenser is very small.
(R): The synchronous condenser is a machine which is not expected to deliver any mechanical power output as per its design. [U.P.S.C. I.E.S. E.E.-II, 2010]

29. (A): The synchronous condenser requires more copper for field winding in comparison with a synchronous motor for equal armature voltage and current ratings.
(R): The synchronous condenser is a synchronous motor operated with heavy excitation *i.e.* heavy field current.

30. (A): In large high speed induction motors it is not essential to use semi-closed slots to reduce the reluctance.
(R): Large high speed induction motors have large pole pitch, so the large number of conductors per pole and, therefore, can have desired flux density in the air gap without an excessive magnetizing current.

31. (A): The squirrel cage induction motor has semiclosed or totally closed type slots on its rotor.
(R): There is little difficulty in inserting the rotor bars in semi-closed or totally closed slots and such slots reduce magnetizing current and teeth loss.

32. (A): The winding factor of slot harmonics is equal to that of the fundamental.
(R): Skewing of the rotor slots of an induction motor reduces the effects of slot harmonics. [U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **10.** (c), **11.** (d), **12.** (a), **13.** (a), **14.** (c), **15.** (b), **16.** (c), **17.** (b), **18.** (a), **19.** (c), **20.** (d), **21.** (c), **22.** (a), **23.** (a), **24.** (a), **25.** (b), **26.** (a), **27.** (a), **28.** (a), **29.** (a), **30.** (a), **31.** (a), **32.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

33. (A): The rotor speed of induction motor is less than the synchronous speed of rotating magnetic field.

(R): At synchronous speed motor torque is zero.

[U.P.S.C. I.E.S. E.E.-II, 2009]

34. (A): The torque-speed characteristic of an induction motor in operating region closely resembles with that of a dc shunt motor.

(R): In an induction motor, even at full load slip does not exceed 5% i.e. the speed varies from 95% to very close to synchronous speed for different loads.

35. (A): Rotor core loss at rated speed of induction motor is negligibly small.

(R): Induced emf frequency of the rotor circuit at rated speed is very low, because slip of the motor at rated speed is low.

[U.P.S.C. I.E.S. E.E.-II, 2009]

36. (A): Squirrel cage induction motors when connected to supply mains sometimes exhibits a tendency to run at a speed which is nearly one-seventh of the synchronous speed.

(R): Seventh harmonic is present in the applied voltage.

[U.P.S.C. I.E.S. E.E.-II, 1994]

37. (A): The leakage reactance of a 3-phase induction motor should be small.

(R): A small value of leakage reactance will increase the maximum power output of motor. [U.P.S.C. I.E.S. E.E.-II, 2008]

38. (A): A squirrel cage induction motor is preferred to the slip-ring induction motor.

(R): Higher starting torque is the main consideration.

[U.P.S.C. I.E.S. E.E.-II, 2011]

39. (A): A double-cage induction motor has good starting characteristics.

(R): At starting, a large portion of starting current flows in the bottom cage. [U.P.S.C. I.E.S. E.E.-II, 2003]

40. (A): The rotor resistance of a deep bar type cage induction motor is higher than the running resistance.

(R): The extra resistance present in the rotor circuit at starting is cut out by a centrifugal switch during normal running.

[U.P.S.C. I.E.S. E.E.-II, 2000]

41. (A): Even at no load a large three-phase squirrel-cage induction motor is started at reduced voltage.

(R): If a large three-phase squirrel-cage induction motor with no load is started at full voltage, it is damaged.

[U.P.S.C. I.E.S. E.E.-II, 2002]

42. (A): Under V/*f* control of induction motor, the maximum value of the developed torque remains constant over a wide range of speed in the sub-synchronous region.

(R): The magnetic flux is maintained almost constant at the rated value by keeping the ratio V/*f* constant over the considered speed range. [U.P.S.C. I.E.S. E.E.-II, 2006; GATE E.E. 2005]

43. (A): A 3-phase induction motor operating on a 3-phase voltage controller for speed control cannot be used for constant load torques.

(R): The voltage waveform of the controller is distorted.

[U.P.S.C. I.E.S. E.E.-II, 1997]

44. (A): Induction generators are widely used for generating power for commercial supply.

(R): Induction generators are simple and rugged in construction, cheaper in initial cost and easy in maintenance.

45. (A): A synchronous induction motor is rarely built for ratings below 25 kW.

(R): A synchronous induction motor does not provide desirable characteristics in smaller sizes.

46. (A): Linear induction motors find wide use in industry and electric traction.

(R): Linear induction motors are cheaper in initial as well as in maintenance costs.

47. (A): A single-phase induction motor is not self-starting.

(R): A three-phase induction motor is self-starting.

[U.P.S.C. I.E.S. E.E.-II, 2002]

48. (A): Single-phase induction motor is not self-starting.

(R): No rotating magnetic field is set up in the air gap of a single-phase induction motor. [U.P.S.C. I.E.S. E.E.-II, 2003]

49. (A): A single-phase induction motor is not self-starting as such.

(R): A single-phase induction motor develops only pulsating magnetic field which provides zero torque at standstill.

[U.P.S.C. I.E.S. E.E.-II, 2004]

50. (A): In a single phase induction motor, while the motor is connected to single phase ac supply and is rotating, the two fields (stator and rotor field) combine to form a resultant rotating field revolving at a synchronous speed.

(R): The rotor field created by rotor currents acts at right angle to the stator field and also lags the stator field by 90° electrical degrees in time phase.

51. (A): The starting torque developed in a single phase reluctance motor is highly dependent upon the rotor position.

(R): Rotor saliency offers different reluctances to the rotating field at different positions of stator.

[U.P.S.C. I.E.S. E.E.-II, 1996]

52. (A): An ideal two-phase ac servomotor is designed to have linear negative torque-speed characteristics which are equally spaced for equal increments of control voltage.

(R): The characteristics are obtained by designing a rotor with high resistance so that the maximum torque occurs at a slip of –0.5, to enable the motor to have a first order transfer function. [U.P.S.C. I.E.S. E.E.-II, 1996]

Answers: **33.** (a), **34.** (a), **35.** (a), **36.** (c), **37.** (b), **38.** (c), **39.** (c), **40.** (c), **41.** (c), **42.** (a), **43.** (c), **44.** (d), **45.** (c), **46.** (d), **47.** (b), **48.** (a), **49.** (a), **50.** (a), **51.** (a), **52.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Type of Coil)	List 2 (Use of Coil)
A. Sandwitch coils.	1. Low voltage coils for currents above 100 A.
B. Disc coils.	2. High voltage windings of small transformers.
C. Crossover coils.	3. Cooling oil is in contanct with each turn of the winding.
D. Spiral type.	4. Shell-type transformer core.

Codes:	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	2	1	4	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2005]

2.

List 1 (Transformer)	List 2 (Voltage Ratio)
A. Power transformer.	1. 230 V/230 V.
B. Auto-transformer.	2. 220 V/240 V.
C. Welding transformer.	3. 400 V/100 V.
D. Isolation transformer.	4. 132 V/11 kV.

Codes:	A	B	C	D
(a)	4	2	3	1
(b)	4	2	1	3
(c)	2	4	1	3
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-II, 2002]

3.

List 1	List 2
A. Silica Gel	1. Bushing
B. Porcelain	2. Bucchholz relay
C. Mercury	3. Tank
D. Fins	4. Breather

Codes:	A	B	C	D
(a)	2	1	4	3
(b)	4	3	2	1
(c)	2	3	4	1
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2002]

4.

List 1 (Magmetic Materials)	List 2 (Applications)
A. Silicon Steel	1. Current trnsformer
B. Ferrite	2. Power transformer
C. Alnico	3. Permanent magnet
	4. High frequency transformer

Codes:	A	B	C
(a)	1	2	3
(b)	1	4	2
(c)	2	1	4
(d)	2	4	3

[U.P.S.C. I.E.S. E.E.-I, 2003]

5.

List 1 (Test)	List 2 (Quantities)
A. OC Test	1. Copper loss and iron loss.
B. SC Test	2. Total losses.
C. Sumpner's Test	3. Iron loss.
D. Load Test	4. Copper loss.

Codes:	A	B	C	D
(a)	3	4	1	2
(b)	2	1	4	3
(c)	3	1	4	2
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-II, 2005]

6.

List 1 (Connections of 3-phase transformers)	List 2 (Utilization factor)
A. Delta-zig zag.	1. 0.5
B. Star-zig zag.	2. 0.667
C. Open delta.	3. 0.866
	4. 1.0

Codes:	A	B	C
(a)	3	3	3
(b)	1	2	3
(c)	2	3	1
(d)	2	2	2

7.

List 1 (Faults)	List 2 (Protective Device Used)
A. Internal fault (minor or major).	1. HRC fuses.
B. External fault.	2. Arcing horns.
C. High voltage surges.	3. Buchholz relay.
	4. Breather.

Codes:	A	B	C
(a)	3	4	2
(b)	3	1	2
(c)	4	1	2
(d)	3	1	4

8.

List 1 (Parts of turbo-generator used in thermal power plants)	List 2 (Materials from which these parts are made)
A. Stator core	1. Copper.
B. Rotor core	2. Copper alloy.
C. Stator windings	3. Silicon steel.
D. Slip-rings	4. Mild steel.
	5. Aluminium.

Codes:	A	B	C	D
(a)	3	5	2	1
(b)	4	5	1	2
(c)	4	3	1	2
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-II, 1995]

9.

List 1 (Type of AC Windings)	List 2 (Features of AC Windings)
A. Single layer	1. Coil span and pole pitch are equal.
B. Double layer	2. Coil span is shorter than pole pitch.
C. Full Pitch	3. Number of slots is equal to number of coils.
D. Chorded	4. Number of slots is twice the number of coils.

Codes:	A	B	C	D
(a)	4	3	1	2
(b)	3	4	2	1

Answers: **1.** (b), **2.** (a), **3.** (d), **4.** (d), **5.** (a), **6.** (a), **7.** (b), **8.** (d), **9.** (a),

44.

List 1 Type of motor	List 2 Application
(i) DC series motor	(a) Centrifugal pump
(ii) Synchronous motor	(b) Cranes
(iii) 3-phase squirrel cage induction motor	(c) Hair dryer
(iv) Single phase shaded pole motor	(d) Condenser

[U.P. Technical Univ. 1st Semester 2009-10]

Answers: **41.** (d), **42.** (a), **43.** (i)-(3), (ii)-(4), (iii)-(1), (iv)-(2), (v)-(6), (vi)-(5), **44.** (i)-(b), (ii)-(d), (iii)-(a), (iv)-(c).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F).

1. Transformer is a static electric device. [R.G.T.U. M.P., December, 2010]
2. A transformer can be connected to dc. [U.P. Technical Univ. Second Semester 2009-10]
3. The emf induced in a transformer is directly proportional to the product of number of turns and rate of change of flux.
4. In any transformer, the voltage per turn in primary and secondary windings remains always same.
5. For step up transformer, the transformer ratio is greater than unity. [R.G.T.U. M.P., December, 2010]
6. The voltage transformation ratio of a transformer is equal to inverse of its current transformation ratio.
7. Energy component of no-load current produces flux in the core which links both of the windings.
8. Mutual flux is the flux in the core which links with both the primary and secondary windings.
9. The function of the magnetizing component of no-load current is to sustain the alternating flux in the core .
10. Energy component of no-load current is in phase with the magnetic flux.
11. From no load to full load on a transformer the flux linkages with the core remain almost constant.
12. In a transformer of given voltage rating, the magnetizing current increases with the increase in frequency.
13. In case of an ideal transformer, primary and secondary currents are in phase opposition.
14. The leakage reactance of the primary and secondary windings of a transformer is independent of load current.
15. The secondary terminal voltage and the secondary induced emf are in phase opposition.
16. Supply voltage is taken as reference phasor in drawing the phasor diagram of a transformer.
17. Total voltage drop in a transformer is due to its total impedance referred to its primary or secondary side.
18. A good transformer must have regulation as high as possible. [R.G.T.U. M.P., December, 2010]
19. Hysteresis losses are associated with the rearrangement of the magnetic domains in the core during each half-cycle.
20. The core losses in a transformer are independent of power factor.

Answers: **1.** (T), **2.** (F), **3.** (T), **4.** (T), **5.** (T), **6.** (T), **7.** (F), **8.** (T), **9.** (T), **10.** (F), **11.** (T), **12.** (F), **13.** (T), **14.** (T), **15.** (F), **16.** (F), **17.** (T), **18.** (F), **19.** (T), **20.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

21. The core losses in a transformer are constant if input voltage is constant but frequency is changed.
22. During a short-circuit test on a transformer, the rated full load current is allowed to flow through the lv winding.
23. The commercial efficiency of a transformer on no load is zero.
24. The efficiency of transformers in comparison to those of electric motors of same ratings is much lower.
25. The commercial efficiency of a transformer is higher at lower power factor loads.
26. The commercial efficiency gives an idea of how effectively, a distribution transformer is used throughout the day.
27. The efficiency of a transformer will be maximum when copper losses are zero.
28. The all day efficiency of a transformer can be computed if its iron losses, full-load copper losses, rated output and load cycle is known.
29. At low frequencies, thin laminations are used.
30. In a transformer, the magnetic coupling between primary and secondary can be increased by employing low reluctance magnetic core.
31. Spacers are provided between adjacent coils in a transformer to provide free passage to the cooling oil.
32. Spacers are provided between adjacent coils in a transformer to insulate the coils from each other.
33. Leakage fluxes in a transformer may be minimized by sectionalizing and interleaving the primary and secondary windings.
34. In sandwich type winding parts of hv and lv windings alternate along the height of the limb.
35. Bushings are employed for insulating and taking out the winding terminals from the container to an external circuit.
36. HT bushings are smaller in size in comparison to LT bushings.
37. For system voltages exceeding 66 kV condenser bushings are used for economic reasons.
38. Conservator consists of an air tight metal drum fixed at the top of the transformer tank.
39. An elbow relief device is provided on transformers equipped with expansion tanks.
40. Transformer breaths-in when its load increases.
41. Silica gel absorbs moisture from the atmosphere.
42. Sludging of transformer oil means formation of semisolid hydro-carbon due to heat and oxidation.
43. Transformer oil is obtained by refining crude petroleum.
44. Transformer oil should be free from wax in order to avoid its solidification at low temperature.
45. Sludging of transformer oil reduces its cooling capacity due to its blanking effect on the cooling surfaces.
46. The cooling fins increase the cooling surface area and result in natural convection current to be formed in the oil.
47. Heat from transformer windings is transferred to the insulating oil chiefly by conduction.
48. In a shell type transformer, the primary and secondary windings are wound on separate formers.
49. Shell type construction is commonly employed in power transformers.
50. In shell type transformers, the iron core surrounds the windings and there are two parallel magnetic paths in which the magnetic flux divides.
51. Berry type transformers give rugged construction and provide better cooling.
52. Consumers are provided connections from distribution transformers.
53. It is not possible to get 3-phase supply with only two single phase transformers.
54. Scott-connections are employed for 2-phase to 3-phase conversion.
55. A V-V connected transformer can be operated in parallel with a Δ–Δ connected transformer but not with a Δ-Y connected transformer.
56. If voltage ratios of two single phase transformers operating in parallel are not equal, the transformers will not be loaded equally.
57. Two transformers operating in parallel will operate at same power factor only when their resistance/reactance ratios are same.
58. A Dy1 transformer can be operated in parallel with YD11 transformer having the same voltage ratings. [A.M.I.E. Sec B. Winter 1999]
59. The tertiary winding in a transformer supplies the substation auxiliaries at a voltage different from those of primary and secondary windings. [A.M.I.E. Sec B. Winter 1998]
60. In a transformer of given output and voltage ratings increase in number of turns will need iron core of more x-sectional area.
61. Transient behaviour of a transformer could be due to lightening.
62. In star-star transformers distortion on voltage wave shape due to third harmonic flux and voltage unbalance on single phase loads are minimum if they are bank of single phase transformers. [A.M.I.E. Sec B. Summer 1996]
63. The magnetic circuit of an auto-transformer may be either core type or shell type.
64. The auto-transformers are widely used as distribution transformers.
65. In an auto-transformer the electrical isolation between primary and secondary sides is lost.
66. The efficiency of an auto-transformer decreases as the transformation ratio approaches unity.
67. Auto-transformers are preferred over conventional two winding transformers in power applications only for economic reasons.
68. The size of an auto-transformer will be smaller in comparison to that of two-winding transformer for a given rating.
69. In case of a current transformer, the overall power factor is high when both of the windings are close together and falls as the distance between them increases.
70. For electric arc furnaces and electrolytic processes, low voltage transformers are required.
71. High leakage transformers can be designed to give open-circuit voltage between 20 and 30 kV and short-circuit current ranging from 1 to 2 m A.
72. The transformer windings are tapped in the middle because it eliminates radial forces on the windings.
73. In a tap-changing transformer, the taps are usually provided on the hv side. [A.M.I.E. Sec B. Winter 1994]
74. Variac is a continuously variable auto-transformer employing carbon brush on a rotary shaft making contact with transformer winding exposed turns.

Answers: **21.** (F), **22.** (T), **23.** (T), **24.** (F), **25.** (F), **26.** (F), **27.** (F), **28.** (T), **29.** (F), **30.** (T), **31.** (T), **32.** (F), **33.** (T), **34.** (T), **35.** (T), **36.** (F), **37.** (T), **38.** (T), **39.** (T), **40.** (F), **41.** (T), **42.** (T), **43.** (T), **44.** (T), **45.** (T), **46.** (T), **47.** (F), **48.** (F), **49.** (F), **50.** (T), **51.** (T), **52.** (T), **53.** (F), **54.** (F), **55.** (T), **56.** (T), **57.** (T), **58.** (T), **59.** (T), **60.** (F), **61.** (T), **62.** (F), **63.** (T), **64.** (F), **65.** (T), **66.** (F), **67.** (T), **68.** (T), **69.** (T), **70.** (T), **71.** (T), **72.** (F), **73.** (T), **74.** (T),

75. Three phase induction regulators need slip-rings because primary is placed on the rotor.
76. Three phase induction regulators are unable to balance the line voltages when supplying unbalanced loads.
77. The potential transformer is a step-down two winding transformer operating on no-load.
78. An alternator used in power-house has stationary field and rotating armature.
79. In a 3-phase synchronous machine, the rotor rotates in the direction opposite to that of the stator field.
80. The rotor of an alternator has two slip rings for dc supply.
81. Revolving armature type alternators are usually of relatively small kVA capacity and low voltage rating.
82. The pole face in a salient pole type rotor is so shaped that the radial air-gap length increases from the pole centre to pole tips.
83. Totally closed slots are commonly used for housing armature winding in alternators.
84. Cylindrical rotor synchronous machines have always horizontal configuration.
85. Cylindrical construction of rotor provides better balance and less noisy operation.
86. Slip rings are made of aluminium.
[U.P. Technical Univ. Second Semester 2009-10]
87. Pelton wheel driven alternators are usually of horizontal configurations.
88. In a large synchronous generator damper winding is provided to improve stability.
89. Synchronous generators driven by IC engines must have large flywheels or heavy damper windings in order to prevent excessive oscillations.
90. The stator core laminations of an alternator are annealed and insulated from each other by thin oxide coating and an enamel.
91. In an alternator, a fractional rather than integral number of slots per pole is often used in order to eliminate harmonics in the waveform.
92. An alternator's capacity to generate electric power is primary limited due to heating within the machine.
93. The single layer winding has one conductor per slot.
94. One turn consists of two-coil sides.
95. For a double layer winding the number of slots in the stator of a synchronous machine is a multiple of the number of poles and the number of phases.
96. The majority of the ac machines use fractional pitch coils.
97. Short-pitch coils cannot be employed in concentric windings.
98. Chorded coils are never employed in synchronous machine windings.
99. The sum of the armature mmfs in the three-phases of the stator winding of a synchronous generator is zero.
[A.M.I.E. Sec B. Winter 1999]
100. The effect of armature reaction in an alternator is taken care of by magnetizing reactance of the machine.
101. In an alternator mmfs of the stator and rotor are stationary with respect to each other.
102. In case of synchronous generator the armature reaction effect is independent of power factor of the load.
103. Synchronous reactance can be determined from open-circuit and short-circuit tests.
104. In an alternator with a load which is partially inductive or capacitive, there is a cross-magnetization in addition to direct demagnetization or magnetization. [A.M.I.E. Sec B. Summer 2001]
105. In an alternator, the terminal voltage is equal to the phasor difference of no-load voltage and product of armature current and synchronous impedance.
106. Under short-circuit conditions, the armature reaction in the alternator is having magnetising effect. [A.M.I.E. Sec B. Winter 1998]
107. The synchronous impedance of an alternator is independent of field current in an unsaturated machine. [A.M.I.E. Sec B. Winter 1998]
108. The rise in voltage of an alternator when the load is thrown off is the same as the fall in voltage when the same load is applied.
109. Percentage impedance is the impedance drop at rated current and frequency expressed as the %age of the rated voltage.
110. Direct load method may be used for determination of voltage regulation for small machines but is not recommended for large machines.
111. The short-circuit ratio of a synchronous machine is defined as the ratio of the field current required to develop rated voltage on open-circuit to the field current required to give rated current on short-circuit.
112. A small short-circuit ratio indicates small armature reaction in an alternator. [A.M.I.E. Sec. B. Winter 1995]
113. When an alternator is operating on no load, the power supplied by the prime mover is mainly utilized to produce induced emf in the armature winding.
114. Ventilation problem is not much severe in case of cylindrical pole alternators.
115. The provision of radial ventilating ducts in the stampings assists in cooling of a machine.
116. The cooling medium flows axially or longitudinally through the air gap and the lamination perforations and is discharged radially through the ventilating ducts.
117. Direct-axis synchronous reactance of a salient pole synchronous machine can be estimated fairly from short-circuit and open-circuit tests. [A.M.I.E. Sec. B. Winter 1999]
118. Proper oil level should be maintained in case of sleeve bearings.
119. The temperature of a correctly fitted and property lubricated bearing should not exceed 50°C.
120. An alternating field can be replaced exactly by two rotating fields of half its amplitude travelling in opposite directions at synchronous speed.
121. In a pulsating field, the polarity reverses at the rate of supply frequency but the field is stationary in nature.
122. A 3-phase synchronous motor has 3-phase armature winding connected to a 3-phase ac supply and the rotor has an electromagnet excited from a dc source.
123. A synchronous motor is provided with narrow air gap in comparison with that of induction motor.
124. Direct-connected exciters are frequently found on high speed synchronous motors.
125. The relation between synchronous speed and number of poles is

$$N_s = \frac{120\,f}{P}$$

[R.G.T.U. M.P., December, 2010]
126. In a 3-phase synchronous motor the magnitude of field flux varies with the power factor.

Answers: **75.** (F), **76.** (T), **77.** (T), **78.** (F), **79.** (F), **80.** (T), **81.** (T), **82.** (T), **83.** (F), **84.** (T), **85.** (T), **86.** (F), **87.** (F), **88.** (T), **89.** (T), **90.** (T), **91.** (T), **92.** (T), **93.** (T), **94.** (F), **95.** (T), **96.** (T), **97.** (T), **98.** (F), **99.** (T), **100.** (T), **101.** (T), **102.** (F), **103.** (T), **104.** (T), **105.** (T), **106.** (F), **107.** (T), **108.** (F), **109.** (T), **110.** (T), **111.** (T), **112.** (F), **113.** (F), **114.** (F), **115.** (T), **116.** (T), **117.** (F), **118.** (T), **119.** (T), **120.** (T), **121.** (T), **122.** (T), **123.** (F), **124.** (T), **125.** (T), **126.** (F),

127. The direction of rotation of a 3-phase synchronous motor can be reversed by interchanging any two of the phases.
128. The rotor poles of a synchronous machine are magnetically locked with its stator poles when the machine is running.
129. A synchronous motor has no starting torque but when started it always runs at a fixed speed.
130. A synchronous motor can withstand overload up to its maximum value of torque angle.
131. A synchronous motor with comparatively larger air gap has poor stability limit.
132. The working of synchronous motor is similar to transmission of mechanical power by shaft.
133. When a synchronous motor operating under normal conditions is shut down and its field circuit is to be opened, this is done by connecting discharge resistance across its terminals.
134. A synchronous motor with larger air gap has a high synchronising power which makes it less sensitive to variation in loads.
135. An increase in field current of a synchronous motor causes a decrease in armature current. Armature current lags the terminal voltage. [A.M.I.E. Sec B. Winter 1999]
136. In two identical cylindrical rotor and salient pole synchronous machines, the power developed for the same load angle is greater in salient pole machine. [A.M.I.E. Sec B. Elec. Machines Summer 1998]
137. A salient pole synchronous motor at no load is connected to an infinite bus. The field circuit is accidently opened. Machine continues to run drawing lagging current from the bus. [A.M.I.E. Sec B. Winter 1999]
138. Pull-out torque of a synchronous motor increases with the decrease in excitation.
139. Pull-out torque and maximum torque are same in a synchronous motor.
140. The torque developed by a synchronous motor is less sensitive to change in supply voltage.
141. It is difficult to synchronise salient pole rotor synchronous machine in comparison to smooth cylindrical rotor machine.
142. In an underexcited synchronous motor counter or back emf is greater than supply voltage.
143. If the synchronous motor is overexcited its power factor tends to approach unity with the increase in load.
144. A synchronous capacitor converts electrical energy into electrical energy.
145. A synchronous motor when operated overexcited and without mechanical load can be employed for improving voltage regulation of a transmission line.
146. Damper grids in a synchronous motor assist in increasing its stability.
147. A 3-phase synchronous motor provided with damper grids is self-starting.
148. Before synchronising a 3-phase synchronous motor to the supply it has to be run up to or near its synchronous speed by some external means.
149. A synchroscope helps in synchronising of a 3-phase synchronous motor.
150. A 3-phase synchronous motor is started with its field energized from a dc source.
151. The field winding of a 3-phase synchronous motor is energized from a dc supply source just before its rotor attains synchronous speed in order to avoid slipping of poles.
152. A 3-phase synchronous motor provided with damper winding can be started on load.
153. The synchronous motors are usually started by induction motor principle.
154. Large 3-phase synchronous motors, specially those designed for starting under full load, use three phase wound rotor type winding.
155. A synchronous motor in comparison to an induction motor is costlier and complicated.
156. The synchronous motors in comparison to induction motors are cheaper in high speed range.
157. The control equipment of a synchronous motor is more complex in comparison to that of an induction motor.
158. Synchronous motors are widely used in industries for driving mechanical loads.
159. Synchronous motors are made in large sizes for constant duty service.
160. A synchronous motor can be employed to drive a synchronous generator for generating power at a frequency different from supply frequency.
161. Synchronous motors are widely used for line shaft drives in small workshops.
162. Three-phase synchronous motors are used in washing machines. [A.M.I.E. Sec B. Summer 2002, Winter 2003]
163. It is necessary to connect many alternators to a common bus-bar in order to share the total load on the system.
164. Synchronisation process by lamp method is more accurate than that by synchroscope.
165. A machine with a large air gap has a high synchronising power.
166. Load shared by a synchronous generator is governed by its excitation.
167. Eye bolt is provided on induction motors for lifting purposes.
168. Frames for small induction motors are made as a single unit and are usually cast.
169. The stator of an induction motor is similar in construction to that of a synchronous machine.
170. The number of terminals in the terminal box of an induction motor is six.
171. In squirrel cage induction motors the stator and rotor slots are of overhung type.
172. Single layer concentric windings are employed in case of large induction motors operating at high voltages.
173. The rotor core of a 3-phase squirrel cage induction motor has heavy copper or aluminium bars placed in its slots.
174. The cage rotor is made of copper.
175. The laminations of the rotor of an induction motor should be properly insulated against one another.
176. The skewing of rotor slots gives more uniform torque.
177. Skewing of rotor slots increases rotor resistance. [A.M.I.E. Sec B. Summer 1998]
178. The rotor bars of a squirrel cage induction motor are open circuited.
179. The slip-rings of a wound rotor induction motor are insulated from the shaft.

Answers: **127.** (T), **128.** (T), **129.** (T), **130.** (T), **131.** (F), **132.** (T), **133.** (T), **134.** (T), **135.** (T), **136.** (T), **137.** (T), **138.** (F), **139.** (T), **140.** (T), **141.** (F), **142.** (F), **143.** (T), **144.** (T), **145.** (T), **146.** (T), **147.** (T), **148.** (T), **149.** (T), **150.** (F), **151.** (T), **152.** (F), **153.** (T), **154.** (T), **155.** (T), **156.** (F), **157.** (T), **158.** (F), **159.** (T), **160.** (T), **161.** (F), **162.** (F), **163.** (T), **164.** (F), **165.** (T), **166.** (F), **167.** (T), **168.** (T), **169.** (T), **170.** (T), **171.** (T), **172.** (T), **173.** (T), **174.** (F), **175.** (F), **176.** (T), **177.** (T), **178.** (F), **179.** (T),

180. The rotor of an induction motor may be considered as an analog of a mechanical clutch.

181. The air gap between the stator and rotor of an induction motor is made as small as practicable in order to keep air gap reluctance minimum.

182. An increase in the value of air gap flux density in an induction motor improves its power factor and efficiency.

183. The emf induced in the rotor of an induction motor at synchronous speed is zero.

184. The torque developed in a 3-phase induction motor at synchronous speed is maximum.

185. At infinite slip induction motor develops no torque. [A.M.I.E. Sec B. Winter 1999]

186. If a rotor of a 4-pole, 3-phase induction motor is replaced by another wound as 6-phase, 4-pole, the machine will develop steady torque.

187. The no-load current in an induction motor is dependent on its kW rating. [A.M.I.E. Sec B. Winter 2001]

188. The torque developed in an induction motor is nearly proportional to supply voltage. [A.M.I.E. Sec B. Summer 1998]

189. The slip of a squirrel cage induction motor is small due to low resistance of rotor winding.

190. The frequency of rotor currents reduces with the increase in speed of an induction motor.

191. In a 3-phase induction motor, the current varies directly as the voltage whereas the torque varies as the square of applied voltage.

192. In an induction motor, although the magnitude of maximum torque is independent of rotor resistance but its exact location depends upon the rotor resistance.

193. The operating characteristics of an induction motor can be well adopted to a constant speed work.

194. Power factor of an induction motor in loaded condition is more than that in no-load condition. [A.M.I.E. Sec B. Summer 1999]

195. When the load on a 3-phase induction motor is increased from no-load to full load, its stator pf increases while rotor pf decreases. [A.M.I.E. Sec B. Winter 1998]

196. The maximum torque developed in an induction motor does not depend upon the rotor resistance. [A.M.I.E. Sec B. Winter 2001]

197. On increasing the starting torque of a 3-phase induction motor, the maximum torque decreases.

198. Torque exerted on the rotor of a 3-phase induction motor is proportional to the input power to rotor.

199. Rotor efficiency can be expressed as the ratio of rotor actual speed to synchronous speed i.e. N/N_s.

200. The no-load current of an induction motor consists of magnetizing component and no-load loss component

201. The magnetizing component of the no-load current in a 3-phase induction motor is much less than power loss component at no load.

202. Rotor input in watts of an induction motor is also known as synchronous wattage.

203. Synchronous wattage of an induction motor is equal to the power transferred across the air gap to the rotor.

204. The power output of an induction motor will be maximum when slip is zero.

205. In a 3-phase induction motor, power factor at starting is higher than that while running.

206. When the load is increased on a 3-phase induction motor, the pf goes on increasing, reaches it maximum value at near about full load and then it decreases.

207. The resistance R_0 of the exciting branch of the equivalent circuit of a 3-phase induction motor represents the friction and windage losses only. [A.M.I.E. Sec B. Winter 1998]

208. Blocked rotor test and no-load run test of an induction motor fall under the category of type test. [A.M.I.E. Sec B. Winter 1999]

209. No-load test at unity slip is performed to determine equivalent circuit of induction motor. [A.M.I.E. Sec B. Summer 1999]

210. The reading of wattmeter in no-load test on an induction motor gives only windage and friction losses.

211. Starting current and starting torque can be determined from blocked rotor test on a squirrel cage induction motor.

212. Blocked rotor test can be performed only on squirrel cage induction motor.

213. Load test is performed at full load and up to 1.25 times full load of the motor.

214. The starting torque of an induction motor can be determined from its circle diagram.

215. A 3-phase induction motor starts up from rest and is not to be synchronised.

216. In a 3-phase induction motor, the mechanical power developed in terms of air-gap power P_s is $(1 - s) P_s$. [A.M.I.E. Sec B. Winter 1998]

217. Temperature rise test is carried out to determine the temperature rise at different parts of the motor while running at rated conditions.

218. For motors with continuous rating, the temperature rise test should be continued till thermal equilibrium has been reached.

219. In temperature rise test, whenever possible, temperature should be measured both while running and after switching off the supply.

220. The synchronous speed of the nth order harmonic is $1/n$th of the synchronous speed of fundamental. [A.M.I.E. Sec B. Summer 1998]

221. In case of 3-phase induction motor the slip of rotor with respect to fifth harmonic is given by $6 + 5$ s. [A.M.I.E. Sec B. Summer 1999]

222. The number of stator slots should be equal to the number of rotor slots to avoid cogging. [A.M.I.E. Sec B. Summer 1998]

223. Cogging and crawling are phenomena associated with squirrel cage motor, the former at a fraction of its rated speed and the latter during starting. [A.M.I.E. Sec B. Winter 1999]

224. An induction motor may fail to start at no-load because of cogging.

225. The skewing of slots has no effect on the production of harmonics in any rotor. [A.M.I.E. Sec B. Summer 1996]

226. A double squirrel cage induction motor has two independent squirrel cage windings on the rotor, each having its own set of slots.

227. Deep bar or double cage construction is used for improving the starting performance of the motor. [A.M.I.E. Sec. B. Winter 2003]

228. The starting current of a double cage induction motor is comparatively higher than those of the ordinary squirrel cage and wound rotor induction motors.

229. At the start of the motor the lower cage offers very low impedance to the flow of current in comparison to upper cage.

230. The double cage induction motor has comparatively higher copper losses.

Answers: **180.** (T), **181.** (T), **182.** (F), **183.** (T), **184.** (F), **185.** (F), **186.** (T), **187.** (F), **188.** (F), **189.** (T), **190.** (T), **191.** (T), **192.** (T), **193.** (T), **194.** (T), **195.** (T), **196.** (T), **197.** (F), **198.** (T), **199.** (T), **200.** (T), **201.** (F), **202.** (T), **203.** (T), **204.** (F), **205.** (F), **206.** (T), **207.** (F), **208.** (F), **209.** (F), **210.** (F), **211.** (T), **212.** (F), **213.** (T), **214.** (T), **215.** (T), **216.** (T), **217.** (T), **218.** (T), **219.** (T), **220.** (T), **221.** (F), **222.** (F), **223.** (F), **224.** (T), **225.** (F), **226.** (T), **227.** (T), **228.** (F), **229.** (F), **230.** (F),

231. During running condition of a double cage induction motor, most of the current flows through the upper or outer cage.
232. During starting of a double cage induction motor, the torque developed by a lower cage is much more than that developed by the upper cage.
233. Slip-ring induction motor cannot be started on load.
234. The rotor of an induction motor gets its power through magnetic induction.
235. The main advantage of wound rotor motor over squirrel cage induction motor is that it can be started with the help of rotor resistances.
236. Three phase induction motor has a low efficiency. [U.P. Technical Univ. Second Semester 2009-10]
237. Induction motors require more maintenance in comparison to that for synchronous motors.
238. The induction motor is much more sensitive to overloads than a dc shunt motor.
239. Induction motor cannot be used in electric traction. [A.M.I.E. Sec B. Winter, 2000; Winter 2001]
240. Low supply voltage is likely to cause operating temperature abnormally high owing to increase in core losses.
241. Magnetic conditions of a motor may get disturbed seriously due to large change in supply voltage.
242. Unbalance rotor resistance may cause a slip-ring induction motor run at about half the synchronous speed. [A.M.I.E. Sec B. Winter 2000]
243. Single phasing of induction motor means its operation when one of its supply lines gets disconnected. [A.M.I.E. Sec B. Summer, 1999]
244. A 3-phase induction motor coupled to a pump is operating at normal speed. If one line gets disconnected, the motor stops. [GATE E.E. 1994]
245. An automatic star-delta starter has a time delay relay through which change-over from start to delta takes place automatically after a prefixed duration of time.
246. An auto-transformer with x % tap is used to start an induction motor. Supply current is reduced to $x/100$ of the value under direct-on-line. [A.M.I.E. Sec B. Summer 1999]
247. The external rotor resistance in a slip-ring induction motor is cut out gradually as the motor picks up speed.
248. In a 3-phase wound rotor induction motor, the external starting resistance is used for the entire operating condition.
249. If the speed of an induction motor is changed by changing the slip, the speed regulation will be poor.
250. The speed of a 3-phase induction motor can be controlled very smoothly over a wide range.
251. The speed of a squirrel cage induction motor can be controlled from rotor side.
252. In the pole changing speed control method, there is only one stator winding.
253. In the consequent-pole technique method of speed control the stator needs two windings.
254. The speed of a squirrel cage induction motor can be changed by varying the slip.
255. Slip of an induction motor can be changed by varying the voltage applied to the stator.
256. Stator voltage control of speed control of induction motor is suitable for constant load drive. [A.M.I.E. Sec B. Summer 2001]
257. Stator voltage control is employed for machine tools. [A.M.I.E. Sec B. Summer 2004]
258. Stator voltage control is most suitable for fan type loads. [A.M.I.E. Sec B. Winter 2003]
259. The applications where speed ratio other than 1 : 2 is required, speed control of induction motor can be done by variation of number of stator poles using multiple stator windings. [A.M.I.E. Sec B. Summer 1998]
260. The main disadvantage of pole changing method of speed control is limited speed range. [A.M.I.E. Sec B. Summer 2004]
261. Pole changing is one of the easiest way of speed control of induction motors. [A.M.I.E. Sec B. Summer 2002]
262. In a variable frequency drive of induction motor V/f is constant to produce high starting torque. [A.M.I.E. Sec B. Winter 1996]
263. In variable frequency induction motor drives the ratio V/f is increased at low speed. [A.M.I.E. Sec B. Summer 1996]
264. In a variable frequency drive of induction motor V/f is kept constant to avoid saturation. [A.M.I.E. Sec B. Winter 1994]
265. V/f control means constant flux in the air gap. [A.M.I.E. Sec B. Summer 2001]
266. For constant V/f operation, maximum torque remains constant at any frequency. [A.M.I.E. Sec B. Winter 2003]
267. V/f ratio of a variable frequency drive is controlled to get constant breakdown torque at all speeds. V/f ratio is to be progressively increased with the decrease in frequency. [A.M.I.E. Sec B. Winter 2000; 2001]
268. Variable frequency control of an induction motor is less efficient than stator voltage control. [A.M.I.E. Sec B. Winter 1998]
269. V/f control provides high torque to current ratio during starting. [A.M.I.E. Sec B. Summer 2001]
270. A low resistance squirrel cage rotor gives high starting torque at low value of frequency.
271. In a 3-phase wound rotor induction motor slip at a given load can be varied by varying the rotor circuit resistance.
272. Efficiency of an induction motor increases by using rotor resistance speed control method.
273. Rotor resistance speed control is used in situations when speed variation is required for short duration only.
274. If the two induction motors used for cascade control have equal number of poles only cumulative cascading is possible.
275. Rotor resistance control is inefficient at low values of speed. [A.M.I.E. Sec B. Winter 2003]
276. Slip-power recovery scheme can be economically employed for speed control of residential fans. [A.M.I.E. Sec B. Summer 2004]
277. Slip-recovery scheme is not suitable for drives running at low speeds. [A.M.I.E. Sec B. Summer 2001]
278. Slip-power recovery scheme is very economical for very low power induction motors. [A.M.I.E. Sec B. Summer 2002; Winter 2003]
279. Kramer system of speed control is based on the emf injecting method.
280. The speed of an induction motor cannot be controlled as easily and efficiently as that of a dc shunt motor.
281. Stiff bearing may be a cause for not starting of an induction motor.
282. Sparking at the brushes of a slip-ring induction motor may be one of the reasons to make the motor to run at lower speed.
283. A 3-phase induction motor can be dried by blocking the rotor and circulating current at a voltage around 10% of rated voltage.

Answers: **231.** (F), **232.** (F), **233.** (F), **234.** (T), **235.** (T), **236.** (F), **237.** (F), **238.** (F), **239.** (F), **240.** (F), **241.** (T), **242.** (F), **243.** (T), **244.** (T), **245.** (T), **246.** (F), **247.** (T), **248.** (F), **249.** (T), **250.** (F), **251.** (F), **252.** (F), **253.** (F), **254.** (F), **255.** (T), **256.** (F), **257.** (F), **258.** (T), **259.** (F), **260.** (T), **261.** (T), **262.** (F), **263.** (F), **264.** (T), **265.** (T), **266.** (T), **267.** (F), **268.** (F), **269.** (T), **270.** (T), **271.** (T), **272.** (F), **273.** (T), **274.** (T), **275.** (T), **276.** (F), **277.** (T), **278.** (F), **279.** (T), **280.** (T), **281.** (T), **282.** (T), **283.** (T),

284. In plugging, supply must be disconnected as soon as motor comes to zero speed. [A.M.I.E. Sec B. Summer 1999]

285. During plugging of induction motors, slip is positive. [A.M.I.E. Sec B. Summer 2004]

286. If any two phases of a 3-phase induction motor are interchanged it will operate as an induction generator.

287. The slip of an induction machine when operating as a generator is $2 - s$.

288. The torque-speed characteristics of the machine as a generator resemble to those of the motor.

289. When used in parallel with synchronous machine, an induction generator can deliver only lagging loads. [A.M.I.E. Sec B. Summer 1994]

290. Induction generators deliver power at leading power factor. [A.M.I.E. Sec B. Summer 1998]

291. Induction motor can work as induction generator with slip-power recovery scheme. [A.M.I.E. Sec B. Summer 2004]

292. The equivalent rotor circuit resistance R_2 is negative for induction generator. [A.M.I.E. Sec B. Winter 1999]

293. The voltage and frequency of an induction generator that is connected to an energized power system cannot be adjusted. [A.M.I.E. Sec B. Winter 1998]

294. Induction generators are designed with high rotor resistance so that they can be started against loads. [A.M.I.E. Sec B. Winter 1998]

295. Induction generator is often used with wind mills. [A.M.I.E. Sec B. Summer 1999]

296. At synchronous speed secondary windings of Schrage motor carry dc. [A.M.I.E. Sec B. Winter 1999]

297. A long air gap in a synchronous induction motor makes it a stiffer machine with a larger overload capability.

298. The operating principle of the linear induction motor is the same as that of a conventional rotary motor.

299. The speed of a linear induction motor depends upon the number of poles, pole pitch and stator supply frequency.

300. The speed of a linear induction motor can be increased increasing the number of poles, the supply frequency and pole-pitch being kept fixed. [A.M.I.E. Sec B Summer 1996]

301. 'Emf effect' in a flat linear induction motor increases with the increase in number of poles. [A.M.I.E. Sec B Summer 1994]

302. Commutator motors are recommended for use in mines. [A.M.I.E. Sec B Summer 194]

303. The brush shift against the direction of rotation of a Schrage motor gives improved power factor for both subsynchronous and supersynchronous operation.

304. The motors built in fractional-horse power sizes are technically termed small motors.

305. In a single phase induction motor if rotor is initially given a start by some external means in either direction, the motor will run in that direction.

306. The stator of a single phase induction motor carries one winding only. [A.M.I.E. Sec B. Summer 1994]

307. A single phase motor has no starting torque of its own. [A.M.I.E. Sec B. Summer, 1999]

308. In a split-phase induction motor the auxiliary winding has a lower resistance to reactance ratio. [A.M.I.E. Sec B. Summer 1994]

309. Split-phasing in a split phase motor is done by transformer. [A.M.I.E. Sec B. Winter 1996]

310. For making a single phase induction motor self starting it is temporarily converted into a 2-phase motor, during starting.

311. For single phase motors using centrifugal switches, the connections of auxiliary winding should be reversed only when the rotor is at rest.

312. Resistance start induction motor has a higher efficiency than that of a permanent capacitor motor.

313. In case of 1-phase induction motor, inductance may be used in series with main winding for getting starting torque. [A.M.I.E. Sec B. Summer 1999]

314. A single-phase motor is noisier than a 3-phase motor because of its low power factor. [A.M.I.E. Sec B. Summer 1998]

315. In a resistance split-phase motor the auxiliary winding has higher R/X ratio as compared to the main winding. [A.M.I.E. Sec B. Winter 1999]

316. In a capacitor-start single phase induction motor, capacitor is used in series with the motor to improve power factor. [A.M.I.E. Sec B. Winter 1994]

317. Electrolytic capacitors are used in capacitor-start motors. [A.M.I.E. Sec B. Summer 1996]

318. Capacitor-start capacitor-run motor finds application in small home air-conditioning units.

319. Induction motors are used in air-conditioners. [A.M.I.E. Sec B. Summer 2004]

320. Domestic fans require starting resistance. [A.M.I.E. Sec B. Summer 2002]

321. In a ceiling fan employing permanent capacitor motor secondary winding surrounds the primary winding. [A.M.I.E. Sec B. Winter 1999]

322. Permanent capacitor induction motor has low pf at full load.

323. Two value capacitor motor is preferred for tape recorder. [A.M.I.E. Sec B. Summer 1998]

324. In a shaded-pole motor the direction of rotation is from shaded portion to unshaded portion. [A.M.I.E. Sec B. Winter 1999]

325. In a shaded pole motor, the laminated pole has a slot cut across the laminations approximately at one-third distance from one edge.

326. A shaded pole motor is the only single phase induction motor which is inherently self starting.

327. The shading coil of a shading pole is made of copper.

328. In a shaded-pole motor, the effect of the shading ring is to reduce the flux in the shaded portion and, at the same time, to shift it in time phase behind the flux in the unshaded portion. [A.M.I.E. Sec B. Summer 1994]

329. The shading bands do not produce any phase displacement between two fluxes in a shaded pole motor. [A.M.I.E. Sec B. Winter 1996]

330. Shaded-pole motors develop higher starting torque than 1-phase capacitor start motors. [A.M.I.E. Sec B. Summer 1994]

331. In a single phase induction motor, shading coil, when used degrades the power factor. [A.M.I.E. Sec B. Winter 1994]

332. Shaded-pole induction motors are used in refrigerator compressors. [A.M.I.E. Sec B. Summer 1996]

333. Speed control of split-phase induction motors is relatively difficult.

Answers: **284.** (T), **285.** (T), **286.** (F), **287.** (F), **288.** (T), **289.** (F), **290.** (T), **291.** (T), **292.** (T), **293.** (T), **294.** (F), **295.** (T), **296.** (T), **297.** (T), **298.** (T), **299.** (F), **300.** (F), **301.** (F), **302.** (F), **303.** (F), **304.** (T), **305.** (T), **306.** (F), **307.** (T), **308.** (F), **309.** (F), **310.** (T), **311.** (T), **312.** (F), **313.** (F), **314.** (F), **315.** (T), **316.** (F), **317.** (T), **318.** (T), **319.** (T), **320.** (F), **321.** (T), **322.** (F), **323.** (F), **324.** (F), **325.** (F), **326.** (T), **327.** (T), **328.** (T), **329.** (F), **330.** (F), **331.** (T), **332.** (F), **333.** (T),

334. The working principle of ac series motor is the same as that of a dc series motor.

335. In ac series motors the yoke and poles are completely laminated in order to reduce eddy current losses.

336. AC series motors need not have laminated yokes. [A.M.I.E. Sec B. Summer 1994]

337. When a dc series motor of normal design is connected across single phase ac supply unidirectional torque is developed. [A.M.I.E. Sec B. Summer, 1998]

338. Large ac series motors are usually designed for operation on high frequencies. [A.M.I.E. Sec B. Winter, 1999]

339. A small ac series motor operates at very low speed.

340. For an ac series motor, on complete removal of mechanical load, the speed is limited by its own friction and windage load.

341. A compensating winding in a single phase ac series motor improves commutation but increases reactance drop. [A.M.I.E. Sec B. Winter, 1998]

342. The reactance voltage drop in an ac series motor tends to increase the speed with the increase in load.

343. A single-phase compensated series motor exhibits shunt characteristics. [A.M.I.E. Sec B. Winter, 1999]

344. In a conductively compensated ac series motor, the compensating winding is connected in parallel with the armature.

345. When the load torque on a single phase ac series motor is increased, its speed and power factor will decrease. [A.M.I.E. Sec B. Winter, 1998]

346. AC series motors have high torque to weight ratio than dc series motor of equal ratings. [A.M.I.E. Sec B. Summer 1996]

347. Compensating winding is provided in a series motor to improve its power factor. [A.M.I.E. Sec B. Winter 1996]

348. Power output to weight ratio is highest in case of universal motors in comparison to other single phase motors.

349. Small single phase ac series motors are called universal motors. [A.M.I.E. Sec B. Summer, 1999]

350. The direction of rotation of a universal motor can be reversed by reversing the supply terminals. [A.M.I.E. Sec B. Winter, 1998]

351. Efficiency of a universal motor is more when operated on dc than when operated on ac. [A.M.I.E. Sec B. Summer, 1999]

352. Small universal motors are generally directly coupled to load.

353. Universal motors are generally used with speed reducing gears. [A.M.I.E. Sec B. Winter 1994]

354. Small universal motors are suitable for grinding purpose. [A.M.I.E. Sec B. Winter 1994]

355. Universal motors are used in food mixer grinder. [A.M.I.E. Sec B. Summer 1996]

356. A repulsion motor runs in the direction of brush shift. [A.M.I.E. Sec B. Winter 1996]

357. The starting torque and current drawn by a repulsion motor depends on the position of brushes.

358. The direction of rotation of a repulsion-start induction motor can be reversed by changing the position of brushes.

359. The speed of repulsion-start induction motor can be varied by brush-shifting. [A.M.I.E. Sec B. Summer 1996]

360. Repulsion motors are unsuitable for high speed running. [A.M.I.E. Sec B. Summer 1994]

361. The repulsion motor has excellent starting torque and a relatively wide range of speed. [A.M.I.E. Sec B. Summer, 1998]

362. The commutation of a repulsion motor is at its best when it runs at about 50% of synchronous speed. [A.M.I.E. Sec B. Winter 1998]

363. The direction of rotation of a repulsion motor is reversed by interchanging the supply leads. [A.M.I.E. Sec B. Winter 1999]

364. Repulsion motor can be used for high inertia load requiring high starting torque. [A.M.I.E. Sec B. Summer 1999]

365. A reluctance motor is a synchronous motor without dc excitation.

366. The rotor of a reluctance motor comes up to nearly synchronous speed by synchronous motor action.

367. The air-gap reluctance of a reluctance motor is uniform. [A.M.I.E. Sec B. Summer 1993]

368. The physical dimensions of reluctance motors are somewhat smaller than other types of motors of same output rating.

369. Value of slip in a reluctance motor is large.

370. In a reluctance motor, when the load increases to an extent that it cannot maintain synchronous speed it will run as an induction motor. [A.M.I.E. Sec B. Winter 1999]

371. Efficiency and power factor of reluctance motor are high as compared to single phase induction motor of same size. [A.M.I.E. Sec B. Summer 1999]

372. Uniform air gap is used to produce a rotating magnetic field in reluctance motor. [A.M.I.E. Sec B. Summer 1999]

373. The reluctance motors are usually built in fractional horse power sizes.

374. Reluctance motors operate on dc as well as on ac.

375. Reluctance motors have starting torques. [A.M.I.E. Sec B. Winter 1994]

376. Reluctance motor employs the conventional split phase stator and a centrifugal switch to open auxiliary winding.

377. In case of a hysteresis motor, the induced emf in the rotor will be maximum at the synchronous speed.

378. An hysteresis motor is a smooth noiseless motor. [A.M.I.E. Sec B. Winter 1994]

379. Hysteresis motors can pull-into step just about any load they can carry, regardless of the connected inertia of that load. [A.M.I.E. Sec B. Summer 1996]

380. Hysteresis loss is minimum in hysteresis motor at standstill. [A.M.I.E. Sec B. Summer 1999]

381. The hysteresis motor develops a constant hysteresis torque at all speeds from standstill up to but not including synchronous speed. [A.M.I.E. Sec B. Winter 1998]

382. In a hysteresis motor the hysteresis torque depends solely on the area of the rotor's hysteresis loop. [A.M.I.E. Sec B. Winter 1998]

383. The starting torque of a hysteresis motor is twice the running torque. [A.M.I.E. Sec B. Summer 1998]

384. Hysteresis motor is normally free from mechanical and magnetic vibrations. [A.M.I.E. Sec B. Summer 1998]

385. Hysteresis motor is not suitable for sound recording system. [A.M.I.E. Sec B. Summer 1999]

386. Eddy current motors operate on dc supply only. [A.M.I.E. Sec B. Winter 1996]

387. A permanent magnet motor is a variable reluctance motor. [A.M.I.E. Sec B. Winter 1996]

Answers: **334.** (T), **335.** (T), **336.** (F), **337.** (T), **338.** (F), **339.** (F), **340.** (T), **341.** (F), **342.** (F), **343.** (F), **344.** (F), **345.** (T), **346.** (F), **347.** (F), **348.** (T), **349.** (F), **350.** (F), **351.** (T), **352.** (T), **353.** (T), **354.** (T), **355.** (T), **356.** (T), **357.** (T), **358.** (T), **359.** (T), **360.** (F), **361.** (T), **362.** (F), **363.** (F), **364.** (T), **365.** (T), **366.** (F), **367.** (F), **368.** (F), **369.** (F), **370.** (T), **371.** (F), **372.** (F), **373.** (T), **374.** (F), **375.** (T), **376.** (T), **377.** (F), **378.** (T), **379.** (T), **380.** (T), **381.** (F), **382.** (T), **383.** (F), **384.** (T), **385.** (F), **386.** (F), **387.** (F),

388. Permanent magnet motors are also called brushless motors. [A.M.I.E. Sec B. Summer 1999]

389. A stepper motor is a constant reluctance motor. [A.M.I.E. Sec B. Winter 1994]

390. Stepper motors are generally used to achieve very fine speed control. [A.M.I.E. Sec B. Winter 1994]

391. Variable reluctance stepper motors operate at larger steps as compared to permanent magnet motors. [A.M.I.E. Sec B. Summer 1998]

392. Stepper motors are compatible with digital systems and do not require digital to analog conversion at the input. [A.M.I.E. Sec B. Winter 1998]

393. In servomotors rapid response is obtained by low torque to inertia ratio. [A.M.I.E. Sec B. Summer 1996]

394. A motor convertor is self starting.

395. A motor convertor can be operated on any frequency.

396. When a rotary convertor receives power from dc supply mains and deliver ac power, it is called direct rotary convertor.

397. A synchronous convertor is not portable.

398. A rotary convertor is liable to flashover and reversal of polarity.

399. A rotary convertor operates on low power factor.

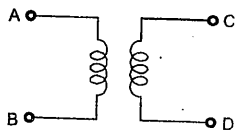
400. Rating of rotary convertor increases with the increase in number of phases.

Answers: 388. (F), 389. (F), 390. (T), 391. (F), 392. (T), 393. (F), 394. (T), 395. (T), 396. (F), 397. (T), 398. (T), 399. (F), 400. (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. When the output voltage is more than input voltage the transformer is called the _____ transformer.
2. The principle of operation of a transformer is based upon _____ induction.
3. Transformer action results when the magnetic flux in its core is _____. [A.M.I.E. Winter 1996]
4. Transformer operates on _____ only.
5. A transformer should never be connected to a _____ source.
6. The winding having larger number of turns will be having _____ induced emf.
7. In a step up transformer, secondary turns are _____ than primary turns.
8. The current flowing through the primary winding, when the secondary is open circuited is called the _____ current.
9. The secondary leakage flux is _____ at no load.
10. A transformer is said to be loaded, when its secondary circuit is completed through an _____ load.
11. The flux which escapes the core and links only with one of the transformer windings is called the _____ flux.
12. The _____ leakage flux is that flux which links with the primary winding but does not link with the secondary winding.
13. The self induced emf in primary winding due to leakage flux is equivalent to a voltage drop owing to _____ reactance.
14. The leakage flux of secondary winding results in _____ reactance of the secondary winding.
15. Energy component of no-load current can be assumed to flow through a resistance R_0 connected _____ the primary winding.
16. Magnetizing component of no-load current can be assumed to flow through a reactance connected _____ the primary winding.
17. In an ideal transformer on no load, the primary voltage is balanced by _____.
18. The phase difference between emfs induced in primary and secondary windings by mutual flux is _____.
19. The phase relationship between primary and secondary voltages of a power transformer is _____.
20. The mmf produced by the secondary winding will _____ the primary mmf.
21. Increase in load or secondary current causes increase in primary current because primary and secondary windings are _____ coupled.
22. If K is the voltage transformation ratio, then secondary voltage V_2 can be transferred to the primary as _____.
23. The primary resistance R_1 of a transformer may be referred to secondary as _____.
24. The load resistance R_L connected across the secondary of a transformer may be referred to the primary as _____.
25. One transformer has leakage impedance of $(1 + j\,4)\ \Omega$ and $(3 + j\,11)\ \Omega$ for its primary and secondary windings respectively. This transformer has _____ (lv/hv) primary and _____ (lv/hv) secondary. [A.M.I.E. Sec B. Elec. Machines Summer 2000]
26. The terminal voltage may rise in case of _____ pf loads at full load.
27. The regulation of transformer may become negative for _____ power factor loads.
28. The regulation of a transformer increases with the _____ in leakage flux.
29. Transformer for constant voltage application should have _____ regulation.
30. Transformer supplying load having negative resistance characteristic, such as an arc load should have _____ regulation.
31. The negative voltage regulation of a transformer is possible with _____ load.
32. Maximum regulation occurs when the power factor of the load is _____.
33. The core losses constitute eddy current and _____ losses.
34. The copper losses in a power transformer are proportional to the square of the _____ current.
35. In a power transformer, copper losses occur in _____.
36. In a power transformer, iron loss occurs in the _____ of the transformer.
37. Two windings of a single phase transformer are indicated by terminals *AB* and *CD* as shown in figure. When a voltage of 100 V is applied across *AB* with *BD* short-circuited, a voltage of 200 V appears across *AC*. The turns ratio from *CD* to *AB* is _____ [A.M.I.E. Sec B. Elec. Machines Summer 2000]



Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

38. The short-circuit test in a transformer is used to determine the _____ loss at full load. [A.M.I.E. Summer 1997]
39. A single phase transformer is working at maximum efficiency. The copper losses are 100 W, then iron losses would be _____. [U.P. Technical Univ. First Semester 2008-09]
40. A 100 kVA single phase transformer operating at 0.9 power factor has 90% maximum efficiency. The iron loss will be _____. [U.P. Technical Univ. First Semester 2009-10]
41. In a transformer _____ is measured on an energy basis. [A.M.I.E. Sec. B. Summer 2001]
42. The cross sections of small transformer core are _____. [A.M.I.E. Sec. B. Summer 2001]
43. The path of the magnetic flux in a transformer should have _____ reluctance.
44. The core of a transformer is assembled with laminated sheets so as to reduce _____ loss. [A.M.I.E. Summer 1995]
45. Silicon steel employed in transformer cores contains _____ per cent of silicon.
46. The _____ type construction is employed in large capacity power transformers.
47. The transformer windings are tapped in the middle because it eliminates _____ forces on the windings.
48. _____ coils are employed in core type transformers.
49. _____ coils are employed in hv windings of large capacity transformers.
50. _____ windings are used in transformers to improve the transient behaviour of the transformer.
51. _____ windings are used in transformers to overcome voltage surges.
52. In sandwich type winding the leakage flux is _____ than that in cylindrical type winding.
53. The permissible temperature rise in transformer winding depends on the _____ employed.
54. _____ insulation is used as the inter-turn insulation in low voltage transformers.
55. Simple porcelain bushings are employed for operating voltage up to _____ kV.
56. Oil impregnated paper condenser bushings are generally used on power transformers operating at _____ kV.
57. The transformer's tanks are usually made of _____.
58. Transformer breaths-in when its load _____.
59. The colour of silica gel is _____ when dry and _____ when moist.
60. The humming noise in a transformer depends on _____.
61. The humming noise in a transformer is mainly caused by the _____ of the iron core.
62. Conservator is not found in _____ cooled transformers.
63. Gas is usually not liberated due to dissociation of transformer oil unless the temperature of the oil exceeds _____.
64. The tubes welded to the sides of the transformers improve the _____ of the transformer.
65. Elaborate cooling arrangement is very essential for _____ rating power transformers.
66. Very small transformers are generally _____ cooled.
67. The relative polarity of the windings in a transformer is determined by _____.
68. Star-star transformers operate satisfactorily only when the load is _____.
69. Delta/star transformers operate satisfactorily on _____ as well as _____ loads.
70. A 3-phase transformer used for the same purpose requires _____ as much iron for the magnetic circuit as a bank of 3 single phase transformers.
71. A 3-phase transformer is cheaper about _____ than a bank of three single phase transformers.
72. The most popular method of connecting transformers is the _____ connections.
73. Three identical single-phase transformers are connected in star-star configuration without neutral wire. Assuming that the supply is 3-phase balanced at 50 Hz, the frequency of the voltage appearing between the supply neutral and the primary star point is nearly _____ Hz. [A.M.I.E. Sec B. Advanced Elec. Machines Summer 2004]
74. The percentage impedance of a 100 kVA, 11 kV/400 V, Δ/Y, 50 Hz transformer is 4.5%. For the circulation of half the full-load current during short-circuit test, with low voltage terminal shorted, the applied voltage on the high voltage side will be _____. [GATE E.E. 1995]
75. A 3-phase transformer bank consists of three identical 2,300/230, 15 kVA single phase transformers connected in Δ/Δ. The bank supplies a 20 kVA, unity pf 3-phase load. If one of the single phase transformer develops a fault, and is removed, the load carried by each of the transformers now operating in delta will be _____ kVA. [GATE E.E 1997]
76. The utility factor in T-T connections is _____.
77. The utility factor in open-delta connections is _____.
78. _____ transformers are required for Scott-connections.
79. In Scott-connections, the neutral point divides the teaser winding in the ratio _____.
80. In Scott connections, the transformer with 0.866 tap is called the _____ transformer.
81. The third winding in a transformer, if provided, is known as _____ winding.
82. Two transformers A and B of equal ratings are connected in parallel. If the impedance of transformer A is more than that of B, transformer A will supply _____ load than that being supplied by B.
83. The kVA rating ratio of transformers operating in parallel, as a general rule should be within _____.
84. For parallel operation of two three phase transformers, it is essential that they have _____ phase sequence.
85. An auto-transformer is a transformer having a part of its winding _____ to the primary and secondary circuits. [A.M.I.E. Winter 1997]
86. The primary and secondary of an auto-transformer are _____ connected together.
87. The current in the part of winding which is common to both primary and secondary is always the _____ of I_1 and I_2.
88. Constant current transformer is used for _____ lighting.
89. Constant current transformer is of _____ type.
90. Tappings are provided on transformers for varying the _____ voltage.
91. In a 1-phase induction regulator rotor carries a short-circuited compensating winding in addition to the _____ winding.
92. Induced voltages in the secondaries of a 3-phase induction voltage regulators are of _____ magnitude and of _____ phase.
93. If the voltage of a transformer is reduced, may be due to any reason, its output volt-amperes will be reduced in the _____ proportion.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

94. If a transformer designed for installation in a tropical country is installed in a cold country, it _____ be operated on higher load than that mentioned on its name plate.
95. A synchronous machine taking mechanical input and delivering electrical output is known as the synchronous _____.
96. A machine which generates ac is called the _____.
97. Revolving field type alternator has a _____ armature or stator, inside of which field structure _____ __.
98. The highest speed of 50 Hz ac generator can be _____. [Mahamaya Technical Univ. Second Semester 2010-11]
99. Hydrogenerators are usually of _____ type.
100. The maximum allowable heating in the armature winding governs the maximum _____ output available from the machine.
101. The field coils of synchronous machine are _____ insulated and _____ impregnated.
102. The field coils of a synchronous machine are usually _____ type former wound.
103. The flux density is _____ on the central polar line of a rotor.
104. The resultant flux of a polyphase winding is of _____ magnitude.
105. The rotor of an alternator has _____ slip rings.
106. The most common type of prime mover used for slow speed alternator is _____ turbine.
107. An alternator driven by a Francis turbine is a _____ speed alternator.
108. Turbo-alternators are usually operated at a speed of _____ rpm.
109. Non-salient or smooth cylindrical rotors are generally employed with _____ speed alternators.
110. The frequency of generated emf by a synchronous generator can be adjusted by regulating the _____ of the prime mover.
111. The reason for an alternator to generate ac at a lower frequency is due to _____ of the prime mover.
112. The permissible duration for which a generator of rated frequency 50 Hz can run at 46 Hz is _____ __ second.
113. A great deal of air-craft equipment operates with voltage of frequency of _____ Hz.
114. The span of each coil must be equal to pole-pitch *i.e.* the two sides of any coil may be under _____ poles.
115. The coils are so connected that emfs induced in them _____ each other.
116. The winding for ac machines is designed to give induced emf of approximately _____ form.
117. Double layer winding will have two _____ per slot.
118. Polyphase synchronous machines have two or more single phase windings _____ spaced around the stator.
119. The armature winding having conductors placed in several slots under one pole, is known as _____ winding.
120. In a fractional pitch winding the coil span is less than _____ electrical degrees.
121. The pitch factor can never exceed _____.
122. The coil span factor for a 3-ϕ distributed winding with full-pitch coils is _____.
123. It is desirable that the 5th harmonic voltage should be eliminated from the output of an alternator. The armature windings of the alternator should be short chorded by an angle of _____. [A.M.I.E. Sec B. Advanced Elec. Machines Summer 2004]
124. The distribution factor for a 36 slot stator with three phase, 8-pole winding, having 120° phase spread is _____. [GATE E.E 1995]
125. The distribution factor for a 3-phase winding with 4 slots per pole per phase is _____.
126. For getting maximum mmf, the coil span should be equal to _____ __ pole pitch.
127. Amplitude of armature mmf wave is proportional to the _____ current.
128. The position of armature mmf wave depends on the _____ of the load.
129. The armature resistance voltage drop is _____ in case of an alternator.
130. The synchronous impedance of a large sized modern alternator is approximately _____ pu.
131. The ratio of armature leakage reactance to synchronous reactance of a large size modern synchronous generator is around _____.
132. Synchronous reactance can be defined as sum of _____ and _____ reactance.
133. The synchronous reactance of a 200 MVA, 10 kV, 3-ϕ, 50 Hz generator is 1.0 pu at its own base. Its pu reactance at 100 MVA, 20 kV base will be _____ pu. [GATE E.E 1997]
134. Regulation of an alternator is better at or near unity power factor but becomes _____ at low power factors.
135. In an alternator with the fall in leading power its voltage _____ from no load to full load.
136. Voltage of an alternator can be changed by varying its _____.
137. A single phase alternator has a synchronous reactance of 2 Ω and negligible resistance. If it supplies 10 A to a purely capacitive load at 200 V, the generated emf will be _____ V and the regulation will be _____ %. [GATE E.E 1997]
138. The quadrature axis synchronous reactance of a salient pole alternator is _____ than the direct axis synchronous reactance. [A.M.I.E. Sec B Summer 1993]
139. $X_d - X_d' - X_d''$. [A.M.I.E Sec B. Summer 1998]
140. The maximum efficiency of an alternator occurs at about _____ per cent of full load.
141. Stray losses in electrical machines consist of friction and windage losses and _____ loss.
142. Excessive windage loss and noise occur with _____ pole rotors.
143. Small synchronous machines are usually _____ cooled while large capacity machines are usually _____ cooled.
144. Thermal conductivity of hydrogen is nearly _____ times of that of air while its density is about _____ per cent of that of air.
145. In a two phase winding two windings are _____ electrical degrees apart from each other.
146. The resultant flux produced by a two phase winding always rotates at _____ speed.
147. In a 3-phase winding three windings are _____ electrical degrees apart from each other.
148. The instantaneous resultant flux set up by a three phase winding will be equal to _____ of the instantaneous values of fluxes set up separately by three windings.
149. The resultant flux set up by a three phase winding makes _____ revolution(s) per cycle.
150. kW rating of an exciter for a synchronous motor is about _____ per cent of the kVA rating of the synchronous motor.
151. Separate motor-generator sets are widely used for excitation of _____ speed synchronous motors.
152. Slip-rings in a synchronous motor carry _____.
153. The decreased excitation to synchronous motor causes _____ power factor.
154. The synchronous motor is non _____ type.
155. The percentage full-load slip in case of a synchronous motor is _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

156. The speed regulation of a synchronous motor is always _____.
157. A synchronous machine is said to be _____ when operated on no load and without losses.
158. The maximum torque that a synchronous motor can develop without loss of synchronism is known as _____ torque.
159. Synchronous motor may fall out of synchronism and stop when the load torque exceeds the _____ torque.
160. In synchronous motors, the pull-out torque is usually _____ of full-load torque.
161. In a synchronous motor the magnitude of counter emf can be varied by varying _____.
162. For 100% excitation in a synchronous motor the counter emf is _____ applied voltage.
163. The induced emf or excitation voltage in a synchronous motor operating at leading power is _____ applied voltage.
164. The synchronous motor operating underexcited will have _____ power factor.
165. An overexcited synchronous motor draws current at _____.
166. A synchronous motor draws _____ current from 3-ϕ ac supply mains at unity power factor.
167. The excitation that gives minimum armature current and unity power factor for a synchronous motor is known as _____ excitation.
168. Maximum power developed by a synchronous motor is given as _____.
169. The region in which the excitation or field current is less than its normal value is known as region of _____ excitation or region of _____.
170. The region in which the excitation of field current is more than its normal value is known as the region of _____ excitation or region of _____.
171. A synchronous motor working at leading power factor without mechanical load is known as synchronous _____.
172. A synchronous motor operated at power factors ranging from lagging through unity to leading without mechanical load is also called the _____ reactor.
173. A synchronous motor has a tendency to _____.
174. The duration of sudden short-circuit test on a synchronous motor is usually about _____.
175. The process of connecting an alternator in parallel with another alternator or with common bus-bars is called the _____.
176. For parallel operation, the frequencies of two machines should be_____.
177. When two alternators are operating in proper synchronism, the synchronising power will be _____.
178. In a system there are two generators operating in parallel. One generator, of rating 250 MVA, has an inertia constant of 6 MJ/MVA while the other generator of 150 MVA has an inertia constant of 4 MJ/MVA. The inertia constant for the combined system on 100 MVA common base is _____ MJ/MVA.
[GATE E.E 1994]
179. An alternator synchronised to the infinite bus delivers lagging power to the bus when the field is _____ (overexcited, underexcited, normally excited). [A.M.I.E. Sec B. Summer 1999]
180. Yoke of an induction motor is made of _____.
181. The frames of _____ and _____ sized machines are fabricated from rolled steel plates.
182. The thickness of stator laminations for an induction motor varies from _____ mm to _____ mm.
183. The stator slots used in a 3-phase induction motor are usually of _____ type.
184. The air gap is usually from _____ to _____ mm in small rating induction motors.
185. The air gap is usually from _____ to _____ mm in large rating induction motors.
186. Under operating conditions the rotor winding of a wound type induction motor is _____ at the slip rings.
187. The end rings in rotor of cage type induction motor acts as a _____ circuit on the individual rotor bar.
188. The number of slip ring(s) on a squirrel cage induction motor is _____.
189. Slip rings on a 3-phase wound rotor induction motor is _____ in number and are usually made of _____
190. In a 3-phase slip-ring induction motor the number of poles on rotor is always _____ number of poles of stator.
191. The number of slip rings on a 3-phase wound rotor induction motor is _____.
192. Slip rings for an induction motor are usually made of _____.
193. For an induction motor and synchronous induction motor of same rating, air gap of synchronous motor _____ air-gap of induction motor. [A.M.I.E. Sec B. Summer 1998]
194. The resultant flux developed by stator of a 3-phase induction motor is _____ the maximum values of flux due to one phase.
195. The rotating magnetic field produced by stator currents rotates at _____ speed.
196. The speed of rotor of an induction motor is always _____ synchronous speed.
197. The direction of rotation of an induction motor depends upon the _____.
198. The difference between the synchronous speed and the actual speed of an induction motor is known as the _____.
199. The no-load slip of a 3-phase induction motor is of the order of _____ per cent.
200. At normal load the slip of induction motor is usually _____.
201. The value of slip of an induction motor at the starting instant is _____.
202. The slip of induction motor at synchronous speed will be _____.
203. An induction motor runs stably under constant torque load at 1,250 rpm at a 50 Hz supply. Its number of poles is _____.
[GATE E.E 1995]
204. The rotor speed of a 6-pole 50 Hz induction motor is 960 rpm, the percentage slip is _____.
[Mahamaya Technical Univ. Second Semester 2010-11]
205. If the squirrel-cage rotor is replaced by a solid cylinder in an induction motor its no-load slip will _____.
206. An induction motor always operates at _____ power factor.
207. Percentage no-load current of a transformer _____ percentage of no load current of an induction motor of comparable rating.
[A.M.I.E. Sec B. Summer 1999]
208. A 3-phase induction motor can achieve the maximum value of power factor to be _____.
209. An induction motor at starting behaves like a _____ circuited transformer.
210. A change of 5% in supply voltage to a 3-phase induction motor will cause approximately _____ change in torque.
211. The load-speed characteristic of an induction motor resembles with those of a dc _____ motor.
212. The speed characteristic of an induction motor is somewhat similar to that of a _____. [A.M.I.E. Sec B. Summer 2001]
213. Variable losses of induction motor are _____ and _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

214. Stator iron loss in an induction motor is practically _____.
215. In a 3-phase induction motor iron loss in rotor is _____ in comparison to that of a stator.
216. The efficiency of a 3-phase induction motor is expected to be about _____.
217. The efficiency of an induction motor is _____ that of a transformer.
218. The presence of odd harmonics in the stator current may cause _____.
219. Skewing of rotor slots _____ rotor resistance.
220. Cogging is avoided in induction motor by _____
[A.M.I.E. Sec B. Summer 1999]
221. Crawling in induction motor is caused due to _____
[A.M.I.E. Sec B. Summer 1998]
222. Double cage induction motors are designed to achieve high _____ torque.
[A.M.I.E. Sec B Summer 1993]
223. The outer winding bars of a double cage induction motor are usually of _____ while the inner winding bars are of _____.
224. The efficiency of a synchronous motor is _____ than that of an induction motor of same size and output rating.
225. The cost of a synchronous motor is _____ in comparison to that of an induction motor of same size and output rating.
226. Direct-on-line starter is normally used for starting of induction motors up to _____ kW rating.
227. Very large three phase induction motors are started by direct on line/by star-delta starters/by auto-transformer starter/by none of the above.
[A.M.I.E. Sec B. Winter 1999]
228. Pole changing method of speed control is applicable only to _____ induction motor.
[A.M.I.E. Sec. B. Summer 1998]
229. The stator of a 3-phase, 6-pole wound rotor induction motor is connected to 50 Hz source but its rotor is energised from 20 Hz. The rotor of this motor would run at speed of _____ rpm and _____ rpm.
[A.M.I.E. Sec B. Elec. Machines Summer 2000]
230. When started by means of an auto-transformer with 50% tapping, supply current at start of an induction motor is reduced to _____ of that when started by means of a star-delta starter.
[GATE E.E. 1995]
231. In a variable frequency induction motor drive, the voltage must be varied _____ to the frequency.
[GATE E.E. 1994]
232. A 3-phase, 20 KW, 400 V, 1470 rpm, 50 Hz squirrel cage induction motor develops a torque of 100 Nm at a speed of 1,400 rpm. If the motor is connected to a 30 Hz supply, for keeping the same air gap flux, the supply voltage should be _____ and for the same load torque, the new speed will be _____ rpm.
[GATE E.E. 1997]
233. A six pole, 50 Hz induction motor rotating at 1,440 rpm is in _____ mode.
[GATE E.E. 1994]
234. If the air gap of the induction motor is increased, the magnetizing current of the motor will _____.
[A.M.I.E. Summer 1997]
235. A thermal overload relay for an induction motor provides protection against _____.
236. By pushing and pulling the rotor shaft a motor can be checked for _____.
237. For high voltage test on an induction motor, the recommended voltage should not be applied more than _____.
238. The high voltage test and insulation resistance test on an induction motor should be carried out at the works of _____.
239. If a polyphase induction motor while connected to a constant voltage and frequency mains is mechanically coupled to a prime mover and is driven at a speed higher than synchronous speed. It will operate as an induction _____.
240. The slip of an induction machine when operating as a generator is _____.
241. The synchronous induction motor is provided with a _____ air gap as expected in a plain _____ motor.
242. The synchronous induction motor is usually not made in size below _____ kW capacity.
243. The linear synchronous speed of a linear motor is given as v_s = _____ where τ is the pole pitch in metres and f is the stator supply frequency in Hz.
244. There are two peculiar effects, which are encountered in a linear induction motor but not in a conventional rotary induction motors. These effects are _____ and _____.
245. The Schrage motor is started with the brushes set in the _____ speed position.
246. Fractional horse power motors are usually _____ phase type.
247. The rotor construction of a single phase induction motor is identical to that of a three phase _____ motor.
248. The rotating part of a single phase ac motor is called the _____.
249. The squirrel cage winding in a single phase induction motor is usually placed in the _____.
250. In a single phase induction motor, the starting torque is _____.
251. For a given frame size and temperature rise the output of single phase motor is about _____ per cent of that of a 3-phase motor.
252. For the same rating, the size of a single phase induction motor is about three times/the same as/1.5 times/one-third that of the corresponding three phase induction motor.
[A.M.I.E. Sec B. Winter 1999]
253. The stator of a split-phase single phase induction motor is provided with _____ winding(s).
254. The main winding and the auxiliary winding placed on the stator of a single phase induction motor are spaced _____ electrical degrees apart.
255. _____ start single phase induction motor is commonly known as split-phase motor.
256. The capacitor usually used in a capacitor-start induction motor is _____ type.
257. _____ induction motors are indeed splendid machines and are used where the load requirements are severe.
258. In a shaded pole motor the necessary phase splitting is produced by _____.
259. The shading coil employed in a shaded pole motor is highly _____.
260. Armature reaction causes _____ in the speed of an ac series motor.
261. Repulsion motor has _____ efficiency in comparison to other single phase motors.
262. The direction of rotation of a single phase repulsion motor can be reversed by _____
[A.M.I.E. Sec B. Elec. Machines Summer 2000]
263. _____ motor is split phase motor with properly designed salient poles and operates at synchronous speed.
264. The hysteresis motor rotor is made of magnetic material having _____ hysteresis loop area.
265. The motor convertor set is usually started from _____ side.
266. A rotary convertor is usually employed to convert _____ into _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

267. Most commonly used convertors are _____ phase.

268. Rotary convertor has _____ commutator(s).

269. A rotary convertor is a single machine with _____ armature(s) and _____ field(s).

270. The number of slip-rings of a single phase and three-phase convertors are respectively _____ and _____.

271. For a 3-phase, 6-pole synchronous convertor there will be _____ taps to the winding.

272. The magnitude of each of the voltage phasor represented by the sides of a regular hexagon in a 6-phase system produced by double-delta connection of the secondaries of transformers is _____ times the voltage of each secondary winding.

273. A 3-ring rotary convertor supplying a 2-wire dc system should not have primaries and secondaries of its transformer connected in _____.

274. A 3-ring rotary convertor supplying a 3-wire dc system must have the secondaries of the transformers connected in _____ only.

275. A 3-phase ac-to -dc diode bridge rectifier is supplied from a three-phase, 440 V source. The rectifier supplies a purely resistive load. The average dc voltage across the load will be _____ V. **[GATE 1995]**

CHAPTER 5

Electrical Engineering Materials

Short Answer Type Questions With Answers

Q. 1. What is free electron theory ?

Ans. The first reasonable approach to an explanation of electrical conduction in solids was proposed by Drude. Drude imagined conductive metal in the form of a gas of free electrons. An applied electric field accelerates the electrons along the field, because the ions they encounter in the crystal lattice deflect them and they interpose resistance, the electrons settle into a constant drift velocity that is proportional to the strength of the applied electric field. Drude assumed that the mean free path i.e. average distance travelled between two collisions with the ions in the lattice, is of the order of interatomic distance.

Q. 2. How does free electron gas in metal differ from ordinary gas in some respects ?

Ans. Firstly the free electron gas is charged while the ordinary gas molecules are generally neutral. Secondly the concentration of electrons in metals is larger than that in the ordinary gas.

Q. 3. Classify materials into conductors, semiconductors and insulators.

Ans. According to the free electron theory, the total energy which is equal to the kinetic as well as the potential energy is assumed to be zero, is related to the wave number by the relation

$$E = \frac{h^2k^2}{2m} \qquad \text{where } k = \frac{2\pi}{\lambda}$$

In the free electron theory, when one considers the interaction of the electron with the period potential of the lattice, one finds that band gaps occur at Brillouin zone boundaries. In case the lower valence band is half filled, the material is said to be a good conductor. There is overlapping of zones/bands. This also refers to case where the material behaves like a metal or good conductor. At higher temperature ($K_BT \geq E_g$) an appreciable number of electrons get excited from the top of the valence band into the bottom of the conduction band. The material is then said to exhibit intrinsic semiconductivity; the magnitude of conductivity depends on the density and mobility of electrons in the conduction band and holes in the valence band. If the band gap is very large so that thermal excitation of electrons from valence to conduction band is negligible even at high temperatures, the material is deemed to be as an insulator.

Q. 4. What is the basis for classifying a material as a conductor, semiconductor or a dielectric ? What is the conductivity of a perfect dielectric ? **[I.E.S. 2002]**

Ans. Conductors possess high conductivity whereas the characteristic property of insulating materials (or dielectrics) is poor conductivity. Semiconductors occupy an intermediate position between conductors and insulators. Though there is no rigid line separating the conductors from semiconductors and semiconductors from insulators, but still according to resistivity the materials of resistivity of the order from 10^{-8} to 10^{-3}, 10^{-3} to 10^{6} and 10^{6} to 10^{18} ohm-metres may be classified as conductors, semiconductors and dielectrics respectively.

Another classification is based on temperature coefficient of resistivity. Metals have positive temperature coefficient of resistivity; semiconductors have small negative temperature coefficient of resistivity and insulators have large negative temperature coefficient of resistivity.

Conductivity of a perfect dielectric is zero.

Q. 5. Describe the factors on which the conductivity of a meterial depend. Give your answer discussing scattering phenomenon. **[I.E.S. 2004]**

Ans. The electrical resistivity of metals is based on the *notion* that scattering of electrons is due to deviations from perfect periodicity of the lattice. The resistivity is given by equation

$$\rho = \frac{m}{ne^2}\left[\frac{1}{\tau_i} + \frac{1}{\tau_T}\right]$$

where τ_i is the relaxation time associated with imperfections and τ_T is the relaxation time resulting from the thermal vibrations of the lattice.

Now with the increase in temperature T, the amplitude of the atomic vibration increases, hence the deviations from the periodicity become more severe and the scattering by lattice

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

vibration increases. Consequently with the increase in T, the mean free path of an electron, λ decreases and since the velocity of electrons with the Fermi energy, v_F is constant, τ_T decreases. Thus with the increase in temperature resistivity increases.

Q. 6. What is superconductivity ?

Ans. The phenomenon that electrical resistivity of some material e.g. mercury disappears completely at very low temperatures (below 4 K) is known as superconductivity.

Q. 7. Is it possible to make a pure metal a superconductor ? Why ?

Ans. No, all the metals can be converted into superconductors because superconducting elements occur between well defined limits of atomic volume.

Q. 8. Give electric, magnetic and thermal properties of superconductors.

Ans. Electrical, magnetic and thermal properties of superconductors are given below :

1. Resistivity is almost zero.
2. If a magnetic field H is applied, the material remains superconducting until a critical field H_c is reached such that $H > H_c$, the material reverts from the superconducting state tc the normal state.
3. For every superconductor there is a transition temperature T_c above which it ceases to be a superconductor.
4. Following relation hold between transition temperature and isotopic mass M of a superconductor.

$$M^{1/2} T_c = \text{Constant}$$

Q. 9. How is superconductivity affected by frequency ?

Ans. The electric and magnetic behaviour of superconductors at higher frequencies differs from zero frequency behaviour. In the radio-frequency (up to about 10^8 Hz) and microwave-frequency (from 10^8 to about 10^{11} Hz) regions of the electromagnetic spectrum, it is found that superconductors do not have zero resistance to the flow of current. The resistance and the accompanying electrical energy loss are still much smaller than in normal state, but they are not zero and they increase with the increase in frequency. On the other hand, in the optical region of the spectrum (about 10^{15} Hz) the electromagnetic response in the superconducting state is indistinguishable from that in the normal state.

Q. 10. What is critical field in a superconductor ? How is it affected by temperature ?

Ans. If we have a superconducting wire and a magnetic field is applied parallel to its length, then the resistance of the wire is suddenly restored at a definite field strength. This of course depends upon temperature. The magnetic field at which the resistance is restored is the characteristic of the particular metal and is called the critical field H_c. The H_c is functionally related to temperature as

$$H_c(T) = H_c(0)\left[1 - \frac{T^2}{T_c^2}\right]$$

where $H_c(0)$ is the critical field at 0 K.

Q. 11. What is enery gap in superconductors ?

Ans. In the superconducting state an energy gap $E_g = 3.5\ K_B T_c$ separates superconducting electrons below from normal electrons above the gap. This gap is detected in experiments on heat capacity, infrared absorption and tunneling.

Q. 12. Define critical magnetic field of a superconductor.

Ans. Critical magnetic field is the maximum field that can be applied to a superconductor without destroying the superconducting behaviour. It decreases from its maximum value at absolute zero to zero at the critical temperature T_c.

Q. 13. Define critical temperature of a superconductor.

Ans. Critical temperature T_c is the temperature that separates superconducting state from the normal state. Above critical temperature, T_c, the material is in the normal state with a finite resistivity, but below T_c it is in the superconducting state with zero resistivity.

Q. 14. Why type-II superconductors are more important ?

Ans. Type-II superconductors are more important because they can carry very high current densities, as a result they have great technological importance. To achieve high critical current densities, a superconducting material should be fine grain material or heavily cold-worked or recovery-anealed material.

Q. 15. Differentiate semiconductors, conductors and insulators on the basis of band gap. **[U.P. Technical Univ. Second Semester 2002-03]**

Ans. The distinction between conductors, insulators and semiconductors is largely concerned with the relative width of the forbidden energy gaps in their energy band structures. There is a wide forbidden gap (more than 5 eV) for insulators, narrow forbidden gap (about 1 eV) in case of semiconductors and no forbidden gap in case of conductors.

Q. 16. What is the forbidden energy gap ? How does it occur ? What is its magnitude for Ge and Si ?

Ans. The energy gap between the valence band and conduction band is known as forbidden energy gap. It is a region in which no electron can stay as there is no allowed energy state. Magnitude of forbidden energy gap in germanium and silicon is 0.72 eV and 1.12 eV respectively at 300 K and 0.785 eV and 1.21 eV respectively at absolute zero temperature.

Q. 17. What in intrinsic semiconductor ?

Ans. An intrinsic semiconductor is one which is made of the semiconductor material in the extremely purely form (impurity content not exceeding one part in 100 million parts of semiconductors).

Q. 18. Why silicon and germanium are the two widely used semiconductor materials ?

Ans. Because the energy required to release an electron from their valence band (*i.e.*, to break their covalent bonds) is very small (1.12 eV for Si and 0.72 eV for Ge).

Q. 19. Which of the two semiconductor materials Si or Ge has larger conductivity at room temperature ? Why ?

Ans. Since energy required in transferring electrons from valence band to conduction band is more in case of silicon than that in case of germanium, the conductivity of Ge will be more than that of Si at room temperature.

Q. 20. Why does a pure semiconductor behave like an insulator at absolute zero temperature ?

Ans. For a pure semiconductor at a temperature of absolute zero (–273.15°C) the valence band is usually full and there may be no electron in the conduction band and it is difficult to provide additional energy required for lifting electron from valence band to conduction band by applying electric field. Hence the conductivity for a pure semiconductor at absolute zero temperature is zero and it behaves like an insulator.

Q. 21. What is the main factor for controlling the thermal generation and recombination ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Temperature, because with the increase in temperature, concentrations of free electrons and holes increase and the rate of recombination is proportional to the product of concentrations of free electrons and holes and also the rate of production of electron-hole pairs (thermal generation) increases with the rise in temperature.

Q. 22. In which bands do the movement of electrons and holes take place ?

Ans. Free electrons move in conduction band while holes in valence bands.

Q. 23. What is the mechanism by which conduction takes place inside the semiconductor.

Ans. Conduction occurs in any given material when an applied electric field causes electrons to move in a desired direction within the material. This may be due to one or both of two processes, electron motion and hole transfer. In case of former process, free electrons in the conduction band move under the influence of the applied electric field. Hole transfer involves electrons which are still attached to the atoms *i.e.* those in valence band.

Q. 24. What do you mean by drift velocity and mobility of a free electron?

[A.M.I.E. Sec B. Summer 1988]

Ans. The average velocity of a free electron is known as drift velocity whereas mobility of an electron is defined as the drift velocity per unit electric field.

Q. 25. Define mobility of a carrier. Show that the mobility constant of electron is larger than that of a hole.

Ans. Mobility is defined as the average particle drift velocity per unit electric field.

The mobility of electrons is more than that of holes because the probability of an electron having the energy required to move to an empty state in the conduction band is much greater than the probability of an electron having the energy required to move to the empty state in valence band. The mobility of electron is about double that of an hole.

Q. 26. Define diffusion current in a semiconductor.

Ans. The diffusion of charge carriers is as a result of a gradient of carrier concentration (*i.e.*, the difference of carrier concentration from one region to another). In this case concentrations of charge carriers (either electrons or holes) tend to distribute themselves uniformly throughout the semiconductor crystal. This movement continues until all the carriers are evenly distributed throughout the material. This type of movement of charge carriers is called the diffusion current.

Q. 27. Define drift current in a semiconductor.

Ans. The steady flow of electrons in one direction caused by applied electric field constitutes an electric current, called the drift current.

Q. 28. What happens to the conductivity of the semiconductor with the rise in temperature? Compare with the conductivity of metals.

Ans. With the increase in temperature, the concentration of charge carriers increases resulting in increase of conductivity of semiconductors. The conductivity of metal decreases with the increase in temperature.

Q. 29. Why the temperature coefficient of resistance of a semiconductor is negative?

Ans. With the increase in temperature, the concentration of charge carriers (electrons and holes) increases. As more charge carriers are made available, the conductivity of a pure semiconductor increases *i.e.* resistivity of a pure semiconductor decreases with the rise in temperature *i.e.* semiconductors have negative temperature coefficient of resistance.

Q. 30. What is meant by Fermi level in semiconductor ? Where does the Fermi level lie in an intrinsic semiconductor ?

Ans. Fermi level in a semiconductor can be defined as the maximum energy that an electron in a semiconductor have at absolute zero temperature.

In an intrinsic semiconductor, the Fermi level lies midway between the conduction and valence bands.

Q. 31. Differentiate between intrinsic semiconductors and extrinsic semiconductors ? Give examples.

Ans. An intrinsic semiconductor is one which is made of the semiconductor material in its extremely pure form.

When a small amount of impurity is added to a pure semiconductor crystal during the crystal growth in order to increase its conductivity, the resulting crystal is called the extrinsic semiconductor.

Q. 32. Give reasons — Doping is done in semiconductors.

Ans. Intrinsic (or pure) semiconductor by itself is of little significance as it has little current conduction capability at ordinary room temperature but if very small amount of impurity (of the order of one atom per million atoms of pure semiconductor) is added to it in the process of crystallization, the electrical conductivity is increased many times.

Q. 33. Describe the difference between P-type and N-type semiconductor materials.

Ans. When a small amount of trivalent impurity (such as boron, gallium, indium or aluminium) is added to a pure semiconductor crystal during crystal growth, the resulting crystal is called the P-type semiconductor.

When a small amount of pentavalent impurity (such as arsenic, antimony, bismuth or phosphorus) is added to a pure semiconductor crystal during crystal growth, the resulting crystal is called the N-type semiconductor.

Q. 34. What do you mean by donor and acceptor impurities?

Ans. Donor impurities (such as arsenic, antimony, bismuth or phosphorus) when added to a pure semiconductor lattice, form N-type extrinsic semiconductor. The pentavalent impurities are called the donor type impurities as such impurities donate electrons to the lattice.

Acceptor impurities (such as boron, gallium, indium or aluminium) when added to a pure semiconductor lattice form P-type extrinsic semiconductor. The trivalent impurities are called the acceptor type impurities because such impurities accept electrons from the lattice.

Q. 35. Explain the term doping and its need.

Ans. The electrical conductivity of intrinsic semiconductor, which has little current conduction capability at ordinary room temperature and so is of little use, can be increased many times by adding very small amount of impurity (of the order of one atom per million atoms of pure semiconductor) to it in the process of crystallization. This process is called the doping.

Q. 36. What are the majority and minority carriers in P-type semiconductor materials ?

Ans. Holes are majority carriers and free electrons are minority carriers in P-type semiconductor materials.

Q. 37. What is the effect of temperature on extrinsic semiconductors ?

Ans. With the increase in temperature of an extrinsic semiconductor, the number of thermally generated carriers is increased resulting in increase of concentration of minority carriers. At temperature exceeding critical temperature the extrinsic semiconductor

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

behaves like an intrinsic semiconductor but with higher conductivity.

Q. 38. What are the charge carriers in N-type and P-type semiconductors ?

Ans. Free electrons in N-type semiconductors and holes in P-type semiconductors are the charge carriers.

Q. 39. For the same order of doping, why does N-type semiconductor exhibit larger conductivity than P-type semiconductor ?

Ans. Since the mobility of electrons is greater than that of holes, for same level of droping, N-type semiconductor exhibits larger conductivity.

Q. 40. Name the factors by which dielectrics are characterized ?

Ans. The dielectrics are characterized by (*i*) relative permittivity (*ii*) tangent of lag angle and (*iii*) dielectric strength.

Q. 41. What is polarizability ?

Ans. The average dipole moment, $\boldsymbol{p}$ of an elementary particle may be assumed to be proportional to electric field strength **E**, that acts on the particle. The proportionality constant is called the polarizability. It may be defined as the average dipole moment per unit field strength and is expressed in Faraday-metre^2.

Q. 42. What is a meant by dielectric strength of a medium ?

Ans. The dielectric strength is the property of a medium which enables it to withstand electric stress without damage. It is usually expressed in terms of the minimum electric stress (potential difference per unit distance) that will cause failure or breakdown of the medium under certain conditions of service.

Q. 43. What is electronic or induced polarization ?

Ans. The electronic polarization $\mathbf{P}_e$ results from a displacement of the centre of the negatively charged electron cloud relative to the positive nucleus of an atom by the electric field.

Q. 44. What is orientational polarization ?

Ans. The polarization due to the alignment of electrical dipole moments is called the orientational polarization.

Q. 45. What is space charge polarization ?

Ans. The polarization due to accumulation of charges at the interphases in the multiphase dielectric material is called the space charge polarization.

Q. 46. What is meant by the term dielectric loss in a dielectric ?

Ans. There is a definite amount of dissipation of energy when a dielectric is subjected to alternating voltage. It is this dissipation of energy that is called dielectric loss.

Q. 47. Enlist the factors which affect the dielectric losses.

Ans. The dielectric losses are affected by (*i*) frequency of applied voltage (*ii*) magnitude of applied voltage (*iii*) temperature and (*iv*) humidity.

Q. 48. What is meant by electrostriction ?

Ans. In most materials dielectric polarization develops a mechanical distortion, but a mechanical distortion does not produce polarization. This electromechanical effect, which is present in all materials is called the electrostriction.

Q. 49. What is curie point ?

Ans. At temperature higher than a critical value (760°C in case of iron), called the *Curie point*, ferromagnetic materials lose their magnetic properties. This temperature is a characteristic of magnetic materials and differ from one material to another.

Q. 50. Give the relative permeabilities of paramagnetic materials, diamagnetic materials and ferromagnetic materials.

Ans.

Type of Materials	*Relative Permeability*
Paramagnetic materials	Small but positive. Slightly higher than unity; say 1.00036 for platinum.
Diamagnetic materials	Slightly less than unity; say 0.999995 for copper.
Ferromagnetic materials	Very high (varying from several hundred to thousands)

Q. 51. What are ferrites ?

Ans. Ferrites is a special group of ferromagnetic materials, that occupy an intermediate position between ferromagnetic and non-magnetic materials.

Q. 52. What is meant by magnetic susceptibility ?

Ans. Magnetic susceptibility χ is defined as the ratio of intensity of magnetization M to the magnetizing force H

$$i.e. \quad \chi = \frac{M}{H}$$

Q. 53. Give the values of magnetic susceptibility for ferromagnetic, paramagnetic, diamagnetic and non-magnetic materials.

Ans. For ferromagnetic and paramagnetic materials magnetic susceptibility χ is positive but for diamagnetic materials it is negative and for non-magnetic materials it is equal to zero.

Q. 54. Give relationship between relative permeability μ_r and magnetic susceptibility χ.

Ans. $\mu_r = (1 + \chi)$.

Q. 55. Give the magnetization **M** of a material in terms of its elementary magnetic dipole moments $\boldsymbol{p}_m$.

Ans. $\mathbf{M} = n\,\boldsymbol{p}_m$ where n is the number of magnetic dipoles per unit volume.

Q. 56. What is magnetostriction ?

Ans. When a ferromagnetic material is magnetized, its dimensions change slightly and the sample being magnetized either expands or contracts in the direction of magnetization. This magnetically induced reversible elastic strain $\delta\rho/\rho$ is called the magnetostriction and this is of the order of 10^{-6}.

Q. 57. Why magnetostriction is a reversible process ? **[I.E.S. 2004]**

Ans. Whenever the ferromagnetic material is magnetized, the physical dimensions get changed, and vice-versa. Thus, it can be said that magnetostriction is a reversible process.

Q. 58. What is Villari effect ?

Ans. The converse of the magnetostriction is known as Villari effect which states that longitudinal deformation leads to a change in permeability in the direction of applied strain.

Q. 59. Differentiate between ferromagnetism and ferrimagnetism. **[I.E.S. 1993]**

Ans. *Ferromagnetism* is a creation of a very large magnetization in a material when subjected to an applied magnetic field and on removal of applied field, the ferromagnetic material retains much of the magnetizaton. On the other hand, *ferrimagnetism* is a type of magnetism in which the magnetic dipole moments of different ions of an ionically bonded solid are aligned by a magnetic field in an antiparallel so that there is a net magnetic moment.

Q. 60. Explain the terms 'antiferromagnetism' and ferrimagnetism with reference to magnetic dipoles of atoms.

Ans. *Antiferromagnetism* occurs when internal interactions of atomic magnetic moments align in opposite directions pairwise causing

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

cancellation and neutralization of magnetism. On the other hand *ferrimagnetism* is neither strong like ferromagnetism nor weak as paramagnetism.

Q. 61. What are the materials used for (*i*) electrical contacts (*ii*) rheostats and (*ii*) fuses ? [I.E.S. 1996]

Ans. High conductivity materials with small contact resistance should be used for electrical contacts.

Rheostat is a variable linear or circular wire wound resistor with a sliding contact and is usually connected in series with the circuit to control the current. Materials generally used for rheostats are constantan and nichrome.

Materials generally used for fuse wire are copper, aluminium, zinc, tin, lead and silver.

Q. 62. On adding a high conductivity material copper in small quantity to nickel of lower conductivity why does the conductivity of the alloy decrease ?

Ans. When one adds to nickel a small amount of copper, the conductivity decreases. The reason is that in replacing some of the nickel atoms in the lattice, the copper atoms destroy the lattice periodicity in their intermediate neighbourhood and thus acts as new scattering centres for the conduction electrons, resulting in decrease in relaxation time, hence resistivity increases.

Q. 63. What is an ACSR conductor ?

Ans. Aluminium conductors with steel reinforcement are called ACSR conductors (aluminium conductors steel reinforced).

Q. 64. What is a thermocouple and thermoelectric emf ?

Ans. The combination of two dissimilar metals is known as thermocouple and the emf developed across the junction is called the thermoelectric emf.

Q. 65. Explain the silver contacts. [I.E.S. 2003]

Ans. Silver contacts are alloys, silver plus refractory constituent (tungsten), and silver plus a semirefractory constituent (cadmium oxide). Some of the compositions of alloys are: pure silver, cadmium silver, palladium.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The tiny block formed by the arrangement of a small group of atoms is called the
(a) space lattice. (b) unit cell.
(c) cubic cell. (d) primitive cell.

2. A unit cell is
(a) a unit cube containing the smallest number of atoms.
(b) a group of atoms which forms the cubic structure.
(c) the smallest group of atoms which when regularly repeated forms the crystal.
(d) none of the above.

3. The coordination number of a cubic structure is
(a) 8 (b) 6 (c) 4 (d) 2.

4. Most of the common metals have _____ structures.
(a) cubic (b) linear (c) hexagonal
(d) none of these.

5. The number of crystal systems is
(a) 3 (b) 4 (c) 7 (d) 14

6. A primitive cell is
(a) a unit cell in which lattice points are only at its corners.
(b) a unit cell of a simple cubic crystal.
(c) the cell that contains smallest group of atoms.
(d) a basic building block of a crystal.

7. An atom in a crystal vibrates at a frequency determined by
(a) crystal temperature. (b) crystal heat content.
(c) the stiffness of the bonds it makes with neighbours.
(d) none of the above.

8. Phonons (Quanta of lattice vibration) obey
(a) Maxwell distribution.
(b) Maxwell-Boltzmann distribution.
(c) Fermi-Dirac distribution.
(d) Bose-Einstein distribution. [U.P.S.C. I.E.S. E.E.-I, 2011]

9. A closed packed hexagonal space lattice is found in
(a) calcium and magnesium.
(b) cobalt, antimony and bismuth.
(c) aluminium, copper and lead.
(d) chromium, tungsten and molybdenum.

10. The Rutherford's atomic model based on experimental observations could not be accepted. This is because
(a) it does not take into account the quantization condition of angular momentum of an electron.
(b) it does not consider orbital motion of an electron.
(c) it does not explain hydrogen spectrum.
(d) the statement is false.

11. Total number of electrons that can be accommodated in various electron states in a valence band of a given solid is equal to
(a) atomic number of the solid.
(b) half the number of atoms in the solid.
(c) the number of atoms in the solid.
(d) twice the number of atoms in the solid. [U.P.S.C. I.E.S. E.E.-I, 2001]

12. Consider the following in relation to the orbital motion of an electron:
1. State of energy momentum.
2. Orbital angular level.
3. Angle between the applied magnetic field and angular momentum.

The quantum numbers l, m and n of an electron in orbit represent respectively
(a) 1, 2 and 3 (b) 2, 3 and 1
(c) 3, 2 and 1 (d) 3, 1 and 2 [U.P.S.C. I.E.S. E.E.-I, 1998]

13. Consider the following statements:
Secondary (or molecular) bonds are
1. the attraction forces exist between atoms or molecules.
2. stronger than primary bonds.
3. can be divided as electrostatic bonds.
4. weaker than primary bonds.

Which of the above statements is/are correct?
(a) 1 only. (b) 2 and 3 only.
(c) 1 and 4 only. (d) 1, 2, 3 and 4. [U.P.S.C. I.E.S. E.E.-I, 2010]

14. Ionic bonding in solids depends primarily on
(a) transfer of electrons. (b) sharing of electrons.
(c) electrical dipoles. (d) all of the above.

15. The velocity of an electron at the Fermi level 5.0 eV is
(a) 1.33×10^4 m/s. (b) 1.33×10^6 m/s.
(c) 1.33×10^8 m/s. (d) 4×10^6 m/s.

16. The average drift velocity V_d of electrons in a metal is related to electric field E and collision time T as
(a) $V_d = \frac{Q_e E T}{m_e}$ (b) $V_d = m_e Q_e T$
(c) $V_d = \frac{m_e Q_e T}{2E}$ (d) $V_d = \frac{Q_e E T}{2m_e}$ [U.P.S.C. I.E.S. E.E.-I, 2003]

17. The drift velocity of an electron under the action of applied electric field is of the order of
(a) 10^{-14} (b) 10^{-11} (c) 10^{-7} (d) 10^{7}

18. Forbidden band is largest in
(a) conductor. (b) semiconductor.
(c) insulator. [A.M.I.E. Sec B. E.E. Materials Winter 1994]

19. Width of energy bands depends on which of the following?
(a) Temperature. (b) Pressure.
(c) Relative freedom of electrons in the crystal.
(d) Mass of atom in the material. [U.P.S.C. I.E.S. E.E.-I, 2006]

20. Packing fraction of simple cube is
(a) 0.48 (b) 0.52 (c) 0.65 (d) 0.89
[A.M.I.E. Sec B. E.E. Materials Winter 1994]

Answers: **1.** (b), **2.** (c), **3.** (b), **4.** (a), **5.** (c), **6.** (a), **7.** (c), **8.** (d), **9.** (b), **10.** (a), **11.** (a), **12.** (b), **13.** (c), **14.** (a), **15.** (b), **16.** (a), **17.** (c), **18.** (c), **19.** (a), **20.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

21. The first critical condition at which free electrons are diffracted in an FCC crystal would occur at which one of the following values of the wave number 'k'? ('a' is lattice parameter)

(a) $\frac{2}{a}$ (b) $\frac{\pi a}{\sqrt{3}}$ (c) $\frac{\pi}{a}$ (d) $\frac{\sqrt{3}\pi}{a}$

[U.P.S.C. I.E.S. E.E.-I, 1998]

22. What is the packing fraction of a BCC (body-centered cubic) unit cell ?

(a) $\frac{\sqrt{3}\pi}{16}$ (b) $\frac{\sqrt{3}\pi}{8}$ (c) $\frac{\sqrt{3}\pi}{12}$ (d) $\frac{\sqrt{2}\pi}{8}$

[U.P.S.C. I.E.S. E.E.-I, 2005]

23. Vacant lattice sites in halide crystals cause

(a) plastic deformation and ionic conductivity.
(b) transparency and diffusion.
(c) diffusion and ionic conductivity.
(d) plastic deformation and transparency.

[U.P.S.C. I.E.S. E.E.-I, 1999]

24. The geometrical configuration of one molecule of C_{60}-buckminsterfullerene contains

(a) 12 hexagons and 20 pentagons of Carbon atoms.
(b) 20 hexagons and 12 pentagons of Carbon atoms.
(c) 20 hexagons and 20 pentagons of Carbon atoms.
(d) 12 hexagons and 12 pentagons of Carbon atoms.

[U.P.S.C. I.E.S. E.E.-I, 2011]

25. In a Hexagonal Close Packed (HCP) crystal structure, if 'a' and 'c' represent, respectively the short and long unit cell dimensions, then $\left(\frac{c}{a}\right)$ ratio should be

(a) 12.00 (b) 0.74 (c) 1.633 (d) 16.33

[U.P.S.C. I.E.S. E.E.-I, 2010]

26. Consider the following types of semiconductors:
1. N-type. 2. P-type. 3. Intrinsic. 4. Extrinsic.
Which of these types of semiconductors are formed by doping germanium with gallium?

(a) 1 and 3. (b) 2 and 4.
(c) 1 and 4. (d) 2 and 3. [U.P.S.C. I.E.S. E.E.-I, 2000]

27. Consider the following energy-momentum (E-k) curves labelled as 1, 2, 3 and 4 of different semiconductors:

1. 
2. 
3. 
3.

Sets of direct and indirect gap curves are respectively

(a) (1, 2) and (3, 4) (b) (1, 4) and (2, 3)
(c) (1, 3) and (2, 4) (d) (2, 3) and (1, 4)

[U.P.S.C. I.E.S. E.E.-I, 2001]

28. The conductivity of material 'A' is half that of material 'B'. The ratio of relaxation time of 'A' to that of 'B' is

(a) 0.5 (b) 1 (c) 2 (d) 4.1

[U.P.S.C. I.E.S. E.E.-I, 2000]

29. For which one of the following materials, is the Hall coefficient zero?

(a) Metal. (b) Insulator.
(c) Intrinsic semiconductor. (d) Alloy. [U.P.S.C. I.E.S. E.E.-I, 2006]

30. For which one of the following materials is the Hall coefficient zero?

(a) Insulator. (b) Intrinsic semiconductor.
(c) Metal. (d) Non-metal.

[U.P.S.C. I.E.S. E.E.-I, 2009]

31. Principle of Hall effect is used in the construction of which one of the following?

(a) Ammeter. (b) Voltmeter.
(c) Galvanometer. (d) Gaussmeter.

[U.P.S.C. I.E.S. E.E.-I, 2006]

32. Consider the following statements:
In a Hall effect experiment, the sign of Hall voltage will change if
1. direction of applied field is changed.
2. direction of applied magnetic field is changed.
3. direction of both applied electric and magnetic fields are changed.
4. direction of current is changed.
Which of the above statements is/are correct?

(a) 1, 2 and 3. (b) 3 only.
(c) 1, 2 and 4. (d) 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2009]

33. The band-gap of a semiconductor is 1.43 eV. Its cut-off wavelength is

(a) 1 μm (b) 0.81 μm (c) 0.56 μm (d) 0.27 μm

[U.P.S.C. I.E.S. E.E.-I, 2000]

34. When temperature of a conductor is approaching zero Kelvin, the mean free path of the free electrons in the conductor is proportional to

(a) T (b) T^3 (c) $\left(\frac{1}{T}\right)^{1/3}$ (d) $\frac{1}{T^3}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

35. Consider the following functions:
1. To mask against diffusion or ion implant.
2. To act as a component in MOS devices.
3. To provide low resistivity paths.
4. To facilitate the entry of dopants.
The function of an oxide layer on a silicon wafer would include

(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 4.

[U.P.S.C. I.E.S. E.E.-I, 1998]

36. Consider the following statements:
1. momentum changes.
2. direction of motion changes.
3. potential energy changes.
4. kinetic energy remains constant.
Which of these statements are correct?

(a) 3 and 4. (b) 2 and 3. (c) 1 and 2. (d) 1 and 4.

[U.P.S.C. I.E.S. E.E.-I, 1999]

37. In a linear chain of atoms of interatomic distance 'l'; the first Brillouin zone occurs between wave numbers

(a) $-\frac{\pi}{l}$ and $+\frac{\pi}{l}$ (b) $-\frac{2\pi}{l}$ and $+\frac{2\pi}{l}$
(c) zero and $\frac{2\pi}{l}$ (d) $-\frac{1}{l}$ and $+\frac{1}{l}$

[U.P.S.C. I.E.S. E.E.-I, 1999]

38. The properties to be considered in selection of electrical engineering materials are

(a) physical. (b) chemical.
(c) electrical. (d) mechanical.
(e) thermal (f) all of these.

39. The important consideration(s) to be made in selection of materials is/are

(a) ease of fabrication. (b) cost.
(c) availability. (d) all of these.

Answers: **21.** (d), **22.** (b), **23.** (c), **24.** (b), **25.** (c), **26.** (b), **27.** (b), **28.** (c), **29.** (c), **30.** (b), **31.** (d), **32.** (c), **33.** (b), **34.** (b), **35.** (a), **36.** (a), **37.** (a), **38.** (f), **39.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

40. The electrical conductivity of metals is typically of the order of (in $ohm^{-1}\ m^{-1}$)
(a) 10^7 (b) 10^{-4} (c) 10^5 (d) 10^{-6}
[U.P.S.C. I.E.S. E.E. I, 1993]

41. The resistivity of metal is a function of temperature because
(a) the magnetic properties change with the variations in temperature.
(b) the amplitude of vibrations of the atoms varies with the temperature.
(c) the electron density varies with the temperature.
(d) none of these.

42. The conductivity of a metal is determined by
(a) the number of valence electrons per atom.
(b) the electron concentration and the mobility of the free electrons.
(c) both (a) and (b). (d) none of these.

43. The factor(s) which affect(s) the resistivity of the material is/are
(a) mechanical stress. (b) alloying.
(c) temperature (d) age hardening
(e) cold working. (f) all of these.

44. According to Wiedemann-Franz law the ratio of thermal conductivity to electrical conductivity of a conductor is
(a) independent of temperature.
(b) directly proportional to temperature.
(c) inversely proportional to temperature.
(d) inversely proportional to square of temperature.
[U.P.S.C. I.E.S. E.E.-I, 2003]

45. Consider the following statements: If the temperature is increased, the resistivity of a metal increases because of
1. decrease in carrier concentration.
2. an increase in the extent of scattering of carriers.
3. increase in density of impurity.
Of these statements
(a) 1, 2 and 3 are correct. (b) 2 alone is correct.
(c) 1 alone is correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1998]

46. Consider the following statements:
Electrical conductivity of a metal has negative temperature coefficient since
1. electron concentration increases with temperature.
2. electron mobility decreases with temperature.
3. electron-lattice scattering increases with temperature.
Which of the statements given above are correct?
(a) 1, 2, and 3. (b) Only 1 and 2.
(c) Only 2 and 3. (d) Only 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

47. The correct sequence of increasing order of electrical resistivity of the given materials is
(a) diamond, doped germanium, silicon, gold.
(b) gold, silicon, doped germanium, diamond.
(c) gold, doped germanium, silicon, diamond.
(d) gold, diamond, silicon, doped germanium.
[U.P.S.C. I.E.S. E.E.-I, 1998]

48. What is the correct arrangement of the following alloys in decreasing order of resistivity?
(a) German silver – constantan – monel metal.
(b) German silver – monel metal – constantan.
(c) Constantan – monel metal – German silver.
(d) Constantan – German silver – monel metal.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

49. In metals, resistivity is composed of two parts : one part is characteristic of the particular substance. The other part is due to
(a) applied voltage. (b) crystal imperfections.
(c) applied magnetic field.
(d) supplied thermal energy. [U.P.S.C. I.E.S. E.E.-I, 2005]

50. Consider the following properties pertaining to an alloy used as a precision resistor:
1. Uniform resistance. 2. Stable resistance.
3. Zero or low temperature coefficient of resistivity.
Which of these properties are desirable?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2001]

51. Which one of the following is correct? As frequency increases, the surface resistance of a metal
(a) decreases. (b) increases.
(c) remains unchanged.
(d) varies in an unpredictable manner. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

52. The conductivity of a conducting material on being subject to critical magnetic field changes to
(a) normal state. (b) unstable state.
(c) temperature-independent state.
(d) temperature-dependent state. [U.P.S.C. I.E.S. E.E.-I, 2001]

53. Which one of the following statements is correct for four-point probe method of determining resistivity?
(a) The sample must be extrinsic.
(b) The current source is connected to the two inner probes.
(c) One probe point must inject minority carriers.
(d) Current flows only in a small area of the sample.
[U.P.S.C. I.E.S. E.E.-I, 2003]

54. The factor that generally affects the resistivity of electrical conductors is
(a) composition. (b) size.
(c) temperature. (d) pressure.

55. The resistivity of a conductor can be reduced by
(a) increasing its temperature. (b) reducing its temperature.
(c) increasing its vibrations. (d) reducing its vibrations.

56. With the fall in temperature, the resistivity of all normal metals
(a) remains unaffected. (b) increases.
(c) tends to be zero.
(d) decreases first and then increases.

57. Among following which conductor has highest conductivity?
(a) Cu (b) Al
(c) Ag (d) Mg
[U.P.T.U. Elec. Engg. Even Semester 2009-10]

58. Consider the following statements with regard to manufacture of a standard resistor:
1. The material should be of high resistivity and low temperature coefficient.
2. Resistors are shielded against magnetic field.
3. Nickel-chromium is best suited for resistance of high value.
Which of the above statements is/are correct?
(a) 1 and 2 only. (b) 1 only.
(c) 1 and 3 only. (d) 3 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

59. The following data are obtained by measurement on gold:
Density = 19.32 gm/cc
Resistivity = 2.42 μΩ/cm
Atomic weight = 197.2

Answers: **40.** (a), **41.** (b), **42.** (b), **43.** (f), **44.** (b), **45.** (b), **46.** (c), **47.** (c), **48.** (d), **49.** (b), **50.** (a), **51.** (b), **52.** (a), **53.** (b), **54.** (a), **55.** (b), **56.** (c), **57.** (c), **58.** (c), **59.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The mobility of electrons in gold is
(a) 4.39×10^{-3} m^2/V-sec. (b) 4.39×10^{-2} m^2/V-sec.
(c) 4.39 m^2/V-sec. (d) 4.39×10^{3} m^2/V-sec.
[U.P.S.C. I.E.S. E.E.-I, 2010]

60. A material is said to be superconductor when its resistance is
(a) zero. (b) very small.
(c) negative. (d) none of these.

61. Which of the following properties is *not* correct for a superconductor in its superconducting stage?
(a) Its resistivity is zero.
(b) Magnetic flux density inside the conductor is zero.
(c) Its relative permeability is unity.
(d) Its magnetic susceptibility is negative.
[U.P.S.C. I.E.S. E.E.-I, 2011]

62. Superconducting metal in superconducting state has relative permeability of
(a) more than one. (b) one.
(c) zero. (d) negative.
[U.P.S.C. I.E.S. E.E.-I, 2007]

63. What is the magnetic susceptibility χ of an ideal superconductor?
(a) 1 (b) –1 (c) 0 (d) Infinite.
[U.P.S.C. I.E.S. E.E.-I, 2006]

64. The transition temperature of mercury at which it becomes superconductive is
(a) 4.12°F (b) 4.12°C
(c) 4.12 K (d) 41.2 K [U.P.S.C. I.E.S. E.E.-I, 2002]

65. Consider the following properties:
1. Perfect diamagnetism.
2. Ionic conductivity.
3. Magnetic field causes an increase in transition temperature.
4. Loss of superconductivity in long circular wire by large currents.

Which of these properties are exhibited by a superconductor?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

66. Which of the following statements is NOT true?
(a) Superconductor show perfect diamagnestism.
(b) Superconductors have almost zero resistivity.
(c) The external magnetic field has no effect on supercoductors.
(d) Entropy increases on going from superconducting state to normal state. [U.P.S.C. I.E.S. E.E.-I, 2002]

67. Consider the following statements about superconductors:
1. The temperature at which the conductor becomes a superconductor is called transition temperature.
2. Superconductors repel magnetic flux lines.
3. All superconductors are paramagnetic materials.
4. Superconductors become normal when placed in a magnetic field of certain critical value.

Which of the above statements are correct?
(a) 1 and 2 only. (b) 2 and 4 only.
(c) 1, 2 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

68. Materials in superconducting state have the property of
(a) absorbing magnetic field.
(b) repelling magnetic field.
(c) absorbing electric field.
(d) repelling electric field. [U.P.S.C. I.E.S. E.E.-I, 2011]

69. As temperature falls below the transition temperature, the value of critical magnetic field of a superconductor
(a) remains unchanged.
(b) increases.
(c) decreases.
(d) first increases, reaches a peak and then decreases.
[U.P.S.C. I.E.S. E.E.-I, 2011]

70. The energy gap of a superconductor
(a) is independent of temperature.
(b) increases with temperature.
(c) is maximum at a critical temperature.
(d) is minimum at a critical temperature.
[U.P.S.C. I.E.S. E.E.-I, 2011]

71. On which of the following factors does the value of critical current density in a superconductor depend?
(a) Temperature. (b) Applied magnetic field.
(c) Temperature and applied magnetic field.
(d) Silsbee's rule. [U.P.S.C. I.E.S. E.E.-I, 2004]

72. Materials, whose specific resistance abruptly falls at very low temperature, are called
(a) conductors. (b) superconductors.
(c) semiconductors. (d) insulators.

73. Superconductivity is due to
(a) all electrons having fermi energy at 0 K.
(b) all electrons interacting in the superconducting state.
(c) crystal structure having no atomic vibration at 0 K.
(d) crystal structure having infinite atomic vibrations at 0 K.

74. The structure sensitive property of a superconductor is
(a) transition temperature. (b) critical magnetic field.
(c) critical current density. (d) none of the above.

75. Consider the following statements:
Superconductivity in a material can be destroyed by
1. increasing the temperature above a certain limit.
2. applying a magnetic field above a certain limit.
3. passing a current, above a certain limit, through the material.
4. decreasing the temperature to a point below the critical temperature.

Of thses statements
(a) 2, 3 and 4 are correct. (b) 1, 3 and 4 are correct.
(c) 1, 2 and 3 are correct. (d) 1, 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E. I, 1993]

76. Superconductivity is destroyed
(a) At high temperature. (b) At high magnetic field.
(c) In presence of magnetic impurities.
(d) In all the above cases. [U.P.S.C. I.E.S. E.E.-I, 2005]

77. The magnetic susceptibility of an ideal type I superconductor in the superconductivity state is
(a) $-\infty$ (b) –1 (c) between 0 and –1
(d) zero. [U.P.S.C.I.E.S. E.E. I, 1994]

78. What type of magnetic behaviour is observed in a type I superconductor ?
(a) Perfect diamagnetism. (b) Perfect paramagnetism.
(c) Perfect ferromagnetism. (d) Perfect ferrimagnetism.
[U.P.S.C. I.E.S. E.E. I, 1995]

79. Superconductivity is observed for
(a) dc and low frequency. (b) ac and high frequency.
(c) infrared frequencies. (d) frequencies having no effect.

80. In a superconductor the value of critical density depends upon
(a) temperature. (b) magnetic field strength.
(c) both (a) and (b). (d) none of these.

Answers: **60.** (a), **61.** (c), **62.** (c), **63.** (b), **64.** (c), **65.** (c), **66.** (c), **67.** (c), **68.** (b), **69.** (b), **70.** (d), **71.** (d), **72.** (b), **73.** (c), **74.** (c), **75.** (c), **76.** (d), **77.** (b), **78.** (a), **79.** (a), **80.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

81. The value of critical field below the transition temperature will
(a) decrease. (b) increase.
(c) not be affected at all. (d) none of these.

82. At transition temperature the value of critical field is
(a) –ve. (b) +ve. (c) zero. (d) infinity.

83. A superconductor material is
(a) copper. (b) silver. (c) mercury. (d) gold.
[A.M.I.E. Sec B. E.E. Materials Summer 1993]

84. According to the BCS theory, a material goes into superconducting state when electron-pairs participate in the following events:
1. Lattice distorts as a free electron A attracts a lattice ion.
2. Temperature is decreased.
3. Energy of electron B is lowered and it forms a pair with electron A.
4. A photon is created which interacts with electron B.
The correct sequence of occurrence of these events is :
(a) 2, 1, 3, 4. (b) 1, 2, 3, 4.
(c) 2, 1, 4, 3. (d) 1, 2, 4, 3.
[U.P.S.C. I.E.S. E.E.-I, 2000]

85. The magnetic field at which a superconductor remains in its superconducting state at a temperature less than the transition temperature is
(a) Zero.
(b) Greater than the critical field corresponding to the given temperature.
(c) Less than the critical field corresponding to the given temperature.
(d) Equal to the critical field corresponding to the transition temperature.
[U.P.S.C. I.E.S. E.E.-I, 2005]

86. The transition temperature of superconducting material is changed by which one of the following ?
(a) Electric field. (b) Magnetic field.
(c) Mechanical stress. (d) None of the above.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

87. Consider the following statements in connection with superconductors:
1. Transition temperature of a superconductor can be reduced by the application of a magnetic field.
2. Transition from the superconducting to normal state under the influence of a magnetic field is irreversible.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only. (c) Both 1 and 2.
(d) Neither 1 nor 2. [U.P.S.C. I.E.S. E.E.-I, 2007]

88. Which one of the following statements is correct?
Superconductors are popularly used for
(a) generating very strong magnetic field.
(b) reducing i^2 R losses. (c) generating electrostatic field.
(d) generating regions free from magnetic field.
[U.P.S.C. I.E.S. E.E.-I, 2004]

89. A superconductor may be used for generating
(a) voltage. (b) pressure.
(c) temperature. (d) magnetic field.
[U.P.S.C. I.E.S. E.E.-I, 2011]

90. Annealing of metals
(a) removes internal stresses. (b) increases conductivity.
(c) increases the grain size. (d) both (a) and (b).

91. Cold working operation
(a) increases conductivity. (b) increases resistivity.
(c) converts a thicker wire into a thin wire.
(d) removes internal stresses.

92. The property of materials by which they can be drawn into wires is known as
(a) malleability. (b) elasticity.
(c) ductility. (d) plasticity.

93. The property of material by which it can be rolled into sheets is called the
(a) malleability. (b) elasticity.
(c) ductility. (d) plasticity.

94. The formation of oxide film on a metal due to atmospheric exposure reduces
(a) creep limit. (b) stiffness.
(c) toughness. (d) none of these.

95. Gold, silver and copper are good electrical conductors because their outer orbits contain
(a) one electron. (b) two electrons.
(c) one proton. (d) more than two electrons.

96. The best variety of copper from the point of view of electrical conductivity is
(a) pure annealed copper. (b) hard drawn copper.
(c) induction hardened copper.
(d) copper containing silicon traces.

97. Which one of the following is the poorest electrical conductor ?
(a) Steel. (b) Carbon. (c) Copper. (d) Aluminium.

98. Copper, though costly, finds use in windings for electrical machines because
(a) it offers low contact resistance.
(b) it can be easily soldered and welded.
(c) it gives less bulky windings leading to compact machines.
(d) all of the above.

99. Copper and aluminium are not used for heating elements. This is due to
(a) their low melting points.
(b) their great tendency for oxidation.
(c) low resistivity leading to requirement of very large length of wires.
(d) all of the above.

100. Which one of the following metals has the lowest temperature coefficient of resistance ?
(a) Gold. (b) Copper. (c) Aluminium. (d) Kanthal.

101. Conductivity of aluminium is _____ time of that of copper.
(a) 1.63 (b) 0.6 (c) 2.5 (d) 0.4

102. Copper has low _____ in comparison to that of aluminium.
(a) melting point (b) specific gravity
(c) resistivity (d) conductivity

103. In many applications copper is being replaced by aluminium. This is due to
(a) low cost, abundantly availability and low specific gravity of aluminium in comparison to that of copper.
(b) low resistivity of aluminium in comparison to that of copper.
(c) more ductility and malleability of aluminium in comparison to that of copper.
(d) low temperature coefficient of resistance of aluminium in comparison to that of copper.

Answers: **81.** (b), **82.** (c), **83.** (c), **84.** (a), **85.** (c), **86.** (b), **87.** (c), **88.** (a), **89.** (d), **90.** (d), **91.** (b), **92.** (c), **93.** (a), **94.** (c), **95.** (a), **96.** (a), **97.** (b), **98.** (d), **99.** (c), **100.** (a), **101.** (b), **102.** (c), **103.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

104. Aluminium does not corrode in atmosphere because
(a) it is a noble metal.
(b) atmospheric oxygen can only diffuse very slowly through the oxide layer which is formed on the surface of the aluminium.
(c) it does not react with oxygen.
(d) all of the above.

105. Carbon is _____ material.
(a) conducting (b) dielectric
(c) semiconducting (d) non-conducting

106. Carbon electrodes are used in
(a) cinema projectors. (b) electric arc furnaces.
(c) GLS lamps. (d) both (a) and (b).

107. In graphite, bonding is
(a) metallic. (b) covalent.
(c) Vander Waals. (d) van der Waals and covalent.

108. Graphite is a good lubricant because
(a) the sheets are bonded to one another by Vander Waals forces.
(b) the sheets are bonded to one another covalently.
(c) both (a) and (b). (d) none of these.

109. Constantan is an alloy composed of
(a) 86% copper, 12% manganese and 2% nickel.
(b) 76% nickel, 21% chromium, 2% manganese and 1% iron.
(c) 60% copper and 40% nickel.
(d) 40% copper, 40% nickel and 20% carbon.
[U.P.S.C. I.E.S. E.E. I, 1995]

110. Platinum is employed in
(a) electrical contacts and thermocouples.
(b) heating elements for electric furnaces.
(c) grids for special purpose vacuum tubes.
(d) all of the above.

111. _____ is employed as heating element for temperatures up to 1350°C.
(a) Nichrome (b) Silicon carbide
(c) Copper (d) Carbon

112. _____ is employed for winding of coils for dc motor starters.
(a) Constantan (b) Nichrome
(c) Copper (d) Aluminium

113. _____ has the highest operating temperature.
(a) Manganin (b) Eureka
(c) Kanthal (d) Nichrome

114. _____ has the lowest temperature coefficient of resistance.
(a) Nichrome (b) Constantan
(c) Molybdenum (d) Kanthal

115. Which of the following has zero temperature coefficient of resistance ?
(a) Manganin. (b) Nichrome.
(c) Carbon. (d) Aluminium.

116. A good electrical contact material should have the properties of
(a) high melting point. (b) good thermal conductivity.
(c) high resistance to corrosion.
(d) high conductivity. (e) all of the above.

117. Addition of 0.3 to 4.5% silicon to iron the electrical resistivity of iron
(a) increases. (b) reduces.
(c) has no effect on. (d) none of these.

118. Magnetic field of Earth has no vertical component at
(a) magnetic poles. (b) magnetic equator.
(c) latitude 45°. (d) longitude 45°.
[U.P.S.C. I.E.S. E.E.-I, 2011]

119. All magnetic materials lose their magnetic properties when
(a) cooled to low temperature.
(b) heated to high temperature.
(c) kept in an aluminium box.
(d) kept in vacuum. [U.P.S.C. I.E.S. E.E.-I, 2005]

120. Bohr magneton is unit of
(a) magnetic energy.
(b) permanent dipole moment due to spin.
(c) polarisability. (d) hysteresis loss.
[U.P.S.C. I.E.S. E.E.-I, 2005]

121. The magnetic field required to reduce the residual magnetisation to zero is called
(a) retentivity. (b) coercivity.
(c) hysteresis.
(d) saturation magnetisation. [U.P.S.C. I.E.S. E.E.-I, 2005]

122. Consider the following statements:
The coercive force can be increased by
1. adding Cobalt because it is a ferromagnetic material.
2. adding Gold because it is a diamagnetic material.
3. adding Super alloy.
4. space charge polarizing.
Which of the above statements is/are correct?
(a) 1, 2, 3 and 4. (b) 1 only.
(c) 2 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

123. Consider the following statements:
Permanent magnet dipoles in matter result from
1. orbital angular momentum of electrons.
2. electron spin angular momentum.
3. nuclear spin angular momentum.
Which of these statements are correct?
(a) 1 and 2. (b) 1 and 3. (c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1999]

124. Heating a permanent magnet results in the loss of magnetic behaviour because
(a) the atoms start vibrating.
(b) the magnetic dipoles start vibrating.
(c) the magnetic dipoles start realigning.
(d) the atoms start conducting. [U.P.S.C. I.E.S. E.E.-I, 2011]

125. Consider the following statements: At finite temperature, magnetic dipoles in a material are randomly oriented giving low magnetization. When magnetic field H is applied, the magnetization
1. increases with H.
2. decreases with H.
3. decreases with temperature for constant H.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only. (c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

126. Consider the following statements regarding magnetic materials.
1. Relative permeability of water is 0.99999 and that of oxygen is 1.00002; hence water is diamagnetic and oxygen is paramagnetic material.
2. Ferrimagnetic material has no eddy current loss.
3. Permalloy and alnico are two examples of hard magnetic materials.

Answers: **104.** (b), **105.** (c), **106.** (d), **107.** (d), **108.** (a), **109.** (c), **110.** (d), **111.** (a), **112.** (b), **113.** (c), **114.** (a), **115.** (a), **116.** (e), **117.** (a), **118.** (b), **119.** (b), **120.** (b), **121.** (b), **122.** (b), **123.** (d), **124.** (c), **125.** (d), **126.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

4. The magnetisation and applied electric field in ferromagnetic materials are related nonlinearly.

Which of the statements given above are correct?

(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2005]

127. What is a material with equal, antiparallel atomic magnetic moments, known as

(a) Ferrimagnetic. (b) Ferrite.
(c) Ferromagnetic. (d) Antiferromagnetic.

[U.P.S.C. I.E.S. E.E.-I, 2007]

128. A permeable substance is one

(a) which is strong magnetic.
(b) which is weak magnetic.
(c) which is a good conductor.
(d) through which magnetic lines of force can pass easily.

[U.P.S.C. I.E.S. E.E.-I, 2011]

129. If the domain walls in a magnetic material can easily be moved, the material displays

(a) high flux density. (b) high permeability.
(c) permanent magnetic behaviour.
(d) high permittivity.

[U.P.S.C. I.E.S. E.E.-I, 2011]

130. In which one of the following magnetic materials, is the net magnetic moment zero?

(a) Paramagnetic. (b) Ferromagnetic.
(c) Ferrimagnetic. (d) Anti-ferrimagnetic.

[U.P.S.C. I.E.S. E.E.-I, 2007]

131. Which one of the following is the temperature below which certain materials are antiferromagnetic and above which they are paramagnetic?

(a) Curie temperature. (b) Neel temperature.
(c) Transition temperature. (d) Weiss temperature.

[U.P.S.C. I.E.S. E.E.-I, 2004]

132. Temperature below which certain materials are anti-ferromagnetic is called

(a) Curie temperature. (b) Neel temperature.
(c) Wein temperature. (d) Debye temperature.

[U.P.S.C. I.E.S. E.E.-I, 2010]

133. The spins in a ferrimagnetic material are

(a) all aligned parallel.
(b) partially aligned antiparallel without exactly cancelling out sublattice magnetism.
(c) randomly oriented.
(d) all aligned antiparallel such that the sublattice magnetism cancels out exactly.

[U.P.S.C. I.E.S. E.E.-I, 1998]

134. Which one of the following is the correct statement?
YIG and YAG are two types of crystals used extensively in technology and are

(a) non-magnetic and magnetic, respectively.
(b) magnetic and non-magnetic, respectively.
(c) both magnetic. (d) both non-magnetic.

[U.P.S.C. I.E.S. E.E.-I, 2007]

135. Ferromagnetic behaviour is shown by those transition metals where the ratio of the atomic diameter to 3*d* orbital diameter is

(a) in the range of 0.5 to 1. (b) in the range of 1 to 1.5.
(c) in the range of 1.5 to 2. (d) greater than 2.

[U.P.S.C. I.E.S. E.E.-I, 2001]

136. With increase in temperature, magnetic susceptibility of a ferromagnetic material will

(a) increase. (b) decrease.
(c) increase initially and then decrease.
(d) remain constant.

[U.P.S.C. I.E.S. E.E.-I, 2006]

137. Paramagnetic susceptibility of a material

(a) increases linearly with temperature.
(b) decreases linearly with temperature.
(c) increases linearly with (1/T).
(d) decreases linearly with (1/T).

[U.P.S.C. I.E.S. E.E.-I, 2011]

138. Consider the following statements:
Magnetic susceptibility
1. depends on the nature of the magnetic material.
2. is not dependent on the relative permeability of the medium.
3. cannot be determined by measuring the force exerted on a magnetic material when placed in a magnetic field.
4. can be determined from M–H curve.

Which of the above statements is/are correct?

(a) 1, 2, 3 and 4. (b) 1 only.
(c) 1 and 4 only. (d) 2 only.

[U.P.S.C. I.E.S. E.E.-I, 2010]

139. Increase in percentage of carbon in carbon steels reduces

(a) resistivity. (b) coercive force.
(d) permeability. (d) retentivity.

140. _____ cause(s) magnetic ageing.

(a) Mechanical vibrations. (b) Temperature conditions.
(c) Presence of strong external fields.
(d) Variations in the external magnetic circuits.
(e) All of the above factors.

141. _____ is the most detrimental impurity in the magnetic materials.

(a) Sulphur (b) Carbon (c) Nitrogen (d) None of these

142. Uniaxial anisotropy can be induced in bulk material by

(a) magnetic annealing. (b) magnetic quenching.
(c) cold working. (d) any of the above method.

143. Practically all organic substances are _____ materials.

(a) paramagnetic. (b) diamagnetic.
(c) ferromagnetic. (d) ferri-magnetic.

144. In a diamagnetic material, the effect of an applied magnetic field is that

(a) there is a net reduction in flux density.
(b) the induced magnetization is in opposition to the applied field.
(c) a net dipole moment is induced in the material.
(d) all of the above. (e) none of these.

145. Diamagnetic materials possess

(a) permanent dipoles. (b) induced dipoles.
(c) both permanent and induced dipoles.
(d) no dipoles.

[U.P.S.C. I.E.S. E.E.-I, 2011]

146. Above the Curie temperature, ferromagnetic materials behave like

(a) paramagnetic. (b) diamagnetic.
(c) anti-ferromagnetic. (d) ferrimagnetic.

[U.P.S.C. I.E.S. E.E.-I, 2005]

147. The phenomenon by which a ferromagnetic material is magnetized to its final state by a magnetic field is attributed to

(a) eddy currents and magnetic viscosity.
(b) magnetic viscosity and hysteresis.
(c) hysteresis and eddy currents.
(d) ageing and magnetic viscosity.

[U.P.S.C. I.E.S. E.E.-I, 1999]

Answers: **127.** (d), **128.** (d), **129.** (b), **130.** (d), **131.** (b), **132.** (b), **133.** (b), **134.** (b), **135.** (c), **136.** (b), **137.** (c), **138.** (c), **139.** (d), **140.** (e), **141.** (b), **142.** (d), **143.** (b), **144.** (d), **145.** (b), **146.** (a), **147.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

148. The magnetic domains, during the process of magnetization of ferromagnetic materials,
(a) only expand.
(b) rotate first and then expand.
(c) expand first and then rotate.
(d) neither rotate nor expand. [U.P.S.C. I.E.S. E.E.-I, 2011]

149. Which one of the following is the correct statement?
During the process of magnetisation of ferromagnetic material, the magnetic domains
(a) only expand. (b) rotate first and then expand.
(c) expand first and then rotate.
(d) neither rotate nor expand. [U.P.S.C. I.E.S. E.E.-I, 2009]

150. Consider the following statements referring to the magnetization:
1. In solenoid magnetization is due to a surface current distribution.
2. Magnetization has its origin in circulating current.
3. The solenoid dipole is represented by an infinitesimal current loop.
4. The magnetization is entirely solenoidal and divergent.
Which of the above statements is/are correct?
(a) 1, 2 and 3 only. (b) 2, 3 and 4 only.
(c) 3 only. (d) 1, 2, 3 and 4. [U.P.S.C. I.E.S. E.E.-I, 2010]

151. A ferromagnetic material exhibits different characteristics above and below the
(a) Joule's temperature. (b) Faraday temperature.
(c) Curie temperature. (d) Neel temperature. [U.P.S.C. I.E.S. E.E.-I, 1998]

152. A large value of the exchange interaction energy in a ferromagnetic material implies
(a) large saturation magnetization.
(b) high Curie temperature. (c) high melting point.
(d) large diamagnetic susceptibility. [U.P.S.C. I.E.S. E.E.-I, 2001]

153. Materials which lack permanent magnetic dipoles are known as
(a) paramagnetic. (b) diamagnetic.
(c) ferromagnetic. (d) ferrimagnetic. [U.P.S.C. I.E.S. E.E.-I, 2008]

154. Metallic copper is a
(a) paramagnetic substance. (b) diamagnetic substance.
(c) ferromagnetic substance.
(d) ferrimagnetic substance. [U.P.S.C. I.E.S. E.E.-I, 2005]

155. Susceptibility of a diamagnetic material is
1. negative. 2. positive.
3. dependent on the temperature.
4. independent of the temperature.
Select the correct answer using the codes given below:
(a) 1 and 3. (b) 2 and 4. (c) 1 and 4. (d) 2 and 3. [U.P.S.C. I.E.S. E.E.-I, 2003]

156. Consider the following statements about diamagnetic materials and diamagnetism:
1. The materials have negative magnetic susceptibility.
2. At very low temperatures, diamagnetic materials are converted into paramagnetic materials.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only. (c) Both 1 and 2.
(d) Neither 1 nor 2. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

157. Which of the following statement(s) is/are correct ?
1. Ferromagnetic substances have very large negative values of susceptibility.
2. Diamagnetic substances have very small negative values of suceptibility.
3. Paramagnetic substances have very small positive values of susceptibility.
4. The permeability of diamagnetic substances is slighly greater than unity.
Select the correct answer using the codes given below
(a) 1 and 4. (b) 2 and 3. (c) 3 and 4. (d) 4 alone. [U.P.S.C. I.E.S. E.E.-I, 1994]

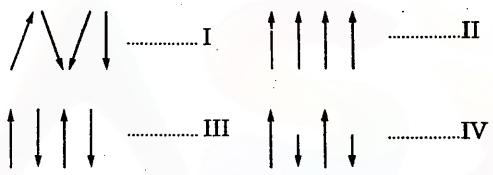
158. Interaction between the neighbouring dipoles is negligible in case of _____ materials.
(a) paramagnetic (b) diamagnetic
(c) ferromagnetic (d) ferrimagnetic

159. In _____ materials the atomic magnetic moments are oriented, in a random fashion, in a solid.
(a) diamagnetic (b) paramagnetic
(c) ferromagnetic (d) none of these

160. A material with unequal, antiparallel atomic magnetic moments is called the _____ material.
(a) ferrimagnetic (b) ferromagnetic
(c) antiferromagnetic (d) none of these

161. Ferrimagnetic materials are generally used as
(a) conductors. (b) insulators.
(c) semiconductors. (d) resistors.

162. The following figures give the schematic arrangement of spins of four different types of magnetic materials.



The ferromagnetic and ferrimagnetic materials refer to arrangements
(a) I and II respectively. (b) II and III respectively.
(c) I and III respectively. (d) II and IV respectively. [U.P.S.C. I.E.S. E.E. I, 1993]

163. Ferrites are _____ materials.
(a) ferromagnetic (b) ferrimagnetic
(c) diamagnetic (d) antiferromagnetic

164. The resistivity of ferrites is _____ that of ferromagnetic materials.
(a) less than (b) equal to
(c) slightly more than (d) very much higher than

165. Ferrites are _____ materials.
(a) hard (b) brittle (c) not easily machinable
(d) hard, brittle and not easily machinable

166. Dielectric loss in ferrites is
(a) zero. (b) very low. (c) low. (d) very high.

167. Magnetically saturated ferrite
(a) interacts with electromagnetic waves.
(b) produces large hysteresis.
(c) produces low eddy currents.
(d) all of the above.

168. When the temperature of a magnetic material is raised above the Curie point, it becomes
(a) diamagnetic. (b) paramagnetic.
(c) ferromagnetic. (d) ferrimagnetic. [U.P.S.C. I.E.S. E.E.-I, 2006]

Answers: **148.** (b), **149.** (b), **150.** (b), **151.** (c), **152.** (a), **153.** (d), **154.** (b), **155.** (c), **156.** (a), **157.** (b), **158.** (a), **159.** (b), **160.** (a), **161.** (c), **162.** (d), **163.** (b), **164.** (d), **165.** (d), **166.** (d), **167.** (a), **168.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

169. Consider the following statements :
In the case of paramagnetic materials, there
1. is no permanent dipole moment.
2. are permanent dipole moments.
3. is no alignment of dipoles in the absence of magnetic field.
4. is no interaction among the dipoles.
Which of these statement(s) is/are correct?
(a) 1 alone. (b) 3 and 4. (c) 2 and 4. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

170. Which of the following exhibit hysteresis?
(a) Ferromagnetic materials only.
(b) Ferroelectric materials only.
(c) Ferrielectric materials only.
(d) Both ferroelectric and ferrielectric materials.
[U.P.S.C. I.E.S. E.E.-I, 2007]

171. What are the materials which exhibit electric polarization even in the absence of an applied electric field called?
(a) Ferromagnetic. (b) Paramagnetic.
(c) Ferroelectric. (d) Antiferroelectric.
[U.P.S.C. I.E.S. E.E.-I, 2005]

172. The property characteristic of ferroelectric materials is
(a) dielectric relaxation. (b) dielectric breakdown.
(c) spontaneous polarization. (d) spontaneous magnetization.
[U.P.S.C. I.E.S. E.E.-I, 2010]

173. Which one of the following is not a characteristic of a ferroelectric material?
(a) High dielectric constant. (b) No hysteresis.
(c) Ferroelectric characteristic only above the Curie point.
(d) Electric dipole moment. [U.P.S.C. I.E.S. E.E.-I, 2007]

174. If the centre of gravity of the positive and negative charges in a body do not coincide in the absence of an applied electric field, the substance has an electric dipole moment and is said to be spontaneously polarised. Such a substance is known as
(a) ferroelectric. (b) dielectric.
(c) insulator. (d) ferromagnetic.

175. A ferroelectric material contains small regions which are polarised in different directions even in the _____ of an electric field.
(a) presence (b) absence (c) either of the above
(d) none of the above

176. Which one of the following is a ferroelectric material ?
(a) Stainless steel. (b) Brass.
(c) Barium nitrate. (d) Wrought iron.

177. Which one of the following is not a ferroelectric material ?
(a) Y-alloy. (b) Rochelle salt.
(c) Lead zirconate. (d) Boron nitride.

178. Materials having high dielectric constant, which is nonlinear, are called the
(a) hard dielectrics. (b) super dielectrics.
(c) ferroelectric materials. (d) none of the above.

179. Ferroelectric materials are characterized by
(a) very high degree of polarization.
(b) a sharp dependence of polarization on temperature.
(c) nonlinear dependence of the charge on the applied voltage.
(d) all of the above.

180. Potassium dihydrogen phosphate has _____ Curie points.
(a) negative (b) positive (c) two (d) none of these

181. The _____ polarization vanishes at Curie temperature of the material.
(a) dipolar (b) spontaneous
(c) ionic (d) polar

182. The temperature beyond which ferroelectric materials lose their ferroelectric properties is called the _____ temperature.
(a) critical (b) inversion (c) Curie (d) absolute

183. The ferroelectric materials, above the Curie temperature lose ferroelectric properties and become ordinary _____ materials.
(a) insulating (b) dielectric
(c) ferromagnetic (d) super conducting

184. Barium titanate is _____ material(s).
(a) ferroelectric (b) piezoelectric
(c) ferromagnetic (d) semiconductor
(e) both ferroelectric and piezoelectric

185. Quartz and $BaTiO_3$ exhibit which of the following properties?
(a) Magnetostriction. (b) Ferromagnetism.
(c) Piezoelectricity. (d) Ferroelectricity.
[U.P.S.C. I.E.S. E.E.-I, 2009]

186. The dielectric strength of ferroelectric materials depends to a large extent on
(a) frequency of applied voltage.
(b) intensity of electric field.
(c) presence of magnetic materials in the vicinity.
(d) hysteresis loop area for the material.

187. Ferroelectric materials are the dielectrics and analogous to _____ materials,
(a) diamagnetic (b) paramagnetic
(c) ferromagnetic (d) antiferromagnetic

188. Ferroelectrics are widely used as _____ transducers.
(a) active (b) passive (c) electromechanical
(d) none of the above

189. The materials having permanent electric moment are known as
(a) electrets. (b) dielectrics.
(c) semiconductors. (d) none of the above.

190. Consider the following statements:
Electrets are the materials which are
1. having permanent electric moments.
2. electromagnets.
3. very similar to permanent magnet materials.
4. similar to anti-ferroelectric materials.
Which of the above statements is/are correct?
(a) 2 only. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

191. Which one the following statements is correct?
(a) The absence of a hysteresis loop in a plot of polarization against field is proof of the absence of spontaneous polarization.
(b) The Curie temperature of a ferroelectric is the temperature above which its spontaneous polarization disappears.
(c) The Curie temperature of a ferroelectric is the temperature below which its spontaneous polarization disappears.
(d) Barium titanate is a ferroelectric because its lattice strains spontaneously above the Curie temperature.
[U.P.S.C. I.E.S. E.E.-I, 1998]

192. Magnetic material in VHF applications is
(a) silicon steel. (b) Alnico.
(c) cobalt salt. (d) ferrite.
[A.M.I.E. Sec B. E.E. Materials Summer 1993]

Answers: **169.** (d), **170.** (d), **171.** (c), **172.** (c), **173.** (c), **174.** (a), **175.** (b), **176.** (c), **177.** (a), **178.** (c), **179.** (d), **180.** (a), **181.** (b), **182.** (c), **183.** (a), **184.** (e), **185.** (c), **186.** (b), **187.** (c), **188.** (c), **189.** (a), **190.** (c), **191.** (b), **192.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

193. Air exhibits
(a) ferromagnetism. (b) paramagnetism.
(c) antiferromagnetism. (d) ferrimagnetism.
[A.M.I.E Sec B. E.E. Materials Winter 1994]

194. Soft magnetic material is
(a) tungsten steel. (b) Alcomax.
(c) bismuth. (d) iron.
[A.M.I.E Sec B. E.E. Materials Summer 1993]

195. Which one of the following materials can be used for permanent magnets?
(a) Alnico. (b) Barium ferrite.
(c) Carbon steel. (d) Iron-cobalt alloy.
[U.P.S.C. I.E.S. E.E.-I, 2002]

196. Which one of the following is not a permanent magnetic material?
(a) Chromium steel. (b) Silicon iron.
(c) Cobalt steel. (d) Alnico.
[U.P.S.C. I.E.S. E.E.-I, 2005]

197. Which among the following magnetic materials has the highest energy-product to make it a permanent magnet?
(a) Alnico. (b) Ferrite.
(c) Samarium cobalt. (d) Cobalt-iron alloy.
[U.P.S.C. I.E.S. E.E.-II, 2006]

198. Which one of the following is correct? Ferrites are particularly suited for high frequency applications because of their
(a) low distortion. (b) low eddy current loss.
(c) high conductivity. (d) high mobility.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

199. Ferrites can be considered as mixed oxides of metals A and B having inverse spinel structure. Their formula can be written as
(a) ABO_2. (b) A_2BO_2. (c) AB_2O_3. (d) AB_2O_4.
[U.P.S.C. I.E.S. E.E.-I, 2001]

200. Up to about 4% silica is added in iron to be used as a soft magnetic material. The major reason for this is to
(a) increase permeability of the material.
(b) increase electrical resistivity of the material.
(c) increase the coercive force.
(d) increase the saturation flux density. [U.P.S.C. I.E.S. E.E.-I, 2002]

201. Consider the following statements with regards to soft iron:
1. It is a magnetic material.
2. It conducts electricity.
3. It is an alloy of iron and copper.
4. It is used to make permanent magnets.
Which of these statements are correct?
(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2011]

202. Soft iron is used in the manufacture of electromagnets because of its
(a) high saturation magnetisation only.
(b) low retentivity only.
(c) low coercive field only.
(d) high saturation magnetisation, low retentivity and low coercive field. [U.P.S.C. I.E.S. E.E.-I, 2006]

203. Soft iron is used to manufacture electromagnets because it has
(a) high retentivity. (b) high coercive field.
(c) low retentivity. (d) low coercive field.
[U.P.S.C. I.E.S. E.E.-I, 2011]

204. Magnetically hard materials do not possess which of the following characteristics?
(a) high retentivity. (b) high coercivity.
(c) strong magnetic reluctance.
(d) zero differential permeability. [U.P.S.C. I.E.S. E.E.-I, 2009]

205. Which one of the following classes of materials can be categorised as ferrites?
(a) Plastics. (b) Metals. (c) Alloys. (d) Ceramics.
[U.P.S.C. I.E.S. E.E.-I, 1998]

206. High frequency transformer cores are generally made of
(a) cast iron. (b) mu-metal. (c) ferrite. (d) graphite.
[U.P.S.C. I.E.S. E.E.-I, 2000]

207. Which one of the following statements is correct?
A ferrite core has lower specific eddy current loss compared to an iron core because the ferrite core has
(a) higher electrical resistance.
(b) lower electrical resistance.
(c) higher permeability. (d) lower permeability.
[U.P.S.C. I.E.S. E.E.-I, 2004]

208. A coil wound on a magnetic core is excited from an ac source. The source voltage and its frequency are both doubled. What will be the eddy current loss in the core?
(a) Four times the original value.
(b) Double the original value.
(c) Same as the original value.
(d) Half the original value. [U.P.S.C. I.E.S. E.E.-I, 2007]

209. The hysteresis loop for the material of the core of a transformer should be
(a) short and narrow. (b) tall and narrow.
(c) short and wide. (d) tall and wide.
[U.P.S.C. I.E.S. E.E.-I, 2005]

210. The change in dimensions during the process of magnetization is termed as
(a) skin effect. (b) magnetostriction.
(c) Hall's effect. (d) Peltier effect.

211. When a ferromagnetic substance is magnetized, there are small changes in dimensions. The phenomenon is called
(a) hysteresis. (b) magnetostriction.
(c) diamagnetism. (d) dipolar relaxation.
[U.P.S.C. I.E.S. E.E.-I, 2010]

212. The converse of magnetostriction effect is
(a) Villari effect. (b) Curie effect.
(c) Skin effect. (d) Seebeck effect.

213. Which one of the following have the maximum permeability ?
(a) Grain oriented silicon steel.
(b) 4% silicon steel. (c) Pure iron.

214. Area of hysteresis loop represents
(a) copper loss. (b) eddy current loss.
(c) hysteresis loss. [A.M.I.E Sec B. E.E. Materials Winter 1994]

215. Silicon content in steel reduces
(a) hysteresis loss. (b) eddy current loss.
(c) copper loss. [A.M.I.E Sec B. E.E. Materials Winter 1994]

216. Maximum flux density in cold rolled grain oriented steel is
(a) 0.5 (b) 1.1 (c) 1.5 (d) 2.1
[A.M.I.E Sec B. E.E. Materials Winter 1994]

217. Hystersis loss is proportional to
(a) f (b) $f^{1.5}$ (c) f^2 (d) F^3
[A.M.I.E Sec B. E.E. Materials Winter 1994]

218. On which of the following factors does hysteresis loss not depend?
(a) Magnetic field intensity. (b) Frequency of the field.
(c) Volume of the material. (d) Neel temperature.
[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **193.** (b), **194.** (d), **195.** (d), **196.** (b), **197.** (c), **198.** (b), **199.** (d), **200.** (a), **201.** (a), **202.** (c), **203.** (d), **204.** (c), **205.** (d), **206.** (c), **207.** (a), **208.** (a), **209.** (b), **210.** (b), **211.** (b), **212.** (a), **213.** (a), **214.** (c), **215.** (a), **216.** (c), **217.** (a), **218.** (d),

219. Which one of the following materials is the hardest ?
(a) Cementite. (b) Ferrite.
(c) Austenite. (d) Iron.

220. Which of the following materials is commonly used for making magnetic recording tape ?
(a) Ferric oxide. (b) Silicon iron.
(c) Iron dust. (d) Silver nitrate.

221. Cu_2 Mn Al is
(a) piezoelectric. (b) paramagnetic.
(c) ferrimagnetic. (d) ferromagnetic.
[U.P.S.C. I.E.S. E.E. I, 1994]

222. Which of the following pair(s) is/are correctly matched?

Material	*Application*
1. Rochelle salt	Phonograph
2. Barium titanate	Amplifier
3. Quartz	Oscillator

Select the correct answer using the codes given below
(a) only 2. (b) 1 and 2. (c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E. I, 1995]

223. Which one of the following pairs is NOT correctly matched?
(a) Copper — Diamagnetic
(b) Sodium — Antiferromagnetic
(c) Iron — Ferromagnetic
(d) Ferrite — Ferrimagentic [U.P.S.C. I.E.S. E.E.-I, 2001]

224. The material which obstructs the flow of current without any appreciable loss of power is called the _____ material.
(a) dielectric (b) insulating
(c) antiferromagnetic (d) super conducting

225. The insulators need _____ energy to shift electrons from valence band to conduction band in comparison to conductors, semiconductors and superconductors.
(a) maximum (b) minimum
(c) zero (d) negligible

226. The insulating materials meant for most of electronic equipment should possess high
(a) dielectric strength. (b) mechanical strength.
(c) thermal stability. (d) all of the above.

227. Consider the following statements:
Characteristics of a good insulating material are
1. given uniform electric and thermal properties.
2. high permittivity.
3. low dissipation factor.
4. low insulating resistance.
Which of the above statements are correct?
(a) 1 and 4 only. (b) 2 and 4 only.
(c) 1 and 3 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

228. Lead
1. is not used to form cable sheaths.
2. is least affected by sea water.
3. has good malleable and ductile properties.
4. will not alloy with many other metals.
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 2011]

229. Exposure of insulating material to moisture causes increase in
(a) dielectric loss. (b) dielectric constant.
(c) dielectric strength. (d) insulation resistance.

230. Surface resistivity of an insulating material is reduced _____ atmosphere.
(a) humid (b) smoky and dirty
(c) both (a) and (b) (d) none of these

231. The electric breakdown strength of an insulating material depends on
(a) composition of the material.
(b) moisture content. (c) thickness of material.
(d) temperature. (e) all of the above.

232. An insulating material starts conducting when the
(a) temperature is raised to a very high level.
(b) voltage applied exceeds the breakdown voltage.
(c) either (a) or (b). (d) none of these.

233. The materials which undergo recoverable deformation and exhibit rubber like elasticity are known as
(a) creep-elastic. (b) elastomers.
(c) elasto-plastic. (d) isotropic.

234. The materials which exhibit the same elastic properties in all directions are called
(a) isotropic. (b) isentropic.
(c) rubbers. (d) creep elastic.

235. Neoprene is
(a) elastic. (b) plastic.
(c) rubber like plastic. (d) none of the above.

236. Which one of the following materials has the maximum dielectric strength ?
(a) Soft rubber. (b) Glass.
(c) Porcelain. (d) Polystyrene.

237. The capacitance per unit volume is maximum for
(a) air capacitor. (b) mica capacitor.
(c) ceramic capacitor. (d) electrolytic capacitor.
[U.P.S.C. I.E.S. E.E.-I, 2008]

238. Which one of the following capacitors is suitable for compensation of harmonic and reactive power?
(a) Mica capacitor. (b) Glass capacitor.
(c) Polypropylene capacitor. (d) Electrolytic capacitor.
[U.P.S.C. I.E.S. E.E.-I, 2004]

239. The ceramic dielectrics used in electrical engineering include
(a) cermet and silicide. (b) porcelain an cermet.
(c) cordierite and porcelain. (d) silicide and cordierite.
[U.P.S.C. I.E.S. E.E.-I, 1999]

240. Which one of the following materials has the highest dielectric strength?
(a) Polystyrene. (b) Marble.
(c) Cotton. (d) Transformer oil.
[U.P.S.C. I.E.S. E.E.-I, 2003]

241. Which one of the following is the remaining grade of paper used in paper capacitors, besides the other two grades of paper-low loss and extra low loss?
(a) Strong dielectric. (b) Regular.
(c) Rough. (d) High loss.
[U.P.S.C. I.E.S. E.E.-I, 2007]

242. Which of these ceramic materials have relative permittivity ε_r between 3 to 6 and loss angle tan δ between 50×10^{-4} to 100×10^{-4}?
(a) Strontium zirconate ($SrZrO_3$).
(b) Titanium oxide (TiO_2).

Answers: **219.** (c), **220.** (a), **221.** (b), **222.** (c), **223.** (b), **224.** (b), **225.** (a), **226.** (d), **227.** (c), **228.** (b), **229.** (a), **230.** (c), **231.** (e), **232.** (c), **233.** (b), **234.** (a), **235.** (c), **236.** (a), **237.** (d), **238.** (d), **239.** (b), **240.** (a), **241.** (b), **242.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Calcium titanate ($CaTiO_3$).
(d) Barium titanate ($BaTiO_3$). [U.P.S.C. I.E.S. E.T.E.-I, 2006]

243. Which of the following insulating materials has the least affinity for moisture?
(a) Cotton. (b) Paper. (c) Asbestos. (d) Mica.
[U.P.S.C. I.E.S. E.E.-I, 2002]

244. High permittivity ceramic is used for capacitors of
(a) a few pF to a few hundred pF.
(b) a few μF to a few hundred μF.
(c) a few nF to a few hundred nF.
(d) a few mF to a few hundred mF. [U.P.S.C. I.E.S. E.E.-I, 2011]

245. Which among the following has/have capacitance value(s) from few μF to high μF?
(a) Mica, glass, low loss ceramic.
(b) High permittivity ceramic.
(c) Paper. (d) Electrolytic. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

246. The relative dielectric constant of solid dielectrics in the alternating field is
(a) maximum at the power frequencies and decreases to unity at frequencies in the ultraviolet range.
(b) maximum at the power frequencies and decreases to zero at frequencies in the ultraviolet range.
(c) unity at the power frequencies and increases to its maximum value at frequencies in the ultraviolet range.
(d) independent of frequency variations. [U.P.S.C. I.E.S. E.E.-I, 2006]

247. Which one of the following statements is not correct?
(a) Vacuum can act as a dielectric material.
(b) Piezoelectric materials can act as transducers.
(c) Quartz crystal is a ferroelectric material.
(d) The dielectric constant of dielectrics depends on the frequency of the applied field. [U.P.S.C. I.E.S. E.E.-I, 2004]

248. The temperature coefficient of resistance of an insulator is
(a) positive and independent of temperature.
(b) negative and independent of temperature.
(c) negative and dependent on temperature.
(d) positive and dependent on temperature.
[U.P.S.C. I.E.S. E.E.-I, 1999]

249. How much (approximate) is the frequency independent power factor of a plastic dielectric capacitor?
(a) 0.00002 (b) 0.0002 (c) 0.002 (d) 0.02
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

250. What does quality factor of a dielectric mean?
(a) It is related to the value of permittivity of the material.
(b) It is related to breakdown voltage of the dielectric.
(c) It is related to the resistivity of the material.
(d) It is related to the ratio between maximum stored energy and average power loss in the dielectric. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

251. In a solid or liquid dielectric with externally applied electric field; as the interatomic distance increases the internal field E_i
(a) increases. (b) decreases.
(c) remains unaltered.
(d) increases or decreases based on temperature.
[U.P.S.C. I.E.S. E.E.-I, 2003]

252. In the case of a dielectric subjected to an alternating electric field of frequency f, the dielectric loss is proportional to which one of the following?
(a) f (b) f^2 (c) $\frac{1}{f}$ (d) $\frac{1}{f^2}$
[U.P.S.C. I.E.S. E.E.-I, 2008]

253. On the application of the field $\vec{E}$, the modified field due to polarization P in solids and liquids having cubic symmetry is given by
(a) $\vec{E}+\frac{\vec{P}}{\varepsilon_0}$ (b) $\vec{E}-\frac{\vec{P}}{\varepsilon_0}$ (c) $\vec{E}+\frac{\vec{P}}{3\varepsilon_0}$ (d) $\vec{E}-\frac{\vec{P}}{3\varepsilon_0}$
[U.P.S.C. I.E.S. E.E.-I, 2002]

254. The dielectric constant of an insulating material is given by
$$\varepsilon = \varepsilon' - i\varepsilon''$$
In a parallel plate capacitor of plate area A and separator d is filled with this material, what would be the loss factor?
(a) $\tan^{-1}\left\{\frac{(A\varepsilon')}{d\varepsilon''}\right\}$ (b) $\frac{(A\varepsilon')}{(d\varepsilon'')}$
(c) $\frac{\varepsilon''}{\varepsilon'}$ (d) $\tan^{-1}\left\{\frac{(d\varepsilon'')}{(A\varepsilon')}\right\}$
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

255. Low current round conductor used in electric machines is covered by
(a) PVC (b) enamel. (c) polythene. (d) rubber.
[A.M.I.E Sec B. E.E. Materials Winter 1994]

256. The degree of crystallinity of a polymer is reduced by
(a) fast cooling from the liquid state.
(b) absorption of water.
(c) slow cooling from the liquid state.
(d) none of the above.

257. _____ is the main constituent of glass.
(a) Al_2O_3 (b) B_2O_3 (c) SiO_2 (d) Fe_2O_3

258. Line insulators are made of
(a) porcelain. (b) mica.
(c) marble. (d) PVC.
[A.M.I.E Sec B. E.E. Materials Winter 1994]

259. Consider the following:
Applications of low permittivity ceramics include which of the following?
1. Suspension insulators for high voltage lines.
2. Superconductors.
3. Pin insulators for low voltage lines.
Select the correct answer using the code given below.
(a) 1 and 2 only. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

260. Spark plug makes use of _____ for insulation.
(a) mica (b) porcelain
(c) asbestos (d) glass

261. In electrical machines varnish is mainly used in
(a) impregnation. (b) coating.
(c) adhesion. (d) all of these.

262. Sometimes varnish is coated on hard porous insulating materials. This is done to improve
(a) resistance to moisture. (b) creeping discharge voltage.
(c) outer appearance. (d) all of the above.

263. At very high frequency (of the order of 10 Hz) the permittivity of a dielectric is due to _____ polarisation.
(a) magnetic (b) ionic
(c) electronic (d) none of these.

Answers: **243.** (d), **244.** (b), **245.** (d), **246.** (a), **247.** (c), **248.** (c), **249.** (b), **250.** (d), **251.** (b), **252.** (a), **253.** (c), **254.** (c), **255.** (b), **256.** (a), **257.** (c), **258.** (a), **259.** (b), **260.** (b), **261.** (d), **262.** (d), **263.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

264. Polar dielectrics are normally employed for
(a) dc and power frequencies.
(b) microwaves. (c) high frequencies.
(d) none of the above.

265. Which of the following dielectric is not preferred for high frequency applications?
(a) Teflon. (b) Butyl rubber.
(c) Polysterene. (d) Polyethylene.

266. Which of the following is a polar dielectric ?
(a) Teflon. (b) Polyethylene.
(c) Nylon. (d) Quartz.

267. Which of the following is a nonpolar dielectric ?
(a) Polystyrene. (b) Castor oil
(c) Phenolic plastics. (d) None of these.

268. The dielectric losses occur in all solid and liquid dielectrics due to
(a) hysteresis. (b) conduction current.
(c) both (a) and (b). (d) none of these.

269. The dielectric susceptibility determines the value of
(a) dielectric strength. (b) dielectric permittivity.
(c) both (a) and (b). (d) none of the above.

270. Ionization of dielectric causes
(a) thermal instability. (b) a real power loss in insulation.
(c) lowering of breakdown voltage of the insulating material.
(d) carbonization, decomposition and mechanical damage to the insulation.
(e) all of the above.

271. The possible breakdown in solid dielectrics may be
(a) electrothermal. (b) electrochemical.
(c) purely electrical. (d) all of these.

272. The power arc following a flashover or the breaking of contacts over the insulation surface puts the surface to
(a) chemical action. (b) extreme heat.
(c) deposition of electrode material.
(d) all of the above.

273. Which one of the following insulating materials has least affinity to moisture ?
(a) Mica. (b) Paper. (c) Asbestos.
(d) Cotton. (e) Rubber. (f) Silk.

274. Insulation used in commutator is
(a) wood. (b) PVC. (c) mica. (d) glass.
[A.M.I.E. Sec B. E.E. Materials Winter 1994]

275. Which one of the following gases is classified as electrogenerative ?
(a) Sulphur hexafluoride. (b) Methane.
(c) Ethane. (d) Nitrogen. (e) Hydrogen.

276. Dielectric strength of sulphur hexafluoride is about _____ times of that of air.
(a) 2.5 (b) 4.5 (c) 6.5 (d) 7.5

277. Sulphur hexafluoride is used in
(a) power transformers. (b) switchgears.
(c) synchronous alternators. (d) synchronous motors.

278. Consider the following statements :
There will be no spontaneous polarization, if
1. there is no hysteresis loop in a plot of polarization against field.
2. there is a hysteresis loop in a plot of polarization against field.
3. the material is below the Curie temperature.
4. the material is above the Curie temperature.
Which of these statements are correct?
(a) 1 and 3. (b) 1 and 4. (c) 2 and 3. (d) 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

279. Consider the following statements:
An insulating material shows polarization due to charged atoms. Its polarizability
1. decreases with applied electric field.
2. remains independent of temperature at a given field.
3. increases with applied electric field at constant temperature.
Which of the statements given above is/are correct?
(a) 1 only. (b) 1 and 2 only.
(c) 3 only. (d) 2 and 3 only.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

280. The electronic polarisability of an inert gas atom is proportional to which one of the following?
(a) R (b) R^2 (c) R^3 (d) R^4
(where R is the radius of the atom) [U.P.S.C. I.E.S. E.E.-I, 2008]

281. Which one of the following is the correct statement?
The orientational polarizability in a polyatomic gas is proportional to
(a) temperature T (b) $\frac{1}{T}$
(c) T^2 (d) independent of T
[U.P.S.C. I.E.S. E.E.-I, 2008]

282. The polarization in a solid dielectric is related to the electric field $\vec{E}$ and the electric flux $\vec{D}$ according to which one of the following equations?
(a) $\vec{E} = \epsilon_0 \vec{D} + \vec{P}$ (b) $\vec{D} = \epsilon_0 (\vec{E} + \vec{P})$
(c) $\vec{D} = \epsilon_0 \vec{E} + \vec{P}$ (d) $\vec{E} = \vec{D} + \epsilon_0 \vec{P}$
[U.P.S.C. I.E.S. E.E.-I, 2007]

283. For a given dielectric, with increase in temperature the ionic polarizability
(a) increases. (b) decreases.
(c) remains same. (d) fluctuates.
[U.P.S.C. I.E.S. E.E.-I, 2001]

284. When a dielectric is subjected to an alternating electric field of angular frequency 'ω', its power loss is proportional to
(a) ω (b) ω^2 (c) $\frac{1}{\omega}$ (d) $\frac{1}{\omega^2}$
[U.P.S.C. I.E.S. E.E.-I, 2001]

285. The losses in a dielectric subjected to an alternating electric field are determined by
(a) real part of the complex dielectric constant.
(b) imaginary part of the complex dielectric constant.
(c) absolute value of the complex dielectric constant.
(d) ratio of the magnitudes of the real and imaginary parts of the complex dielectric constant. [U.P.S.C. I.E.S. E.E.-I, 2003]

286. Consider the following statements:
Factors affecting the dielectric loss are
1. directly proportional to the frequency of supply voltage.
2. inversely proportional to the supply frequency.
3. inversely proportional to the square of the supply voltage.
4. directly proportional to the square of the supply voltage.
Which of the above statements are correct?
(a) 1 and 3 only. (b) 2 and 3 only.
(c) 2 and 4 only. (d) 1 and 4 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

Answers: **264.** (a), **265.** (b), **266.** (c), **267.** (a), **268.** (c), **269.** (b), **270.** (e), **271.** (d), **272.** (d), **273.** (a), **274.** (c), **275.** (a), **276.** (a), **277.** (b), **278.** (b), **279.** (c), **280.** (c), **281.** (b), **282.** (c), **283.** (c), **284.** (a), **285.** (b), **286.** (d),

Downloaded From : www.EasyEngineering.net

287. A dielectric material has the real part of the dielectric constant (ε_r') as 4 and its loss tangent is 0.04. What is the complex dielectric constant (ε_r^*) represented by?
(a) $4 + j\,0.016$ (b) $4 - j\,0.016$
(c) $4 + j\,0.001$ (d) $4 - j\,0.001$
[U.P.S.C. I.E.S. E.E.-I, 2004]

288. When the time period of the applied voltage is much shorter than the relaxation time of a polarization process, the loss of angles δ is
(a) zero. (b) between 0 and 90°.
(c) 90°. (d) greater than 90°.
[U.P.S.C. I.E.S. E.E.-I, 1998]

289. Which one of the following is a realistic representation of an equivalent circuit of a containing a lossy dielectric ?
(a) (b) (c) (d) [U.P.S.C. I.E.S. E.E.-I, 1998]

290. An air-filled parallel plate capacitor made of square plates, each 10 cm × 10 cm, has a capacitance C. If the plates are reduced to 2.5 cm × 2.5 cm, what would be the new capacitance?
(a) C/4 (b) C/8 (c) C/16 (d) C/32
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

291. By inserting a slab of dielectric material between the plates of a parallel plate capacitor, the energy stored in the capacitor has increased three times. The dielectric constant of the material is
(a) 9 (b) 3 (c) $\frac{1}{3}$ (d) $\frac{1}{9}$
[U.P.S.C. I.E.S. E.E.-I, 2001]

292. de Broglie wavelength associated with a material particle is
(a) inversely proportional to its energy.
(b) directly proportional to momentum.
(c) directly proportional to its energy.
(d) inversely proportional to momentum. [U.P.S.C. I.E.S. E.E.-I, 2002]

293. Consider the following statements regarding EM Wave:
1. An EM wave incident on a perfect dielectric is partially transmitted and partially reflected.
2. An EM wave incident on a perfect conductor is fully reflected.
3. When an EM wave is incident from a more dense medium to less dense medium at an angle equal to or exceeding the critical angle, the wave suffers total internal reflection.
Which of the statements given above are correct?
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

294. The velocity of light in a particular medium is 10^8 m/s. What is the relative permittivity of the medium
(a) 1.732 (b) 3 (c) 9 (d) 0.333
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

295. A uniform plane wave has a wavelength of 2 cm in free space and 1 cm in a perfect dielectric. What is the relative permittivity of the dielectric?
(a) 2.0 (b) 0.5 (c) 4.0 (d) 0.25
[U.P.S.C. I.E.S. E.E.-I, 2005]

296. Piezoelectric materials serve as source of _____ waves.
(a) micro (b) ultrasonic
(c) musical (d) resonant

297. Which one of the following materials is not the piezoelectric material ?
(a) Quartz. (b) Rochelle salt.
(c) Glass. (d) Barium titanate.
(e) Lead zirconate titanate.

298. Rochelle salt has _____ Curie point(s).
(a) one (b) two (c) three (d) no

299. Which one of the following statements is not true regarding Rochelle salt ?
(a) It possesses anisotropic properties.
(b) It is a salt of tartaric acid.
(c) Its crystal possesses a centre of symmetry.
(d) It crytallises in the orthorhombic system.

300. Which of the following statements are true of piezoelectric crystals ?
1. Their crystal structure possesses a centre of symmetry.
2. They always exhibit ferroelectricity.
3. They are necessarily poor electrical conductors.
4. They exhibit a relative permittivity less than unity.
Select correct answer using the codes given below.
Codes:
(a) 1, 2 and 4. (b) 2, 3 and 4.
(c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E. I, 1994]

301. Piezoelectricity has been observed in
(a) nickel. (b) glass. (c) quartz. (d) mica.
[A.M.I.E.Sec B. E.E. Materials Winter 1994]

302. Piezoelectric effect is generally observed in
(a) insulators.
(b) insulators and semiconductors.
(c) conductors and superconductors.
(d) conductors and semiconductors. [U.P.S.C. I.E.S. E.E.-I, 2000]

303. The piezoelectric effect is the polarization of a dielectric under the influence of
(a) light. (b) mechanical stress.
(c) electrical stress. (d) heat. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

304. Which one of the following materials is not a piezoelectric material?
(a) $BaTiO_3$. (b) Quartz.
(c) Rochelle salt. (d) Yttrium garnet.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

305. Which of the following is piezoelectric material?
(a) Quartz. (b) Silica sand.
(c) Corundum. (d) Polystyrene.
[U.P.S.C. I.E.S. E.E.-I, 2002]

306. Ceramic resonators use which one of the following?
(a) Barium titanate. (b) Silicon.
(c) Piezoelectric quartz crystal.
(d) Zirconium titanate. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

307. Consider the following statements in respect of a quartz crystal:
1. Quartz displays ferroelectric behaviour.
2. Quartz is used in electric oscillator circuits.
3. Quartz crystal is formed by repeating silicate tetrahedrons.
Which of the statements given above are correct?
(a) 1, 2 and 3. (b) Only 1 and 2.
(c) Only 2 and 3. (d) Only 1 and 3.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

Answers: **287.** (b), **288.** (a), **289.** (c), **290.** (c), **291.** (b), **292.** (d), **293.** (a), **294.** (c), **295.** (c), **296.** (b), **297.** (c), **298.** (b), **299.** (c), **300.** (c), **301.** (c), **302.** (a), **303.** (b), **304.** (d), **305.** (a), **306.** (c), **307.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

308. Consider the following statements for the piezoelectric materials:
1. All piezoelectric materials are ferroelectric materials also.
2. Piezoelectric materials have high value of dielectric constant.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

309. Piezoelectricity is the reverse effect of
(a) Electroluminescence (b) Electrostriction.
(c) Peltier effect. (d) Halt effect.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

310. A piezoelectric crystal has an Young's modulus of 130 GPa. The uniaxial stress that must be applied to increase its polarization from 500 to 510 Cm^{-2} is
(a) 1.171 GPa. (b) 1.182 GPa.
(c) 2.6 GPa. (d) 2.55 GPa.
[U.P.S.C. I.E.S. E.E.-I, 2001]

311. At optical frequencies, the major contribution to the total polarization comes from
(a) space charge polarization. (b) orientational polarization.
(c) ionic polarization. (d) electronic polarization.
[U.P.S.C. I.E.S. E.E.-I, 2002]

312. Liquid crystal material is used in
(a) ultrasonic amplification and display devices.
(b) thermal sensors and transducers.
(c) display devices and thermal sensors.
(d) transducers and ultrasonic amplification.
[U.P.S.C. I.E.S. E.E.-I, 1999]

313. Which one of the following is an example of electroluminescent devices?
(a) Liquid crystal display and photodiode.
(b) Liquid crystal display and phototransistor.
(c) Electroluminescent panel.
(d) Light emitting diode and phototransistor.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

314. Potassium Dihydrogen Phosphate (KDP) crystals are used to produce second harmonics of optical frequencies. Which one of the following is an important requirement?
(a) Their susceptibility should be a constant.
(b) Their susceptibility should be an odd function of applied electric field.
(c) Their susceptibility should vary with square of the applied electric field.
(d) Their susceptibility should exhibit a peak at the second harmonic frequency. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

315. Consider the following statements for a photoconducting material :
1. Its dark conductivity is small.
2. With the absorption of radiation, equal numbers of electrons and of holes are produced.
Which of the statements given above is/are correct?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

316. Lithium Niobate is used in
(a) SAW devices. (b) LED's.
(c) the manufacture of optical fibres.
(d) laser diodes. [U.P.S.C. I.E.S. E.E.-I, 1998]

317. In the optical fibre used for communication, the core and cladding material used are respectively
(a) pure silica and Ge-doped silica.
(b) P-doped silica and Ge-doped silica.
(c) Ge-doped silica and P-doped silica.
(d) Ge-doped silica and pure silica. [U.P.S.C. I.E.S. E.E.-I, 2000]

318. Which one of the following is NOT true for Sulphur Hexafluoride gas?
(a) It is electronegative in nature.
(b) It has high dielectric strength.
(c) It is non-toxic. (d) It is highly inflammable.
[U.P.S.C. I.E.S. E.E.-I, 2003]

Answers: **308.** (b), **309.** (b), **310.** (c), **311.** (d), **312.** (c), **313.** (c), **314.** (d), **315.** (c), **316.** (c), **317.** (d), **318.** (d).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): At absolute zero degree Kelvin temperature the semiconductor materials behave as insulators.
(R): At absolute zero degree Kelvin temperature, there is no energy available to generate the current carriers in the semiconductor. [U.P.S.C. I.E.S. E.E.-I, 2007]

2. (A): Electron mobility in metals decreases with increasing temperature.
(R): In metals electron concentration is high.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

3. (A): A heavily doped semiconductor can exhibit positive temperature coefficient of resistance.
(R): The carrier mobility decreases with increase of temperature.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

4. (A): In an alternating field of 10^{14} Hz, the electrical conductivity of a metal is zero.
(R): As the electrons fail to respond to the fast changing electric field, there is no drift. [U.P.S.C. I.E.S. E.E.-I, 1998]

Answers: **1.** (a), **2.** (b), **3.** (a), **4.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

5. (A): An electric or mechanical input makes the flux jump from one superconductor to another, generating large direct currents.
(R): The electric resistivity of superconductors depends upon the magnetic field. [U.P.S.C. I.E.S. E.E.-I, 2004]

6. (A): In a type II superconductor, the magnetization gradually decreases between two critical values of the applied field H_{c1} and H_{c2}.
(R): In a type II superconductor, magnetic flux lines are pinned by microstructural imperfection. [U.P.S.C. I.E.S. E.E.-I, 1998]

7. (A): A superconductor is a perfect diamagnetic material.
(R): A superconductor is a perfect conductor.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

8. (A): Superconductors cannot be used as coils for production of strong magnetic fields.
(R): Superconductivity in a wire may be destroyed if the current in the wire exceeds a critical value. [U.P.S.C. I.E.S. E.E.-I, 2011]

9. (A): Superconductivity of a superconducting material can be destroyed by application of an external magnetic field.
(R): If the applied magnetic field is greater than the critical magnetic field at a given temperature which is more than the transition temperature, superconductivity can be destroyed. [U.P.S.C. I.E.S. E.E.-I, 2006]

10. (A): Cryotron is a switch constructed out of superconducting materials.
(R): Switching action is characteristic of superconductors only.
[U.P.S.C. I.E.S. E.E.-I, 2004]

11. (A): If a piece of metal is made to have a temperature gradient between its two ends, an emf exists between these ends.
(R): Electrons at the hot end move towards the cold end.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

12. (A): Thermal noise in metallic resistors can be characterized by Gaussian probability density function.
(R): Power spectral density of thermal noise is essentially constant for a very large frequency range.
[U.P.S.C. I.E.S. E.E.-I, 2002]

13. (A): Ammonium dihydrogen phosphate is a piezoelectric material.
(R): There is no centre of symmetry in ammonium dihydrogen phosphate. [U.P.S.C.I.E.S. E.E. I, 1993]

14. (A): Diamagnetic effect is present in all the materials.
(R): The applied magnetic field alters the orbital motion of the constituent electrons of the material.
[U.P.S.C. I.E.S. E.E. I, 1993]

15. (A): The spins within a magnetic domain are aligned permanently below Curie temperature in a ferromagnetic material.
(R): Ferromagnetic material is magnetic only when the domains are aligned by an external field. [U.P.S.C. I.E.S. E.E.-I, 2010]

16. (A): Iron, cobalt and nickel are ferromagnetic.
(R): Spin imbalance of electrons in the 3rd band is responsible.
[U.P.S.C.I.E.S. E.E. I, 1993]

17. (A): Soft magnetic material is used in making electromagnets.
(R): Soft magnetic materials have a high coercive field.
[U.P.S.C. I.E.S. E.E.-I, 2004]

18. (A): Soft magnetic materials cannot be used for the construction of cores for the electrical machines.
(R): Soft magnetic materials have relatively small and narrow hysteresis loop.

19. (A): Alnico (aluminium-nickel-iron-cobalt) alloys are the most important of hard magnetic materials.
(R): Alnico magnet alloys have the lowest energy per unit of volume of any permanent magnet material available commercially.

20. (A): Hard magnetic materials are used for making permanent magnets.
(R): Hard magnetic materials have relatively small and narrow hysteresis loop.

21. (A): DC resistance of ferrites is much higher than that of dia-, para- or ferro-magnetic materials.
(R): Ferrites are obtained by replacing divalent ferrous ion in ferrimagnetic magnite by another divalent metal such as Mg, Zn etc., but the exchange interactions are antiferromagnetic type. [U.P.S.C. I.E.S. E.E.-I, 2000]

22. (A): Ferrites are useful at very high frequencies.
(R): Ferrites have high permeability and high resistivity.
[U.P.S.C. I.E.S. E.E.-I, 2008]

23. (A): Ferrites cores are used in inductances for high frequencies.
(R): Ferrites provide high flux density with minimum eddy current loss and are insulators. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

24. (A): Magnetic cores are generally used in main memory of a digital computer.
(R): Magnetic cores are slow and volatile.
[U.P.S.C. I.E.S. E.E.-I, 2010]

25. (A): Storage of energy in a dielectric is due to shift in relative positions of internal charges against normal atomic and molecular forces.
(R): All dielectrics are characterised by the presence of molecules having permanent displacement between the centres of gravity of the positive and negative charges.
[U.P.S.C. I.E.S. E.E.-I, 2000]

26. (A): An insulator has a high value of resistivity, and with increasing temperature the value of its resistivity decreases exponentially.
(R): With increasing temperature, the value of the energy band gap decreases. [U.P.S.C. I.E.S. E.E.-I, 2005]

27. (A): The relative dielectric constant of an insulator decreases with increase in frequency of the applied alternating field.
(R): With increase in frequency of the applied field, the polarization process increases in number.
[U.P.S.C. I.E.S. E.E.-I, 1999]

28. (A): Mica is usually not used for slot linnings of high voltage machines.
(R): Space factor in high voltage machines is high.

29. (A): Skin depth is the depth by which electromagnetic wave has been increased to 37% of its original value.
(R): The depth of penetration of wave in a lossy dielectric increases with increasing wavelength.
[U.P.S.C. I.E.S. E.E.-I, 2005]

30. (A): Sulphur hexafluoride gas is highly inflammable.
(R): Sulphur hexafluoride gas is used in switchgears.

31. (A): Mica has very high dielectric strength
(R): Mica cannot be used for large commutator of a dc machine.

Answers: **5.** (d), **6.** (a), **7.** (c), **8.** (a), **9.** (c), **10.** (c), **11.** (a), **12.** (b), **13.** (a), **14.** (d), **15.** (c), **16.** (a), **17.** (c), **18.** (d), **19.** (c), **20.** (c), **21.** (b), **22.** (a), **23.** (a), **24.** (c), **25.** (a), **26.** (d), **27.** (c), **28.** (c), **29.** (c), **30.** (d), **31.** (b).

Matching Type Questions

Notes: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Crystalline Structure)

A. Simple cube
B. Body-centered cube structure (BCC)
C. Face-centered cube structure (FCC)

List 2 (Number of Atoms per Unit Cell)

1. 2
2. 4
3. 1
4. 6

Codes:	A	B	C
(a)	3	1	2
(b)	1	2	3
(c)	3	1	4
(d)	6	1	2

2.

List 1 (Structure)

A. Simple cube
B. BCC
C. FCC
D. Diamond

List 2 (Atomic Packing Fraction)

1. 0.34
2. 0.52
3. 0.68
4. 0.74

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	1	2	4	3
(d)	2	1	3	4

3.

List 1

A. Hexagonal crystal
B. Rhombohedral crystal
C. Triclinic crystal
D. Monoclinic crystal

List 2

1. $a = b = c$; $\gamma = \alpha = \beta \neq 90°$
2. $a = b \neq c$; $\alpha = \beta = 90°$, $\gamma = 120°$
3. $a \neq b \neq c$; $\alpha = \beta \neq \gamma \neq 90°$
4. $a \neq b \neq c$; $\alpha \neq \gamma \neq 90° \neq \beta$

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	1	4	3
(c)	1	2	4	3
(d)	2	1	3	4

[U.P.S.C. I.E.S. E.T.E.-I., 2007]

4.

List 1 (Semiconductor Parameters)

A. Impurity concentration
B. Carrier mobility
C. Carrier life time
D. Intrinsic carrier concentration

List 2 (Physical Process)

1. Recombination
2. Band to band transition
3. Scattering
4. Ion implantation

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	4	3	2	1
(c)	3	4	1	2
(d)	4	3	1	2

[U.P.S.C. I.E.S. E.E.-I., 2001]

5.

List 1 (Semiconductor)

A. Ga As
B. In P
C. In Ga As
D. Ga Al As

List 2 (Bandgap in eV)

1. 1.8
2. 1.43
3. 1.35
4. 0.75

Codes:	A	B	C	D
(a)	2	3	1	4
(b)	2	3	4	1
(c)	3	2	4	1
(d)	3	2	1	4

[U.P.S.C. I.E.S. E.E.-I., 1999]

6.

List 1 (Semiconductor Property)

A. Electron mobility of 0.13 $m^2 V^{-1} s^{-1}$
B. *p*-type
C. *n*-type
D. Wide band gap

List 2 (Type of Semiconductor)

1. Germanium doped with arsenic
2. Gallium arsenide
3. Silicon
4. Gallium doped silicon

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	4	3	1	2
(c)	3	4	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I., 1999]

7.

List 1 (Application)

A. Light emitting diode
B. Gunn diode
C. Thyristor
D. Infrared detector

List 2 (Semiconductors)

1. Si
2. Gap
3. InSb
4. GaAs

Codes:	A	B	C	D
(a)	2	4	3	1
(b)	4	2	3	1
(c)	4	2	1	3
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-I, 1998]

8.

List 1 (Material)

A. Conductors
B. Insulators
C. Germanium
D. Silicon

List 2 (Forbidden Energy Gap in eV)

1. Large
2. Zero
3. 1.12
4. 0.72

Codes:	A	B	C	D
(a)	2	1	3	4
(b)	1	2	4	3
(c)	3	1	4	2
(d)	2	1	4	3

9.

List 1 (Materials)

A. Hg
B. Lead
C. Sn

List 2 (Transition Temperature)

1. 4.12 K
2. 3.40 K
3. 7.22 K
4. 3.73 K

Codes:	A	B	C
(a)	1	2	3
(b)	1	3	4
(c)	2	3	4
(d)	1	2	4

Answers: **1.** (a), **2.** (b), **3.** (b), **4.** (c), **5.** (b), **6.** (c), **7.** (c), **8.** (d), **9.** (b),

10.

List 1 (Metal)	List 2 (Application)
A. Constantan	1. Lamp filament
B. Tungsten	2. Standard resistance coil
C. Nichrome	3. Electric heater filament
D. Manganin	4. Rheostat

Codes:	A	B	C	D
(a)	4	1	2	3
(b)	4	1	3	2
(c)	1	4	2	3
(d)	1	4	3	2

11.

List 1 (Alloy)	List 2 (Composition)
A. Gun metal	1. Copper 60% and zinc 40%
B. Brass	2. Copper 86% manganese 12% and nickel 2%
C. Manganin	3. Nickel 61% chromium 15% and ferric 24%
D. Nichrome	4. Copper 88% tin 10%and zinc 2%

Codes:	A	B	C	D
(a)	4	1	3	2
(b)	1	4	2	3
(c)	3	1	2	4
(d)	4	1	2	3

12.

List 1 (Components)	List 2 (Material Used)
A. Structural components	1. Cast iron
B. Frames of small electric machines	2. Steel and medium size
C. Frames of large machines	3. Silicon steel size electric
D. Transformer tanks (large size)	4. Tungsten steel

Codes:	A	B	C	D
(a)	1	1	2	2
(b)	3	1	2	4
(c)	3	1	4	2
(d)	1	3	2	4

13.

List 1	List 2
A. Precision work	1. Graphite
B. Rheostat	2. Nichrome
C. Heating devices	3. Constantan
D. Brushes	4. Magnesium

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	1	3	2	4
(c)	4	2	3	1
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-I, 2010]

14.

List 1	List 2
A. High conductivity materials	1. Tungsten, Carbon
B. High resistivity materials	2. Platinum, Molybdenum
C. Metals for lightly loaded contacts	3. Aluminium, Copper
D. Materials for bimetallic strip	4. Iron, Nickel, Constantan

Codes:	A	B	C	D
(a)	3	1	2	4
(b)	4	1	2	3
(c)	3	2	1	4
(d)	4	2	1	3

[U.P.S.C. I.E.S. E.E.-I, 2010]

15.

List 1	List 2
A. Enamel covering	1. Laminations
B. Insulation	2. Wires
C. Fibrous materials	3. Machines
D. Empire cloth	4. Transformers

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	3	4	1	2
(c)	2	1	4	3
(d)	3	1	4	2

[U.P.S.C. I.E.S. E.E.-I, 2010]

16.

List 1	List 2
A. Metals	1. Are in spontaneously polarized state
B. Semiconductors	2. Finite forbidden gap
C. Insulators	3. Smaller forbidden gap
D. Ferroelectric crystals	4. Partially filled bands

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	1	3	2	4
(c)	4	2	3	1
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-I, 2010]

17.

List 1	List 2
A. Ferroelectric materials	1. Neel temperature
B. Anti-Ferroelectric materials	2. Magnetostrictive transducers
C. Ferrites	3. Magnetocaloric effect
D. Ferromagnetic materials	4. Cannot be shaped by ordinary machining process

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	3	4	1	2
(c)	2	1	4	3
(d)	3	1	4	2

[U.P.S.C. I.E.S. E.E.-I, 2010]

18.

List 1	List 2
A. Magnetic induction	1. Bohr magneton
B. Magnetic field	2. Tesla
C. Magnetic moment	3. Henry/metre
D. Permeability	4. Ampere/metre

Codes:	A	B	C	D
(a)	2	1	4	3
(b)	3	1	4	2
(c)	2	4	1	3
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-I, 2011]

19.

List 1 (Type of Material)	List 2 (Name of the Material)
A. Ferromagnetic	1. Rochelle salt
B. Soft magnetic	2. Alnico
C. Hard magnetic	3. Perm alloy
D. Semiconductor	4. GaAs

Answers: **40.** (c), **41.** (a), **42.** (d), **43.** (c).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F).

1. Materials with BCC or FCC crystals are generally isotropic.
2. According to Rutherford's nuclear model an atom consists of a central positively charged nucleus of radius 10^{-11} mm.
3. The drawbacks of Rutherford's model were overcome by Prof. Neil Bohr by applying Planck's quantum theory.
4. Isobars are the atoms which have same mass number but differ in atomic number.
5. A definite amount of energy is required to be spent in order to move an electron from its orbit.
6. Lattice parameter means dimensions of the unit cell in any of the crystallographic arrangements.
7. The crystals of most metals have a highly symmetrical structure with close packed atoms.
8. A crystal is said to have a simple form if its all faces are similar.
9. Atomic packing factor is defined as the ratio of the volume of atoms per unit cell to the total volume occupied by unit cell.
10. Ionic bonds are unidirectional.
11. At the most three electrons may occupy one energy level.
12. A covalent bond is due to sharing of pair of valence electrons by two or more atoms.
13. In the covalent bond, atoms of different elements transfer electrons from one to the other so that both have stable outermost orbits.
14. It is the valence electrons that determine most of the properties of the elements and form bonds to hold the material together.
15. High hardness and low conductivity are typical properties of ionic bond solids.
16. Aluminium is easily solderable.
17. Gold has resistivity lower than that of aluminium, but higher than that of silver.
18. Silver alloys are widely employed for making contacts.
19. Tin is employed in the manufacture of high current high voltage fuses.
20. Electrical resistance of electrolytes generally increases with the increase in temperature.
21. The best electrical conductors are also the best heat conductors.
[A.M.I.E. Sec B. E.E. Materials Winter, 1993]
22. Copper can be converted into a superconductor at 0 K.
[A.M.I.E. Sec B. E.E. Materials Winter 1993]
23. All metals are conductors of electricity.
24. Gold is the best conductor of electricity.
25. Mechanical stressing of crystal structure reduces the resistivity of metal.
26. Age hardening increases the conductivity of an alloy.
27. Copper has high contact resistance.
28. Copper loses its hardness abruptly at 200°C.
29. Aluminium has low contact resistance.
30. The transition from superconducting state to conducting state is irreversible.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (T), **5.** (T), **6.** (T), **7.** (T), **8.** (T), **9.** (T), **10.** (T), **11.** (F), **12.** (F), **13.** (F), **14.** (T), **15.** (T), **16.** (F), **17.** (T), **18.** (T), **19.** (T), **20.** (F), **21.** (T), **22.** (F), **23.** (T), **24.** (F), **25.** (F), **26.** (F), **27.** (F), **28.** (T), **29.** (F), **30.** (F),

31. Annealed conductors are good conductors of electricity than a material subjected under sudden fall of temperature.

[A.M.I.E Sec B. E.E. Materials Winter 1993]

32. Monovalent metals are not superconducting.
33. The transition temperature of superconductors varies with the isotopic mass.
34. Many metals have vanishing resistivity at absolute zero temperature.
35. The metal and compounds which are superconducting are rather bad conductors at ordinary temperatures.
36. Eureka is a copper nickel alloy.
37. Cadmium bronze is used for contacting conductor and commutator segments.
38. Bronze contains 60% copper and 40 per cent zinc.
39. Beryllium bronze may be employed for making current carrying springs.
40. An alloy has higher conductivity than the pure base metal.
41. Steel contains iron and small percentage of carbon.
42. Platinum is corrodible material.
43. Silicon and germanium are brittle, crystalline solids.
44. The conductivity of a semiconductor material is usually high.
45. Semiconductors are usually nonmetallic in appearance.
46. Germanium is a soft element.
47. Germanium has a grey metallic lustre.
48. Silicon carbide is extremely refractory.
49. The Fermi level lies very close to the conduction band in the case of intrinsic semiconductor.

[A.M.I.E. Sec B. E.E. Materials Summer 1994]

50. Silicon is the most important nonmagnetic material alloyed with iron to improve magnetic properties.

[A.M.I.E. Sec B. E.E. Materials Winter 1993]

51. Magnetostriction shortens an iron bar while it elongates nickel.

[A.M.I.E Sec B. E.E. Materials Winter 1993]

52. Ferrites are non-metallic ferromagnetic materials which essentially show exchange interactions of antiferromagnetic type.

[A.M.I.E Sec B. E.E. Materials Summer 1994]

53. Non-magnetic materials do not respond to magnetic field.
54. Materials are classified into diamagnetic, paramagnetic and ferromagnetic materials depending upon the manner in which they respond to electric current.
55. If an external magnetic field is applied to a paramagnetic material it induces magnetization in the direction opposite to that of applied field.
56. Ferromagnetism arises out of the electron structure.
57. When a ferromagnetic material is magnetized its magnetic poles get oriented in the directon of coercive force.
58. During the process of magnetization when all the magnetic dipoles of a magnetic material get oriented in one direction, the core is said to be grain oriented.
59. Ferrimagnetic materials do not have permanent dipoles.
60. Ferrites are widely employed in computers and microwave applications.
61. Transverse magnetostriction is the change in dimension perpendicular to magnetization direction.
62. When the crystals of a ferromagnetic material are cold worked, the material has very poor magnetic properties.
63. Grain orientation increases hysteresis loss in a magnetic material.
64. High silicon steel has comparatively higher permeability and high saturation.
65. Addition of 0.5 to 5% of silicon in iron causes increase in eddy current loss.
66. CRGOS sheet steels are widely employed for construction of cores of rotating electrical machines.
67. Grain orientation of silicon steel is obtained by annealing.
68. Dielectric strength is the maximum voltage which when applied to an insulating material will cause serious damage to it and destruct to its insulating properties.
69. Asbestos is used as an insulation in high voltage installations.
70. Asbestos is neither mechanically strong nor flexible.
71. Asbestos is least hygroscopic.
72. Asbestos insulation is used at low temperature electrical installations.
73. Fibre glass insulation is employed at low temperature electrical installations.
74. Ceramic insulators have excellent insulating properties and impact strength.
75. Cotton is non-hygroscopic.
76. Paper is hygroscopic and absorbent.
77. A plastic in a broad sense is defined as any nonmetallic material that can be moulded to shape.
78. Mica is rigid, tough, strong and is not affected by moisture.
79. Mica is not affected by oils.
80. Bitumens and waxes are resinous insulating materials.
81. Polarisation is a vector quantity.
82. Dipolar polarisation in solid and liquid dielectrics lowers the dielectric constants.
83. The electrical conductivity of solid dielectrics is not affected by the presence of different impurities.
84. In a solid dielectric electrothermal breakdown causes its destruction due to heat produced by the dielectric losses.
85. Capacitor with very high dielectric constants have been developed by treating $BaTiO_3$ in a reducing atmosphere.
86. Dielectric constant of air decreases linearly with the increase in gas pressure.
87. The dielectric strength of sulphur hexafluoride increases at increased pressure.
88. Ferroelectric materials have a low dielectric constant.
89. Higher the dielectric constant higher the dielectric strength.
90. In ferroelectrics high electric field applied to a device cannot cause voltage breakdown.

Answers: **31.** (F), **32.** (T), **33.** (T), **34.** (T), **35.** (T), **36.** (T), **37.** (T), **38.** (F), **39.** (T), **40.** (F), **41.** (T), **42.** (F), **43.** (T), **44.** (F), **45.** (F), **46.** (F), **47.** (T), **48.** (T), **49.** (F), **50.** (T), **51.** (F), **52.** (F), **53.** (T), **54.** (F), **55.** (F), **56.** (T), **57.** (F), **58.** (F), **59.** (F), **60.** (T), **61.** (T), **62.** (T), **63.** (F), **64.** (F), **65.** (F), **66.** (F), **67.** (F), **68.** (F), **69.** (F), **70.** (T), **71.** (F), **72.** (F), **73.** (F), **74.** (F), **75.** (F), **76.** (T), **77.** (T), **78.** (T), **79.** (F), **80.** (F), **81.** (T), **82.** (F), **83.** (F), **84.** (T), **85.** (T), **86.** (F), **87.** (T), **88.** (F), **89.** (F), **90.** (F).

Fill in the Blanks Type Questions

Note:- Fill in the blanks with appropriate word or words.

1. In a crystal, the arrangement of atoms is in periodically _____ pattern.
2. Secondary bonds are _____ than primary bonds.
3. The addition of small amounts of impurity may _____ the conductivity considerably.
4. Pure aluminium is _____ than copper.
5. Aluminium has relatively _____ thermal and electrical conductivities.
6. Boiling point of mercury is _____ .
7. Bronze has _____ resistivity than that of copper.
8. High resistance materials have high _ _____ .
   [A.M.I.E Sec B. E.E. Materials Summer 1993]
9. Tungsten is used in lamp due to _____ .
   [A.M.I.E. Sec B. E.E. Materials Winter 1994]
10. A voltage (maximum) of _____ volt per turn should be used when designing constantan wire rheostats.
11. Platinum does not _____ in air.
12. With increase of temperature the resistivity of a metal _____ while the conductivity of a semiconductor _____ .
    [A.M.I.E Sec B. E.E. Materials Summer 1994]
13. Resistivity of ferrites ranges from _____ to _____ ohm-m.
14. The resistivity of ferrites is very much _____ than that of the ferromagnetic materials.
15. The majority carriers are _____ in n-type semiconductor, while the minority carriers are _____ in p-type semiconductor.
    [A.M.I.E. Sec B.. E.E. Materials Summer 1994
16. The conductivity of intrinsic semiconductor is primarily dependent on _____ mobility and _____ mobility.
    [A.M.I.E Sec B. E.E. Materials Summer 1993]
17. A reverse biased P-N junction diode operating on the breakdown phenomenon is called a _____ .
    [A.M.I.E Sec B. E.E. Materials Summer 1993]
18. Barium titanate has _____ crystal structure and is a _____ material.
    [A.M.I.E. Sec B. E.E. Materials Summer 1994]
19. Core of electrical machine is of _____ .
    [A.M.I.E Sec B. E.E. Materials Winter 1994]
20. Diamagnetic materials are _____ materials.
21. Above the _____ temperature, the domains may disrupt and the material may lose its ferromagnetic properties.
22. When a paramagnetic material is placed in a magnetic field, the field distortion is _____ .
23. In hard magnetic materials the coercive force is _____ .
24. In hard magnetic materials it is _____ to orient the domains in comparison to the soft magnetic materials.
25. Hard magnetic materials have _____ magnetic reluctance.
26. Alnico is _____ than Alni.
27. Silk resins possess _____ electrical insulating properties.
28. Silicon rubbers have_____electrical insulating properties.
29. Silk is _____ hygroscopic and has _____ dielectric strength in comparison to those for cotton.
30. Electronic polarisation is _____ pronounced in liquid and solid dielectrics than in gas.

ANSWERS

1. repeating
2. weaker
3. increase
4. softer
5. low
6. 357°C
7. higher
8. resistivity
9. its high melting point
10. 1
11. oxidise
12. increases, increases
13. 0.1, 10
14. higher
15. electrons, electrons
16. electron, hole
17. Zener diode
18. an unsymmetrical, piezoelectric
19. silicon steel
20. nonmagnetic
21. Curie
22. negligible
23. large
24. difficult
25. high
26. more expensive
27. good
28. high
29. less, higher
30. more

CHAPTER 6

Electrical Machine Design

Short Answer Type Questions With Answers

Q. 1. Enumerate the major considerations for evolving a good design.

Ans. The major considerations to evolve a good design are: (i) durability (ii) compliance with performance criteria as laid down in specifications and (iii) cost.

Q. 2. What are the main areas of design?

Ans. The main areas of design are: (i) magnetic circuit (ii) electrical circuit (iii) insulation (iv) thermal circuit and (v) mechanical construction.

Q. 3. What are the design limitations?

Ans. The limitations imposed on the design are: (i) saturation of magnetic parts (ii) temperature rise (iii) commutation (iv) insulation (v) customer's specification (vi) efficiency (vii) power factor and (viii) mechanical strength specially in large size and high speed machines.

Q. 4. What are the basic requirements of a good conducting material used in windings of electrical machines?

Ans. The basic requirements of a good conducting material used in windings of electrical machines are: (i) highest possible conductivity (ii) least possible temperature coefficient of resistance (iii) high tensile strength (iv) reliability (v) durability (vi) good weldability and solderability and (vii) no brittleness.

Q. 5. Why is it difficult to substitute aluminium for copper for windings of electrical machines?

Ans. Aluminium cannot be substituted for copper for windings of electrical machines because aluminium has higher resistivity and low tensile strength.

Q. 6. Why is silicon content in iron laminations kept within 5%?

Ans. Silicon content in iron laminations is kept within 5% as it makes the material brittle.

Q. 7. What are the basic requirements of a good insulating material?

Ans. The fundamental needs of a good insulating material are (i) high dielectric strength (ii) high insulating resistance, (iii) low dielectric loss (iv) good mechanical strength (v) good thermal conductivity (vi) high degree of thermal stability and (vii) good machinability to mass production. Besides these it must be easily and economically available.

Q. 8. Enumerate the basic considerations to be made in the design of insulation.

Ans. The basic considerations to be made in the design of insulation are mechanical, electrical and thermal considerations.

Q. 9. Why is excessive insulation harmful to a coil?

Ans. Excessive insulation is harmful to a coil because heat transfer becomes poor.

Q. 10. Give the condition when the rate of rise of temperature in a machine will be zero.

Ans. Heat generated = Heat dissipated to the surroundings by one or more of the natural modes of heat transfer.

Q. 11. On what factors does the rate of temperature depend ?

Ans. The temperature rise depends upon (*i*) the amount of heat produced and (*ii*) the amount of heat dissipated per °C rise of the surface of a machine.

Q. 12. Define heating time constant of the machine.

[A.M.I.E. Sec B. Summer 1996]

Ans. Heating time constant may be defined as the time during which the machine will attain 63.2% of its final steady temperature.

Q. 13. Why the cooling time constant of a rotating machine is usually larger than its heating time constant ?

Ans. The cooling time constant of a rotating machine is usually larger than its heating time constant owing to poor ventilation conditions, when the machine cools.

Q. 14. What informations should the rating of a machine give ?

Ans. The rating of an electrical rotating machine should include the output, voltage, speed and any other information that may be necessary for the proper operation of the machine.

Q. 15. In what terms are dc machines rated ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The dc machines are rated in terms of kW output at a given speed and voltage.

Q. 16. What is the main factor which governs the size and rating of an electric machine ?

Ans. "Temperature rise" is the main factor which governs the size and rating of an electric machine.

Q. 17. What are the standard period for short-time rating of a machine ?

[A.M.I.E. Sec B. Winter 1994]

Ans. Standard short-time ratings are 10, 30, 60 and 90 minutes.

Q. 18. Explain why a motor of smaller rating can be selected for a short time duty ? **[U.P. Technical Univ; Electric Drive 2005-06]**

Ans. The short-time duty motor operates at a constant load for some specified periods which is then followed by a period of rest. The period of run (or load) is so short that machine cannot attain its steady temperature rise while the period of rest is too long that the motor temperature drops to the ambient temperature. Thus a motor of smaller rating can be operated with a larger power output for the maximum temperature rise in a short duration.

Q. 19. Why a totally enclosed type of motor is more expensive than a screen protected type ?

Ans. In totally enclosed type motor, due to cooling difficulties, the output obtainable is only about 50 to 70% that obtained from a protected type of same dimensions and for same temperature rise.

Q. 20. Why machines having long core length are provided with radial ventilating ducts while machines having deep cores are provided with axial cooling ? **[A.M.I.E. Sec. B. Summer 1995]**

Ans. Radial ventilating ducts provided with long core machines take away heat at a faster rate. Also in case of deep cores axial ventilating ducts does. Otherwise the central portion of long core and inner portion of deep core may attain a temperature higher than permissible value.

Q. 21. The outside of the machine should be cleaned frequently and the air passages blown out regularly. Why ?

Ans. Otherwise dust deposit upon the external surface of a machine will act as a heat insulant and in air ducts will restrict the flow of cooling air and consequently temperature will rise.

Q. 22. What are the methods which are used in determining the rating of motor for variable load drives.

Ans. The methods used for determination of rating of motor for variable load drives are (i) average loss method (ii) equivalent current method (iii) equivalent torque method and (iv) equivalent power method.

Q. 23. Enumerate the desirable properties for the materials for the shaft.

Ans. The desirable properties for the shaft materials are (i) sufficient mechanical strength (ii) low sensitivity to stress concentration (iii) good machinability and (iv) ability to withstand heat and case hardening treatment to reduce the effects of stress concentration and increase the wear resistance of the journal bearings.

Q. 24. Give two important considerations for the selection of number of poles of a dc machine.

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. Two important considerations for selection of number of poles of a dc machine are:

1. Number of poles should be such as to provide the frequency of flux reversals between limits of 25 and 50 Hz. Lower values of frequency are used for large machines.
2. The value of current per parallel path is limited to about 200 A. Thus the current per brush arm should not exceed 400 A.

Q. 25. Why are dc machines designed with a large value of air-gap length?

Ans. DC machines are designed with a large value of airgap length because it provides better ventilation and reduces the distortion effect and pulsation losses.

Q. 26. Why is mica used to insulate the commutator segments in a dc machine?

Ans. Mica is used to insulate the commutator segments because it is mechanically strong and has very high specific weight.

Q. 27. What should be the minimum number of coils for a 400 V, 6-pole lap-connected dc machine for a maximum voltage of 15 V between adjacent commutator segments?

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. Number of coils required per parallel path for a 400 V with 15 V between commutator segments $= \frac{400}{15} = 26.67 \simeq 27.$

A dc machine with 6-pole lap-connected winding will have 6 parallel paths, hence total number of coils required in the machine $= 27 \times 6 = 162$. Number of coils less than this number of 162 will have more than 15 V between commutator segments.

Q. 28. Why are the brushes staggered in a dc machine?

Ans. Brushes are staggered in a dc machine in order to have uniform wear of commutator with consequent prevention of ridge formation on the commutator surface.

Q. 29. Which conducting materials are best suited for rheostats?

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. Constantan (an alloy of 60% copper and 40% nickel), and nichrome (an alloy of nickel and chromium) are widely used for rheostats.

Q. 30. Why are stepped core sections used in a transformer?

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. Multistep core is used in large size transformers because the circular coils that are used are easier to wind and provide more mechanical strength, especially when short-circuit occurs. Other advantages of using multistep core are high space factor and reduced mean length of turns resulting in reduced cost of copper and reduced copper loss.

Q. 31. Why are primary and secondary windings of a transformer interlaced?

Ans. The primary and secondary windings of a transformer are interlaced for reducing leakage reactance.

Q. 32. How can the transformer winding leakage reactance be increased?

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. Distribution of leakage flux depends upon the mutual position of windings and their relative dimensions. So, by increasing the spacing between the windings and their dimensions, leakage, reactance can be increased.

Q. 33. In a distribution transformer what should be the order of the ratio of copper loss to core loss and why?

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006]

Ans. The order of the ratio of full-load copper loss to iron loss should be about 3 *i.e.* full-load copper losses are kept about 3 times the iron losses so that the maximum efficiency of transformer occurs at about 57.8% of full-load. This is necessary because distribution

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

transformers are kept in operation all the 24 hours a day whether they are carrying any load or not. In such transformers iron loss occur for all the time where copper loss occurs only when they are loaded. So, distribution transformers are designed with iron losses smaller in comparison to full-load copper loss.

Q. 34. Why is rotor diameter of a turbo-alternator limited to about 1.2 metres?

Ans. Turbo-alternator is smooth cylindrical and high speed machine and its rotor diameter is limited to about 1.2 m because of centrifugal forces developed, deflection and critical speed.

Q. 35. Why in ac machine windings, short-pitch coils are often preferred to full-pitch coils.

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2006

Ans. The armature winding is chorded in order to (*i*) improve the waveform of induced emf (*ii*) save copper in the coil ends due to less span and (*iii*) reduce inductance of the winding.

Q. 36. Why is damper winding used in a synchronous generator?

Ans. Damper winding is used in a synchronous generator so as to suppress the negative sequence field and to damp the oscillations when the generator starts hunting.

Q. 37. What are the advantages of hydrogen cooling?

Ans. Hydrogen cooling has the advantages of (i) increased output rating, efficiency and operating life (ii) elimination of fire hazard (iii) reduced maintenance (iv) small size of coolers and (v) significant reduction in windage noise and sound damping effect of heavy gas tight enclosure resulting in of quiter operation.

Q. 38. Why is air gap kept smallest possible in an induction motor?

Ans. The air gap in an induction motor is made smallest possible so as to produce required flux with a minimum exciting current and give leakage reactance as small as possible. This results in improved power factor.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The major considcration(s) to evolve a good design is/are
(a) durability. (b) cost.
(c) compliance with performance criteria as laid down in specifications.
(d) all of the above.

2. The main areas of design are
(a) magnetic circuit. (b) electrical circuit.
(c) insulation. (d) thermal circuit.
(e) mechanical construction. (f) all of the above.

3. Limitation(s) imposed on the design is /are
(a) saturation of magnetic parts.
(b) temperature rise.
(c) efficiency. (d) power factor.
(e) commutation. (f) all of these.

4. Power factor imposes a limitation on _____ motors.
(a) dc (b) synchronous
(c) induction (d) none of these

5. Commutation imposes limitation on
(a) induction motors. (b) dc motors.
(c) synchronous motors. (d) all of these.

6. The design of mechanical parts is particularly important in case of _____ speed machines.
(a) high (b) medium (c) low (d) all of these.

7. The action of electromagnetic machines is based upon the principle(s) of
(a) induction. (b) interaction.
(c) alignment. (d) all of these.

8. The basic needs of a good conducting material used for windings of electrical machines are
(a) highest possible conductivity and least possible temperature coefficient of resistance.
(b) high tensile strength and absence of brittleness.
(c) reliability, durability, good weldability and solderability.
(d) all of the above.

9. _____ is universally used for windings of electrical machines.
(a) Silver (b) Aluminium
(c) Hard drawn copper (d) Annealed copper

10. Aluminium when used as a conductor material in _____ transformer reduces the overall cost of the transformer.
(a) large size (b) medium size
(c) small size (d) any size of

11. Aluminium when used as a conductor material in large size transformer, it
(a) gives reduced overall cost.
(b) gives increased size and cost.
(c) does not affect the size and cost.

12. It is difficult to substitute aluminium for copper for windings of electrical machines. This is due to its
(a) much lower tensile strength.
(b) higher resistivity.
(c) both (a) and (b). (d) none of these.

13. _____ is used in the manufacture of resistance grids for the motor starters.
(a) Cast iron (b) Copper
(c) Aluminium (d) Steel

14. The desired properties of magnetic materials used for electrical machines are
(a) narrow hysteresis loop to give small hysteresis loss.
(b) increased resistivity to give small eddy current loss.
(c) free from ageing problem.
(d) high ductility and free from brittleness.
(e) high permeability and high saturation flux density.
(f) all of the above.

15. For a soft magnetic material there will be
(a) steeply rising magnetization curve.
(b) relatively narrow and small hysteresis loop.
(c) less energy loss per cycle of magnetization.
(d) all the above. **[A.M.I.E. Sec B. Principles of Elec. Design Summer 1994]**

16. For a given frequency and maximum flux density, the hysteresis loss in 'soft' magnetic material is _____ in hard magnetic material.
(a) more than that (b) less than that
(c) the same as that

17. Hot rolled sheets have _____ permeability.
(a) zero (b) low (c) unity (d) high

18. Addition of silicon in iron laminations
(a) almost eliminates the ageing problem.
(b) increases the electrical resistivity of iron thereby reduces the eddy current loss.
(c) reduces hysteresis loss.
(d) increases the permeability at low and moderate flux densities but decreases it at high flux densities.
(e) all of the above.

19. Silicon content in iron laminations is kept within 5% as it
(a) increases hysteresis loss.
(b) increases cost.
(c) makes the material brittle.
(d) reduces the curie point.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

20. Unbalanced magnetic pull is proportional
(a) directly with d. (b) inversely with d.
(c) directly with d^2. (d) inversely with d^2.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

21. CROS cannot be used in _____ rotating machines.
(a) small (b) medium (c) large (d) any

22. For under frequency operation the eddy current loss
(a) decreases. (b) increases.
(c) remains unaltered. (d) cannot be predicted.
[A.M.I.E Sec B. Principles of Elec. Design Winter 1993]

Answers: **1.** (d), **2.** (f), **3.** (f), **4.** (c), **5.** (b), **6.** (a), **7.** (d), **8.** (d), **9.** (d), **10.** (c), **11.** (b), **12.** (c), **13.** (a), **14.** (f), **15.** (d), **16.** (b), **17.** (b), **18.** (e), **19.** (c), **20.** (a), **21.** (a), **22.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

23. _____ is extensively used for those portions of magnetic circuit which carry steady flux and need superior mechanical properties.
(a) Stainless steel (b) Cast iron
(c) Grey cast iron (d) Aluminium

24. What is suitable shape of plunger magnet to give almost flat force-stroke characteristics ?
(a) Flat faced. (b) Conical.
(c) Stepped. (d) Tapered.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

25. The most common thickness of silicon steel sheets ranges from
(a) 0.35 mm to 0.5 mm. (b) 0.1 mm to 0.25 mm.
(c) 0.4 mm to 0.75 mm. (d) 0.5 mm to 1.0 mm.

26. An ideal insulating material should have low
(a) dielectric strength. (b) dielectric loss.
(c) insulation resistance. (d) thermal conductivity.

27. The basic considerations in the design of insulation are
(a) mechanical considerations. (b) electrical considerations.
(c) thermal consideration. (d) all of the above.

28. Excessive insulation is harmful to a coil because
(a) it increases the cost. (b) copper losses are increased.
(c) heat transfer becomes poor.
(d) dielectric strength is reduced.

29. Maximum temperature limit for class B insulation is
(a) 105 °C (b) 120 °C (c) 130 °C (d) 155 °C
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

30. Maximum temperature limit for class F insulation is
(a) 105 °C (b) 120 °C (c) 130 °C (d) 155 °C
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

31. The class of insulation employed for large rating high voltage alternators is
(a) B (b) C (c) E (d) F

32. Tan δ (dielectric loss angle) increases with the
(a) presence of moisture. (b) fall in temperature.
(c) variation in voltage. (d) all of the above.

33. The heat generated in a transformer is dissipated to surroundings mainly by
(a) conduction. (b) convection.
(c) radiation. (d) conduction and convection.

34. Heat convected depends on
(a) gravitational constant.
(b) thermal resistivity, density, specific heat.
(c) temperature difference of heated surface and coolant.
(d) power density. (e) all of the above.

35. Radiation from a plain surface is generally
(a) 12.5 $W/m^2/°C$ (b) 3.0 $W/m^2/°C$
(c) 6.0 $W/m^2/°C$ (d) 9.0 $W/m^2/°C$
[A.M.I.E Sec B. Design of Electrical System Winter 2005]

36. In case of air natural cooling, the cooling surface increases as the _____ of the linear dimensions.
(a) square (b) inverse (c) cube (d) inverse square

37. Losses in a machine increases as the _____ of the linear dimensions of the machine.
(a) inverse (b) inverse square
(c) cube (d) square

38. The increase in heat dissipation by air blasts is due to increase in
(a) conduction. (b) convection.
(c) radiation. (c) any of these.

39. The time taken by the machine to attain ___ ___ of its final steady temperature rise is called the heating time constant.
(a) 0.5 (b) 0.632 (c) 0.85 (d) none of these.

40. Temperature rise-time curve is a/an
(a) straight line. (b) parabola.
(c) exponential curve. (d) hyperbola.

41. In self-cooled motors the cooling time constant is _____ its heating time constant.
(a) equal to (b) smaller than
(c) larger than (d) unpredictable

42. The maximum temperature rise of a transformer is 50°C. It attains a temperature of 31.6° in $\frac{1}{2}$ hour . What is its thermal time constant?
(a) 2 hours (b) $\frac{1}{2}$ hour (c) 1 hour (d) $\frac{1}{4}$ hour
[U.P.S.C. I.E.S E.E.-I, 2005]

43. The system adopted for cooling of turbo-machines is
(a) open-circuit ventilation. (b) closed-circuit air cooling.
(c) closed-circuit hydrogen cooling.
(d) none of the above.

44. Which one of the following statements regarding hydrogen and air is WRONG ?
(a) The density of hydrogen is one-four-teenth of that of air.
(b) The heat transfer coefficient of hydrogen is 1.5 times of that of air.
(c) Heat transfer capability of hydrogen is one seventh of that of air.
(d) The thermal conductivity of hydrogen is 7 times of that of air.

45. Hydrogen cooling has the advantage(s) of
(a) increased output rating, efficiency and operating life.
(b) elimination of fire hazard. (c) reduced maintenance.
(d) significant reduction in windage noise and sound damping effect of heavy gas tight enclosure resulting in of quiter operation.
(e) small size of coolers. (f) all of the above.

46. Since hydrogen has density 1/14 th of that of air so it reduces
(a) windage loss. (b) noise.
(c) efficiency. (d) both (a) and (b).

47. The precaution(s) to be taken with hydrogen cooled machines is/are
(a) frame of hydrogen cooled machines must be gas-tight and explosion proof.
(b) hydrogen gas must be maintained above atmospheric pressure in the machine in order to avoid internal explosion.
(c) while filling and emptying the machine casing, an explosive hydrogen air mixture must be avoided.
(d) oil film gas seals must be used to prevent leakage of hydrogen.
(e) all of the above.

48. _____ cooling is the process of dissipating the armature and field losses to a cooling medium circulating within the winding insulation wall.
(a) Direct (b) Indirect
(c) Conventional (d) None of these.

49. Machines cooled by direct cooling may be called the
(a) conductor cooled. (b) inner cooled.
(c) supercharged. (d) any of these.

50. In direct hydrogen gas cooling both stator and rotor conductors are made
(a) solid. (b) hollow.
(c) perforated. (d) any of these.

Answers: **23.** (b), **24.** (d), **25.** (a), **26.** (b), **27.** (d), **28.** (c), **29.** (c), **30.** (d), **31.** (b), **32.** (a), **33.** (b), **34.** (e), **35.** (c), **36.** (a), **37.** (c), **38.** (b), **39.** (b), **40.** (c), **41.** (c), **42.** (b), **43.** (c), **44.** (c), **45.** (f), **46.** (d), **47.** (e), **48.** (a), **49.** (d), **50.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

51. With conventional hydrogen cooling it is possible to increase the rating of a machine up to
(a) 50 MW (b) 100 MW
(c) 200 MW (d) 600 MW

52. With direct water cooling it is possible to have rating up to
(a) 600 MW (b) 400 MW
(c) 200 MW (d) 100 MW

53. Direct water cooling of rotor winding creates _____ mechanical difficulty(ies)
(a) no (b) lesser (c) greater (d) none of these

54. The method (s) of determining the rating of motor for variable load drives is/are
(a) average loss method. (b) equivalent current method.
(c) equivalent torque method.
(d) all of the above.

55. Which one of the following methods of determination of motor rating for variable load drives is most accurate ?
(a) Equivalent current method. (b) Equivalent torque method.
(c) Equivalent power method. (d) Average loss method.

56. _____ method does not take into account the maximum temperature rise.
(a) Average loss (b) Equivalent current
(c) Equivalent torque (d) Equivalent power

57. Electrical machines having power output rating up to about 750 W may be called the _____ size machines.
(a) small (b) medium (c) large

58. Electrical machines having power output rating ranging from a few kW up to about 250 kW may be called the _____ size machines.
(a) small (b) medium (c) large

59. Commercially available medium size machines have the speeds ranging from
(a) 300 to 400 rpm. (b) 600 to 800 rpm.
(c) 1,200 to 1,500 rpm. (d) 2,000 to 2,500 rpm.
(e) above 3,000 rpm.

60. In case of electrical machines, the intermittent rating is _____ in comparison to its continuous rating.
(a) same (b) less (c) more (d) any of these

61. A machine is specified as 100 kW maximum continuous rating. The machine
(a) cannot be overloaded.
(b) can be overloaded by 10% only.
(c) can be overloaded by 20% only.
(d) can be overloaded by 25% for 2 hours only.

62. Short time rating machines have usual _____ operating time and _____ shutdown time.
(a) longer, longer (b) smaller, smaller
(c) smaller, longer (d) longer, smaller

63. The output of a rotating electrical machine is limited by
(a) peripheral velocity. (b) temperature rise.
(c) size of machine. (d) efficiency of the machine.

64. A shaft may fail due to fatigue developed due to
(a) stress concentration.
(b) presence of cyclic overloads.
(c) wrong adjustment of bearings, insufficient clearances etc.
(d) all of the above.

65. The desirable properties for the materials for the shafts are
(a) sufficient high strength.
(b) low sensitivity to stress concentration.
(c) good machinability.
(d) ability to withstand heat and case hardening treatment to reduce the effects of stress concentration and increase the wear resistance of the journals.
(e) all of the above.

66. The design of shaft for an electrical machine is determined by considerations of
(a) ability to resist deflection due to weight of rotor and unbalanced magnetic pull.
(b) strength to transmit power.
(c) both (a) and (b). (d) none of these.

67. Shaft is designed satisfying the requirements
(a) of sufficient strength to transmit torque at all loads without stress concentration.
(b) sufficiently rigid so that during operation the rotor does not touch the stator.
(c) critical speed of rotation must be different from the operating speeds of the machine.
(d) all of the above.

68. The shaft diameter in the bearings is usually _____ that under armature.
(a) $\frac{3}{4}$th of (b) equal to (c) $\frac{2}{3}$rd of (d) $\frac{5}{4}$ times of

69. The diameter of the shaft for a 500 V, 100 kW, 600 rpm motor is about
(a) 120 mm (b) 60 mm (c) 180 mm (d) 240 mm

70. In _____ machines, the size (diameter) of the shaft is decided by the critical speed.
(a) small (b) medium (c) large (d) any of these

71. The shaft of electric motors is generally supported in _____ bearings.
(a) magnetic (b) ball of roller
(c) bush (d) journal

72. The critical speed of the shaft for an electric motor should be _____ operating speed.
(a) exactly the same as (b) away from the
(c) half of (d) double of

73. Stiff shaft is necessary in case of induction motors due to
(a) small air gap. (b) pulsating torque.
(c) high operating speed. (d) all of the above.

74. _____ bearings are most commonly used in electrical machines up to rating of 500 kW.
(a) Ball and roller (b) Thrust
(c) Both (a) and (b) (d) none of these

75. Which of following bearings is/are classified as anti-friction bearings?
(a) Ball bearings. (b) Roller bearings.
(c) Pedestal bearings. (d) Shield bearings.
(e) Both ball and roller bearings.

76. Which of the following bearings are/is classified as sleeve bearings?
(a) Pedestal bearings. (b) Shield bearings.
(c) Ball and roller bearings.
(d) Both pedestal and shied bearings.

77. Which of the following bearings is/are plain bearings?
(a) Pedestal bearings.
(b) Shield bearings. (c) Ball bearings.
(d) Roller bearings. (e) All of the above.

Answers: **51.** (c), **52.** (a), **53.** (c), **54.** (d), **55.** (a), **56.** (a), **57.** (a), **58.** (b), **59.** (d), **60.** (c), **61.** (a), **62.** (c), **63.** (b), **64.** (d), **65.** (e), **66.** (c), **67.** (d), **68.** (c), **69.** (a), **70.** (c), **71.** (b), **72.** (b), **73.** (a), **74.** (a), **75.** (e), **76.** (d), **77.** (e),

78. Bearings used for horizontal shaft machines are
(a) plain bearings. (b) thrust bearings.
(c) either (a) or (b). (d) none of these.

79. Bearings used for vertical shaft machines are
(a) plain bearings. (b) thrust bearings.
(c) either (a) or (b). (d) none of these.

80. Pedestal bearings are used for _____ machines.
(a) small size (b) medium size
(c) large size (d) medium and large size

81. Shield bearings are used for _____ machines.
(a) small size (b) medium size
(c) large size (d) small and medium size

82. The slot leakage can be computed by assuming that
(a) the permanence of air paths is only considered, the reluctance of iron path being assumed as zero.
(b) the leakage path is straight across the slot and around the iron at the bottom.
(c) the current in the slot conductors is uniformly distributed over their cross section.
(d) all of the above.

83. The magnitude of exciting current depends upon
(a) total mmf required.
(b) the number of turns in the exciting winding.
(c) the way in which the winding is distributed.
(d) all of the above.

84. _____ magnetic materials are used for construction of core of electromagnets.
(a) Soft (b) Hard
(c) Either soft or hard (d) None of these

85. The design of electromagnets is based upon
(a) voltage equation. (b) heating equation.
(c) force equation. (d) magnetic circuit equation.
(e) all of the above.

86. The force exerted by a lifting magnet varies with distance (D) as
(a) D^2 (b) $1/D^2$ (c) D (e) 1/D

87. The winding where dummy coils are employed is sometimes called the _____ winding.
(a) duplex (b) triplex (c) forced (d) none of these

88. Dummy coils should not be employed in
(a) small machines. (b) large machines.
(c) either (a) or (b). (d) none of these.

89. The space factor is independent of
(a) density of the conductor. (b) size of the conductor.
(c) insulation thickness. (d) arrangement of the conductor.

90. In a dc machine "contraction coefficient" is used to take into account the reduction of
(a) air-gap area due to armature slots.
(b) iron losses in the teeth due to lower tooth density.
(c) armature mmf due to armature slots.
(d) torque due to ventilating ducts. **[U.P.S.C.I.E.S. E.E.-II, 1993]**

91. Carter's coefficient is applicable for estimating
(a) requirement of air-gap mmf.
(b) flux distribution in air gap.
(c) length of air gap. (d) no-load loss.
[A.M.I.E. Sec B. Principles of Electrical Design Winter 1993]

92. A lap wound dc machine has 400 conductors and 8 poles. The voltage induced per conductor is 2 volts. The machine generates a voltage of
(a) 100 V (b) 200 V (c) 400 V (d) 800 V
[A.M.I.E. Sec B. Principles of Electrical Design Winter 1994]

93. If the maximum flux density in the armature teeth at minimum section exceeds 2.2T, higher flux density
(a) causes increased iron losses, specially for a machine having high frequency of flux reversals.
(b) needs higher ampere-turns for passing the flux through armature teeth leading to increased field copper losses and increased cost of copper.
(c) both (a) and (b). (d) none of these.

94. Specific electric loading is not governed by
(a) heating or temperature rise.
(b) speed of machine. (c) magnetizing current.
(d) machine size. (e) machine voltage.
(f) armature reaction and commutation.

95. Specific magnetic loading is not governed by
(a) maximum flux density in the iron parts of the machine.
(b) armature reaction and commutation.
(c) iron losses. (d) magnetizing current.

96. Use of higher specific electric loading is restricted due to problem of
(a) heat dissipation. (b) commutation.
(c) armature reaction. (d) all of these.

97. Use of more number of poles in a dc machine reduces
(a) weight of core and yoke.
(b) cost of copper in armature as well as field.
(c) overall diameter and length of the machine.
(d) length of commutator. (e) all of the above.

98. In dc machines the field mmf is made _____ that of armature mmf in order to prevent excessive distortion of field form due to armature reaction.
(a) lesser than (b) much larger than
(c) equal to (d) none of these

99. In dc machines the increase in field mmf causes
(a) increase in size and cost of the machine.
(b) reduction in size and cost of the machine.
(c) excessive sparking. (d) none of the above.

100. The yoke of a dc machine
(a) must be made of magnetic material.
(b) should preferably be made of magnetic material but can be of non-magnetic material.
(c) must be made of non-magnetic material.
(d) is partially made of magnetic material and partially of non-magnetic material.
[A.M.I.E Sec B. Design of Electrical System Winter 2005]

101. The pole shoes of a dc machines
(a) are always laminated. (b) are never laminated.
(c) are sometimes laminated. (d) are partially laminated.
[A.M.I.E Sec B. Design of Electrical System Winter 2006]

102. Poles of dc machines are often laminated to
(a) reduce pulsation loss. (b) reduce armature reaction.
(c) reduce iron weight. (d) dissipate more heat.
[A.M.I.E Sec B. Principles of Elec. Design Winter 1993]

103. The number of poles for a dc machine is determined by
(a) frequency of flux reversal.
(b) flash-over between brushes.
(c) commutator length. (d) overall size of the machine.
(e) all of the above.

Answers: **78.** (a), **79.** (b), **80.** (d), **81.** (d), **82.** (d), **83.** (d), **84.** (a), **85.** (e), **86.** (b), **87.** (c), **88.** (b), **89.** (a), **90.** (a), **91.** (a), **92.** (a), **93.** (c), **94.** (c), **95.** (b), **96.** (d), **97.** (e), **98.** (b), **99.** (a), **100.** (a), **101.** (a), **102.** (a), **103.** (e),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

104. In a dc machine, with the increase in number of poles all of the following increases except
(a) iron losses. (b) labour charges.
(c) overall size of the machine.
(d) frequency of flux reversal. (e) tendency of flash over.

105. As the number of poles in a dc machine increases the chances of flashover increases because
(a) the voltage between the segments increases.
(b) the voltage between segments decreases.
(c) the length of the commutator decreases.
(d) effect of armature reaction increases.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

106. Suitable value of number of poles for a 250 kW, 600 rpm dc motor is
(a) 2 (b) 4 (c) 6 (d) 8
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

107. Use of large core length in a dc machine
(a) reduces the cost of the machine.
(b) results in bad commutation.
(c) facilitates ventilation. (d) both (a) and (b).

108. In a large size dc machine the conductors are of _____ in cross section.
(a) circular (b) rectangular
(c) triangular (d) none of these

109. In a dc machine the diameter of an armature is governed by
(a) pole pitch, (b) peripheral speed,
(c) core length. (d) both (a) and (b).

110. In a dc machine the peripheral speed should not normally exceed
(a) 15 m/s (b) 30 m/s (c) 50 m/s (d) 60 m/s

111. In dc machines the width of ventilating ducts usually varies from
(a) 4 to 5 mm. (b) 8 to 10 mm.
(c) 12 to 15 mm. (d) 2 to 3 mm.

112. Air gap at the pole tips of a dc machine is kept more than that at the centre of the pole mainly to reduce
(a) reactance voltage. (b) effect of armature reaction.
(c) losses in armature core. (d) noise of machine.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

113. In dc machines air gap is _____ in comparison to that in ac machines.
(a) very short (b) short
(c) longer (d) any of these

114. DC machines designed with a large value of air gap length
(a) provides better ventilation.
(b) reduces the pulsation losses.
(c) reduces the distortion effect. (d) all of the above.

115. The air gap provided in dc machines of smaller diameters and provided with lesser number of poles is comparatively
(a) smaller. (b) longer. (c) any of these.

116. DC machines provided with a large value of air-gap length
(a) provides comparatively quiet operation.
(b) provides better ventilation.
(c) provides poor ventilation. (d) both (a) and (b).

117. In a dc machine, for the same values of Φ, Z and N; which one of the following statements is correct?
(a) Armature emf is more with wave winding than with lap winding.
(b) Armature emf is less with wave winding than with lap winding.
(c) Armature emf depends on whether the machine is running as a motor or a generator.
(d) Armature emf is the same as long as the flux density in the air gap remains the same.
[U.P.S.C. I.E.S. E.E.-II, 2004]

118. Number of parallel paths in a dc machine with duplex wave winding is
(a) 2 (b) 4 (c) 8 (d) 16
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

119. The number of parallel paths for a 4-pole duplex lap winding will be
(a) 2 (b) 4 (c) 6 (d) 8
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

120. In a dc machine if the number of slots in the armature are more
(a) cooling is likely to be poor.
(b) commutation will be poor. (c) cost will be more.
(d) the flux pulsation will be more.
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1994]

121. Normally _____ winding is used for dc machines having output current more than 400 A.
(a) simplex wave (b) simplex lap
(c) duplex wave (d) duplex lap

122. The number of brush arms is made sometimes equal to the number of poles in case of a simplex dc wave winding to
(a) avoid sparking commutation.
(b) reduce armature reaction.
(c) reduce the length of commutator and to equalise the number of coils in each parallel path.
(d) none of the above.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

123. In dc machines
(a) the number of slots per pole pair should be an odd integer.
(b) the number of slots per pole should be at least 9.
(c) the number of slots per pole usually lies between 9 and 16.
(d) all of the above.

124. In dc machines, the slot pitch usually lies between
(a) 25 to 35 mm. (b) 50 to 60 mm.
(c) 15 to 25 mm. (d) 10 to 15 mm.

125. Use of high current density increases
(a) copper cost. (b) copper losses.
(c) temperature rise. (d) efficiency.
(e) both (b) and (c).

126. Minimum number of coils for 400 V, 6-pole lap connected dc machine for a maximum voltage of 15 volts between adjacent commutator segments should be
(a) 80 (b) 160 (c) 200 (d) 400
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

127. The commutator diameter generally lies between _____ and _____ times of armature diameter.
(a) 0.25, 5 (b) 0.4, 0.6 (c) 0.6, 0.8 (d) 1.2, 1.5

128. The commutator segment pitch should not be less than
(a) 0.4 mm. (b) 4 mm. (c) 2 mm. (d) 8 mm.

129. The higher commutator peripheral speeds generally leads to
(a) commutation difficulties. (b) ventilation difficulties.
(c) both (a) and (b). (d) none of these.

130. Mica is used to insulate the commutator segments because
(a) it has very high specific weight.
(b) it is mechanically strong.
(c) it is cheaper. (d) both (a) and (b).

Answers: **104.** (c), **105.** (a), **106.** (d), **107.** (d), **108.** (b), **109.** (d), **110.** (b), **111.** (b), **112.** (a), **113.** (c), **114.** (d), **115.** (a), **116.** (d), **117.** (a), **118.** (b), **119.** (d), **120.** (c), **121.** (b), **122.** (a), **123.** (d), **124.** (a), **125.** (e), **126.** (b), **127.** (c), **128.** (b), **129.** (a), **130.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

131. Commutator segments are insulated from each other by mica layers of thickness varying from
(a) 0.1 to 1 mm. (b) 0.4 to 1.5 mm.
(c) 1.5 to 2.5 mm. (d) 2 mm to 4 mm.

132. Reactance voltage in a dc machine
(a) increases in direct proportion with the increase in number of commutator segments.
(b) increases linearly with the increase in speed of the machine.
(c) increases with the increase in brush thickness.
(d) all of the above.

133. Along with the rate of change of current, reactance voltage in dc machines also varies with
(a) number of turns on the coil.
(b) square of the number of turns on the coil.
(c) square root of the number of turns of the coil.
(d) none of the above.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

134. When commutation is obtained by increasing the current density at the leading edge and reducing the same at the trailing edge, it is called the _____ commutation.
(a) linear (b) under
(c) over (d) none of the above

135. The brushes of a dc motor suitable for rotation in any direction should be placed as
(a) radial. (b) reaction.
(c) trailing. (d) any of the these.
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

136. Width of carbon brush should be equal to
(a) less than the width of one commutator segment.
(b) the width of 1 to 2 commutator segments.
(c) the width of 2 to 3 commutator segments.
(d) the width of more than 3 commutator segments.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

137. Which of the following brushes are fragile and cause excessive wear of commutator ?
(a) Hard carbon. (b) Natural graphite.
(c) Metal graphite. (d) None of these.

138. _____ brushes are used for higher values of current density.
(a) Metal graphite (b) Hard carbon
(c) Natural graphite (d) Carbon

139. The brush friction loss depends upon
(a) peripheral speed of commutator.
(b) brush pressure.
(c) coefficient of friction between brush and the commutator.
(d) all of the above.

140. The area of each individual brush should be taken so that it does not carry current more than
(a) 20 A (b) 40 A (c) 70 A (d) 100 A

141. The brushes are staggered to
(a) avoid eating away of copper due to arcing.
(b) avoid ridges and to have even commutator surface.
(c) reduce brush contact loss. (d) reduce armature reaction.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

142. Though the cost of single layer winding is less than that of the double layer winding, single layer winding is not generally used for dc machines because it
(a) leads to high reactance voltage and sparking commutation.
(b) increases the effect of armature reaction under pole.
(c) reduces the efficiency of operation.
(d) leads to less number of segments.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

143. In a dc generator, emf commutation can be achieved by
(a) keeping the brushes in the gap.
(b) shifting the brushes ahead of gap.
(c) shifting the brushes forward.
(d) shifting the brushes backward.
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

144. The mmf of an interpole is proportional to
(a) armature current. (b) field current.
(c) product of armature and field currents.
(d) ratio of armature and field currents.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

145. The terminal voltage of a 20 hp, 230 V dc series motor under rated speed and no-load condition is
(a) 0 V (b) 230 V
(c) about 5 to 20 V (d) 250 V
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

146. Modern starters used in dc shunt motors
(a) are manual. (b) use time-delay relays.
(c) use back emf sensing relays.
(d) use time-delay relays or back emf sensing relays.
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

147. Power transformers have ratings above _____ kVA
(a) 50 (b) 100 (c) 250 (d) 500

148. Magnetic material used for large transformers is
(a) cast steel. (b) hot rolled silicon steel.
(c) cold rolled grain oriented steel.
(d) either (b) or (c).
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

149. Yokes with rectangular cross section are used for _____ capacity transformers.
(a) small (b) medium (c) large (d) any of these

150. CRGOS has _____ permeability in the direction of grain orientation.
(a) nil (b) maximum
(c) minimum (d) none of these

151. CRGOS has_____in comparison to hot rolled silicon steel.
(a) better finish (b) improved space factor
(c) much better magnetic properties
(d) all of the above

152. Cold rolled grain oriented steel
(a) can be worked at much higher flux densities due to improved magnetic properties.
(b) gives much reduced iron losses.
(c) both (a) and (b). (d) none of these.

153. Thickness of core laminations of transformers is
(a) 18 cm (b) 25 cm (c) 20 cm (d) 15 cm
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

154. For transformer laminations _____ silicon steel is preferred.
(a) cold rolled (b) hot rolled
(c) grain oriented (d) any of these

155. Eddy currents are reduced in high content silicon steel as it
(a) increases resistivity. (b) reduces resistivity.
(c) short circuits. (d) none of the above.

156. In order to reduce hysteresis loss
(a) core may be laminated,
(b) silicon steel may be used as the core material.

Answers: **131.** (b), **132.** (d), **133.** (b), **134.** (c), **135.** (d), **136.** (c), **137.** (b), **138.** (a), **139.** (d), **140.** (c), **141.** (b), **142.** (a), **143.** (c), **144.** (a), **145.** (b), **146.** (c), **147.** (c), **148.** (c), **149.** (a), **150.** (b), **151.** (d), **152.** (c), **153.** (c), **154.** (d), **155.** (a), **156.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) core may be constructed with any permanent magnet material such as alnico.
(d) core may be impregnated with varnish.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

157. While punching silicon steel for use in transformer core, burrs produced in laminations are likely to cause
(a) increase in core loss. (b) decrease in core loss.
(c) decrease in copper loss (d) increase in copper loss.

158. A transformer having constant flux and constant current density, designed for minimum cost must satisfy the following relation
(a) iron loss = copper loss.
(b) weight of iron = weight of copper.
(c) $\frac{\text{weight of iron}}{\text{weight of copper}} = \frac{\text{specific cost of copper}}{\text{specific cost of iron}}$.
(d) $\frac{\text{weight of iron}}{\text{weight of copper}} = \frac{\text{specific cost of iron}}{\text{specific cost of copper}}$.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

159. The condition for a transformer to be designed for the minimum volume is
(a) iron loss = copper loss
(b) volume of iron = volume of copper
(c) weight of iron = weight of copper.
(d) The volume of iron is minimum.
(e) The volume of copper is minimum.

160. The use of mitred joints for cores and yokes
(a) minimizes core loss and magnetizing current.
(b) simplifies the core construction.
(c) complicates the core construction.
(d) both (a) and (c). (e) both (a) and (b).

161. Multi-step core is used in a transformer to
(a) increase the output.
(b) decrease the cost of core material
(c) decrease the cost of copper. (d) increase the efficiency.
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1994]

162. When the height of windows is increased in comparison to the width in a transformer
(a) cost of copper will be reduced.
(b) voltage regulation will decrease.
(c) efficiency will decrease due to increase in copper losses.
(d) both (a) and (b). (e) (a) and (c).

163. Gross window area in a transformer is 750 cm^2. The approximate height of window is
(a) 50 cm (b) 75 cm (c) 30 cm (d) 25 cm
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

164. If the insulation material in the window of transformer occupies 70% of window area, the window space factor is
(a) 0.7 (b) 0.3 (c) 0.49 (d) 0.09
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

165. The inductive reactance of a distribution core type transformer with concentric cylindrical coils of equal length can be reduced by
(a) increasing the window height.
(b) increasing the window width.
(c) decreasing the yoke height.
(d) increasing the operating flux density in the yoke.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

166. If all the dimensions of a transformer is doubled its iron loss will be
(a) half. (b) double. (c) four times. (d) 8 times.
[A.M.I.E. Sec B. Priniciples of Elec. Design Winter 1993]

167. The hum in a transformer is due to
(a) magnetostriction.
(b) vibrations developed by laminations depending upon the tightness of clampings.
(c) mechanical vibrations of the tank walls.
(d) all of the above.

168. Humming noise in a transformer can be reduced by
(a) using lower flux densities.
(b) tightening the clampings of laminations.
(c) using suitable cushions, paddings and oil barriers.
(d) all of the above.

169. Cylindrical windings using circular conductors employed in transformers are
(a) multi-layered. (b) double layered.
(c) triple layered. (d) single layered.

170. The disadvantage of cylindrical winding is
(a) high copper loss. (b) poor mechanical strength.
(c) more eddy current loss. (d) none of the above.

171. In transformers, the cylindrical winding with rectangular conductors is usually used for _____ voltage winding,
(a) tertiary (b) high (c) low (d) any of these

172. In transformers cylindrical windings are not used for voltage exceeding
(a) 6 kV (b) 13 kV (c) 33 kV (d) 66 kV

173. The cylindrical windings employing circular conductors are used for current rating of up to
(a) 20 A (b) 50 A (c) 80 A (d) 150 A

174. Helical windings are employed in _____ transformers.
(a) distribution (b) power
(c) shell typ (d) none of these

175. Multi-layer helical windings are widely employed in the power transformers as hv windings
(a) 25 kV. (b) upto 66 kV.
(c) 110 kV and above. (d) 220 kV and above.

176. Disc windings are primarily employed in _____ capacity transformers.
(a) low (b) medium (c) high (d) any of these

177. The high voltage winding is usually
(a) continuous disc type winding with rectangular conductors.
(b) cylindrical winding with circular conductors.
(c) crossover winding with either circular or small rectangular conductors.
(d) all of the above .

178. The primary and secondary windings are interlaced for
(a) easiness of coil making.
(b) reduced leakage reactance.
(c) reduced cost. (d) uniform heating.
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

179. It is necessary that magnetic coupling in a transformer is close. This is done to ensure
(a) high efficiency. (b) good regulation.
(c) good regulation and high efficiency.
(d) good regulation and high power factor.
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

180. The thickness of insulation between lv and hv windings is determined by relation
(a) (5 + 0.9 kV) mm. (b) (9 + 0.5 kV) mm.
(c) (0.9 + 0.5 kV) mm. (d) (4 + 0.75 kV) mm.

Answers: **157.** (a), **158.** (c), **159.** (b), **160.** (d), **161.** (c), **162.** (d), **163.** (a), **164.** (b), **165.** (a), **166.** (d), **167.** (d), **168.** (d), **169.** (a), **170.** (b), **171.** (c), **172.** (a), **173.** (c), **174.** (b), **175.** (c), **176.** (c), **177.** (d), **178.** (b), **179.** (d), **180.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

181. What is the arrangement of windings in a core type single-phase transformer?
(a) Half lv inside and half hv outside on each core limb.
(b) LV on one core limb and hv on the other.
(c) Sandwiched lv and hv discs on each core limb.
(d) Half hv inside and half lv outside on each core limb.
[A.M.I.E. Sec B. Principles of Elec. Design, Winter 1994]

182. With increase in voltage, the window space factor of a transformer
(a) decreases. (b) increases.
(c) remains constant.
(d) decreases or increases depending upon whether it is a distribution or power transformer,
[A.M.I.E. Sec B Principles of Elec. Design Winter 1994]

183. No-load current in a large sized transformer is about
(a) 10% of full-load current. (b) 7% of full-load current.
(c) 4% of full-load current. (d) 1% of full-load current.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

184. A 200/400 ratio transformer has a secondary winding resistance of 0.5 Ω. The total resistance as referred to primary is about
(a) 0.125 Ω (b) 0.5 Ω (c) 1 Ω (d) 2 Ω
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

185. Typical value of per unit impedance for a transformer is
(a) 0.2 (b) 0.1 (c) 0.05 (d) 0.01
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

186. If the total iron loss in a transformer at full load is 600 W, the total iron loss at 25% of overload will be
(a) 600 W (b) 750 W (c) 1,000 W (d) 400 W
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

187. For minimum copper loss in the transformer windings
(a) the primary and secondary currents should be equal.
(b) the current densities in primary and secondary windings must be the same.
(c) copper losses should be equal to iron losses.
(d) none of the above.

188. If the thickness of liminations is t, eddy current losses are proportional to
(a) t (b) t^2 (c) t^3 (d) $\sqrt{t}$
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

189. Stacking factor will be minimum for _____ core.
(a) four stepped (b) three stepped
(c) square (d) cruciform

190. In a transformer, the emf per turn is determined, in terms of its kVA output rating S. from the relation
(a) $E_t = KS$. (b) $E_t = k\sqrt{S}$.
(c) $E_t = kS^{3/2}$. (d) $E_t = k/\sqrt{S}$.

191. The usual value of maximum flux densities for distribution transformers using hot rolled silicon steel are
(a) 0.5 to 0.75 T. (b) 0.75 to 1.1 T.
(c) 1.1 to 1.4 T. (d) 1.5 to 2.0 T.

192. Suitable value of flux density for design of large transformer is
(a) 1.1 T (b) 1.4 T (c) 1.6 T (d) 1.9 T
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

193. An iron cored transformer is working at a maximum flux density of 0.8 Wb/m^2. Its core is replaced by silicon steel core, working at a maximum flux density of 1.2 Wb/m^2. If the total flux is to remain the same, what is the reduction in volume expressed as a percentage of the original volume? The frequency and voltage per turn are the same in both cases.
(a) 33% (b) 9% (c) 22% (d) 11%
[U.P.S.C. I.E.S. E.E.-II, 2007]

194. The usual values of current densities for medium and large power transformers are
(a) 1.5 to 2.6 A/mm^2. (b) 2.4 to 3.4 A/ mm^2.
(c) 5.4 to 6.3 A/mm^2. (d) 6.5 to 8.5 A/mm^2.

195. A transformer is considered to have a network of series capacitance due to
(a) laminated core. (b) earthling.
(c) inter turn insulation. (d) surrounding tank.

196. In a transformer, the series capacitance is increased and shunt capacitance is reduced by using _____ winding.
(a) layer type (b) shielded
(c) interleaved (d) any of these

197. _____ surge is the most damaging for a transformer.
(a) Steeper front flatter trail (b) Flatter front steeper trail
(c) Uniform (d) All will be equally damaging

198. The surge phenomenon is most important in case of _____ voltage transformers.
(a) low (b) medium (c) high (d) any of these

199. The tap changing facility is usually provided on _____ transformers.
(a) high voltage (b) distribution
(c) current (d) all of these

200. Tappings of a transformer are provided
(a) at the phase end of lv side. (b) at the phase end of hv side.
(c) at the neutral end of hv side. (d) at the middle of the hv side.
[A.M.I.E. Sec B Principles of Elec. Design Summer 1993]

201. Under short-circuit conditions the windings of a transformer having 5% impedance will experience a radial force
(a) 5 times of full load value. (b) 20 times of full load value.
(c) 25 times of full load value. (d) 400 times of full load value.
[A.M.I.E. Sec B Principles of Elec. Design Summer 1993]

202. Addition of tubes to the transformer tank improves heat dissipation capacity because of
(a) additional cooling surface.
(b) additional dissipation by radiation only.
(c) additional dissipation by convection only.
(d) additional dissipation by radiation and convection both.
[A.M.I.E. Sec B Principles of Elec. Design Summer 1993]

203. In transformers, mechanical forces are developed due to
(a) interaction of currents flowing in the winding and leakage flux around it.
(b) vibrations, (c) gap between laminations.
(d) none of the above.

204. The overload capacity of a transformer depends on
(a) supply frequency. (b) core size.
(c) both (a) and (b). (d) none of these.

205. For a pulse transformer, the material used for its core and the possible turns ratio from primary to secondary are respectively as
(a) ferrite; 20 : 1 (b) ferrite; 1 : 1
(c) laminated iron; 1 : 1 (d) powdered iron; 1 : 1.
[A.M.I.E. Sec B. Power Electronics Summer 2007]

206. Normally for the design of a transformer the ambient temperature is taken as
(a) 20 °C. (b) 25 °C. (c) 45 °C. (d) 65 °C.

207. A transformer is designed for certain ambient temperature. If it is operated at a temperature 10 °C above the temperature for which the transformer has been designed, its kVA rating should be
(a) reduced by 20%. (b) reduced by 10%.
(c) reduced by 5%. (d) the same as designed.

Answers: **181.** (a), **182.** (a), **183.** (d), **184.** (a), **185.** (c), **186.** (a), **187.** (b), **188.** (b), **189.** (c), **190.** (b), **191.** (c), **192.** (c), **193.** (a), **194.** (b), **195.** (c), **196.** (d), **197.** (a), **198.** (c), **199.** (b), **200.** (d), **201.** (d), **202.** (d), **203.** (a), **204.** (b), **205.** (b), **206.** (c), **207.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

208. Heat dissipation by radiation in oil immersed transformers with cooling tubes is
(a) about 0.6 W/m^2/°C. (b) about 2 W/m^2/°C.
(c) about 10 W/m^2/°C. (d) about 50 W/m^2/°C.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2006]

209. The heat dissipation capacity of transformer of rating exceeding 50 kVA is increased by providing
(a) fins. (b) tubes.
(c) radiator tanks. (d) corrugations.
(e) all of the above.

210. Transformers with a capacity of up to _____ have a cooling radiator system with natural cooling.
(a) 2 MVA (b) 5 MVA (c) 10 MVA (d) 25 MVA

211. The forced oil and air circulation method is usually employed for cooling of power transformers of rating exceeding
(a) 10 MVA. (b) 20 MVA.
(c) 30 MVA. (d) 25 MVA.

212. Synchronous compensators are used for controlling the reactive power (kVAR) of power supply networks with rating up to about
(a) 100 MVAR. (b) 50 MVAR.
(c) 25 MVAR. (d) 10 MVAR.

213. In turbo-alternators the rotor diameter is limited to about 1.2 m. due to
(a) centrifugal forces. (b) deflection.
(c) critical speed. (d) all of these.

214. The stator core of turbo-alternators is made of.
(a) segmental laminations of low loss silicon steel.
(b) cold rolled non-oriented steel with about 3% silicon.
(c) cold rolled grain oriented steel with about 4% silicon.
(d) both (a) and (b).

215. Multiple inlet system of air cooling of turbo-alternators can be employed for machines of rating up to
(a) 20 MW (b) 100 MW (c) 60 MW (d) 250 MW

216. _____ cooling is most commonly used in hydrogeneration.
(a) Closed circuit air (b) Hydrogen gas
(c) Direct water (d) Any of these

217. The diameter of hydrogenerator is as large as
(a) 2.5 m (b) 5 m (c) 10 m (d) 15 m

218. Turbo-alternators are designed for a maximum peripheral speed of about
(a) 140 m/s (b) 175 m/s (c) 275 m/s (d) 400 m/s

219. Hydrogenerators are designed for a maximum peripheral speed of about
(a) 140 m/s (b) 175 m/s (c) 75 m/s (d) 250 m/s

220. The slot leakage flux is more in case of
(a) open type of slots. (b) semiclosed slots.
(c) closed slots.
(d) open slots with aluminium conductors.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2005]

221. For a phase sequence of RYB, the phase windings under a pole for 60° phase spread are to be arranged in the order
(a) RYB (b) BYR (c) RBY (d) YRB
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2005]

222. An ac winding has 2 slots per pole per phase. The slot harmonics will be
(a) 5th and 7th. (b) 11th and 13th.
(c) 17th and 19th. (d) none of the above.
[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

223. If m is the slots per pole/phase and A is any integer, then what order harmonics will have the same distribution factor as the fundamental
(a) 6 A$m \pm 1$ (b) 6 A $\pm m$
(c) 5 $m \pm$ A (d) none of these.
[A.M.I.E. Sec B. Design of Electrical System Winter 2005]

224. Damper winding is used to
(a) reduce air gap harmonic flux.
(b) reduce oscillations.
(c) increase stability limits. (d) resist the moisture.
[A.M.I.E. Sec B Principles of Elec. Design Winter 1993]

225. Use of higher specific magnetic loading (B_{av}) in synchronous machines is restricted due to
(a) excessive iron losses. (b) higher short-circuit current.
(c) reduced space available for armature teeth in high voltage machines.
(d) all of the above.

226. Use of higher B_{av} in synchronous machines causes increase in
(a) iron losses. (b) synchronizing power.
(c) short-circuit current. (d) all of these.

227. Use of higher specific electric loading in synchronous machines reduces
(a) copper losses. (b) synchronous reactance.
(c) synchronizing power. (d) stray load losses.

228. Higher values of ampere-conductors cannot be recommended for synchronous machines as it will cause
(a) increase in copper loss leading to poor efficiency and temperature rise.
(b) increase in synchronous reactance leading to poor inherent voltage regulation.
(c) increase in stray load loss.
(d) all of the above.

229. Usual values of ac recommended for salient pole machines are
(a) 5,000 to 10,000 ampere-conductors/m.
(b 10,000 to 20,000 amp- conductors/m.
(c) 20,000 to 50,000 amp-conductor/m.
(d) 50,000 to 100,000 amp-conductors/m.

230. Usual values of ac recommended for turbo-alternators are
(a) 50,000 to 100,000 amp-conductors/m.
(b) 20,000 to 50,000 amp-conductors/m.
(c) 10,000 to 20,000 amp-conductors/m.
(d) 5,000 to 10,000 amp-conductors/m.

231. The use of salient poles on high speed synchronous machines will cause
(a) excessive windage loss. (b) excessive noise.
(c) reduced windage loss. (d) reduced noise.
(e) both (a) and (b).

232. A synchronous machine with longer air gap will have
(a) lower stability limit.
(b) smaller unbalanced magnetic pull.
(c) higher noise level.
(d) poor ventilation. (e) more tooth pulsation loss.

233. Short-circuit ratio for modern turbo-generators is usually
(a) 0.5 to 0.6 (b) 1.0 to 1.5
(c) 0.2 to 0.3 (d) 2.0 to 2.5

234. When a synchronous generator is designed with lower SCR it
(a) will give higher stability limit.
(b) will have lower SC current.

Answers: **208.** (a), **209.** (e), **210.** (c), **211.** (c), **212.** (a), **213.** (d), **214.** (d), **215.** (c), **216.** (a), **217.** (d), **218.** (b), **219.** (a), **220.** (c), **221.** (c), **222.** (b), **223.** (d), **224.** (b), **225.** (d), **226.** (d), **227.** (c), **228.** (d), **229.** (c), **230.** (a), **231.** (e), **232.** (b), **233.** (a), **234.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) will give better voltage regulation.
(d) will have high synchronizing power.

[A.M.I.E. Sec B. Principles of Elec. Design Summer 1994]

235. An alternator with higher value of SCR has
(a) poor voltage regulation and lower stability limit.
(b) better voltage regulation and higher stability limit.
(c) poor voltage regulation and higher stability limit.
(d) better voltage regulation and lower stability limit.

[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

236. Which one of the following statements regarding synchronous machines is incorrect?
(a) A machine with a large air gap has a high synchronizing power.
(b) A machine designed with high flux density has better stability.
(c) A machine with higher value of SCR has poor voltage regulation.
(d) A machine designed with higher specific electric loading has a poor inherent voltage regulation.

237. Under short-circuit conditions, the power factor of a synchronous machine is
(a) 1 (b) about 0.8 lagging
(c) almost zero lagging (d) 0.5

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

238. Output coefficient of induction motor is given as
(a) $\frac{\text{output}}{\text{active volume of machine}}$
(b) $\frac{\text{active volume of machine}}{\text{output}}$
(c) $\frac{\text{output}}{\text{input}}$ (d) $\frac{\text{input}}{\text{output}}$

239. If the stator winding of a 3-phase induction motor is delta connected, the rotor winding
(a) should be delta connected. (b) should be star connected.
(c) should not be delta connected.
(d) may be delta or star connected.

[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

240. A 3-phase squirrel cage induction motor designed to operate with stator in star, needs W kg of copper for its stator winding. Now if this motor is to be designed to operate with stator in delta, then weight of copper required for stator would be
(a) $\sqrt{3}$ W kg (b) $\frac{W}{\sqrt{3}}$ kg (c) 3 W kg (d) $\frac{W}{3}$ kg

241. An increase in number of poles of an induction motor results in
(a) decrease in maximum pf. (b) increase in maximum pf.
(c) no change in maximum pf. (d) cannot be predicted.

[A.M.I.E. Sec B. Principles of Elec. Design Winter 1993]

242. The effect of leakage flux in case of 3-phase induction motor is to
(a) reduce the torque produced.
(b) increase the torque produced.
(c) increase the operating power factor.
(d) none of the above.

[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

243. _____ depends on leakage reactance in an induction motor.
(a) Starting current (b) Starting torque
(c) Maximum torque (d) All of the above

244. In an induction motor, leakage reactance is due to_____leakage flux.
(a) slot (b) overhang
(c) differential (d) all of these

245. Leakage reactance per phase of the stator of a polyphase induction motor is 1.0 ohm. The turns per phase of the stator are increased by 10%. The leakage reactance is then equal to
(a) $(1.1)^2$ (b) $(0.9)^2$ (c) $1/(1.1)^2$ (d) $1/(0.9)^2$

[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

246. When a 3-phase induction motor is designed with higher value of B_{av} it will give
(a) better full-load power factor.
(b) a higher starting torque.
(c) higher full load efficiency.
(d) higher overload capacity.

[A.M.I.E. Sec B. Principles of Elec. Design Summer 1994]

247. A machine with large value of specific magnetic loading has
(a) poor power factor. (b) poor efficiency.
(c) poor maximum power output and poor overload capacity.
(d) less iron-losses. (e) both (a) and (b).

248. In case of induction motors, the air-gap flux density usually taken is
(a) 0.1 to 0.2 T. (b) 0.2 to 0.35 T.
(c) 0.3 to 0.6 T. (d) 1.0 to 1.5 T.

249. Higher values of flux density can be taken while designing machines for
(a) larger rotor diameter. (b) larger output.
(c) both (a) and (b). (d) none of these.

250. Higher values of flux density can be taken while designing machines for
(a) smaller number of poles. (b) low voltages.
(c) both (a) and (b). (d) none of these.

251. In an induction motor, specific electric loading is not governed by
(a) commutation. (b) temperature rise.
(c) overload capacity. (d) voltage.
(e) machine size.

252. In induction motor, higher values of ampere-conductors give rise to
(a) increased copper losses leading to increased temperature rise and poor efficiency.
(b) increase in overload capacity.
(c) decrease in size of motor. (d) all of the above.

253. High voltage induction motors have _____ number of ampere-conductors.
(a) large (b) small (c) very large

254. The average value of ampere-conductors for induction motors is in the range of _____ ampere-conductors per metre
(a) 50 to 100 (b) 20,000 to 50,000
(c) 5,000 to 45,000 (d) 50,000 to 1,00,000

255. With larger values of L/τ, the insulation cost
(a) increases. (b) decreases.
(c) remains unaffected. (d) none of these.

256. For good overall design of induction motors, the ratio of L/τ for a fixed number of poles should be
(a) 1.2 to 2 (b) 1.5
(c) 1.0 (d) 1.0 to 1.25

257. In general, the value of L/τ lies between _____ depending on the size of the machine and characteristics desired.
(a) 0.6 and 2 (b) 1.0 to 1.25
(c) 1.2 to 2 (d) 0.5 to 2.5

258. In case of induction motors the ratio of L/τ for minimum cost is taken as
(a) 1.0 (b) 1.2 to 2.0
(c) 0.6 to 2.0 (d) 2.0 to 3.5

Answers: **235.** (b), **236.** (c), **237.** (c), **238.** (a), **239.** (d), **240.** (b), **241.** (a), **242.** (a), **243.** (d), **244.** (d), **245.** (a), **246.** (d), **247.** (e), **248.** (c), **249.** (c), **250.** (c), **251.** (a), **252.** (a), **253.** (b), **254.** (c), **255.** (b), **256.** (c), **257.** (a), **258.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

259. In case of induction motors, the ratio of length to pole pitch (L/τ) for good efficiency is taken as
(a) 1.0 (b) 1.2 to 2 (c) 1.5 (d 0.6 to 2

260. In case of induction motors L/τ for good power factor is taken as
(a) 1.0 to 1.25 (b) 1.2 to 2.0
(c) 1.5 (d) 2.0 to 3.5

261. For small induction motors, the ratio of length to pole pitch is taken as
(a) 0.25 (b) 0.6 (c) 1.0 (d) 1.5

262. Peripheral speed of rotor of a normal induction motor should be
(a) 10 m/s. (b) 20 m/s. (c) 30 m/s. (d) 80 m/s.

263. For a 3-phase 50 Hz 4 pole induction motor having a rotor diameter of 35 cm, the peripheral speed is
(a) 20.1 m/s (b) 24.2 m/s (c) 26.9 m/s (d) 32.2 m/s
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2006]

264. In case of slip-ring induction motor, the full load rotor mmf is taken as_____ percent of stator mmf.
(a) 85 (b) 65 (c) 45 (d) 95

265. In induction motors semiclosed slots give
(a) better overload capacity.
(b) less noise. (c) low pf.
(d) none of the above.

266. Closed slots are preferred for _____ size induction motors.
(a) large (b) medium (c) small

267. In induction motors, phase reactance _____ with the increase in number of slots per pole per phase.
(a) decreases (b) increases
(c) remains unaffected (d) none of the above

268. In the design of induction motors, normally the number of slots per pole per phase is taken as
(a) two. (b) three. (c) three to five. (d) eight.

269. In induction motors provided with open slots
(a) exciting current is high. (b) power factor is low.
(c) exciting current is low. (d) power factor is high.
(e) both (a) and (b).

270. In an induction motor the best power factor can be achieved when the diameter D in terms of length L and number of poles P is equal to
(a) L (b) $1.35\ P\sqrt{L}$ (c) $\sqrt{PL}$ (d) $P\sqrt{L}$

271. For a 3-phase, 4-pole induction motor, $D^2L = 0.005\ m^3$. Then internal diameter and gross length should be about
(a) 0.23 m and 0.1 m. (b) 0.18 m and 0.15 m.
(c) 0.19 m and 0.13 m. (d) 0.13 m and 0.19 m.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2006]

272. Air gap of a polyphase induction motor is kept small to
(a) reduce the possibility of crawling.
(b) reduce the noise. (c) reduce magnetizing current.
(d) obtain high starting torque.
[A.M.I.E. Sec B. Principles of Elec. Design Winter 1994]

273. If an induction motor is designed with lesser air gap, then the motor will have
(a) better cooling. (b) better overload capacity.
(c) better power factor. (d) lower power factor.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2006]

274. The length of air gap in an induction motor is given by
(a) $0.2 + \sqrt{2DL}$ mm. (b) $0.2 + 2\sqrt{DL}$ mm.
(c) $2\sqrt{DL}$ mm. (d) $0.2 + \sqrt{DL}$ mm.

275. In induction motors, the length of air gap is kept as small as practically possible. This is to achieve
(a) high overload capacity. (b) low unbalanced magnetic pull.
(c) high power factor. (d) less noise.

276. A 3-phase squirrel cage induction motor is designed to have rotor copper bars. If instead of using copper, aluminium is used for rotor bars
(a) maximum torque will remain unaffected.
(b) starting torque will be 1.62 times of that with the use of copper.
(c) output of the machine will be 78 percent of that with the use of copper.
(d) full load slip will be 1.62 times that with copper conductors.
(e) all of the above.

277. The number of stator slots should _____ be equal to the number of rotor slots.
(a) never (b) always (c) sometimes
(d) none of these

278. Current density in the rotor bars of an induction motor is taken
(a) 3 to 4 A/mm^2. (b) 4 to 7 A/mm^2.
(c) 8 to 10 A/mm^2. (d) 10 to 15 A/mm^2.

279. If the design of a 3-phase induction motor is done with a higher value of current density then
(a) weight of copper will be more.
(b) temperature rise would be less.
(c) copper losses would be more.
(d) winding resistance would be less.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2006]

280. In induction motors, the harmonic fields are produced due to
(a) saturation. (b) slotting.
(c) windings. (d) irregularities in the air gap.
(e) all of the above.

281. The value of operating power factor of a 3-phase induction motor is high say when
(a) closed slots are used both on stator and rotor.
(b) semiclosed slots are used both on stator and rotor.
(c) open slots are used both on stator and rotor.
(d) open and closed slots are used on stator and rotor respectively.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

282. In rotating machines, the harmonics are produced due to
(a) slotting of the stator core.
(b) non-sinusoidal form of field.
(c) both (a) and (b). (d) none of these.

283. A 3 phase winding carrying sinusoidal currents produces harmonics of the order of
(a) $n = 6N \pm 3$. (b) $n = 6N \pm 1$.
(c) $n = 8N \pm 1$. (d) $n = 8N \pm 3$.

284. A 5 hp, 400 V, 4-pole, 50 Hz induction motor having 36 slots in the stator and 40 slots in the rotor may crawl synchronously at
(a) 50 rpm. (b) 150 rpm. (c) 200 rpm. (d) 750 rpm.
[A.M.I.E. Sec B. Principles of Elec. Design Summer 1993]

285. If the number of slots selected for a 3-phase, 6-pole induction motor is 42, then it is possible to get
(a) balanced fractional slot winding.
(b) full pitch integral slot winding.
(c) short pitch integral slot winding.
(d) none of the above.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2005]

286. The effects of harmonics in rotating machines can be reduced/ eliminated by
(a) using distributed winding. (b) skewing the poles.

Answers: **259.** (c), **260.** (a), **261.** (b), **262.** (c), **263.** (c), **264.** (a), **265.** (a), **266.** (c), **267.** (a), **268.** (c), **269.** (e), **270.** (b), **271.** (a), **272.** (c), **273.** (c), **274.** (b), **275.** (c), **276.** (e), **277.** (a), **278.** (b), **279.** (c), **280.** (e), **281.** (b), **282.** (c), **283.** (b), **284.** (b), **285.** (a), **286.** (e),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) increasing air gap length.
(d) using short chord winding. (e) all of the above.

287. For avoiding cogging in induction motor the difference between the number of stator slots and rotor slots should not be equal to
(a) 3 P (b) P (c) 5 P (d) 7 P

288. Skewing of slots
(a) improves heat transfer. (b) reduces noise.
(c) suppresses the undesirable harmonics.
(d) none of the above.

289. If the stator of a 4-pole, 3-phase induction motor has 24 slots then the order of tooth ripples produced are
(a) 5 and 7 (b) 6 and 8 (c) 9 and 11 (d) 11 and 13
[A.M.I.E Sec B. Design of Electrical Systems Winter 2005]

290. Synchronous cusps in torque-speed curve of a 3-phase induction motor is due to
(a) even harmonics. (b) odd harmonics.
(c) both odd and even harmonics.
(d) none of the above.
[A.M.I.E. Sec B. Design of Electrical Systems Winter 2005]

291. The ratio of magnetizing current to ideal short-circuit current is called the
(a) leakage coefficient. (b) short-circuit ratio.
(c) dispersion coefficient. (d) none of the above.

292. Dispersion coefficient is the ratio of
(a) magnetizing current to supply voltage.
(b) magnetizing current to ideal short-circuit current.
(c) magnetizing current to full load current.
(d) none of the above.

293. Maximum power factor is given as
(a) $\frac{1-\sigma}{1+\sigma}$ (b) $\frac{1+\sigma}{1-\sigma}$ (c) $\frac{1}{1+\sigma}$ (d) $\frac{1}{1-\sigma}$

294. If the frequency is changed without changing the number of poles, the dispersion coefficient will
(a) increase. (b) decrease. (c) remain unaffected.

295. A large value of short-circuit current is an indication of
(a) good pf. (b) poor pf. (c) zero pf. (d) unity pf.

296. For a 20 kW, 3-phase, 400 V induction motor, the no load current is about
(a) 100 A (b) 40 A (c) 10 A (d) 2 A
[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

297. An induction motor of 75 kW, 1000 rpm will have _____ power factor and _____ efficiency in comparison to those of 5 kW 1000 rpm motor.
(a) low, low (b) high. high
(c) low, high (d) high, low

298. An induction motor of 10 HP, 1500 rpm will have _____ power factor and _____ efficiency in comparison to those of 10 Hp; 750 rpm motor.
(a) low high (b) high low (c) high, high (d) low, low

299. At $s = 0$, the torque of an induction motor is
(a) 0. (b) equal to full-load torques.
(c) very high. (d) very low.
[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

300. Under full-load condition, the power factor of the rotor circuit of 3-phase induction motor is
(a) about 0.2 lagging. (b) about 0.5 lagging.
(c) almost unity. (d) about 0.8 lagging.
[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

Answers: **287.** (a), **288.** (c), **289.** (d), **290.** (b), **291.** (c), **292.** (b), **293.** (a), **294.** (c), **295.** (a), **296.** (c), **297.** (b), **298.** (c), **299.** (a), **300.** (c).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below.
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

1. (A): Efficiency is one of the limitations imposed on the design.
(R): The machine designed for higher efficiency becomes costly in initial cost and the machine designed for lower efficiency becomes costly in operating cost and gives problems associated with temperature rise.

2. (A): Aluminium is gaining ever increasing applications as winding material.
(R): Aluminium is next best to copper in electrical conductivity, lighter in weight and is widely available in India.

3. (A): CROS cannot be used is small rotating machines.
(R): In small machines it is difficult to correspond the axis of core with the rolling direction.

4. (A): Class of insulation is essentially mentioned on the name plate of the equipment.
(R): The class of insulation put on the name plate of the equipment gives the idea about the highest permissible temperature or the temperature rise to which the machine parts can be subjected.

5. (A): In self cooled motors the cooling time constant is about 2 to 3 times greater than the heating time constant.
(R): Cooling conditions are worse at standstill.

6. (A): Axial ventilating system is used for moderate output and high speed machines.
(R): In high speed machines, a solid rotor construction with restricted spider is used in order to avoid centrifugal stresses and this restricts the provision of radial ventilating ducts.

7. (A): It is not practicable to operate a machine with a normal operating speed near the critical speed.
(R): The deflection tends to be very large at critical speed and gives rise to considerable vibrations.

Answers: **1.** (a), **2.** (d), **3.** (a), **4.** (a), **5.** (a), **6.** (a), **7.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

8. (A): The frame for an ac machine is designed to have sufficient rigidity but at the same having light weight.
(R): The frame of an ac machine is only to support the machine.

9. (A): The use of large core length in a dc machine gives rise to difficulty to ventilate.
(R): For large core length the proportion of inactive copper to active copper is small.

10. (A): The use of large core length in a dc machine leads to bad commutation.
(R): EMF induced per conductor is higher for a longer length machine leading to increased voltage across the commutator segments.

11. (A): For obtainng improved magnetic properties, the transformer magnetic core is assembled using cold-rolled silicon-steel sheets.
(R): The laminations for the core could be cut out of the cold-rolled silicon steel sheets, cutting either in the direction of rolling or transverse there of, without affecting the magnetic properties in any way. **[U.P.S.C. I.E.S E.E.-II, 2005]**

12. (A): Larger the transformer rating, lower is its efficiency.
(R): In a transformer output increases as the fourth power and losses as the third power of linear dimensions.

13. (A): In an induction motor, higher specific magnetic loading (B_{av}) results in poor power factor.
(R): Higher value of B_{av} means higher value of flux to pass through requiring large magnetizing current.

14. (A): Harmonic leakage flux in a squirrel cage induction motor is zero.
(R): In squirrel cage induction motors, the current in the rotor balances the stator current at every point.

15. (A): Single-phase induction motors are usually set on rubber or spring mounts.
(R): Torque developed by a single-phase induction motor is non-uniform (pulsating) causing vibrations and noise.

16. (A): The rotor of a reluctance motor is of unsymmetrical magnetic construction squirrel cage type.
(R): Unsymmetrical magnetic construction provides variable reluctance path between stator and rotor.

Answers: **8.** (a), **9.** (b), **10.** (a), **11.** (c), **12.** (d), **13.** (a), **14.** (a), **15.** (a), **16.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Machine part)		List 2 (Magnetic material used)
A.	Yokes of dc machine.	1. Low content silicon steel.
B.	Rotors of turbo-generators.	2. High content silicon steel.
C.	Small rotating machine cores.	3. Steel forging.
D.	Transfarmer core.	4. Cast iron.

Codes:	A	B	C	D
(a)	4	3	1	2
(b)	4	3	2	1
(c)	3	4	1	2
(d)	2	1	3	4

2.

List 1 (Machines)		List 2 (Cooling system used)
A.	Moderate output and moderate speed machine.	1. Radial ventilating system.
B.	Moderate output and high speed machine.	2. Multiple-inlet ventilating system.
C.	Large motors and small turbo-alternators.	3. Axial ventilating system.
D.	Large turbo-alternators.	4. Combined radial and axial ventilating system.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	1	3	2	4
(c)	1	3	4	2
(d)	3	1	4	2

3.

List 1 (Synchronous machines)		List 2 (Rated output and speed)
A.	Turbo-rpm	1. 20MW;1500 pm alternators.
B.	Hydrogenerators.	2. 1000 MW; 3000 or 3600 rpm.
C.	Engine driven generators.	3. 750 MW; 100 to 1000 rpm.

Codes:	A	B	C
(a)	1	2	3
(b)	2	1	3
(c)	3	2	1
(d)	2	3	1

4.

List 1 (Rating of turbo-generator)		List 2 (Cooling system used)
A.	Up to 60 MW.	1. Hydrogen cooling.
B.	Up to 200 MW.	2. Direct water cooling.
C.	Above 200 MW.	3. Closed circuit air cooling.

Codes:	A	B	C
(a)	1	3	2
(b)	3	1	2
(c)	2	1	3
(d)	1	2	3

Answers: **1.** (a), **2.** (c), **3.** (d), **4.** (b).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Design may be defined as a creative physical realization of theoretical concepts.
2. The type of construction to be adopted for a machine is least influenced by the operating cost.
3. Iron exhibits preferred directions of magnetization.
4. CRGOS, though costly, gives much reduced iron loss and much better magnetization curve than hot rolled steels.
5. The thermal resistivity across the laminations is low in comparison to that along the laminations.
6. The heating time constant of electrical machines is usually with in the range of $\frac{1}{2}$ to 3.4 hours.
7. Heat conducted by radiation is proportional to temperature difference.
8. The temperature rise in an electrical machine can be kept within safe limits by properly designing its ventilation system.
9. Large waterwheel generators employ direct water cooled stator and rotor windings.
10. The resistivity and so the effectiveness of water as a coolant depends upon its purity.
11. The power required to circulate a given coolant depends upon the mass of coolant and the pressure head required.
12. Hydrogen is used in large turbo-generators as a dielectric.
13. Sulphur hexafluoride is used as an insulating material in turbo-generators.
14. The power outputs of larger size machines may be as high as hundreds of MW.
15. Roller bearings can take thrust loads.
16. Peripheral leakage flux is negligible for most of the electrical machines.
17. A distinguishing feature of the continuous disc windings is the transposition of the coils.
18. Partitions of solid insulating materials placed inside an oil duct are called the barriers.
19. Inter poles are tapered to ensure that there is no saturation at the root of the pole at heavy overloads.
20. In a dc machine, the choice of number of poles directly depends on the speed of the machine and frequency of supply.
21. DC windings are always two layer.
22. In dc machines two layer winding with diamond shaped coils is employed.
23. The specific magnetic loading is limited by the saturation in the magnetic circuit.
24. A higher value of ampere-conductors is taken for high voltage machines.
25. A large value of ampere-conductors will cause large number of turns per phase.
26. The use of mitred joints for cores and yokes assures that the flux flows along the direction of grain orientation.
27. Varnish gives a stacking factor of about 0.95.
28. In transformers, the maximum operating temperature of winding imposes a limit on the insulation life.
29. The transformer life can be enhanced by improving cooling system.
30. When a transformer is operated on a supply frequency, higher than its rated frequency its kVA rating will be lower.
31. Lower values of B_{av} improves stability of a synchronous machine.
32. For induction motors of output rating up to 100 kW aluminium can be employed for bars and squirrel cage.
33. The phenomenon of skin effect occurs mostly in stator and rotor windings of a squirrel cage motor.
34. With the increase in number of poles in an induction motor, it becomes difficult to have high power factor.
35. In an induction motor, with the increase in length of air gap, the short-circuit current increases while the magnetizing current decreases.
36. In induction motors, maximum power factor increases with the increase in dispersion coefficient.
37. In induction motors, with the increase in number of poles, the ideal short-circuit current increases, magnetizing current remains unaffected and the dispersion coefficient increases.
38. AC series motors have high torque to weight ratio than dc series motor of equal ratings. **[A.M.I.E. Sec B. Summer 1996]**
39. Universal motors are generally used with speed reducing gears. **[A.M.I.E. Sec B. Winter 1994]**
40. Reluctance motors operate on dc as well as on ac.

Answers: **1.** (T), **2.** (F), **3.** (T), **4.** (T), **5.** (F), **6.** (T), **7.** (F), **8.** (T), **9.** (T), **10.** (T), **11.** (T), **12.** (F), **13.** (F), **14.** (T), **15.** (T), **16.** (T), **17.** (T), **18.** (T), **19.** (T), **20.** (F), **21.** (T), **22.** (T), **23.** (T), **24.** (F), **25.** (T), **26.** (T), **27.** (T), **28.** (T), **29.** (T), **30.** (F), **31.** (F), **32.** (T), **33.** (T), **34.** (T), **35.** (F), **36.** (F), **37.** (F), **38.** (F), **39.** (T), **40.** (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Low silicon content sheet steel known as _____ grade steel is used for rotating electrical machines.
2. High silicon content sheet steels are called the _____ grade steels.
3. In ordinary hot rolled sheets the constituent crystals are disposed in a _____ fashion.
4. The most vulnerable part of an electrical machine is its _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

5. The type of insulation to be used is governed by the maximum operating _____ of the machine parts where it is put.
6. In _____ cooling, the machine is cooled by air movement set up in the machine due to its rotation or due to the temperature difference between inside parts and the ambient air.
7. In _____ cooling, the machine is cooled by air blown by fan integrally built with the rotor or mounted on the shaft.
8. In _____ cooling, the machine is cooled by air blown by fan driven by a separate machine.
9. _____ is the process by which heat is dissipated from the surface by means of heat waves and depends upon the temperature of the surface and other characteristic like colour, roughness etc.
10. The apparatus used for outdoor duty absorbs radiant heat from the Sun by _____ phenomenon and gets heated.
11. The internal part of the apparatus or machinery at which heat is generated and dissipated in all directions has the maximum temperature is called the _____.
12. In modern electrical machines, heat is removed by artificial circulation of _____.
13. _____ law of cooling is strictly true for cases where the body is acted upon by a uniform current of air.
14. The noise produced by a hydrogen cooled machine is _____ as the rotor moves in a medium of _____ density.
15. For transmission of torque, the motor shaft should have good _____ strength.
16. Smaller is the number of slots, the _____ is the distortion in the field flux.
17. _____ loss(es) occur in the yoke of a dc machine.
18. The dimensions of a dc machine primarily depend on _____.
19. The drawback of employing high current density in the design of electrical machine is that of _____.
20. Square section of the transformer core needs _____ copper wire than that required for equivalent rectangular section.
21. Maximum permissible water content in a transformer oil is _____ ppm.
22. Dielectric dissipative factor for transformer oil is _____.
23. The resistivity of the transformer oil is of the order of _____ Ω-m.
24. The maximum pour point of transformer oil should be _____.
25. The kinematic viscosity of transformer oil should be _____ cst.
26. The density of transformer oil is around _____ kg/m^3.
27. Transformer oil should have _____ flash point.
28. _____ speed is defined as the speed which the prime mover would have, if it is suddenly unloaded while operating at its rated speed.
29. Skew leakage flux is only present when the slots are _____.
30. Unbalanced magnetic pull is _____ in induction motors.
31. A large value of ampere-conductors would lead to _____ number of turns per phase.
32. Harmonic losses, skin effect and pulsation losses in induction motors are accounted for as _____ losses.
33. The runaway speed of a Pelton wheel is usually _____ times its rated speed.
34. In induction motors, rotor slots give _____ reluctance and _____ magnetizing current.
35. A large value of short-circuit current indicates _____ power factor.
36. There are two peculiar effects, which are encountered in a linear induction motor but not in a conventional rotary induction motors. These effects are _____ and _____.
37. Fractional horse power motors are usually _____ phase type.
38. The squirrel cage winding in a single phase induction motor is usually placed in the _____.
39. The stator of a split-phase single-phase induction motor is provided with _____ winding(s).
40. In a shaded pole motor the necessary phase splitting is produced by _____.

ANSWERS

1. dynamo
2. transformer
3. random
4. insulation
5. temperature
6. natural
7. self
8. separate
9. Radiation
10. insolation
11. hot spot
12. cooling medium
13. Newton's
14. less; smaller
15. shear
16. more
17. No
18. kW output
19. high copper loss
20. less
21. 50
22. 0.005
23. 10×10^{10}
24. 10 °C
25. 2.5
26. 800
27. high
28. Runaway
29. skewed
30. very large
31. large
32. stray
33. 1.8
34. low, less
35. good
36. transverse edge effects; end effect
37. single
38. rotor
39. 2

CHAPTER 7

Electrical Installation and Wiring

Short Answer Type Questions With Answers

1. WIRING SYSTEMS

Q.1. What is the maximum number of points of light, fan and socket-outlets that can be connected in one sub-circuit ?

Ans. Ten.

Q.2. What is the maximum load (light and fan) that can be connected in one sub-circuit ?

Ans. 800 watts.

Q.3. On what basis is the number of circuits/sub-circuits determined in house wiring installations ?

Ans. The number of circuits and sub-circuits is decided on the basis of total number of points to be wired and the total load to be connected to the supply system.

Q.4. Which system is used for distribution of electrical energy in a building ?

Ans. Distribution board system.

Q.5. Which system is used in connections of various lamps or appliances in parallel ?

Ans. Loop-in-system.

Q.6. Which of the following wiring systems is commonly used for light/fan load in domestic and commercial buildings ?

(*a*) Cleat wiring (*b*) Casing-capping wiring
(*c*) TRS wiring (*d*) Lead sheathed wiring
(*e*) PVC wiring

Ans. PVC wiring.

Q.7. Which wiring system is employed in mechanical workshops ?

Ans. Conduit wiring system (surface or concealed).

Q.8. What are that points which will be considered in selecting the wiring for a particular installation ?

Ans. The main points, which are considered in selection of the type of wiring for a particular installation, are safety, durability, appearance mechanical protection, permanency, accessibility and cost (initial as well as maintenance).

Q.9. What is difference between wire and cable ?

Ans. Single wire, may be bare or covered with insulation is called the wire while several wires stranded together is called the cable.

Q.10. Why conductor is covered with insulating material ?

Ans. The conductor is covered with insulating material so as to prevent leakage of current from the conductor.

Q.11. What are the essential properties, which the insulation used in cables must possess ?

Ans. The insulating materials used in cables must have the properties of high resistivity, high flexibility, high dielectric strength, non-inflammability, non-hygroscopicity, highly resistive to moisture, acids or alkalies and capability to withstand high rupturing voltages and high temperatures without much deterioration.

Q.12. Which insulation is most widely used for covering wires/cables used in internal wiring ?

Ans. PVC.

Q.13. Why multi-strand conductors are preferred over solid conductors ?

Ans. Multi-strand conductors are preferred over solid conductors because they provide flexibility and durability.

Q.14. PVC cables are most widely used in internal wiring. Why ?

Ans. PVC cables are most widely used in internal wiring because PVC insulation provides better flexibility, has better insulating qualities, has no chemical effect on metal of wire and gives smaller diameter of cable.

Q.15. Where are flexible cords used ?

Ans. Flexible cords are used as connecting wires for such purposes as from ceiling rose to lamp holder, socket-outlet to portable apparatus such as radios, fans, lamps etc.

Q.16. What is meant by voltage grading of cables ?

Ans. Voltage grading of cable specifies the safe voltage which the insulation of the cable can withstand.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q.17. What is meant by distribution board ?

Ans. Distribution board is an assembly of parts, including one or more fuses or circuit breakers, arranged for the distribution of electrical energy to different circuits or other distribution boards known as submain distribution boards.

Q.18. What is meant by a switch ?

Ans. A switch is a device that is used for making or breaking the electric circuit in a convenient way.

Q.19. What for ceiling rose is used ?

Ans. Ceiling rose is used for connecting the pendant lamps, fans or fluorescent tubes to the installation through flexible plastic or silk covered wire.

Q.20. What is meant by a fuse ?

Ans. Fuse is a device used in an electrical circuit for protecting electrical equipment against overloads and/or shor-circuits.

Q.21. On what principle does the fuse operate ?

Ans. The action of a fuse is based upon the heating effect of the electric current. During overloads or short-circuits the fuse gets heated up to melting point due to excessive current and breaks the circuit.

Q.22. What kind of protection is offered by a fuse ?

Ans. The fuse provides protection against short-circuits and overloads.

Q.23. What function does the fuse perform ?

Ans. The function of a fuse wire is (*i*) to carry the normal working current safely without heating and (*ii*) to break the circuit when current exceeds the limiting current.

Q.24. Give the names of five materials with their melting points which are used for fuse element.

Ans. The materials commonly used for fuse elements are silver, tin, lead, copper and aluminium. Their melting points are 980°C, 240°C, 328°C, 1,090°C and 665°C respectively.

Q.25. What material is mostly used for an ordinary fuse wire ?

Ans. Copper or lead-tin alloy.

Q.26. What is fuse link ?

Ans. Fuse link is that part of the fuse which needs replacement when the fuse blows out.

Q.27. On what factors does the current carrying capacity of a fuse depend ?

Ans. The current carrying capacity of a fuse depends upon the permissible temperature rise of the contacts of the fuse holder, size of fuse wire, fuse material and the surrounding of the fuse.

Q.28. On what factors does the fusing current depend ?

Ans. The fusing current depends upon (*i*) diameter of wire (*ii*) length of wire (*iii*) fuse material (*iv*) x-sectional area (round or rectangular) (*v*) size and location of terminals (*vi*) type of enclosure used (*vii*) type of surface etc.

Q.29. What are the purposes of using quartz sand as filler material in the construction of HRC fuse ?

Ans. The purposes of using quartz sand as filler material in the construction of HRC fuse are to absorb heat at a very high rate, to produce a substance of high resistance and avoid the oxidation of silver element.

Q.30. Can the HRC fuse be used for both ac and dc circuits. If so under what condition ?

Ans. In general an HRC fuse meant for ac circuit may not be used for dc circuits; but however, a fuse satisfying the requirement of arc voltage can be used on both ac and dc circuits.

2. EARTHING SYSTEMS

Q.31. What is meant by earth continuity conductor ?

Ans. The conductor, by means of which the metal body of an equipment or an appliance is connected to the earth, is known as earth continuity conductor (ECC).

Q.32. What are maximum permissible values of resistance of earth system for (*a*) large power stations (*b*) major power stations (*c*) small substations (*d*) in all other cases ?

Ans. Maximum permissible values of resistance of earth system are as follows :

Large power stations	– 0.5 Ω
Major power stations	– 1.0 Ω
Small substations	– 2.0 Ω
In all other cases	– 5 Ω maximum.

Q.33. What should be the minimum size of earth continuity conductor ?

Ans. The cross-section of earth continuity conductor should not be either less than 2.9 mm^2 (14 SWG) or half of the installation conductor size.

Q.34. What is harm if earth resistance exceeds the permissible value of earth resistance ?

Ans. The sensitivity of the protective equipment, system voltage and the maximum fault current directly relate to permissible value of earth resistance. In case the earth resistance exceeds the permissible value, then in the event of earth fault, the fault current may not reach a sufficient value to operate the protective equipment (such as fuses or relays) and dangerous condition may arise.

Q.35. Why charcoal and salt is used in earthing ?

Ans. Generally alternate layers of charcoal and salt are used to increase the effective area of the earth and to reduce the earth resistance respectively.

3. INSPECTION AND TESTING WIRING INSTALLATIONS

Q.36. What is the limiting valume of leakage current in an electrical installation ?

Ans. Not exceeding 1/5,000 of maximum supply current.

Q.37. Enlist the tests to be performed before a new installation or an addition to an existing installation is connected to the supply mains.

Ans. The required tests are as follows :

(*a*) Testing of IR between the wiring and earth.
(*b*) Testing of IR between conductors.
(*c*) Testing of polarity of single pole switches.
(*d*) Testing of earth continuity path.

Q.38. What is the aim of performing IR test between the wiring and earth ?

Ans. The aim of performing IR test between the wiring and earth is to know whether the wires/cables used in the wiring system are sufficiently insulated to avoid leakage of current.

Q.39. Why polarity test is performed ?

Ans. Polarity test is performed to ensure that all the switches are placed in phase or live conductors and not in neutral conductor.

Q.40. What are the possible reasons for excess recording of energy consumption by energy meter ?

Ans. The possible reasons for excess recording of energy consumption are :

(*i*) Defective wiring *i.e.* exessive leakage current.
(*ii*) Defective meter *i.e.* meter may creep or other defect causing recording of excessive energy consumption.

Downloaded From : www.EasyEngineering.net

4. OVERHEAD TRANSMISSION AND DISTRIBUTION LINES

Q.41. What are the various components of an overhead line ?

Ans. The main components of an overhead line are supports/towers, cross-arms and clamps, insulators, conductors, guys and stays, lightning arresters, earth wire, V-guards, guard wires, phase plates, bird guards, danger plates, anticlimbing devices, vibration dampers etc.

Q.42. What is the function of line support ?

Ans. The function of a line support is to support the line conductors and keep them at a safe distance from the ground.

Q.43. What are the main requirements of line supports ?

Ans. The main requirements of line supports are high mechanical strength, lighter in weight, low maintenance cost, longer life, cheaper in cost, good appearance, easy accessibility for painting and erection of line conductors and immune to damage from lightning and fire.

Q.44. What are four types of line supports ?

Ans. The four types of line supports are wooden poles, RCC or PCC poles, rail poles and steel structures or towers.

Q.45. What are the drawbacks of wooden poles ?

Ans. The main drawbacks of wooden poles are comparatively smaller life, poor mechanical strength, tendency to rot below the ground level and requirement of periodical inspection.

Q.46. Wooden poles are commonly used for rural electrification. Why?

Ans. Because of low cost.

Q.47. On what factors does the height of a pole used in a distribution line depend ?

Ans. The height of a pole used in a distribution line depends upon the following factors :

(*i*) The minimum clearance of the lowest conductor from the ground.

(*ii*) The number of conductors to be carried and minimum vertical clearance between conductors and

(*iii*) The length of the pole to be buried in the ground (about one-sixth of the total length to be buried if the soil is normal).

Q.48. Why steel towers are required to be painted or galvanised regularly ?

Ans. For protection against corrosion.

Q.49. What are the main requirements of good conductor material used for overhead lines ?

Ans. Main requirements of good conductor material used for overhead lines are high electrical conductivity, high tensile strength, low specific gravity, low cost, easy availability, free from brittleness and the material should not react with atmospheric condition.

Q.50. What for ACSR conductor stands ?

Ans. ACSR conductor stands for aluminium conductor steel reinforced conductor.

Q.51. Why are conductors for transmission line stranded ?

Ans. All conductors used for overhead transmission lines are stranded so as to increase the flexibility. Solid wires, except of smaller sizes, are difficult to handle when used for long spans and tend to crystallise at the points of supports because of swinging in winds.

Q.52. Why is galvanised steel wire not suitable for EHT lines for the purpose of transmitting large amounts of power over a long distance ?

Ans. The galvanised steel wire is not suitable for EHT lines for the purpose of transmitting large amounts of power over a long distance because of poor conductivity, high internal reactance and eddy current and hysteresis.

Q.53. Why the copper conductor is not used for transmission of electrical power nowadays?

Ans. Owing to the difficulty of importing it because of lack of foreign exchange in our country.

Q.54. What is the function of cross-arms ?

Ans. The function of cross-arms is to keep the line conductors at a safe distance from each other and from the pole.

Q.55. What are the factors on which conductor spacings and ground clearance depend ?

Ans. Factor affecting conductor spacings is voltage while factors affecting ground clearance are voltage and area (living or non-living, urban or suburban, along the streets or across the streets, river crossings/hill crossings, railway track/bridge etc.).

Q.56. What are the important properties that an overhead line insulator must possess ?

Ans. The most important properties that an overhead line insulator must possess are : High mechanical strength, high relative permittivity, high insulation resistance, high ratio of rupturing strength to flash-over voltage and capability of withstanding temperature variations.

Q.57. What types of insulators are used for overhead transmission and distribution lines ?

Ans. The insulators used for overhead lines are pin type, suspension type, strain type and shackle insulators.

Q.58. How do the insulators fail ? [A.M.I.E. Sec B. Summer 1993]

Ans. Electric failure of insulators may occur either by puncture or flash-over. In the case of puncture the arc passes through the insulator body while flash-over is caused by an arc discharge between the line conductor and earth through air surrounding the insulator.

Q.59. Why insulators are provided on overhead lines?

Ans. To avoid current leakage from line conductors to the earth through line supports.

Q.60. Why the use of pin type insulators is restricted up to 50 kV?

Ans. Because beyond voltage of 50 kV the pin type insulators become bulky, cumbersome and costly.

Q.61. Where and why suspension type insulators are used?

Ans. Beyond voltage of 50 kV the pin type insulators become bulky, cumbersome and costly, and therefore, suspension type insulators are used.

Q.62. Where and why strain type insulators are used?

Ans. Where there is a dead end of the line, or there is a corner or a sharp curve, or the line crosses river etc. the line is subjected to greater tension. Pin type insulators cannot be used in such situations because they cannot take conductor load in tension which often occurs in such situations. For low-voltage lines (say, up to 11,000 V), shackle insulators can be used, but for higher voltage transmission lines strain insulators consisting of an assembly of suspension type insulators are used.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q.63. Why stay insulators are provided in stay wires?

Ans. Stay insulators are provided in stay wires to insulate the lower part of guy cable from the pole for the safety of the people and animals on ground.

Q.64. Where stay sets are provided in overhead lines?

Ans. It becomes essential to provide stay sets in overhead lines to stay supports at angle and terminal positions as the supports take the pull due to conductors.

Q.65. Why lightning arresters are used in transmission lines?

Ans. To protect the electrical equipment from damage due to lightning.

Q.66. Why phase plates are provided on overhead lines?

Ans. To distinguish different phases.

Q.67. Why danger plates are provided on overhead lines?

Ans. To indicate the working voltage of the line and caution the people against risk to life.

Q.68. Why barbed wire is provided on poles?

Ans. To safeguard against the climbing of unauthorised persons?

Q.69. Why beads are used for jumpers?

Ans. To avoid birdage insulating beads are put all along the jumpers.

Q.70. Why earthing of transmission line is necessary?

Ans. The earthing is done (*i*) to ensure that no current carrying conductor rises to a greater potential with respect to general mass of earth than its designed insulation and (*ii*) to ensure that the potential of non-current carrying metalwork does not rise to a value such that a person may get shock on touching it. The supply system neutral point is earthed at power station or substation to serve the former purpose whereas the latter purpose is served by the regulations which specify that all non-current carrying metalwork of high voltage lines shall be permanently and efficiently connected to earth. For this purpose a continuous earth wire shall be run and connected to earth at four points in every 1.6 km, the spacing between the points being as nearly equal as possible, or alternatively, the metalwork shall be connected to an effective earthing device at each individual support.

5. UNDERGROUND DISTRIBUTION LINES

Q.71. For what purpose metallic sheath is provided in underground cables ?

Ans. The metallic sheath is provided around the insulation to protect it against ingress of moisture, gas or other damaging liquids (acid or alkalies) from the soil and atmosphere.

Q.72. Why is a layer of bedding provided over the metallic sheath in underground cables ?

Ans. A layer of bedding is provided over the metallic sheath for the protection of metallic sheath against corrosion and from mechanical injury.

Q.73. Why are copper conductors not used in power cables ?

Ans. Copper conductors are not used in power cables because of scarcity of copper.

Q.74. What are the main requirements of insulating materials used for underground cables ?

Ans. The main requirements of the insulating materials used for underground cables are high insulation resistivity, high dielectric strength, good mechanical properties, non-hygroscopic, non-inflammable, immune to attacks by acids and alkalies.

Q.75. Why single core cables are usually not provided with armouring ?

Ans. Single core cables are usually not provided with armouring in order to avoid excessive loss in the armour.

Q.76. What are the factors, which are to be considered while selecting a cable for a particular service ?

Ans. The factors to be considered in selection of a cable are continuous current rating, voltage grade, permissible voltage drop and short-circuit current rating (in case of *ht* cables only) and operating cost.

6. INSTALLATION OF SERVICE CONNECTIONS

Q.77. What is meant by service line?

Ans. The overhead line or cable connecting the supplier's distributing line to the consumer premises is called the service line.

Q.78. When overhead service line with bare conductors is used to provide service connection?

Ans. Overhead service line with bare conductors is used for providing service connection in case the distance of consumer premises from the nearest distribution support exceeds 45 m.

Q.79. What are the various types of service lines?

Ans. Service lines are of two types namely (*i*) overhead service line and (*ii*) underground service line.

Q.80. For giving service connection to a consumer having a load of 1 kW, copper conductor is used, give its size.

Ans. 10 SWG having current carrying capacity of 37 A.

Q.81. For giving service connection to a consumer having a load of 2.5 kW AAC is used, give its size.

Ans. 13.9 mm^2.

Q.82. For giving service connection to a consumer having a load of 10 kW copper conductor is used, give its size.

Ans. 8 SWG having current carrying capacity of 52 A.

Q.83. For giving service connection to a consumer having a load of 12 kW ACSR conductor is used, give its size.

Ans. 19.4 mm^2.

Q.84. Why GI pipe used for carrying cable for service connection is bent back at the upper end with opening facing downward?

[R.T.E. U.P. 1985]

Ans. To prevent entry of rain water into the pipe.

Q.85. Why the height of the roof pole should not exceed 3 m?

Ans. To avoid tensile stresses to become excessively large.

Q.86. Why the roof pole is braced by a steel rope in roof pole connection?

Ans. To keep tensile stresses low.

Q.87. State the type of cable used for cable service connection.

Ans. Weather proof or PVC cable.

Q.88. State the type of cable used for underground service connection?

Ans. Underground cables.

7. SUBSTATIONS

Q.89. State any four types of substations according to the service ?

Ans. The substations, according to the service rendered are: Transformer substations, Switching substations, Converting substations and Frequency changing substations.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q.90. State the relative merits of indoor and outdoor substations.

Ans. **Merits of Indoor Substations.** Less requirement of space, less maintenance and control cable length; protection from lightning; flexibility in installation, no dust and dirt.

Merits of Outdoor Substations. No building requirement, short erection time; Easy fault finding due to visibility of equipment; Easy repair work; Easier installation/extension; Availability of sufficient space between equipments.

Q.91. What are the factors governing the selection of site for substations ?

Ans. Factors governing the selection of site for a substation are :

1. Nearness to load centre 2. Availability of suitable and sufficient land 3. Availability of communication facilities 4. Drainage facilities 5. Availability of essential amenities to the staff. 6. Pollution free atmosphere 7. Facility for future extension 8. Distance from airport, military or police rifle training centre.

Q.92. List out the equipment used in a substation.

Ans. Equipment used in a substation are Transformer(s); Bus-bars; Circuit breakers; CTs; PTs; Insulators; Isolators; Switchgear (fuses, air-break switches etc.), Protective relays; Surge arresters; Cables, Fire-fighting equipment; Batteries; Earthing arrangement, Wave traps, Reactors etc.

Q.93. What are the functions of panels and fire-fighting equipment in a substation ?

Ans. *Panels* or *cubicles* in a substation are provided to support the various equipment like meters, relays etc. It saves the horizontal space and facilitates the supervisory staff to record readings easily. All the panels/cubicles are properly grounded.

Special type of fire extinguishers are installed in a substation to quench electric fire in case of a fire accident because ordinary fire extinguishers or water cannot be used to quench electric fire as it is dangerous. They are provided in accessible position and every one in the substation must know its operation.

Q.94. What is flexible bus ?

Ans. Flexible bus consists of flexible ACSR or all aluminium alloy stranded conductors supported by strain insulators from each end.

Q.95. Name the interlockings provided with isolators.

Ans. The interlocking provided with isolators are :

1. Interlocking between three poles for simultaneous operation.
2. Interlocking with circuit breakers.

Q.96. In what way is an isolator different from an air-break switch ?

Ans. Isolators are used to connect or disconnect the line only under no-load condition while air-break switches are used for making and breaking of the circuit under loaded condition. Air-break switches are provided with arc control devices.

Q.97. Why are isolators necessarily provided on the supply side of the circuit breakers ?

Ans. Isolators are necessarily provided on the supply side of the circuit breaker in order to ensure isolation of the circuit breaker from the live parts for the purpose of maintenance.

Q.98. Give the sequence of operation during opening and closing of a circuit.

Ans. Sequence of operation of circuit breaker, isolator and earthing switch during opening/closing of a circuit are given below.

While Opening: Open circuit breaker, open isolator and then close earthing switch if provided.

While Closing: Open earthing switch, close isolator and then close circuit breaker.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. As per recommendation of ISI the maximum load that can be connected in one sub-circuit is
(a) 800 watts. (b) 1,000 watts.
(c) 1,600 watts. (d) 500 watts.

2. As per recommendation of ISI the maximum number of points of lights, fans and socket outlets that can be connected in one sub-circuit is
(a) 8 (b) 10 (c) 15 (d) 20

3. The cheapest system of internal wiring is _____ wiring.
(a) cleat (b) casing-capping
(c) CTS or TRS (d) conduit

4. Highly skilled labour is required in
(a) TRS wiring. (b) conduit wiring.
(c) casing-capping wiring.
(d) both conduit and casing-capping wiring.

5. Which of the following types of wiring is preferred for workshop lighting?
(a) Casing-capping wiring. (b) Batten wiring.
(c) Concealed conduit wiring. (d) Surface conduit wiring.

6. Non-metallic conduits used in internal wiring are generally made of
(a) wood. (b) rubber. (c) PVC. (d) cork.

7. PVC conduits can be buried in
(a) plaster. (b) lime. (c) concrete. (d) any of these.

8. PVC conduits can be joined by
(a) welding. (b) threading.
(c) solvent cement. (d) any of these.

9. PVC cables are usually used for
(a) internal wiring of buildings and workshops.
(b) 6.6 kV (c) 11 kV (d) 33 kV

10. PVC is preferred over VIR in extreme environments such as in cement/chemical factory. This is because
(a) PVC is inert to oxygen and almost inert to oils and to many alkalines and acids.
(b) PVC is less costly.
(c) of good mechanical properties of PVC.
(d) all of the above.

11. Multistrand cables have the following advantages(s) with respect to the solid conductor
(a) The multistrand cables are more flexible and durable and, therefore, can be handled conveniently.
(b) The surface area of multistrand cable is more as compared to the surface area of equivalent single solid conductor, so heat radiating capacity is more.
(c) Skin effect is better as the conductor are tubular, specially in case of high frequency.
(d) all of the above.

12. A fuse is provided in an electric circuit for
(a) safeguarding the installation against heavy current.
(b) reducing the current flowing in the circuit.
(c) reducing the power consumption.
(d) all of the above.

13. According to fuse law, the current carrying capacity varies as
(a) diameter. (b) $(\text{diameter})^{1.5}$
(c) $(\text{diameter})^{1/2}$ (d) $\frac{1}{\text{diameter}}$

14. The rating of fuse wire is always expressed in
(a) volts. (b) amperes.
(c) ampere-volts. (d) ampere hours.

15. A fuse is normally a
(a) power limiting device. (b) voltage limiting device.
(c) current limiting device.
(d) power factor correcting device.

16. A fuse is
(a) always connected in series with the circuit.
(b) always connected in parallel with the circuit.
(c) normally connected in series with the circuit.
(d) normally connected in parallel with the circuit.

17. A fuse is
(a) normally inserted in phase wire.
(b) normally inserted in neutral wire.
(c) never inserted in neutral wire.
(d) never inserted in phase wire.

18. The fuse blows off by
(a) arcing. (b) burning.
(c) melting. (d) none of the above.

19. Protection by fuses is generally not used beyond
(a) 200 A. (b) 50 A. (c) 25 A. (d) 10 A.

20. Fuse material must have
(a) high melting point and high specific resistance.
(b) low melting point and high specific resistance.
(c) low melting point and low specific resistance.
(d) high melting point and low specific resistance.
[A.M.I.E. Sec B. Summer 1998]

21. A material best suited for manufacturing of fuse wire is
(a) silver. (b) copper. (c) aluminium. (d) zinc.

22. In comparison to rewirable fuses HRC fuses have the advantage(s) of
(a) high speed operation. (b) high rupturing capacity.
(c) no ageing effect. (d) all of the above.

23. The insulation on a current carrying conductor is provided to prevent
(a) current leakage. (b) shock.
(c) both (a) and (b). (d) none of these.

24. The thickness of insulation provided on the conductor depends upon
(a) current rating. (b) voltage rating.
(c) both (a) and (b). (d) none of these.

Answers: **1.** (a), **2.** (b), **3.** (a), **4.** (d), **5.** (c), **6.** (c), **7.** (d), **8.** (d), **9.** (a), **10.** (a), **11.** (d), **12.** (a), **13.** (b), **14.** (b), **15.** (c), **16.** (a), **17.** (c), **18.** (c), **19.** (a), **20.** (c), **21.** (a), **22.** (d), **23.** (c), **24.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

25. When a heater is connected to the power supply, the heater coil will glow but the supply wiring does not glow. This is because
(a) resistance of heater coils is very high incomparison to that of internal wiring.
(b) internal wiring is of superior material.
(c) the resistance of internal wiring is very high.
(d) supply wires are covered with insulation.

26. Lamps in street lighting are all connected in
(a) series. (b) parallel.
(c) series-parallel. (d) end-to-end.

27. Energy meter, for connection, has _____terminals.
(a) 2 (b) 4 (c) 6 (d) 8

28. Supplier's fuse, which is provided in domestic wiring system
(a) after the energy meter. (b) before the energy meter.
(c) before distribution board. (d) after main switch.

29. The safety of electrical appliances and wiring is ensured by
(a) insulation. (b) earthing.
(c) providing a fuse wire in the electric circuit.
(d) all of the above.

30. It is fatal to touch a live wire as
(a) the voltage may cause burns to the skin.
(b) it will cause flow of current through the human body.
(c) the current may cause burns to the skin or inside the body.
(d) it may cause damage to the heart and nerve system.

31. An electrical installation is earthed for
(a) safety to personnel. (b) fire protection.
(c) protection against electric shock.
(d) all of these. [G.B. Technical Univ. Second Semester 2010-11]

32. The earth wire should be
(a) good conductor of electricity.
(b) mechanically strong. (c) both (a) and (b).
(d) mechanically strong but bad conductor of electricity.

33. Earth wires are made of
(a) copper. (b) aluminium.
(c) iron. (d) galvanised stranded steel.

34. The resistance of earth should be
(a) infinite. (b) high.
(c) low. (d) the minimum possible.

35. The earth potential is taken as
(a) zero. (b) that of supply.
(c) infinite. (d) none of these.

36. The loop earth wire used shall not be of size less than
(a) 8 SWG. (b) 10 SWG (c) 16 SWG. (d) 20 SWG
(e) 14 SWG (2.9 mm^2) or half of the size of the sub-circuit wire.

37. Which of the following site will be preferred for earthing ?
(a) Clayey soil. (b) Dry and rocky.
(c) Wet mashy ground. (d) Damp and wet sand pit.

38. Which of the following is least preferred for earthing ?
(a) Clayey soil. (b) Dry earth.
(c) Earth mixed with salt and charcoal.
(d) None of the above.

39. Resistivity of earth increases sharply when mositure falls below.
(a) 60% (b) 40% (c) 20% (d) 10%

40. Earth electrodes can be in the form of
(a) strip or wire. (b) rod.
(c) pipe. (d) plate.
(e) any of the above.

41. Consider the following statements:
1. Shape of electrode.
2. Depth to which the electrode is driven into earth.
3. Specific resistance of soil.
4. Material of electrode.
Which of the following statements is correct?
(a) 1, 2, 3 and 4 (b) 2, 3 and 4
(c) 1 and 2 (d) 1, 3 and 4
[U.P.S.C. I.E.S. E.E.-I, 2001]

42. Which of the following is not used as earth continuity conductor ?
(a) Gas pipe. (b) Water pipe.
(c) Structural steel members. (d) All of the above.

43. Which of the following mixture is preferred for filling around the earth electrode for having effective earthing ?
(a) Coal-salt mixture. (b) lime-sand mixture.
(c) Sawdust-sand mixture. (d) Any of the above.

44. Inside the earth or pit, the earthing electrode should be placed
(a) horizontally. (b) vertically.
(c) inclined at 45°. (d) in any position.

45. The earthing electrodes should be placed within a distance of _____ metres from the building whose installation system is being earthed.
(a) 4.0 (b) 2.5 (c) 1.5 (d) 0.5

46. Third pin in a 3-pin plug is provided so as to
(a) provide an earth connection.
(b) provide a 3-phase supply, when required.
(c) provide a spare phase when required.
(d) prevent the plug being reversed in the socket.

47. Halogen lamps are useful for the illumination of
(a) airports. (b) parks and large gardens.
(c) playing fields. (d) all of the above.

48. Sodium vapour lamps are used for the illumination of
(a) streets and highways. (b) rail yards, storage yards.
(c) parks. (d) all of the above.

49. The fluorescent tube in comparison to tungsten filament lamp has the advantage of
(a) low cost. (b) longer life.
(c) simple installation. (d) more brightness.

50. Blinking of a fluorescent tube may be on account of
(a) low circuit voltage. (b) loose contact.
(c) defective starter. (d) any of the above.

51. In a fluorescent tube if only the ends of the tube remains lighted, it indicates that
(a) starter is short-circuited. (b) the choke is defective.
(c) the tube is defective. (d) any of the above.

52. Failure of lamp to light may be due to
(a) defective starter. (b) defective choke.
(c) defective and loose holders.
(d) any of the above.

53. Blinking of a fluorescent tube may be removed by
(a) replacement of starter. (b) checking of all connections.
(c) change of ballast tapping.
(d) any of the above-turn by turn.

54. The lamp that cannot sustain much voltage fluctuations is
(a) sodium vapour lamp. (b) mercury vapour lamp.
(c) incandescent lamp. (d) mercury iodide lamp.

Answers: **25.** (a), **26.** (b), **27.** (b), **28.** (a), **29.** (d), **30.** (b), **31.** (d), **32.** (d), **33.** (d), **34.** (d), **35.** (a), **36.** (e), **37.** (c), **38.** (b), **39.** (c), **40.** (e), **41.** (a), **42.** (d), **43.** (a), **44.** (b), **45.** (c), **46.** (a), **47.** (d), **48.** (d), **49.** (b), **50.** (d), **51.** (a), **52.** (d), **53.** (d), **54.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

55. Which of the following lamps you will recommend for kitchen to a poor man?
(a) Sodium vapour lamp. (b) Incandescent lamp.
(c) Mercury iodide lamp. (d) Carbon arc lamp.

56. The direct lighting scheme is most efficient but is liable to cause
(a) glare. (b) hard shadows.
(c) monotony. (d) both (a) and (b).

57. Standard domestic ac supply voltage in India is
(a) 220 V (b) 230 V (c) 240 V
[A.M.I.E. Sec B. Power Systems Summer 1999]

58. The most suitable way of providing electric supply to a multistorey building is by means of
(a) rising main. (b) overhead line.
(c) paper insulated cable.
(d) PVC insulated armoured cable.

59. In India high voltage transmission is mostly by
(a) overhead system. (b) underground system.
(c) both (a) and (b). (d) none of the above.

60. Transmission of power by ac cables is impossible beyond
(a) 40-60 km. (b) 400 km.
(c) 200 km. [A.M.I.E. Sec B. Power Systems Summer 1997]

61. Which of the following distribution systems is not normally used ?
(a) 3 phase, 3-wire. (b) 3 phase, 4-wire.
(c) Single phase, 3-wire. (d) Single phase, 2-wire.

62. Maximum permissible span with wooden poles is
(a) 20 m. (b) 30 m. (c) 50 m. (d) 100 m.

63. In order to protect the wooden poles from the action of termites etc. it is necessary to treat them with
(a) lime water. (b) creosite oil.
(c) bleaching powder. (d) sodium hydroxide.

64. Which support for overhead transmission line has the least life ?
(a) Wooden poles. (b) Fabricated steel structure.
(c) RCC poles. (d) Steel poles.
[A.M.I.E. Sec B. Power Systems Winter 1998]

65. Consider the following materials for line conductors :
1. Hard drawn copper. 2. Cadmium copper.
3. Aluminium. 4. Galvanised steel.
The correct sequence of the descending order of their electrical conductivities is
(a) 1, 2, 4, 3 (b) 2, 1, 4, 3
(c) 2, 1, 3, 4 (d) 1, 2, 3, 4
[U.P.S.C I.E.S. E.E.-II, 1995]

66. Galvanised steel wire is usually used as
(a) stay wire. (b) earth wire.
(c) structural components. (d) all of the above.

67. What will happen when a line conductor of an overhead supply line breaks down and touches the earth ?
(a) Current will flow to earth.
(b) Supply voltage will increase.
(c) No current will flow in the conductor.
(d) None of the above.

68. HV transmission line uses
(a) pin type insulators. (b) suspension insulators.
(c) both(a) and (b). (d) none of the above.

69. The insulators used in guy cables are
(a) egg or stay insulators. (b) shackle insulators.
(c) pin type insulators. (d) disc type insulators.

70. The size of conductor used in power cables depends on
(a) operating voltage. (b) power factor.
(c) current to be carried. (d) type of insulation used.

71. The insulating material most commonly used for power cables is
(a) PVC. (b) paper. (c) rubber.
[A.M.I.E. Sec B. Summer 1995]

72. Aluminium conductor cables can be joined by
(a) gas welding. (b) soldering.
(c) compression. (d) thermit-welding.

73. The method(s) used for jointing of copper conductor cable and aluminium conductor cable is/are
(a) thermit welding. (b) soldering.
(c) compression. (d) both (b) and (c).

74. The method(s) used for laying of underground cables is/are
(a) direct laying. (b) draw-in-system.
(c) solid system. (d) all of these.

75. Direct laying method of laying underground cable has the draw-back(s) of
(a) high maintenance cost. (b) localization of fault difficult.
(c) possibility of damage of cable sheath owing to undergoing chemical changes due to impurities present in the soil.
(d) risk of cable being damaged at a subsrequent excavation work carried out for expansion or repair.
(e) all of the above.

76. Draw-in-system of laying underground cables has the draw-back(s) of
(a) higher cost.
(b) reduced current carrying capacity of the cables.
(c) requirements of much deeper and wider trenches.
(d) repairs, alterations or additions difficult.
(e) all of the above except (d).

77. Solid system of laying underground cables has the drawback(s) of
(a) much higher cost.
(b) reduced current carrying capacity of cables.
(c) taking more time in laying and repair.
(d) no protection against mechanical injuries and from impurities present in the soil.
(e) all of the above except (d).

78. The system of laying underground cables adopted in congested areas, where excavation is expensive and inconvenient, is
(a) draw-in-system. (b) solid system.
(c) direct laying. (d) any of these.

79. Minimum distance of underground cable from the foundation of building should be
(a) 100 cm (b) 50 cm (c) 10 cm (d) 5 cm

80. Which of the following dc distribution systems is the simplest and cheapest in first cost ?
(a) Radial. (b) Ring main.
(c) Interconnected. (d) None of these.

81. Which distribution system is more reliable ?
(a) Ring main system. (b) Tree system.
(c) Radial system. (d) All are equally reliable.
[A.M.I.E. Sec B. Power Systems Winter 1999]

Answers: **55.** (b), **56.** (d), **57.** (c), **58.** (a), **59.** (a), **60.** (a), **61.** (c), **62.** (c), **63.** (b), **64.** (a), **65.** (d), **66.** (d), **67.** (a), **68.** (c), **69.** (a), **70.** (c), **71.** (b), **72.** (c), **73.** (d), **74.** (d), **75.** (e), **76.** (e), **77.** (e), **78.** (a), **79.** (c), **80.** (a), **81.** (a),

82. Which of the following statements is correct about erection of poles ?
(a) Dead-man and derrick pole methods of erection of poles are used respectively for heavier poles and lighter poles.
(b) Dead-man and derrick pole methods of erection of poles are used respectively for lighter poles and heavier poles.
(c) Dead-man method of erection of poles is used for lighter as well as heavier poles.
(d) None of the above.

83. Cradle guards are provided on the road crossings for the safety of the
(a) power line itself.
(b) human beings, animals and material moving on the road.
(c) both (a) and (b). (d) neither (a) nor (b).

84. The short length of the conductor used to connect the line conductor on one side of the terminal pole to the line conductor on the other side of the pole is known as
(a) jumper. (b) petticoat. (c) guard. (d) guy.

85. The insulation resistance test is performed on power line with
(a) ohmmeter. (b) earth tester.
(c) meggar. (d) any of these.

Answers: **82.** (b), **83.** (b), **84.** (a), **85.** (c).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below.
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

1. (A): It is dangerous to touch electric appliances with wet hands.
(R): When we touch electric appliances with wet hands, the transition resistance to the body reduces considerably.

2. (A): Switching of a lamp in house produces noise in a radio.
(R): Switching operation produces arc across separating contacts.

3. (A): Sparking occurs when a load is switched off.
(R): The circuit has high resistance.

4. (A): Rewirable fuse units are used in domestic installations of voltage rating up to 400 V and of current rating up to 300 A.
(R): Accurate calibration of fuse wire is not possible, as a longer fuse operates earlier than one of shorter length.

5. (A): As a general rule the lower the value of earth resistance better it is.
(B): The earth wire and earth electrode should be of same material.

6. (A): True colour rendition is not possible with mercury vapour lamps.
(R): There is complete absence of red light from mercury vapour lamp radiations.

7. (A): Direct lighting is the most commonly used type of lighting scheme.
(R): Direct lighting is most efficient lighting scheme.

8. (A): Distribution by ac system is undoubtedly superior to that by dc system.
(R): In ac system voltage control is easy by means of transformers.

9. (A): RCC poles are usually used for distribution purposes specially in urban area.
(R): RCC poles are very strong and have very long life.

10. (A): Glass insulators are commonly used for use on high voltage transmission lines.
(R): Glass is cheaper than porcelain and is transparent providing facility for detecting flaws in the material ready for visual examination.

11. (A): In extra high voltage transmission lines suspension insulators are used in place of pin type insulators.
(R): In a string of suspension insulators one or more insulators can be replaced without replacing the whole string.

12. (A): Pure rubber is commonly used as an insulating material.
(R): Pure rubber possesses high insulating qualities (permittivity between 2 and 3 and dielectric strength of 30 kV/mm).

13. (A): Paper insulated cables are commonly used in transmission and distribution of large blocks of power.
(R): Paper insulated cables are non-hygroscopic and need no protection against the ingress of moisture.

14. (A): Single-core cables are not provided with armouring.
(R): Single-core cables need not to be protected against mechanical injury.

15. (A): Solid system of cable laying is most suitable for short length cable routes such as in workshops, railway bridge crossings where frequent digging is costlier or impossible.
(R): In solid system of cable laying the cables remain protected mechanically and from chemical reaction due to impurities present in the soil.

16. (A): Radial system is most commonly used system of distribution of power.
(R): Radial system is the simplest and lowest in first cost.

17. (A): 3-wire dc distribution system is preferred over 2-wire dc distribution system.
(R): The 3-wire dc system of distribution is more safe.

18. (A): The survey of the overhead line must be carried out accurately and expeditiously.
(R): A mistake in the field or subsequent office work may cause unnecessary expenditure and inconvenience on later stage.

Answers: **1.** (a), **2.** (a), **3.** (c), **4.** (b), **5.** (b), **6.** (a), **7.** (a), **8.** (a), **9.** (b), **10.** (d), **11.** (b), **12.** (d), **13.** (c), **14.** (c), **15.** (d), **16.** (d), **17.** (c), **18.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

19. (A): The guards are provided below the line conductors of an overhead line when they cross road.
(R): The above is done to avoid damage to the line and thus maintain continuity of the supply.

20. (A): Special inspections of overhead lines are necessarily carried out before and after the monsoon/heavy rains.
(R): Interruptions and breakdowns on overhead lines are usually more frequent during rainy seasons due to the thunderstorms and rains.

nswers: 19. (c), **20.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Type of wiring)	List 2 (Fields of application)
A. Cleat-wiring	1. Godowns, workshops and public buildings.
B. Casing-capping wiring	2. Residential commercial and office buildings.
C. CTS or TRS wiring	3. Not in common use nowadays
D. Conduit wiring	4. Temporary installations.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	1	4	2
(d)	4	3	2	1

2.

List 1	List 2
A. Pole fuse	1. To carry earth fault current
B. Energy meter	2. To take many circuits from one
C. Supplier fuse	3. To protect meter
D. Distribution board	4. To register energy consumption
E. Earth wire	5. To protect service mains

Codes:	A	B	C	D	E
(a)	5	4	3	2	1
(b)	5	4	2	3	1
(c)	4	5	3	2	1
(d)	5	3	4	2	1
(e)	4	5	3	1	2

3.

List 1	List 2
A. Earthing.	1
B. Fuse.	2
C. Isolator.	3
D. Bus-bar	4 
Codes:	A	B	C	D
(a)	3	2	4	1
(b)	1	2	3	4
(c)	2	3	4	1
(d)	3	4	2	1

4.

List 1 (Type of lamp)	List 2 (Applications)
A. Carbon arc lamps.	1. General lighting.
B. Sodium vapour lamps.	2. Flood lighting.
C. Mercury iodide.	3. Street lighting.
D. Fluorescent tubes.	4. Cinema projectors.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	1	4	3
(c)	3	4	2	1
(d)	4	3	2	1

5.

List 1 (Symptom)	List 2 (Possible causes of faults in fluorescent tubes)
A. Dark streaks along tube.	1. Control unit in circuit or choke short-circuited.
B. Ends of tube remain lighted.	2. Defective tube/starter/ choke/holders.
C. Burn out electrodes.	3. Short-circuited starter.
D. Failure of tube to light up.	4. Mercury globules.

Codes:	A	B	C	D
(*a*)	4	3	1	2
(*b*)	3	4	1	2
(*c*)	4	3	2	1
(*d*)	1	2	3	4

6.

List 1	List 2
A. Poles.	1. To support line conductors at a safe distance from ground.
B. Cross arms.	2. To keep conductors at a safe distance from each other and from the pole.
C. Guys and Stays.	3. To protect the line against the lightning.
D. Continuous earth wire on top of the the tower.	4. To stay overhead lines at angle and terminal positions.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	1	4	3
(c)	1	2	4	3
(d)	3	4	1	2

nswers: 1. (d), **2.** (a), **3.** (a), **4.** (d), **5.** (a), **6.** (c).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Loop-in-system is universally used for connections of various lamps and other appliances in parallel.
2. Conduit wiring provides protection against fire and mechanical damage.
3. Fuse in provided only in phase wire, never on neutral wire.
4. In motor wiring installations, looping of conductors and use of tee-joints is not permitted.
5. The fusing current for a stranded fuse will be equal to the product of the number of strands and fusing current for one strand.
6. The characteristics of a fuse is governed by fuse material and shape of the fuse element.
7. Current rating of fuse element is always more than its fusing current.
8. In transmission lines, the ground wires run below the line conductors.
9. Maintenance of discharge lamps is more cumbersome.
10. Sodium vapour lamp is only suitable for operation on dc .
11. For the same lumens output, the operating cost of fluorescent lamp is less than the filament lamp.
12. With use, walls of a fluorescent tube blacken a little and dark rings appear near the ends owing to the deposition of active material from the electrodes.
13. Interior lighting is designed by lumen method.
14. Luminaires are generally categorized as industrial, commercial or residential.
15. Illumination level in railway yards is usually maintained at 10 to 20 lux.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (T), **5.** (F), **6.** (T), **7.** (F), **8.** (F), **9.** (T), **10.** (F), **11.** (T), **12.** (T), **13.** (T), **14.** (T), **15.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. As per recommendation of ISI the maximum load that can be connected in one sub-circuit/is _____ watts.
2. Non-metallic conduits used in internal wining are generally made of _____.
3. Fuses are always rated in _____ .
4. _____ is essentially a small price of metal inserted in a circuit which melts when a predetermined value of current flows through it. (circuit breaker, fuse)
   [A.M.I.E. Sec B Summer 2000]
5. ..... of a fuse element is defined as the current, which the fuse wire can normally carry without overheating or melting.
6. If two stranded fuse wires are twisted together, then fusing current of this wire will be ..... the sum of fusing current of two wires. (equal to, less than)
   [A.M.I.E. Sec B Summer 2000]
7. Resistivity of earth increases sharply when moisture falls below _____ .
8. Inside the earth of pit, the earthing electrode should be placed _____ .
9. _____ lighting scheme is best suited to rooms with high ceilings where a high level of uniformly distributed illumination is required.
10. Mercury vapour and _____ lamps have been found to have certain advantages for street lighting purposes.
11. The distribution by ac system is undoubtedly _____ to that by dc system.
12. RCC poles are _____ in weight and need _____ maintenance.
13. In an overhead system, the number of cross-arms carried by a pole depends on the number of _____ it has to carry.
14. The modern practice is not to use pin type insulators beyond _____ .
15. Shackle insulators are used on _____ lines.
16. Insulating materials are classified for different temperature rise such as _____.
17. The insulating materials most commonly used in a cable are _____ .
    [A.M.I.E. Sec B. Winter 1997]
18. All metallic parts, line components (except main line conductors) should be _____ properly according IE rule no. 90.
19. Dead-man method is used for erection of _____ poles.
20. _____ joint is preferred for jointing AA and ACSR conductors because it provides a good electrical contact and sufficient mechanical strength.

Answers

1. 800	2. PVC	3. amperes	4. Fuse
5. Current rating	6. less than	7. 20%	8. vertically
9. Semidirect	10. sodium discharge	11. superior	12. heavy; little
13. wires	14. 33	15. low voltage	16. Y, A, E, B, F, H, C
17. VIR; PVC; impregnated	18. earthed	19. lighter	20. Sleeve

CHAPTER 8

Electrical Power Generation and Economic Considerations

Short Answer Type Questions With Answers

1. INTRODUCTORY

Q. 1. What are the sources of energy that are utilized for generation of electrical energy?

Ans. Various sources of energy for generation of electrical energy are fuels (solid, liquid or gaseous), water and the atomic energy.

Q. 2. What are the reasons of power crises in India?

Ans. The causes, which are responsible for power crises in India, are sharp increase in demand, poor utilisation of electrical equipment, high transmission losses, the delay in commissioning of power projects, erratic monsoons, shortage of coal, faulty planning and plant outages.

2. HYDROELECTRIC POWER PLANTS

Q. 3. On what factors does the power output of a hydropower plant depend ?

Ans. The power developed by a hydro plant depends upon the discharge and head and is directly proportional to their (discharge and head) product.

Q. 4. What is meant by catchment area ?

Ans. The catchment area is the area, bounded by water sheds, which drains into a stream or river across which the dam has been built at a suitable place.

Q. 5. What is hydrograph ?

Ans. A hydrograph is a graphical representation between discharge or flow with time.

Q. 6. What is a mass curve ?

Ans. Mass curve is a curve which indicates the total volume of run-off in m^3 up to a certain time.

Q. 7. What is the use of mass curve ?

Ans. Mass curve is used in determination of the capacity of the storage reservoir in hydro-projects.

Q. 8. What for pondage is provided ?

Ans. In case power plant is away from the storage reservoir, a small pond is provided near the power plant in order to meet the hourly changes in power demand.

Q. 9. What for dam is provided ?

Ans. The functions of a dam in hydropower plants are to raise the water surface of the stream to create an artificial head and also to provide the pondage, storage or the facility of diversion into conduits.

Q. 10. What civil engineering works are necessary for a hydroelectric project ?

Ans. The civil engineering works for a hydroelectric project include reservoir dam, forebay, spillway, intake structures, surge tank, penstock, tail race etc.

Q. 11. What for surge tank is provided ?

Ans. Surge tank is provided to absorb sudden changes in water requirements and reduce water hammer and negative pressure in penstock.

Q. 12. What are the different types of turbines ?

Ans. Turbines employed in hydroelectric power plants are Pelton wheel, Francis turbine and Kaplan turbine.

Q. 13. On what factors does the selection of a water turbine depend ?

Ans. The selection of a water turbine depends upon various factors such as working head, available discharge, speed, output and nature of load.

Q. 14. Can an old steam power plant be an alternative to a pumped storage plant for peak load operations ?

Ans. No, because it is a costly proposition and moreover it (steam power plant) needs large starting time and shutdown time.

Q. 15. What are the advantages of small hydropower plants ?

Ans. Small hydropower plants offer several advantages such as simple operation, reliability, minimal maintenance, quick construction, simple civil engineering and small financial requirements.

3. STEAM POWER PLANTS

Q. 16. Why the thermal efficiency of a steam power plant is quite low ?

Ans. In a steam power station, more than 50% of total heat of combustion is lost as heat rejected to the condenser and this loss is unavoidable as heat energy cannot be converted into mechanical energy without a drop in temperature, and the steam in condenser

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

is at the lowest temperature. This is the reason that the thermal efficiency of a power plant is quite low.

Q. 17. Why thermal power stations are always situated by the side of a river or lake ?

Ans. The thermal power stations are always situated by the side of a river or lake so as to meet large quantity water requirement. Water is required in a steam power station (*i*) to raise the steam in boilers. (*ii*) for cooling purposes such as in condensers (*iii*) as a carrying medium such as in disposal of ash and (*iv*) for drinking purposes.

Q. 18. What is the function of the deaerator in a steam power plant ?

Ans. The function of deaerator is to reduce dissolved oxygen content in the condensate (feed water) by heating the feed water on the way from low pressure feed water heaters to the high pressure feed water heaters by the heat from bled steam.

Q. 19. Why are superheaters and reheaters used in steam power plants ?

Ans. Superheaters are used in steam power plants to remove the last traces of moisture from the saturated steam leaving the boiler tubes and also to increase its temperature above the saturation temperature from the heat of combustion gases from the furnace.

Reheaters are used in steam power plants to resuperheat the partly expanded steam from the turbine so that the steam remains dry as far as possible through the last stage of the turbine.

Q. 20. Why economiser and air-preheaters are used in steam power plants ?

Ans. Economiser and air-preheaters are such devices which recover the heat from the flue gases on their way to the chimney and raise the temperature of feed water and air supplied for combustion respectively and thus improve the efficiency of steam plants.

Q. 21. How does air-preheating save fuel ? **[A.M.I.E. Sec B. Summer 2000]**

Ans. In preheating of the incoming air the heat recovered from the flue gases leaving the economiser is utilized, which otherwise would have gone waste. This raises the temperature of the furnace gases, improves combustion rates and efficiency, and lowers the stack temperature, thus improving the overall efficiency of the boiler.

Q. 22. What is the function of the condenser in a steam power plant ?

[A.M.I.E. Sec B. Summer 1998]

Ans. The condenser does the job of condensing the steam exhausted from turbine and thus it helps in maintaining low pressure (below atmospheric) at the exhaust., thereby permitting expansion of steam in the turbine to a very low pressure. This improves the plant efficiency.

Q. 23. What for evaporators are used in steam power plants ?

Ans. Evaporators are used for supplying pure water as make-up feed water in steam power plants.

Q. 24. What is the function of steam nozzle ?

Ans. The function of a steam nozzle is to convert the heat energy of steam into kinetic energy and the chief use of a steam nozzle is to develop a high velocity jet of steam for driving a steam turbine .

Q. 25. On what factors does the selection of coal for a steam power plant depend ?

Ans. The selection of coal for a steam power plant depends on calorific value, weatherability, sulphur content, ash content, particle size, grindability index, caking characteristics etc.

Q. 26. How does overfeed and underfeed stokers differ ?

Ans. Overfeed stoker and underfeed stoker differ in the manner of feeding coal below or above the level at which primary air is admitted in the furnace. In the case of underfeed stokers, fuel is supplied into the furnace below the point of air admission while in the case of overfeed stokers, the coal is supplied into the grate above the point of admission of air.

Q. 27. What is tangential firing ? **[A.M.I.E. Sec B. Summer 2000]**

Ans. In tangential firing, the burners are placed in the corners of the furnace and they send horizontal streams of air and fuel tangent to an imaginary circle in the centre of the furnace.

Q. 28. What are the functions of primary air and secondary air in a pulverized coal fired boiler ? **[A.M.I.E. Sec B. Summer 2000]**

Ans. The function of primary air in a pulverized coal fired boiler is to dry the coal and convey the powdered fuel to the furnace while that of secondary air is to complete the combustion.

4. NUCLEAR POWER PLANTS

Q. 29. Name three important factors in choosing a site for atomic power plant. **[A.M.I.E. Sec B. Power Systems, Summer 1993]**

Ans. Three important factors in choosing a site for atomic power plants are :

(*i*) availability of water supply (*ii*) distance from populated area and (*iii*) transportation facilities.

Q. 30. Name three different types of fuels used in nuclear reactors.

[A.M.I.E. Sec B. Power Systems, Summer 1994]

Ans. Three different types of fuels used in nuclear reactor are :

(*i*) natural uranium U-235 (*ii*) plutonium (*iii*) enriched uranium.

Q. 31. How much power is generated by a fissioning of 1 gm of U^{235} per day ? **[Pb. Univ. Power Station Practice, December 1994]**

Ans. $\frac{2.57}{2.68}$ MW

Q. 32. What is meant by radioactivity ?

Ans. The disintegration or decay of unstable atoms accompanied by emission of radiation is called the radioactivity.

Q. 33. What is decay constant ?

Ans. The decay or disintegration constant may be defined as the proportion of atoms of an isotope decaying per second.

Q. 34. What is half-life ?

Ans. The half life or half-life period of a radioactive isotope is the time required for one half of the isotope to decay.

Q. 35. What is meant by mass defect ?

Ans. The difference between the experimental mass and calculated mass of the nucleus is called the mass defect or mass deficit.

Q. 36. What is binding energy ?

Ans. The energy that binds the nucleus together in the nucleus is called the nuclear binding energy. Binding energy is the energy equivalent of the mass defect.

Q. 37. What is mass energy equivalence ?

Ans. 1 amu = 931.5 MeV; amu stands for atomic mass unit.

Q. 38. What is nuclear fission ?

Ans. The splitting of a heavy nucleus into two or more smaller nuclei is termed nuclear fission.

Q. 39. What is critical mass ?

Ans. The minimum mass of fissionable material required to sustain a chain reaction is called the critical mass.

Q. 40. What is the purpose of a moderator is a nuclear power reactor ?

[A.M.I.E. Sec B. Power Systems, Summer 1994]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The purpose of a moderator in a nuclear power reactor is to slowdown the neutrons.

Q. 41. Name three moderators commonly used.

[A.M.I.E. Sec B. Power Systems, Summer 1994]

Ans. Three commonly used moderators are : (*i*) graphite (*ii*) ordinary or natural water and (*iii*) heavy water.

42. What is the purpose of a control rod in a nuclear power reactor ?

[A.M.I.E. Sec B. Summer 1994]

Ans. Control rods are meant for controlling the rate of fission of U-235.

43. Name any two materials used for control rods.

[A.M.I.E. Sec B. Summer 1994]

Ans. The materials used for control rods must have very high absorption capacity for neutrons. The commonly used materials for control rod are cadmium, boron or hafnium.

5. DIESEL ELECTRIC POWER PLANTS

Q. 44. What is the basic difference between a diesel engine and a steam turbine?

Ans. The main difference between a diesel engine and a steam turbine is that in the diesel engine the chemical energy of combustion is released inside the cylinder whereas in case of steam turbine the energy developed during combustion of fuel is first transformed into steam outside the turbine and then supplied to the turbine which in turn develops mechanical power in the turbine.

Q. 45. Why are superchargers provided in the air intake system of a diesel engine?

Ans. The supercharger is usually provided in the air intake system of a diesel engine so as to increase the pressure of intake air above atmospheric one and so develop an increased power output.

Q. 46. Why are strainers provided in the fuel supply system of a diesel engine?

Ans. Strainers are provided in the fuel supply of a diesel engine in order to remove suspended impurities and thus ensure clean fuel supply to the engine.

Q. 47. What is supercharging?

Ans. Supercharging, also known as *boosting,* can be defined as the admittance of an air charge into the cylinder larger than that obtainable as a result of the regular suction stroke. It is accomplished by external means as compared to regular suction, called the *natural aspiration.* The main object of supercharging is to increase the power output of the diesel engine without increasing its rotational speed or the cylinder dimensions. This is achieved by increasing the charge of air causing burning of more fuel and resulting in increase in mean effective pressure.

Q. 48. What are the advantages of supercharging?

Ans. Supercharging offers advantages of an *increased power output* (30-50%) at the given speed, *fuel economy* due to better combustion, *higher mechanical efficiency, better scavenging action* (in the case of two-stroke engines), *increased volumetric efficiency* and *reduced possibility of knocking* in diesel engines.

6. GAS TURBINE POWER PLANTS

Q. 49. How does a gas turbine differ from a diesel engine?

Ans. The gas turbine is different from the diesel engine in the respect that the combustion region is external to the prime mover.

Q. 50. Why are majority of gas turbine power plants employed as peak load plants?

Ans. Majority of such power plants are usually used for driving generators and supplying peak loads in other types of power plants (steam and hydroelectric power plants), because they can be started and loaded quickly. Other reasons for it are low initial costs and higher fuel costs.

Q. 51. Why are coal and peat not used as fuel in gas turbine power plants?

Ans. Though coal and peat can be employed as gas turbine fuels but these are not used mainly because of coal handling and ash handling problems.

Q. 52. Why is it advantageous to use high pressure turbine for driving compressor and low pressure turbine for driving alternator in gas turbine power plants ?

Ans. This arrangement has the advantage that the speed of the power turbine (the turbine driving the alternator) can be kept constant at synchronous speed while the speed of the turbine driving the compressor can be varied according to the output required.

Q. 53. Why is the efficiency of open-cycle gas turbine power plants quite low?

Ans. The overall efficiency of such power plants called the *open cycle plants is very low* as a greater part (around 65%) of the power developed by the turbine is used in driving the compressor. The fact that the hot gases from the combustion chamber are cooled to a safe temperature before admitting it to the turbine, also reduces the efficiency. The overall efficiency of the plant, owing to above reasons seldom exceeds 20%.

Q. 54. Compare the diesel power plants and gas turbine power plants of the same capacity. [Pb. Univ. 1991]

Ans. The gas turbine power plants have numerous inherent advantages over diesel power plants such as smaller site area, lower cost of buildings, low initial cost, better heat rate, less water requirement, easier maintenance, reduced attendance charges, improved reliability, less vibrations, no cyclic variations etc. There are no problems of fuel injection and cylinder lubrication as with diesel engines. Possibilities of use of lower grades of fuel oil or low grade waste gases with gas turbines are also there.

The only drawback of gas turbine power plant in comparison to diesel power plants is higher fuel consumption (0.2 – 0.25 kg per kWh output) which is insignificant against their inherent advantages, mentioned above.

Q. 55. In what respects gas turbine power plants are inferior to steam power plants?

Ans. The drawbacks of gas turbine power plants over steam power plants are:

1. The operating costs of a gas turbine power plants are much higher than those of a steam power plant.
2. Gas turbines can be employed only in small sizes (about 50 MW or so)
3. Like steam turbines, the gas turbine is not readily reversible.
4. In case of a gas turbine power plant, the compressor has to be started before starting of turbine and the former requires power from some external source.

7. NON-CONVENTIONAL METHODS OF POWER

Q. 56. What are merits, drawbacks and applications of thermoelectric power generation?

Ans. The main advantages of thermal converters are absence of moving parts, non-involvement of high pressures and use of any heat source. They are readily serviceable and quiet in operation. Thermal converters are preferred over other power sources from the point of view of reliability, compactness, portability and ease

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

of use. These are widely employed as power sources on spacecrafts, submarines, missiles, beacons, and other equipment of different kinds.

The main drawbacks of thermal converters are high cost, low efficiency and low outputs.

Q. 57. What is solar cell?

Ans. It is possible to convert solar energy directly into electrical energy by means of silicon wafer *photovoltaic cells*, also called the *solar cells*, without any intermediate thermodynamic cycle. The solar cells operate on the principle of *photovoltaic* effect, which is a process of generating an emf as a result of the absorption of ionizing radiation. Thus a solar cell is a transducer, which converts the sun's radiant energy directly into electrical energy and is basically a semiconductor diode capable of developing a voltage of 0.5-1 volt and a current density of 20-40 mA/cm² depending on the materials used and the conditions of sunlight.

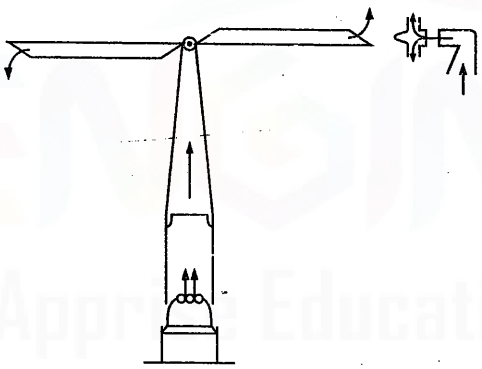
Q. 58. What is fuel cell?

Ans. A fuel cell is a device in which the chemical energy is converted directly into electrical energy. The chemical energy is the free energy of the reactants employed. The basic feature of the fuel cell is that the fuel and its oxidant are combined in the form of ions rather than neutral molecules.

Q. 59. How can wind energy be converted into electrical energy?

[Pb. Univ. January 1993]

Ans. The wind power can be harnessed to drive a wind turbine, to which is coupled an alternator. Schematic diagram is illustrated in figure. The hollow blades of about 25 m diameter are arranged on a tower. The air passes from the hollow chimney to the hollow blade ends, and due to centrifugal force the blades rotate. As the air passes into the tower, it drives the wind turbine and thus generates electrical energy. The speed of the wind may be of the order of 40-80 kmph and an output of 100 kW can be obtained.



Q. 60. Give the advantages of tidal power generation?

Ans. The advantages of tidal power are :

1. It is free from the problems of uprooting the people and disturbing the ecology balance.
2. It is everlasting and is not influenced by the changing mood of the nature such as failure of the monsoon.
3. No extra submerging of land is involved.

8. COMBINED OPERATION OF POWER PLANTS

Q. 61. What is the difference between base load and peak load?

Ans. The unvarying load, which occurs almost the whole day on the power plant is called the *base load* whereas the various peak demands of the load over and above the base load of the power plant is called the *peak load.*

Q. 62. Why the hydroelectric power plants are suited for both base load and peak load plants?

Ans. The power plants to be employed as base power plants should have (*i*) low operating cost (*ii*) capability of working continuously for the long periods (*iii*) requirement of few operating personnel and their repair should be economical and speedy.

The power plants to be employed as peak power plants should have the capability of quick start, synchronisation and taking up of system load and quick response to load variations.

As hydroelectric power plants meet the requirements of both base load and peak load plants, the hydropower plants are well suited for both base load and peak load operations. The hydropower plants should be employed for base load operation as far as possible because of their higher capital cost. However, during the periods of draught, the hydropower plants may be used as peak load plants.

Q. 63. Why are diesel engine power plants rarely used?

Ans. Diesel engine power plants are playing a very little role in bulk power generation because of their uneconomical operating costs.

Q. 64. Why is it advantageous to interconnect various power plants?

Ans. Interconnection of various power plants have the advantages of reduced reserved plant capacity in the system as a whole, improved load factor, diversity factor and operation efficiency, increased reliability of supply and effective capacity of the whole system, reduced capital cost per kW and economical operation of power plants.

9. ECONOMIC CONSIDERATIONS

Q. 65. What items constitute the fixed and running charges of generation of electrical energy ?

Ans. The fixed charges include the annual interest and depreciation on the capital cost of generating plant, transmission and distribution network, buildings and other civil works, all types of taxes and insurance charges and salaries of high officials, management and clerical staff and compensation given to the workers.

The running or operating cost includes annual costs of fuel, lubricating oil, water, maintenance and repairs of equipment and salaries of operational and maintenance staff and salaries of supervisory staff engaged in the running of the plant.

Q. 66. What is depreciation reserve ?

Ans. The depreciation charge represents the amount which is set aside from income every year and the amount so accumulated is called the depreciation reserve.

10. ECONOMICS OF GENERATION

Q. 67. How does the load duration curve differ from chronological load curve ?

Ans. The daily variations in load on the power station from time to time-hourly or half hourly can be plotted on a graph taking load on Y-axis and time on X-axis. The curve so obtained is known as chronological load curve. The load duration curve indicates the variation of load, but with the load arranged in descending order of magnitude *i.e.* the greatest load on the left, lesser loads towards the right hand and the least load at the extreme light.

Q. 68. What informations can be supplied by load curves ?

Ans. The informations that can be had from load curves are (*i*) variations of load during different hours of the day (*ii*) total number of units generated in a day (*iii*) maximum demand on the power station (*iv*) average load and (*v*) load factor.

Q. 69. How does energy load curve differ from mass curve ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The curve drawn between demand in kW or MW on Y-axis and units generated (kWh) on X-axis is known as integrated load duration curve or energy load curve while mass curve is plotted with units (kWh) generated as ordinate and time as abscissa.

Q. 70. What is diversity factor and how does it influence the cost of generation ?

Ans. The ratio of sum of individual maximum demands of all the consumers supplied by it to the maximum demand of the power station is called the diversity factor. It is always greater than unity. Higher the diversity factor better it is. With a given number of consumers the higher the diversity factor of their loads, the smaller will be capacity of the power plant required and consequently the fixed charges due to capital investment will be much reduced.

11. TARIFF

Q. 71. What type of tariff is employed for domestic consumers ?

Ans. Block rate tariff.

Q. 72. What is two-part tariff ?

Ans. In the two part tariff, the total charge to be made to the consumer is divided into two components namely fixed charge (proportional to connected load or maximum demand) and the running or operating charges (proportional to the units consumed).

Q. 73. For which category of consumers two-part tariff is used ?

Ans. Two-part tariff is mostly applicable to medium industrial consumers.

Q. 74. Which type of tariff encourages the consumers to keep the load factor and power factor high ?

Ans. kVA maximum demand tariff encourages the consumers to keep the load factor and power factor high.

Q. 75. Can a power factor be included in a tariff ?

Ans. Yes, power factor is included in power factor tariffs such as kVA maximum demand tariff, kWh and kVARh tariff and sliding scale or average power factor tariff.

Q. 76. What type of tariff is usually applied to bulk consumers.

Ans. Three-part tariff.

Q. 77. What are the advantages of using industrial/agricultural loads during night hours ?

Ans. During night hours a large proportion of the generating and distribution equipment remains idle due to extremely low demand. In case industrial and agricultural consumers are encouraged to use electricity during night and other off peak hours by giving a special discount, the energy can be supplied without incurring any additional capital cost.

Q. 78. What are the different types of loads ?

Ans. The main types of loads on a power system are domestic, commercial, agricultural, industrial, municipal, traction etc.

12. POWER FACTOR IMPROVEMENT

Q. 79. What is the necessity of power factor improvement ?

Ans. Low power factor causes the ratings of generators and transformers, cross-sectional area of the bus-bars and the contact surface of the switchgear, the size of the feeders and distributors, energy losses, voltage drops in generators, transformers, transmission lines and distributors to increase.

Q. 80. What factors determine the economical limit of power factor correction ?

Ans. Economical limit of power factor correction is governed by the relative costs of the supply and power factor correcting equipment.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The commercial sources of energy are
(a) fossile fuels, water and radioactive substances.
(b) solar, wind, biomass.
(c) wood, animal wastes and agricultural wastes.
(d) none of the above.

2. Which of the following power plants is the least reliable ?
(a) Wind. (b) Tidal.
(c) Geothermal. (d) Solar.

3. Which of the following methods of generating electric power from the sea water is more advantageous ?
(a) Ocean currents. (b) Wave power.
(c) Tidal power. (d) None of the above.

4. What is the total power installed capacity (approximate) in India?
(a) 125,000 MW (b) 175,000 MW
(c) 200,000 MW (d) 50,000 MW
[U.P.S.C. I.E.S. E.E.-II, 2007]

5. The power development programmes that are pssible in Tamil Nadu are largely based on
(a) steam power plants. (b) hydroelectric power plants.
(c) nuclear power plants. (d) diesel power plants.

6. The power output from an hydroelectric power plant depends on
(a) type of dam, type of catchment area and discharge.
(b) type of dam, head and system efficiency.
(c) discharge, head and system efficiency.
(d) type of turbine, type of dam and type of catchment area.

7. What is the correct expression for the electrical power developed by a hydroelectric plant in kW?
(a) $\frac{0.736}{75}$ wQHη (b) $\frac{75}{0.736}$ wQHη
(c) 75×0.736 wQHη (d) $\frac{7}{75 \times 0.736}$ wQHη
(Symbols have their usual meaning) [U.P.S.C. I.E.S. E.E.-II, 2007]

8. Taking the density of water to be 1,000 kg/m^3, how much power would be developed by a hydroelectric generator unit, assuming 100% efficiency, with 1.0 m head and 1.0 m^3/s discharge?
(a) 2.90 kW (b) 4.45 kW (c) 9.80 kW (d) 19.60 kW
[U.P.S.C. I.E.S. E.E.-II, 2008]

9. One million cubic meters of water is stored in a reservoir feeding a water turbine. The density of water is 993 kg/m^3. If the centre of mass of water is 50 meters above the turbine and the losses are negligible, the energy produced by that volume of water is:
(a) 135.3 MWhr. (b) 130 MWhr.
(c) 120 MWhr. (d) 140 MWhr.
[U.P.S.C. I.E.S. E.E.-II, 2011]

10. If power P available from a hydro-scheme is given by the formula P = 9.81 QH, where Q is the flow rate through the turbine in *l/s* and H is the head in metres, then P will be in units of
(a) W (b) HP (c) kJ/s (d) kWh
[U.P.S.C. I.E.S. E.E.-II, 2000]

11. If the discharge is 1 m^3/s and head of the water is 1 m, then the power generated by the alternator in one hour (assume 100% efficiency of generator and turbine) will be
(a) 10 kW (b) $\frac{73}{75}$ kW (c) $\frac{746}{75}$ kW (d) 100 kW
[U.P.S.C. I.E.S. E.E.-II, 1997]

12. An hydroelectric power station is supplied from a reservoir of capacity 3×10^7 m^3 at a head of 150 m. The overall efficiency of the power plant is 70% . Energy available from the plant will be
(a) 12.2625×10^6 kWh (b) 8.58375×10^6 kWh
(c) 1.25×10^6 kWh (d) 0.875×10^6 kWh

13. A hydroelectric power station is commonly found in
(a) desert areas. (b) hilly areas.
(c) swamps. (d) grasslands.
[A.M.I.E. Sec B. Summer 1993]

14. In hydroelectric power plants
(a) operating cost is low and initial cost is high.
(b) operating cost is high and initial cost is low.
(c) both operating cost as well initial cost are high.
(d) both operating cost as well as initial cost are low.

15. The advantage(s) of hydro plants is/are
(a) low operating cost.
(b) they can be started and loaded very quickly.
(c) they can be used as base load and peak load plants as well.
(d) all the above. [A.M.I.E. Sec B. Power Systems, Summer 1998]

16. The largest size of hydroelectric unit in India is
(a) 350 MW (b) 500 MW
(c) 165 MW (d) 90 MW
[A.M.I.E. Sec B. Power Systems, Summer 1996]

17. Gross head of an hydroelectric power station is
(a) the difference of water level between the level in the storage and tail race.
(b) the height of water level in the river where the tail race is provided.
(c) the height of water level in the river where the storage is provided.
(d) all of the above.

18. With reference to hydropower station, the graphical representation of the discharge as a function of time is known as:
(a) Monograph. (b) Hectrograph.
(c) Load duration curve. (d) Hydrograph.
[U.P.S.C. I.E.S. E.E.-II, 2011]

19. A graphical representation of the discharge and time is known as
(a) load curve. (b) load duration curve.
(c) monograph. (d) hectograph.
(e) hydrograph. [A.M.I.E. Sec B. Power Plant Engineering Summer 1994]

20. An hydrograph indicates
(a) the discharge at any time during the period under consideration.

Answers: **1.** (a), **2.** (a), **3.** (c), **4.** (a), **5.** (c), **6.** (c), **7.** (a), **8.** (c), **9.** (a), **10.** (a), **11.** (c), **12.** (b), **13.** (b), **14.** (a), **15.** (d), **16.** (c), **17.** (a), **18.** (d), **19.** (e), **20.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) the maximum and minimum run-off during the period.
(c) the average run-off during the period.
(d) all of the above.

21. Hydrograph is similar to
(a) load duration curve. (b) mass curve.
(c) energy load curve. (d) chronological load curve.
[A.M.I.E. Sec B. Power Systems, Summer 2000]

22. The factors affecting the run-off are
(a) rain fall pattern, shape and size of catchment area.
(b) the topography and nature of soil in the catchment area.
(c) amount of vegetation and weather condition in the catchment area.
(d) all of the above.

23. The flow duration curve at a given head of a hydroelectric plant is used to determine
(a) total power available at the site.
(b) total units of energy available.
(c) load-factor at the plant. (d) diversity factor for the plant.
[U.P.S.C. I.E.S. E.E.-II,1994]

24. The area under a flow duration curve represents.
(a) total units of energy available.
(b) total power available at site.
(c) total quantity of run-off during that period.
(d) maximum rate of run-off during that period.

25. A mass curve can be plotted from
(a) load duration curve.
(b) chronological load curve.
(c) energy load curve.
(d) both load duration curve and chronological load curve.
[A.M.I.E. Sec B. Design of Electrical Systems Summer 2005]

26. Storage requirement can be determined from
(a) hydrograph. (b) flow-duration curve.
(c) mass curve.
(d) either by hydrograph or by mass curve.

27. In hydropower stations what is an enlarged body of water just above the intake and used as a regulating reservoir, called?
(a) Spillways. (b) Forebay.
(c) Reservoir. (d) Penstock.
[U.P.S.C. I.E.S. E.E.-II, 2006]

28. A penstock is used as a conduit between
(a) the steam chest and the turbine in a thermal station.
(b) the dam and the turbine in a hydrostation.
(c) the turbine and the discharge drain.
(d) the heat exchanger and the turbine in a nuclear power plant.
(e) None of these.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1998]

29. In high head hydroelectric power plant, the velocity of water flow in penstock is around
(a) 2 m/s (b) 4 m/s (c) 7 m/s (d) 10 m/s

30. Location of a surge tank, in an hydroelectric power station, is near
(a) turbine. (b) tail race.
(c) reservoir. (d) dam.

31. The function of a surge tank is to
(a) supply water at constant pressure.
(b) relieve water hammer pressures in the penstock pipe.
(c) produce surge in the pipeline.
(d) none of the above.

32. Water hammer occurs in
(a) surge tank. (b) penstock.
(c) turbine casing. (d) draft tube.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1999]

33. In a medium or high head hydroelectric power station, a surge tank is provided to
(a) reduce the length of the penstock pipes.
(b) augment water at the forebay.
(c) control the pressure variations in the penstock pipes due to sudden load changes.
(d) control the water flow through the turbine.
[U.P.S.C. I.E.S. E.E.-II, 1996]

34. Where is the draft tube of a hydropower station that is an airtight pipe located?
(a) Near the surge tank.
(b) In between the penstock and the runner.
(c) In between the runner exhaust and the tailrace.
(d) At the beginning of penstock. [U.P.S.C. I.E.S. E.E.-II, 2009]

35. The draft tube is provided to
(a) raise the water surface of the stream to create an artificial head.
(b) reduce the effect of water hammer.
(c) increase the acting head on the water wheel.
(d) none of the above.

36. For variable heads of near about but less than 30 metres, which type of turbines is used in hydropower stations?
(a) Pelton. (b) Kaplan.
(c) Francis. (d) None of the above.
[U.P.S.C. I.E.S. E.E.-II, 2006]

37. For harnessing lower variable water heads, the suitable hydraulic turbine with high percentage of reaction and runner adjustable vanes is
(a) Kaplan (b) Francis (c) Pelton (d) Impeller
[GATE E.E.-2004]

38. For harnessing low variable water heads, the suitable hydraulic turbine with reaction and adjustable vanes is:
(a) Francis (b) Impeller.
(c) Kaplan. (d) Pelton.
[U.P.S.C. I.E.S. E.E.-II, 2011]

39. For high head and low discharge the water turbine used is
(a) Pelton wheel. (b) Kaplan turbine.
(c) Francis turbine. (d) propeller turbine.

40. The specific speed (N_s) of a turbine is given by the equation
(a) $N_s = \frac{N\sqrt{P}}{H^{0.75}}$ (b) $N_s = \sqrt{N}.P/H^{3/2}$
(c) $N_s = \frac{N\sqrt{P}}{H^{1.25}}$ (d) $N_s = N\sqrt{P}/H^{2/3}$

41. The "specific speed" of a water turbine is the speed at which the turbine develops
(a) maximum horse power. (b) unit horse power at all heads.
(c) unit horse power at unit head.
(d) minimum horse power. [U.P.S.C. I.E.S. E.E.-II, 1993]

42. The specific speeds of Kaplan, Francis and Pelton turbines are in
(a) the increasing order. (b) the decreasing order.
(c) neither increasing nor decreasing order.
[A.M.I.E. Sec B. Summer 1993]

Answers: **21.** (d), **22.** (d), **23.** (a), **24.** (c), **25.** (b), **26.** (d), **27.** (b), **28.** (b), **29.** (c), **30.** (a), **31.** (b), **32.** (b), **33.** (c), **34.** (b), **35.** (c), **36.** (b), **37.** (a), **38.** (c), **39.** (a), **40.** (c), **41.** (c), **42.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

43. An impulse turbine
(a) is most suited for low head and high discharge power plants.
(b) operates by initial complete conversion to kinetic energy.
(c) makes use of a draft tube.
(d) always operates submerged.

44. Turbines installed at Bhakra Nangal are
(a) Pelton wheels. (b) Francis turbines.
(c) Kaplan turbines. (d) Propeller turbines.

45. In water turbines, the runaway speed of Pelton wheel is
(a) 1.8 times rated speed. (b) 2 – 2.2 times rated speed.
(c) 2.5–3 times rated speed. (d) full load speed.

46. The number of buckets (Z) for a Pelton wheel in terms of jet ratio(m) is given by empirical relation
(a) $Z = 15\ m + 0.5$ (b) $Z = 0.5\ m + 15$
(c) $Z = 2\ m + 15$ (d) $Z = 2 + 15\ m$

47. In reaction turbine, the function of draft tube is to
(a) reduce water hammer. (b) increase flow rate of water.
(c) convert kinetic energy of water to potential energy by a gradual expansion in divergent part.
(d) none of the above.

48. In Francis turbine runner, the number of blades is usually of the order of
(a) 16 – 24 (b) 8 – 10 (c) 6 – 8 (d) 3 – 6

49. The maximum head of a Kaplan turbine is limited to
(a) 25 m (b) 70 m (c) 125 m
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

50. Which of the following statements is/are correct?
In pumped storage power plants,
(a) water is recirculated through water turbines.
(b) reversible turbines are used which operate as turbines for power generation during peak load hours and as pumps for pumping water during peak-off hours.
(c) plain Francis turbines are used.
(d) both (a) and (c) above are employed. [U.P.S.C. I.E.S. E.E.-II, 2007]

51. Consider the following statements regarding pumped storage plants:
1. A pumped storage plant is a base load plant.
2. The starting time of a pumped storage plant is very short.
3. Reversible turbines and pumps are highly suitable for pumped storage plants.
Which of the statements given above are correct?
(a) 1 and 2. (b) 1 and 3.
(c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2004]

52. In pump storage hydropower plant, the electrical machine is made to work alternately as generator and motor. The efficiency of the generator working at the same electric power level is
(a) greater than that as motor.
(b) equal to that as motor. (c) less than that as motor.
(d) greater or less than that as motor depending on the type of the machine. [U.P.S.C. I.E.S. E.E.-II, 2001]

53. A 'Pumped storage hydroelectric plant' consists of:
(a) A synchronous machine and a multistage centrifugal pump in one shaft.
(b) A synchronous machine, a reaction turbine, and a multistage centrifugal pump all in one shaft.
(c) An induction generator, a synchronous machine and a reaction turbine, all in one shaft.
(d) An induction generator, a synchronous machine, and a multistage centrifugal pump, all in one shaft.
[U.P.S.C. I.E.S. E.E.-II, 2011]

54. Consider the following statements:
Pumped storage plants when operated in interconnected power systems serve to
1. increase load factor of steam plant.
2. provide added capacity to meet peak loads.
3. decrease load factor of steam plant.
4. provide added capacity to meet base loads.
Which of the above statements are correct?
(a) 1, 2, 3 and 4. (b) 1 and 3 only.
(c) 1 and 2 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

55. Consider the following statements regarding the pumped storage plants:
1. A pumped storage plant is a peak load plant.
2. The starting time of a pumped storage plant is very long.
3. Reversible turbines and pumps are very suitable for pumped storage plants.
4. Pumped storage plants can be used for load frequency control.
Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 2 only.
(c) 1, 3 and 4. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2009]

56. In India, pumped storage power plant
(a) does not exist at all. (b) exists is Rajasthan alone.
(c) exists in Kadampurai (TN).
(d) exists in Haryana.

57. The pumped storage scheme is employed to supply
(a) during the peak hours. (b) during the off-peak hours.
(c) system base load. [A.M.I.E. Sec B. Power Systems, Summer 1999]

58. In pumped storage scheme, the generator is also used as
(a) induction generator or synchronous condenser.
(b) induction generator or synchronous motor.
(c) synchronous generator or induction generator.
(d) synchronous motor or synchronous condenser.
[U.P.S.C. I.E.S. E.E.-II, 1993]

59. Pump storage schemes are used to improve
(a) the power factor. (b) the diversity factor.
(c) the load factor. (d) the quality of voltage.
(e) the reactive power capacity.
(f) the plant capacity factor as well as the load factor of the power system. [A.M.I.E. Sec B. Power Plant Engineering, Summer 1998]

60. A hydel power plant of run-off-river type should be provided with pondage so that the
(a) firm capacity of the plant is increased.
(b) operating head is controlled.
(c) pressure inside the turbine casing remains constant.
(d) kinetic energy of the running water is fully utilized.
[U.P.S.C. I.E.S. E.E.-II, 1998]

61. Bulb turbines are
(a) low head axial flow turbines.
(b) high speed turbines. (c) high head turbines.
(d) high pressure turbines.

62. Bulb turbines
(a) can be used at very low and widely varying heads.
(b) are smaller, faster and easier to build than other types and are cheaper in capital cost than Kaplan turbines.
(c) are universally used for small hydro schemes.
(d) all of the above.

63. In turbulent flow
(a) cohesion is more effective than momentum transfer in causing shear stress.

Answers: **43.** (b), **44.** (a), **45.** (a), **46.** (b), **47.** (c), **48.** (a), **49.** (a), **50.** (b), **51.** (c), **52.** (c), **53.** (b), **54.** (c), **55.** (c), **56.** (c), **57.** (a), **58.** (d), **59.** (f), **60.** (a), **61.** (a), **62.** (d), **63.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) shear stresses are usually larger than those in laminar flow.
(c) the fluid particles move in an orderly manner.
(d) momentum transfer is on molecular scale only.

64. Rotameter is used for measuring .
(a) fluid discharge. (b) fluid density.
(c) fluid viscosity. (d) all of the above.

65. A hydraulic turbine having rated speed of 250 rpm is connected to a synchronous generator. In order to produce power at 50 Hz, the number of poles required in the generator are
(a) 6 (b) 12 (c) 16 (d) 24
[GATE E.E.-I, 2004]

66. A steam power station needs space
(a) less than that required by the diesel power station of the same output.
(b) less than that required by atomic power station of the same output.
(c) less than that required by hydropower station of the same capacity.
(d) less than that required by a gas turbine power station of the same output.

67. Consider the following statements concerning steam power plants:
1. Maintenance and operating costs are low.
2. Water is required in huge quantity.
3. Requires long time for starting.
4. Handling of coal and disposal of ash can be done easily.
Which of the above statements is/are correct?
(a) 1 only. (b) 2 and 3.
(c) 3 only. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2009]

68. Operating cost of steam power station is
(a) less than that of nuclear power plants.
(b) less than that of diesel/gas turbine power plants.
(c) less than that of hydroelectric power plants.
(d) is the same as that of nuclear power plant.

69. The public sector unit associated with the manufacturing of steam power plant equipment in India is
(a) Bharat Heavy Electricals Ltd.
(b) N.T.P.C.
(c) Heavy Engineering Corporation.
(d) Neyveli Lignite Corporation.

70. Public sector undertaking associated with erection and commissioning of steam power plants in India is
(a) Indian Electricity Authority.
(b) National Thermal Power Corporation Ltd.
(c) Bharat Coking Coal Ltd. (d) Coal India Ltd.

71. On which one of the following cycles does a modern steam power plant work?
(a) Carnot cycle (b) Rankine cycle
(c) Otto cycle (d) Bell-Coleman cycle
[U.P.S.C. I.E.S. E.E.-II, 2005]

72. Rankine cycle efficiency of a steam power plant is in the range of
(a) 20–30%. (b) 30–45%.
(c) 45–60%. (d) 60–80%.

73. In Rankine cycle, the work output from a turbine is given by
(a) change of enthalpy between inlet and outlet.
(b) change in internal energy between inlet and outlet.
(c) change of entropy between inlet and outlet.
(d) change in temperature between inlet and outlet.

74. Binary vapour cycles are used for
(a) increasing the turbine efficiency.
(b) improving the condenser performance.
(c) improving the plant efficiency.
(d) all of the above.

75. Binary vapour cycles are not being adopted because
(a) initial cost of such plants is high.
(b) such plants are suitable for high load factors only.
(c) pipes of thicker sections are required.
(d) ideal vapours are not available.

76. The overall efficiency of a thermal power station is equal to
(a) that of Rankine cycle. (b) that of regenerative cycle.
(c) that of Binary vapour cycle.
(d) product of boiler efficiency, turbine efficiency and generator efficiency.

77. Rankine cycle operating between pressure limits of P_1 and P_2 has thermal efficiency
(a) lower than that of Carnot cycle operating between same pressure limits.
(b) higher than that of Carnot cycle operating between same pressure limits.
(c) same as that of Carnot cycle operating between same pressure limits.
(d) none of the above.

78. Reheat cycle in a steam power station is employed for
(a) improving thermal efficiency.
(b) improving condenser performance.
(c) reducing heat losses. (d) utilising heat of flue gases.

79. In a regenerative cycle, feed water is heated by
(a) heaters.
(b) drained steam from the turbine.
(c) exhaust gases. (d) all of the above.

80. In a regenerative feed heating cycle,
(a) the optimum value of the fraction of steam extracted for feed water heating increases with the increase in Rankine cycle efficiency.
(b) the greatest economy is affected when steam is extracted from several places in different stages of the steam turbine.
(c) thermal efficiency is reduced.
(d) both (a) and (b).

81. What is the approximate efficiency of a normal thermal power station?
(a) 30-40% (b) 45-55% (c) 20-25% (d) 60-70%
[U.P.S.C. I.E.S. E.E.-II, 2007]

82. In a thermal power station, a typical heat balance sheet, for a large turbine and surface condenser taken together, is the percentage distribution of heat energy in:
1. work done or thermal efficiency.
2. friction and windage loss.
3. heat to circulating water.
4. heat in condensate to be retained to the boiler.
The percentage amount of heat in the heads stated above, in the descending order is:
(a) 3, 4, 1 and 2. (b) 2, 1, 4 and 3.
(c) 3, 1, 4 and 2. (d) 2, 4, 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2011]

83. Maximum efficiency of modern coal fired steam-raising thermal power plants is restricted to about 0.35 (a low value), mainly because of

Answers: **64.** (a), **65.** (d), **66.** (c), **67.** (b), **68.** (b), **69.** (a), **70.** (b), **71.** (b), **72.** (b), **73.** (a), **74.** (c), **75.** (a), **76.** (d), **77.** (b), **78.** (a), **79.** (b), **80.** (d), **81.** (a), **82.** (c), **83.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) low alternator efficiency. (b) high energy loss in boilers.
(c) low steam turbine mechanical efficiency.
(d) high energy loss from turbine exhaust to condenser.
[U.P.S.C. I.E.S. E.E.-II, 2008]

84. Which of the following contributes to the Rankine cycle efficiency improvement in a steam power plant ?
(a) Use of high pressure.
(b) Reheat of steam at intermediate stages.
(c) Use of steam for heating of boiler feed water.
(d) All of the above.

85. The steam power plant efficiency can be improved by
(a) using large quantity of water.
(b) burning large quantity of coal.
(c) using high pressure and high temperature steam.
(d) decreasing the load on the plant.

86. The average load factor of thermal power plants in India is
(a) 100% (b) 80-95% (c) 50-60% (d) 35-45%
(e) 20-30% [A.M.I.E. Sec B. Summer 1994]

87. As the size of a thermal generating unit increases, the capital cost per kW of installed capacity
(a) increases. (b) decreases.
(c) remains the same. (d) may increase or decrease.
[A.M.I.E. Sec B. Power Systems, Summer 1996]

88. The modern trend in electric power generation is
(a) to have a large number of small size thermal plants located at different places.
(b) to have large size thermal plants near load centres.
(c) to have large size thermal plants located near coal fields.
(d) none of the above. [A.M.I.E. Sec B. Power Systems, Summer 1998]

89. In the feed water and steam circuit of a thermal power plant, the condensate flows from the condensate extraction pump to the boiler feed pump and, then to the boiler. The HP and LP heaters are located in this circuit in relation to the boiler feed pump (BFP) as
(a) both HP and LP heaters after BFP.
(b) HP heater before and, LP heater after BFP.
(c) both HP and LP heaters before BFP.
(d) LP heater before and, HP heater after BFP.
[U.P.S.C. I.E.S. E.E.-II, 1996]

90. In thermal power plants, the pressure in the working fluid cycle is developed by
(a) condenser. (b) superheater.
(c) feed water pump. (d) turbine. [GATE E.E. E.E.-2004]

91. Deaerative heating is done to
(a) heat the steam. (b) heat the feed water.
(c) remove dissolved gases in water.
(d) remove dissolved solid impurities in water.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1999]

92. In a thermal power plant, the feed water coming to the economiser is heated using
(a) HP steam. (b) LP steam.
(c) direct heat in the furnace. (d) flue gases. [GATE E.E. 2000]

93. Arrange the following in the correct sequence in which the flue gas passes through them after coming out of the boiler in a thermal power station:
(1) ID Fan. (2) Air preheater.
(3) Economiser. (4) Electrostatic precipitator.
Select the answer using the codes given below Codes
(a) 4, 3, 2, 1 (b) 3, 2, 4, 1 (c) 2, 1, 4, 3 (d) 1, 4, 3, 2
[U.P.S.C. I.E.S. E.E.-II, 1994]

94. In bleeder turbines, part of the steam is extracted for
(a) condensation. (b) reheating.
(c) feed water heating. (d) secondary air heating.

95. Which of the following is not a fire tube boiler ?
(a) Babcock and Wilcox. (b) Lancashire.
(c) Locomotive. (d) Cochron.

96. Water is supplied to the boiler at
(a) atmospheric pressure.
(b) more than steam pressure in the boiler.
(c) slightly more than atmospheric pressure.
(d) any pressure.

97. The efficiency of a boiler used in a modern steam power plant is of the order of
(a) 30% (b) 50% (c) 85% (d) 100%

98. Steam pressure used in steam power plants in India is in the range of
(a) 110–170 kg/cm^2 (b) 40–80 kg/cm^2
(c) 20–40 kg/cm^2 (d) 250 kg/cm^2

99. Critical pressure for steam is in the range of
(a) 50 – 100 kg/cm^2 (b) 100 – 200 kg/cm^2
(c) 200 – 250 kg/cm^2 (d) above 300 kg/cm^2

100. A super critical boiler is one that operates above the pressure and temperature of the following values
(a) 100 kg/cm^2 and 540° C (b) 218 kg/cm^2 and 540° C
(c) 100 kg/cm^2 and 373° C (d 218 kg/cm^2 and 373° C
[A.M.I.E. Sec B. Summer 1993]

101. In a boiler, the carry over of slugs of water into the piping because of dirty water is called the
(a) foaming. (b) pitting. (c) scalping. (d) beating.

102. Which of the following steam will have least enthalpy ?
(a) Dry and saturated steam at 25 kg /cm^2.
(b) Wet steam at 25 kg/cm^2.
(c) Superheated steam at 25 kg/cm^2.
(d) All of the above will have the same enthalpy.

103. The boilers using lignite as fuel do not use
(a) spreader stoker. (b) travelling grate stoker.
(c) underfeed stoker. (d) all of the above.

104. Pipes carrying steam are generally of
(a) steel. (b) cast iron.
(c) aluminum. (d) cobalt.

105. For given power a water tube boiler occupies
(a) less floor area and less height.
(b) more floor area and less height.
(c) less floor area and more height.
(d) more floor area and more height than a fire tube boiler.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

106. The selection of the type and size of a steam boiler depends upon
(a) the power required and working pressure.
(b) the geographical position of the powerhouse.
(c) the fuel and water availability.
(d) all of the above factors.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

107. In a superheater
(a) pressure rises and temperature drops .
(b) temperature rises and pressure drops .
(c) temperature rises and pressure remains unchanged.
(d) pressure rises and temperature remains the same.

Answers: **84.** (d), **85.** (c), **86.** (c), **87.** (b) **88.** (c), **89.** (d), **90.** (c), **91.** (c), **92.** (d), **93.** (b), **94.** (c), **95.** (a), **96.** (b), **97.** (c), **98.** (a), **99.** (c), **100.** (b), **101.** (a), **102.** (b), **103.** (c), **104.** (a), **105.** (c), **106.** (a), **107.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

108. Within the boiler, the steam has highest temperature in
(a) superheater. (b) water tubes.
(c) water walls. (d) water drum.

109. Which of the following enters the superheater ?
(a) Superheated steam. (b) Wet steam.
(c) Hot water. (d) Cold water.

110. Superheated steam is always
(a) at a pressure more than that of the boiler steam.
(b) at a pressure lower than the maximum cycle pressure.
(c) at a temperature higher than the temperature of saturation corresponding to the steam pressure.
(d) none of the above.

111. Steam is superheated in order to
(a) improve Rankine cycle efficiency.
(b) reduce initial condensation losses.
(c) avoid too high temperature in the last stage of the turbine.
(d) all of the above.

112. The function of the economiser is to
(a) heat up the incoming water with exhaust steam.
(b) heat up the pulverised fuel by exhaust gases.
(c) heat up the incoming air by exhaust gases.
(d) heat up the incoming water by exhaust gases.
[A.M.I.E. Sec B. Winter 1994]

113. The main function of economiser of a boiler plant is to
(a) increase steam production.
(b) reduce fuel consumption.
(c) increase steam pressure.
(d) increase life of the boiler. **[A.M.I.E. Sec B. Winter 1994]**

114. In a steam power plant heat from the flue gases is recovered in
(a) a condenser. (b) a chimney.
(c) economiser and air preheater. (d) a desuperheater.

115. Economiser in a steam power plant
(a) improves the boiler efficiency by 10-12%.
(b) saves fuel consumption by 5-15%.
(c) becomes a necessity for pressure exceeding 70 kg/cm^2.
(d) all of the above.

116. The advantage of reheating of steam in a turbine is that
(a) it increases the efficiency of the turbine.
(b) it reduces the wears on the blades.
(c) it increases the workdone through the turbine.
(d) all of the above advantages.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

117. Air preheater in a steam power plant
(a) recovers the heat from the flue gases leaving the economiser.
(b) improves combustion rate.
(c) raises the temperature of the furnace gases.
(d) all of the above.

118. Condensers in thermal power plants are for condensing
(a) steam to water. (b) water to ice.
(c) hydrogen gas to liquid gas.
(d) carbon dioxide to dry ice.
[A.M.I.E. Sec B. Power Systems, Summer 1993]

119. A condenser in a steam power plant condenses steam coming out of
(a) turbine. (b) boiler.
(c) economiser. (d) superheater.

120. In a steam power plant water is used for cooling purposes in
(a) economiser. (b) condenser.
(c) superheater. (d) electrostatic precipitator.

121. In a steam turbine cycle, the lowest pressure occurs in
(a) condenser. (b) turbine inlet.
(c) boiler. (d) superheater.

122. Increase in condenser back pressure will lead to a
(a) loss. (b) gain. (c) none of these.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1996]

123. In which part of the thermal power plant, the steam pressure is less than that of atmosphere ?
(a) Boiler. (b) Turbine.
(c) Superheater. (d) Condenser.

124. The major function of the condenser is to
(a) remove the condensate for boiler feed water.
(b) condense steam.
(c) reduce the back pressure so that maximum heat energy can be extracted from steam.
(d) provide a closed cycle. **[A.M.I.E. Sec B. Summer 1993]**

125. The function of a condenser in a steam power plant is to
(a) condense the large volume of steam to water to be used as boiler feed water.
(b) receive the large volume of steam exhausted from the steam turbine.
(c) maintain pressure below atmospheric so that maximum heat energy can be extracted from steam.
(d) all of the above.

126. Evaporative type of condenser has
(a) steam in pipes surrounded by water.
(b) water in pipes surrounded by steam outside.
(c) steam and cooling water mixed to give condensate.
(d) none of the above.

127. In a jet type condenser
(a) steam passes through tubes and cooling water surrounds them.
(b) water passes through tubes and steam surrounds them.
(c) steam and cooling water mix.
(d) none of the above.

128. In a shell and tube surface condenser
(a) steam passes through the tubes and cooling water surrounds them.
(b) cooling water passes through the tubes and steam surrounds them.
(c) steam and water mix to give condensate.
(d) none of the above.

129. In a regenerative surface condenser
(a) there is no pump to remove condensate and the condensate gets removed by gravity.
(b) there is only one pump for removing air and condensate.
(c) there are two pumps to remove air and condensate.
(d) there are three pumps to remove air, condensate and vapour.

130. In a surface condenser, on removal of air
(a) absolute pressure of condenser is reduced.
(b) absolute pressure of condenser is increased.
(c) absolute pressure of condenser remains unaffected.
(d) temperature of condensed steam is increased.

131. The purpose of the boiler feed pump is to
(a) pump hot air into the boiler.
(b) pump pulverised coal into the boiler.
(c) pump out steam from the boiler.
(d) pump water into the boiler.
(e) none of the above. **[A.M.I.E. Sec B. Winter 1994]**

Answers: **108.** (a), **109.** (b), **110.** (b), **111.** (d), **112.** (d), **113.** (b), **114.** (c), **115.** (d), **116.** (d), **117.** (d), **118.** (a), **119.** (a), **120.** (b), **121.** (a), **122.** (a), **123.** (d), **124.** (c), **125.** (d), **126.** (a), **127.** (c), **128.** (b), **129.** (c), **130.** (a), **131.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

132. The function of air pumps in a condenser is to
(a) remove water.
(b) air leaking into the condenser and maintain vacuum.
(c) maintain atmospheric pressure in the condenser.
(d) both (a) and (b).

133. Wet air pump is to remove
(a) condensate only. (b) air only.
(c) both air and condensate. (d) vapour from the condenser.

134. In a steam power plant cooling towers are used for
(a) cooling condenser outlet water.
(b) cooling exhaust steam. (c) cooling feed water.
(d) all of the above.

135. Spray ponds are used for cooling warm water coming out of condenser in
(a) large power plants. (b) medium power plants.
(c) small power plants.
(d) both in medium and large power plants.

136. The drawback (s) of spray ponds is /are
(a) large ground area is required especially in case of large sized power plants.
(b) loss of water due to evaporation.
(c) considerable quantity of water is carried away in air when its velocity is high.
(d) all of the above.

137. In which of the following steam turbines the back pressure will be below the atmospheric one ?
(a) Non-condensing turbine. (b) Condensing turbine.
(c) Topping turbine. (d) None of the above.

138. The modern steam turbines are
(a) reaction turbines. (b) impulse turbines.
(c) impulse reaction turbines.
(d) none of the above.

139. In case of reaction steam turbine
(a) there is a enthalpy drop both in fixed and moving blades.
(b) there is enthalpy drop only in moving blades.
(c) there is enthalpy drop only in fixed blades.
(d) none of the above.

140. The largest size of steam turbine installed in India is
(a) 100 MW (b) 250 MW
(c) 500 MW (d) 1,000 MW

141. As compared to steam at entry to the turbine which of the following will be larger at exit ?
(a) Flow rate. (b) Pressure.
(c) Specific volume. (d) Specific enthalpy.

142. For the same power, the size of a turbine
(a) increases with speed. (b) remains with speed.
(c) decrease with speed.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1993]

143. The pressure on the two sides of the impulse wheel of a steam turbine
(a) is different. (b) is the same.
(c) reduces from one side to the other side.
(d) increases form one side to the other side.

144. Reheat factor in steam turbines depends on
(a) stage efficiency. (b) exit pressure.
(c) initial pressure and temperature.
(d) all of the above.

145. In steam turbines, the reheat factor
(a) increases with the increase in number of stages.
(b) reduces with the increase in number of stages.
(c) remains the same irrespective of number of stages.
(d) none of the above.

146. The value of reheat factor for a multistage steam turbine lies in the range of
(a) 1.005 to 1.03 (b) 1.01 to 1.06
(c) 1.02 to 1.1 (d) 1.10 to 1.2
[A.M.I.E. Sec B. Winter 1994]

147. Steam turbines are governed by
(a) nozzle control governing. (b) throttle governing.
(c) bypass governing. (d) all of the above.

148. Topping turbines are
(a) low pressure condensing ones.
(b) high pressure condensing ones.
(c) high pressure non-condensing ones.
(d) low pressure non-condensing ones.

149. Compounding of steam turbines is done in order to
(a) reduce the rotor speed. (b) increase the rotor speed.
(c) balance the turbine. (d) none of the above.

150. The governing employed for medium and larger sized steam turbines is
(a) bypass. (b) nozzle.
(c) throttle. (d) combination of (b) and (c).

151. The ratio of exit pressure to inlet pressure of maximum mass flow rate per unit area of steam through a nozzle, when the steam is initially super heated, is
(a) 0.65 (b) 0.578 (c) 0.5457 (d) 0.5325

152. The ratio of exit pressure to inlet pressure of maximum mass flow rate per unit area of steam through a nozzle, when the steam is initially dry saturated, is
(a) 0.5325 (b) 0.5457 (c) 0.578 (d) 0.65

153. The effect of considering friction in steam nozzles for the same pressure ratio leads to
(a) increase in dryness fraction of exit steam.
(b) decrease in exit velocity from the nozzle.
(c) no change in exit velocity from the nozzle and quality of exit steam.
(d) both (a) and (b).

154. The steam is superheated to the highest economical temperature in order to
(a) reduce the requirement of steam for a given output of energy owing to its high internal energy and thus reduce the turbine size.
(b) reduce the mechanical resistance to the flow of steam over turbine blades and increase the efficiency as superheated steam is dry and so turbine blades remain dry.
(c) avoid corrosion and pitting at the turbine blades occurring owing to steam dryness.
(d) all of the above.

155. Any leakage of air into the condenser destroys the vacuum and causes
(a) an increase in air pressure in the condenser limiting the useful heat drop in the steam turbine.
(b) lowering of the partial pressure of the steam and of the saturation temperature along with it.
(c) undercooling of the condensate more severe.
(d) all of the above.

Answers: **132.** (b), **133.** (c), **134.** (a), **135.** (c), **136.** (d), **137.** (b), **138.** (c), **139.** (a), **140.** (c), **141.** (c), **142.** (c), **143.** (b), **144.** (d), **145.** (a), **146.** (b), **147.** (d), **148.** (c), **149.** (a), **150.** (b), **151.** (c), **152.** (c), **153.** (d), **154.** (d), **155.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

156. A 200 MW steam power plant will consume nearly _____ tonnes of coal per day.
(a) 1,000 (b) 2,000 (c) 4,000 (d) 7,500

157. Heating value of coal is roughly
(a) 1,000-1,500 kcal /kg (b) 3,000-4,500 kcal /kg
(c) 5,000-6,500 kcal /kg (d) 7,500-10,000 kcal /kg

158. Calorific value of coal largely depends upon
(a) ash content. (b) size of coal particles.
(c) moisture content. (d) volatile matter.

159. The coal of the lowest calorific value is
(a) anthracite. (b) bituminous coal.
(c) lignite. (d) steam coal.

160. The coal having highest calorific value is
(a) anthracite. (b) bituminous.
(c) lignite. (d) peat.

161. Coal used in thermal power plants is also known as
(a) soft coal. (b) steam coal.
(c) charcoal. (d) coke.

162. Coking cokes
(a) do not form ash. (b) burn completely.
(c) form lumps or masses of coke.
(d) burn freely.

163. Which of the following is considered to be superior quality of coal ?
(a) Bituminous. (b) Coke.
(c) Lignite. (d) Peat.

164. Low grade coals have
(a) low carbon content. (b) low calorific value.
(c) low moisture content. (d) low ash content.

165. Coal is usually considered of
(a) lava origin. (b) animal origin.
(c) vegetable origin. (d) none of the above.

166. Coal rank classifies coal as per its
(a) specific gravity. (b) degree of metamorphism.
(c) carbon percentage. (d) ash content.

167. The average ash content in Indian coals is around
(a) 5%. (b) 10%. (c) 20%. (d) 30%.

168. The coal that has highest ash content is
(a) lignite. (b) coking coal.
(c) bituminous coal. (d) steam coal.

169. Ash content of coal can be reduced by
(a) pulverising. (b) washing.
(c) slow burning. (d) mixing with high grade coal.

170. Combustible elements in the fuel are
(a) carbon and hydrogen. (b) carbon, hydrogen and ash.
(c) carbon, hydrogen and sulphur.
(d) carbon, nitrogen and ash.

171. The percentage of carbon in anthracites is usually
(a) more than 90%. (b) about 70%.
(c) about 50%. (d) below 40%.

172. Solvent refined coal has low percentage of
(a) impurities. (b) sulphur.
(c) ash. (d) all of the above.

173. Presence of sulphur content in coal will cause
(a) spontaneous combustion during coal storage and air heater corroding.
(b) clinkering and slagging. (c) facilitating ash precipitation.
(d) all of the above.

174. Sulphur content of liquid fuels assumes importance from the point of view of
(a) firing rate. (b) heating rate.
(c) corrosion. (d) efficiency.

175. Chemical composition of coal is given by
(a) ultimate analysis. (b) proximate analysis.
(c) gross analysis. (d) any of the above.

176. Ultimate analysis of fuel determines the percentage of
(a) ash, volatile matter and moisture.
(b) total carbon by weight.
(c) total carbon by weight—unit weight of H_2, O_2, N_2, sulphur and ash.
(d) none of the above.

177. Complete combustion of pulverized coal in a steam raising thermal power plant is ensured by what type of an analysis of flue gas going out by the chimney?
(a) O_2 content for given air intake.
(b) CO_2 content for given fuel rate feed.
(c) CO content.
(d) All of these. **[U.P.S.C. I.E.S. E.E.-II, 2009]**

178. The proximate analysis of coal gives percentage by weight of
(a) moisture, and volatile matter.
(b) moisture, volatile matter, fixed carbon and ash.
(c) carbon, hydrogen, oxygen, nitrogen, sulphur and ash.
(d) carbon, hydrogen, and oxygen. **[A.M.I.E. Sec B. Winter 1994]**

179. The ash content of bituminous coal is
(a) 2 to 3% (b) 6 to 12%
(c) 15 to 20% **[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]**

180. The most important factors to be considered in the selection of fuel for power plants include
(a) cost of fuel. (b) calorific value of fuel.
(c) none of the above. (d) both (a) and (b).

181. Live storage of coal in power plant means
(a) a covered storage near the boiler furnace having coal sufficient to meet 24 hour demand of the power plant.
(b) coal in transit. (c) coal ready for combustion.
(d) storage of coal sufficient to meet one week demand of the plant readily.

182. In a steam power plant, coal is carried from storage to boiler generally by means of
(a) trolleys. (b) V-belts. (c) buckets. (d) manually.

183. Belt conveyors can be employed for transporting coal at inclination upto
(a) 75° (b) 60° (c) 30° (d) 15°

184. The maximum length of a screw conveyor is around
(a) 85-90% (b) 60-75%
(c) 40-60% (d) 15-30%

185. In small power plants, coal is unloaded by means of
(a) belt conveyors. (b) coal accelerators.
(c) lift trucks. (d) all of the above.

186. Load carrying capacity of a belt conveyor is around
(a) 10–20 tonnes per hour. (b) 20–40 tonnes per hour.
(c) 50–100 tonnes per hour. (d) 100–160 tonnes per hour.

Answers: **156.** (b), **157.** (c), **158.** (a), **159.** (c), **160.** (a), **161.** (b), **162.** (c), **163.** (a), **164.** (b), **165.** (c), **166.** (b), **167.** (c), **168.** (a), **169.** (b), **170.** (c), **171.** (a), **172.** (d), **173.** (d), **174.** (c), **175.** (a), **176.** (c), **177.** (d), **178.** (b), **179.** (b), **180.** (d), **181.** (a), **182.** (b), **183.** (c), **184.** (a), **185.** (b), **186.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

187. Bucket elevators are employed for
(a) carrying coal in vertical direction.
(b) carrying coal in horizontal direction.
(c) carrying coal in any direction.
(d) none of the above.

188. In coal preparation plants, the magnetic separation are used for removing
(a) dust. (b) iron particles.
(c) clinkers. (d) all of the above.

189. Burning of low grade fuel can be improved by
(a) pulverising.
(b) blending with better quality coals.
(c) oil assisted ignition. (d) any of the above.

190. Which one is essential for combustion of fuel ?
(a) Oxygen. (b) Correct fuel-air ratio.
(c) Proper ignition temperature.
(d) All of the above three.

191. The percentage of O_2 in atmospheric air is
(a) 21 % by volume. (b) 23 % by weight.
(c) 79 % by volume and 77% by weight.
(d) both (a) and (b).

192. The proper indication of incomplete combustion is
(a) the smoking exhaust from chimney.
(b) high temperature of flue gas.
(c) high CO content in flue gases at exit.
(d) high CO_2 content in flue gases at exit.

193. The stoker used in large capacity boilers, when unpulverised coal is used, is
(a) overfeed stoker. (b) underfeed stoker.
(c) any of the above. (d) none of the above.

194. Overfeed stoker includes
(a) travelling grate. (b) chain grate.
(c) spreader. (d) all of the above.

195. The equipment used for supplying coal to the boiler, when unpulverised coal is being used, is
(a) skip hoist. (b) stoker.
(c) any of the above. (d) none of the above.

196. Capacity of the underfeed stoker is in the range of _____ of coal burned per hour.
(a) 100 – 250 kg (b) 100 – 500 kg
(c) 100 – 2,000 kg (d) 100 – 5,000 kg

197. Travelling grate stoker can burn coal at the rate of
(a) 50 to 75 kg/m^{2}h (b) 75 to 100 kg/m^{2}h
(c) 100 to 150 kg/m^{2}h (d) 150 to 200 kg/m^{2}h
[A.M.I.E. Sec B. Winter 1994]

198. Pulverised coal is
(a) non-smoking coal. (b) coal free from ash.
(c) coal broken in fine particles.
(d) coal which burns for long time.

199. Equipment used for pulverising the coal is the
(a) hopper. (b) stoker. (c) ball mill. (d) burner.

200. Pulverised fuel is used for
(a) better burning.
(b) increased calorific value of coal.
(c) less radiation loss. (d) medium size units.
[A.M.I.E. Sec B. Summer 1993]

201. The advantages of using pulverised fuel include
(a) higher boiler efficiency, low air requirement and low fan power.
(b) easy and complete combustion.
(c) fast response to load changes and low banking losses.
(d) all of the above.

202. The drawbacks of using pulverised fuel include
(a) additional investment in pulverising plant and stack flyash removal equipment.
(b) extra power requirements for the pulverising plant.
(c) reduced power plant efficiency.
(d) both (a) and (b).

203. Ash is the main waste product of steam power plants with low grade coal (may be in tonnes per day). This ash
(a) can be used in building construction.
(b) can be used in brick making near the plant side.
(c) it can be dumped in disused mines, river or sea or in an area excavated in the waste land, as the case may be.
(d) all of the above.

204. Flyash generally results from
(a) fluidized bed boilers. (b) pulverised coal boilers.
(c) diesel engines. (d) gas turbines.

205. Dust can be separated from gas by
(a) impingement upon small baffles.
(b) sudden velocity decrease owing to enlargement.
(c) abrupt changes of flow direction.
(d) any of the above.

206. Which of the following equipment is installed in steam power plants to reduce air pollution ?
(a) Desuper heater. (b) Air filter.
(c) Air electrostatic precipitator.
(d) Stock. (e) None of them.
[A.M.I.E. Sec B. Winter 1993]

207. In coal-fired thermal power stations, what are the electrostatic precipitators used for?
(a) To remove dust particles settling on the bus bar conductors in the station switchyard.
(b) To condense steam by electrostatic means.
(c) To keep the air heaters clean.
(d) To collect the dust particles from the flue gases.
[U.P.S.C. I.E.S. E.E.-II, 2007]

208. Electrostatic precipitator is installed between
(a) induced fan and chimney.
(b) air preheater and induced fan.
(c) economiser and air preheater.
(d) boiler furnace and economiser.

209. The draught produced by a chimney is called the
(a) forced draught. (b) induced draught.
(c) natural draught. (d) balanced draught.

210. The draught produced by steel chimney in comparison to that produced by brick chimney, for the same height, is
(a) more. (b) less.
(c) the same. (d) unpredictable.

211. Artificial draught is produced by
(a) a forced fan. (b) an induced fan.
(c) induced and forced fan. (d) all of the above.

212. For the same draught produced the power of forced draught fan, in comparison to that of induced draught fan, is
(a) more. (b) less. (c) the same.
(d) may be more or less.

213. The artificial draught is usually designed to produce
(a) more draught. (b) less smoke.

Answers: **187.** (a), **188.** (b), **189.** (d), **190.** (d), **191.** (d), **192.** (c), **193.** (a), **194.** (d), **195.** (b), **196.** (d), **197.** (d), **198.** (c), **199.** (c), **200.** (a), **201.** (d), **202.** (d), **203.** (d), **204.** (b), **205.** (d), **206.** (c), **207.** (d), **208.** (b), **209.** (c), **210.** (a), **211.** (d), **212.** (b), **213.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) low temperature of chimney gas.
(d) all of the above.

214. The draught produced by a chimney of a given height at a given outside temperature
(a) decreases with the increase in temperature of chimney gases.
(b) increases with the increase in temperature of chimney gases.
(c) remains unchanged irrespective of temperature of chimney gases.
(d) may increase or decrease.

215. The natural draught
(a) is provided by a chimney.
(b) is used in small steam boilers.
(c) can also be used in large steam boilers if economisers and preheaters have been used.
(d) both (a) and (b).

216. The magnitude of natural draught depends upon
(a) average temperature difference between flue gases within the chimney and the outside air.
(b) height of the chimney above the furnace grate level.
(c) weather and operating conditions.
(d) all of the above.

217. For forced draught the blower is located
(a) at the top of the chimney.
(b) near the base of the chimney.
(c) near the base of the boiler.
(d) any where permissible.

218. The height of chimney, in a steam power stations, is governed by
(a) the draught to be produced.
(b) the quantity of flue gases being produced.
(c) pollution control. (d) all of the above.

219. The draught produced in locomotive boilers is by
(a) forced fan. (b) steam jet.
(c) chimney. (d) motion of locomotive.

220. The pressure at the furnace is minimum in case of
(a) induced draught. (b) forced draught.
(c) balanced draught. (d) natural draught.

221. In forced draught the main function of the chimney is to
(a) discharge gases high up in the atmosphere from the point of view of air pollution.
(b) accelerate the fuel combustion.
(c) reduce the temperature of the discharged hot gases.
(d) all of the above.

222. Induced draught fans are used to
(a) cool the steam let out by the turbine in thermal station.
(b) cool the hot gases coming out of the boiler.
(c) force the air inside the coal furnace.
(d) control the heat generated in a nuclear reactor.
(e) pull the gas out of the chimney.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1998]

223. What is the nominal pH value of water that is to be maintained in a steam raising thermal power station?
(a) 0.0 (b) 7.0
(c) 8.5 (d) 14.3 **[U.P.S.C. I.E.S. E.E.-II, 2009]**

224. The feed water treatment is done mainly to avoid
(a) embrittlement problem. (b) carry over problem.
(c) corrosion and scale formation problems.
(d) all of the above problems.

225. Boiling down of boiler water is done so as to
(a) control the solid concentration in the boiler water by removing some of the concentrated saline water.
(b) remove dissolved gases in the water.
(c) reduce boiler pressure.
(d) increase steam temperature.

226. It is necessary to heat water before feeding it back to the boiler as because of this
(a) the dissolved oxygen and carbon dioxide which would otherwise corrode boiler are removed in the feed water heater.
(b) thermal stresses due to cold water entering the boiler drum are avoided.
(c) some other impurities carried by steam and condensate due to corrosion in boiler and condenser are precipitated outside the boiler.
(d) all of the above.

227. Huge quantity of water is required in a steam power plant. It is required
(a) to raise the steam in boilers.
(b) for cooling purposes such as in condensers.
(c) as a carrying medium such as in disposal of ash.
(d) all of the above .

228. For a 3-element feed water control in a coal-fired thermal power station, measurements of level of water in the boiler drums is made so that the water level does not
(a) exceed a specified upper limit.
(b) fall below a specified lower limit.
(c) violate specified upper and lower limits.
(d) restrict to a specified limit. **[U.P.S.C. I.E.S. E.E.-II, 2010]**

229. The auxiliary consumption in a thermal power (steam) station is
(a) 2–5% (b) 8–10% (c) 15–20% (d) 20–25%
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1996]

230. Turbo-alternators run at
(a) a variable speed around 2,000 rpm.
(b) a constant speed of 1,000 rpm.
(c) a constant speed of 3,000 rpm.
(d) a variable speed above 1,000 rpm.
(e) none of the above.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 1998]

231. A coal-fired steam power station working at a plant load factor of 80% has one 500 MW generating unit. If the heat content of coal is 2 kWh/kg, the overall plant efficiency is 40% and a train load of coal is 2,000 metric tons, then the number of trains required daily for the plant is
(a) 1 (b) 6 (c) 10 (d) 24
[U.P.S.C. I.E.S. E.E.-II, 2000]

232. Large size steam plants and nuclear plants are suitable for
(a) peak loads. (b) intermediate loads.
(c) base loads. (d) both base and peak loads
[A.M.I.E. Sec B. Power Systems, Summer 1996; Summer 1998]

233. The efficiency of a nuclear power plant is less than that of a coventional fuel fired thermal plant because of
(a) less rejection of heat in the condenser.
(b) higher temperature conditions.
(c) higher pressure conditions
(d) low temperature and pressure conditions.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

Answers: **214.** (b), **215.** (d), **216.** (d), **217.** (c), **218.** (a), **219.** (b), **220.** (c), **221.** (a), **222.** (c), **223.** (c), **224.** (d), **225.** (a), **226.** (d), **227.** (d), **228.** (c), **229.** (a), **230.** (c), **231.** (b), **232.** (c), **233.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

234. The first nuclear power plant installed in India is
(a) Kota (Rajasthan). (b) Tarapur (Maharashtra).
(c) Kalpakkam (TN). (d) Narora (U.P.).

235. Western U.P, Rajasthan, Punjab, Haryana, Tamil Nadu are quite suitable areas for
(a) hydroelectric power plants.
(b) steam power plants. (c) nuclear power plants.
(d) all of the above.

236. One atomic mass unit (amu) is approximately equal to
(a) 1.66×10^{-24} kg (b) 1.66×10^{-27} kg
(c) 1.6×10^{-19} kg (d) 1.6×10^{-13} kg

237. One atomic mass unit is equaivalent to
(a) 931.4 Mev. (b) 251.2 Mev.
(c) 120.4 Mev. [A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

238. One kilogram of natural uranium gives energy equivalent to about
(a) 100 kg of coal. (b) 1,000 kg of coal
(c) 5,000 kg of coal. (d) 10,000 kg of coal.
[A.M.I.E. Sec. B. Power Systems, Summer 1996; Summer 2000]

239. Generation of one watt needs about _____ fissions per second.
(a) 3.1 (b) 3.1×10^6
(c) 3.1×10^7 (d) 3.1×10^{10}

240. Particles having the same atomic numbers but different mass numbers are called the
(a) beta particles. (b) decayed particles.
(c) isotopes. (d) neutrons.

241. In a nuclear reactor thermal energy is obtained from
(a) fission of radioactive materials.
(b) fussion of radioactive materials.
(c) Burning of the fuel rods in oxygen.
[A.M.I.E. Sec. B. Power Systems, Summer 1999]

242. Nuclear reactors usually employ
(a) fission. (b) fusion.
(c) both fission and fusion. (d) none of the above.

243. In nuclear chain fission reaction each neutron causing fission produces
(a) no new neutron. (b) less than one new neutron.
(c) one new neutron. (d) at least one new neutron.

244. Which of the following is not a secondary nuclear fuel ?
(a) Pu_{239} (b) U_{233}
(c) U_{235} (d) none of above.

245. Which of the following are the fertile materials ?
(a) U_{238} and Th_{232} (b) U_{238} and Th_{239}
(c) U_{233} and Pu_{239} (d) U_{238} and Pu_{239}

246. Which of the following are the fissile materials ?
(a) U_{238} and Th_{232} (b) U_{235}, U_{233} and Pu_{239}
(c) U_{235} and Th_{239} (d) None of the above.

247. In the nuclear fission reactions, isotope of uranium used is
(a) U_{234} (b) U_{235} (c) U_{233} (d) U_{238}

248. When a nuclear reactor is operating at constant power the multiplication factor
(a) is equal to unity. (b) is less than unity.
(c) is greater than unity. (d) may be any of the above.

249. One fission of U_{235} releases energy of
(a) 335 MeV (b) 200 MeV
(c) 430 MeV (d) 525 MeV

250. Which of the following statements are correct ?
1. Nuclear fission occurs whenever a uranium nucleus reacts with a neutron.
2. Nuclear fission is accompanied by the release of neutrons and gamma rays.
3. About 200 MeV of energy is released in the fission of a uranium nucleus.
4. Energy from the fission of uranium nucleus is released mainly as the kinetic energy of the neutrons and the energy of gamma radiations.

Select the correct answer using the codes given below.
Codes:
(a) 1, 2, 3 and 4. (b) 2 and 3.
(c) 2, 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1993]

251. Consider the following statements:
1. Nuclear fission occurs whenever Uranium reacts with a neutron.
2. Nuclear fission is accompanied by the release of neutrons and gamma rays.
3. About 200 MeV of energy is released in the fission of a U^{235} nucleus.
4. Energy from the fission of U^{235} nucleus is released mainly as kinetic energy of the neutrons and the energy of gamma radiations.

Which of the above statements are correct?
(a) 1, 2, 3 and 4. (b) 3 and 4 only.
(c) 2, 3 and 4 only. (d) 1, 2 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

252. In what form the initial energy will be released for the 200 MeV per fission by a neutron in a slow thermal nuclear reactor?
(a) Heat energy. (b) Electromagnetic radiation.
(c) Kinetic energy of particles and electromagnetic radiation.
(d) Kinetic and sound energy. [U.P.S.C. I.E.S. E.E.-II, 2009]

253. The operation of a nuclear reactor is controlled by controlling the multiplication factor (k), defined as

$$K = \frac{\text{Number of neutrons of any one generation}}{\text{Number of neutrons of immediately preceding generation}}$$

The power level of the reactor can be increased by
(a) raising the value of k above 1 and, keeping it at that raised value.
(b) raising the value of k above 1, but later bringing it back to k = 1.
(c) lowering the value of k below 1 and keeping at that lowered value.
(d) lowering the value of k below 1, but later bringing it back to k = 1.
[U.P.S.C. I.E.S. E.E.-II, 1994]

254. Critical mass of the fuel is the amount required to make the multiplication factor
(a) less than unity. (b) more than unity.
(c) equal to unity. (d) 0.5

255. The power output of a nuclear power station is proportional to
(a) the rate at which fission reaction occurs
(b) square root of the rate at which fission reaction occurs.
(c) square of the rate at which fission reaction occurs.
(d) none of the above.
[A.M.I.E. Sec. B. Power Plant Engineering, Winter 1999]

256. The function of moderator in a nuclear reactor is
(a) to absorb the excess neutrons.
(b) to increase the energy of the neutrons.
(c) to slow down the neutrons.
[A.M.I.E. Sec B. Power Systems, Summer 1999]

Answers: **234.** (b), **235.** (c), **236.** (b), **237.** (a), **238.** (d), **239.** (d), **240.** (c), **241.** (a), **242.** (a), **243.** (d), **244.** (c), **245.** (a), **246.** (b), **247.** (c), **248.** (a), **249.** (b), **250.** (a), **251.** (a), **252.** (c), **253.** (b), **254.** (c), **255.** (a), **256.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

257. A moderator material should have
(a) small atomic mass. (b) large atomic mass.
(c) none of the above. [A.M.I.E. Sec B. Power Systems, Summer 2000]

258. Graphite is used in nuclear power plant as a
(a) fuel. (b) coolant. (c) moderator. (d) electrode.
[A.M.I.E. Sec B. Summer 1993]

259. Which of the following materials cannot be used as a moderator ?
(a) Deuterium. (b) Graphite.
(c) Heavy water. (d) Beryllium.

260. Consider the following moderators used in nuclear reactors:
1. Graphite. 2. Beryllium.
3. Heavy water.
Their correct sequence in increasing order of their neutron absorption cross section is
(a) 1, 3, 2. (b) 2. 1, 3.
(c) 3, 1, 2. (d) 3, 2, 1. [U.P.S.C. I.E.S. E.E.-II, 1999]

261. Which material is used in controlling chain reaction in a nuclear reactor ?
(a) Thorium. (b) Heavy water.
(c) Boron. (d) Beryllium. [GATE E.E. 1996]

262. Control rods used in nuclear reactors are made of
(a) zirconium. (b) boron.
(c) beryllium. (d) lead. [U.P.S.C. I.E.S. E.E.-II, 1997]

263. In a nuclear reactor, chain reaction is controlled by introducing
(a) iron rods. (b) cadmium rods.
(c) graphite rods. (d) brass rods.
[U.P.S.C. I.E.S. E.E.-II, 2000]

264. Heavy water is used in nuclear power plant as
(a) fuel. (b) coolant.
(c) reflector. (d) moderator.
(e) shield. (f) both (b) and (d)

265. Which of the following materials can be used as a coolant ?
(a) Heavy water. (b) CO_2.
(c) Helium. (d) Any of the above.

266. The function of reflector in a nuclear reactor is to
(a) bounce back most of the neutrons that escape from the fuel core.
(b) reduce the speed of the neutrons.
(c) stop the chain reaction. (d) all of the above.

267. Reflectors of a nuclear reactor are made of
(a) cast iron. (b) beryllium.
(c) steel. (d) boron.

268. Thermal shielding is provided to
(a) absorb the fast neutrons.
(b) protect the operating personnel from exposure to radiations.
(c) prevent the reactor wall from getting heated.
(d) all of the above.

269. The radiation shield for a nuclear power reactor for biological safety is provided by having the reactor:
(a) immersed in water pool. (b) encased by thick metal walls.
(c) encased by thick concrete wall.
(d) isolated from outside word with strong magnetic fields.
[U.P.S.C. I.E.S. E.E.-II, 2011]

270. In boiler water reactor (BWR)
(a) the feed water acts both coolant and a moderator.
(b) enriched uranium is used as fuel.
(c) there is a danger of radioactive contamination of steam.
(d) all of the above.

271. Tarapur atomic power station has
(a) CANDU type reactors. (b) boiling water reactors.
(c) pressurised water reactors.
(d) gas cooled reactors.

272. The thermal efficiency of a boiler water reactor is
(a) greater than. (b) equal to.
(c) less than that of a pressurized water reactor.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

273. In a pressurized water reactor (PWR)
(a) light or heavy water is used as both coolant and moderator.
(b) water is used at high pressure (as high as 140 kg/cm^2) so that it is available in liquid form at about 280°C.
(c) the coolant water boils in the reactor core.
(d) both (a) and (b).

274. A CANDU reactor uses
(a) highly enriched uranium as fuel and light water as moderator and coolant.
(b) natural uranium as fuel and heavy water as moderator and coolant.
(c) enriched uranium as fuel and ordinary water as moderator and cooler.
(d) only fertile material.

275. Which one of the following is employed as a moderator by CANDU type of slow thermal nuclear reactors?
(a) Water. (b) Heavy water.
(c) Graphite. (d) Beryllium.
[U.P.S.C. I.E.S. E.E.-II, 2006]

276. Which one of the following fuels is used by the slow thermal nuclear reactors for power generation?
(a) U^{235} (b) U^{238} (c) Th^{232} (d) Pu^{239}
[U.P.S.C. I.E.S. E.E.-II, 2007]

277. Consider the following statements regarding the nuclear power plants:
1. A thermal reactor needs a moderator material.
2. In a nuclear reactor, multiplication factor is kept almost equal to one.
3. Nuclear power plants are used as peak load plants only.
Which of the statements given above are correct?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-II, 2008]

278. In a thermal nuclear reactor
1. the purpose of moderator is to slowdown fast neutrons produced due to fission.
2. the moderator material must have low molecular weight.
3. ordinary water can be used as moderator with natural uranium as fuel.
4. the multiplication factor is kept slightly greater than unity during its normal functioning.
Of these statements
(a) 1 and 3 are correct. (b) 3 and 4 are correct.
(c) 1, 2 and 3 are correct. (d) 1, 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 2001]

279. A heavy water reactor
(a) has higher neutron flux which can be produced at a given power level.
(b) requires less time to shutdown than in the case of graphite because of photo-neutron production.
(c) is not stable.
(d) cannot use natural uranium as fuel.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

Answers: **257.** (a), **258.** (c), **259.** (a), **260.** (d), **261.** (c), **262.** (b), **263.** (b), **264.** (f), **265.** (d), **266.** (a), **267.** (b), **268.** (d), **269.** (c), **270.** (d), **271.** (b), **272.** (a), **273.** (d), **274.** (b), **275.** (b), **276.** (a), **277.** (b), **278.** (d), **279.** (a),

280. The conversion ratio of a breeder reactor is
(a) less than unity. (b) more than unity.
(c) equal to unity. (d) none of the above.

281. Fast breed reactors are best suited for India owing to
(a) large thorium deposits. (b) large plutonium deposits.
(c) large uranium deposits. (d) none of the above.

282. Gas cooled reactor
(a) uses CO_2 or helium as coolant and graphite as the moderator.
(b) uses coolant at pressure of 14-28 kg/cm^2 and at temperature of 700- 800°C.
(c) uses heavy water as coolant as well as moderator.
(d) both (a) and (b).

283. A sodium graphite reactor uses
(a) sodium as moderator and graphite as coolant.
(b) sodium as coolant and graphite as moderator.
(c) a mixture of sodium and graphite as coolant.
(d) a mixture of sodium and graphite as moderator.

284. The economic prospects of nuclear power generation in India to a great extent depends on successful development of
(a) fast reactors using enriched uranium as the fuel thus avoiding import of heavy water.
(b) thermal reactors using natural uranium as the fuel and avoiding import of enriched uranium.
(c) breeder reactors using thorium as blanket material and U_{233} as the fuel.
(d) reactor using plutonium as the fuel, natural uranium as blanket and liquid sodium as the coolant. **[U.P.S.C. I.E.S. E.E.-II, 1993]**

285. Compared to steam engines, the internal combustion engines have
(a) much higher thermal efficiency.
(b) almost same thermal efficiency as that of steam engines.
(c) much lower thermal efficiency.
(d) can have lower or higher thermal efficiency.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1995]

286. The lubrication cost in a diesel power plant is
(a) high. (b) moderate. (c) low.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

287. Which of the following statements is True ?
(a) Diesel power plants employ only four stroke engines.
(b) Space requirement for diesel power plants in more than that for a conventional steam power plant.
(c) A two stroke engine develops more power for the same speed and piston displacement.
(d) The specific fuel consumption of a diesel power plant decreases with the decrease in load.

288. The diesel engines are available in sizes from
(a) 0–5 kW (b) 5–50 kW
(c) 75–3,750 kW (d) above 10,000 kW

289. The compression ratio in diesel engine may be in the range of
(a) 15–20 (b) 10–15
(c) 5–10 (d) 3–5

290. Air standard efficiency of a diesel engine depends upon
(a) expansion ratio. (b) compression ratio.
(c) fuel used. (d) none of the above.

291. In case of diesel engines, the thermal efficiency is in the range of
(a) 10–20 per cent. (b) 20–30 per cent.
(c) 30–40 per cent. (d) 40–50 per cent.

292. In ideal diesel cycle the working substance is
(a) air. (b) diesel.
(c) mixture of air and diesel. (d) any combustible gas.

293. Air-fuel ratio required for combustion in diesel engine is around
(a) 20 : 1 (b) 15 : 1 (c) 10 : 1 (d) 5 : 1

294. In a diesel engine fuel is injected at a pressure of
(a) 20–25 kg/ cm^2 (b) 50–75 kg/cm^2
(c) 90–130 kg/cm^2 (d) 130–160 kg/cm^2

295. Maximum temperature developed in a diesel engine cylinder is in the range of
(a) 2,000–2,500°C (b) 1,500–2,000°C
(c) 1,000–1,500°C (d) 800–1,000°C

296. In a diesel engine, the heat lost to the cooling water is about
(a) 50% (b) 30% (c) 20% (d) 15%

297. The highest proportion of total heat supplied to a diesel engine goes to
(a) useful output. (b) heat lost to exhaust gases.
(c) heat lost to cooling water.
(d) heat lost to friction, windage and radiation losses.

298. Which of the following diesel engines have minimum air consumption per bhp ?
(a) 2 stroke, air injection. (b) 4 stroke, air injection.
(c) 4 stroke, mechanical injection.
(d) All of the above almost equal air consumption.

299. Heating value of diesel oil is around
(a) 4,000 kcals/kg. (b) 10,000 kcals/kg.
(c) 15,000 kcals/kg. (d) 20,000 kcals/kg.

300. In a four stroke petrol engine during suction stroke
(a) only petrol is sucked in. (b) only air is sucked in.
(c) mixture of petrol and air is sucked in.
(d) any combustible gas is sucked in.

301. In a four stroke engine, the four operations (suction, compression, expansion and exhaust) are completed in _____ revolution(s) of crankshaft.
(a) eight (b) four (c) two (d) one

302. In a two stroke engine, the four operations (suction, compression, expansion and exhaust) are completed in _____ revolution(s) of crankshaft.
(a) one (b) two (c) four (d) eight

303. Most of the heat generated in IC engines goes to
(a) cooling water. (b) exhaust gases.
(c) friction, windage and radiation loses.
(d) lubricating oil.

304. Reciprocating motion of piston is converted into rotary one by
(a) crank shaft. (b) connecting rod.
(c) gudgeon pin. (d) gear box.

305. A two stroke engine may be identified by
(a) cooling system. (b) lubrication system.
(c) absence of valves. (d) any of the above.

306. The performance of engines of different outputs, speeds and sizes can be compared on the basis of
(a) specific fuel consumption. (b) cylinder volume.
(c) compression ratio. (d) piston size.

307. The thermal efficiency of a diesel engine in comparison to that of a petrol engine is
(a) lower. (b) higher.
(c) the same. (d) may be lower or higher.

Answers: **280.** (b), **281.** (a), **282.** (d), **283.** (b), **284.** (c), **285.** (a), **286.** (a), **287.** (c), **288.** (c), **289.** (a), **290.** (b), **291.** (c), **292.** (a), **293.** (b), **294.** (c), **295.** (a), **296.** (b), **297.** (a), **298.** (c), **299.** (b), **300.** (c), **301.** (c), **302.** (a), **303.** (a), **304.** (b), **305.** (c), **306.** (a), **307.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

308. In a multicylinder engine, the firing order should be in particular sequence because it
(a) will operate ignition system smoothly.
(b) will give smooth turning moment.
(c) will provide the best performance of the engine.
(d) all of the above.

309. High output diesel engines are started by
(a) self starter. (b) compressed air.
(c) battery. (d) cranking.

310. The temperature of cooling water leaving the diesel engine should not exceed
(a) 25°C (b) 40°C (c) 70°C (d) 85°C

311. Air filter is used in
(a) steam power plants. (b) nuclear power plants.
(c) hydropower plants. (d) diesel power plants.

312. For supercharging of diesel engines, the air is supplied through
(a) injector. (b) reciprocating compressor.
(c) centrifugal blower. (d) any of the above.

313. Supercharging of diesel engines
(a) supply pressurized air during suction.
(b) increases the power output of the engine.
(c) reduces the specific fuel consumption.
(d) both (a) and (b).

314. The temperature at which a lubricating oil will give sufficient vapours to form a combustible mixture with air is called the
(a) flash point. (b) pour point.
(c) fire point. (d) combustion point.

315. Which of the following will be the lowest for a lubricating oil ?
(a) Flash point. (b) Pour point.
(c) Fire point. (d) Combustion point.

316. Fire and flash points of oils are important from the point of view of
(a) heating value. (b) viscosity.
(c) ignition and storage hazards.
(d) tendency of freezing during winter.

317. For larger output diesel electric power plants the engines used are
(a) horizontal type.
(b) vertical type, multicylinder and supercharged.
(c) air cooled. (d) low rpm.

318. The gas turbine power plants have the advantages of
(a) simplicity of design and installation, high reliability, compactness, clean exhaust and low initial cost.
(b) quick starting and capability of putting to share full load in few minutes.
(c) high overall efficiency, low specific consumption and long life in comparsion to that of steam power plants.
(d) both (a) and (b).

319. The main drawbacks of gas turbine power plants are
(a) low overall efficiency, noisy operation and limited unit capacity.
(b) inability of using coal or heavy residual petroleum as fuels.
(c) high initial cost, poor reliability and large space requirements.
(d) both (a) and (b).

320. A gas turbine works on
(a) Carnot cycle. (b) Brayton cycle.
(c) dual cycle. (d) Rankine cycle.
(e) regenerative cycle.
[A.M.I.E. Sec B. Summer 1994]

321. Gas turbine is widely used in
(a) locomotives. (b) automobiles.
(c) aircrafts. (d) pumping stations.

322. Gas turbine power plants are not widely used
(a) as peak load plants. (b) as standby power plants.
(c) as base load plants.
(d) in combination with steam power plants.

323. In comparsion to steam power plants, the gas power plants have
(a) low initial cost but higher operating cost.
(b) high initial cost but low operating cost.
(c) both initial as well operating costs high.
(d) both initial as well as operating costs low.

324. In which of the following places 70 MW gas turbine power plant being operated as base load plant ?
(a) Nangal (H.P.). (b) Namrup (Assam).
(c) Jharia (Bihar). (d) Kokkata (W.B.).

325. The gas turbine power plants mainly use
(a) coal and peat.
(b) kerosine oil, diesel oil, residual oil.
(c) gas oil.
(d) natural gas and liquid petroleum fuels.

326. Compressor used in gas turbine is
(a) reciprocating compressor.
(b) screw compressor.
(c) multistage axial flow compressor.
(d) either (a) or (b).

327. The blades of gas turbines are made of
(a) stainless steel. (b) carbon steel.
(c) high alloy steel. (d) high nickel alloy.

328. The pressure ratio in a gas turbine power plant is
(a) 5 to 6 (b) 9 to 12 (c) 2 to 3
[A.M.I.E. Sec B. Power Plant E., Winter 1996]

329. The highest temperature ever used for gas turbine power plants is about
(a) 1,000°C (b) 500°C (c) 2,000°C
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

330. The heating value of gaseous fuels is about
(a) 300 kJ/litre. (b) 100 kJ/litre.
(c) 30 kJ/litre. (d) 10 kJ/litre.

331. Which of the following statements is not correct ?
(a) The efficiency of modern gas turbine power plants is more than 50%.
(b) One advanced feature of modern gas turbine power plants is higher firing temperature.
(c) The installed capacity of gas turbine power plants in India exceeds 20% of total installed generating capacity.
(d) The gas turbine power plants have the advantages of quick starting and capability of putting to share full load in few minutes.

332. Which of the following statements is correct ?
(a) In a gas turbine plant, the combustion takes place in the compressor.
(b) Aeroderivative turbines use clean fuel.
(c) Capital cost of a gas turbine power plant is higher than that of a steam power plant.
(d) Gas turbine power plants have the drawbacks of poor reliability and large space requirements.

333. The compressor has to be started
(a) before starting of gas turbine.
(b) after starting of gas turbine.
(c) simultaneously with starting of gas turbine.
(d) at any time (*i.e.* before or after starting of gas turbine).

Answers: **308.** (c), **309.** (b), **310.** (c), **311.** (d), **312.** (c), **313.** (d), **314.** (a), **315.** (b), **316.** (c), **317.** (b), **318.** (d), **319.** (d), **320.** (b), **321.** (c), **322.** (c), **323.** (a), **324.** (b), **325.** (d), **326.** (c), **327.** (d), **328.** (a), **329.** (a), **330.** (c), **331.** (c), **332.** (b), **333.** (a),

334. For starting gas turbine, its rotor is usually motored up to
(a) 10 per cent of turbine rated speed.
(b) 25 per cent of turbine rated speed.
(c) half of turbine rated speed. (d) turbine rated speed.

335. In comparsion to diesel engines the gas turbines have maximum combustion pressure
(a) less. (b) same.
(c) more. (d) unpredictable.

336. For the same cylinder size and speed which of the following engines will develop more power ?
(a) Petrol engine. (b) Diesel engine.
(c) Supercharged engine. (d) Gas engine.

337. Greater part of the power developed by the turbine is used in driving the compressor. It is around
(a) 75% (b) 65% (c) 45% (d) 35%

338. The work ratio of closed cycle gas turbine power plant depends upon
(a) only on pressure ratio.
(b) temperature ratio of the cycle and specific heat ratio.
(c) pressure ratio, temperature ratio and specific heat ratio.
(d) pressure ratio and specific heat ratio.

339. Overall efficiency of gas turbine is
(a) less than that of diesel cycle.
(b) more than that of diesel cycle.
(c) more than that of otto cycle.
(d) equal to that of Rankine or Carnot cycle.

340. In comparison to diesel power plant the gas turbine power plant has
(a) lower overall thermal efficiency.
(b) higher overall thermal efficiency.
(c) the same overall thermal efficiency.
(d) unpredictable.

341. Mechanical efficiency of a gas turbine in comparison to that of reciprocating IC engine is
(a) lower. (b) higher.
(c) the same. (d) unpredictable.

342. Thermal efficiency of a gas turbine improves because of
(a) reheating of gas after partial expansion.
(b) removing the heat from compressed air between the stages of compression.
(c) utilizing the heat of exhaust gases to heat the compressed air before it is sent to combustion chamber.
(d) all of the above.

343. The thermal efficiency of a gas turbine cycle with ideal regenerative heat exchanger is
(a) less than work ratio. (b) more than work ratio.
(c) equal to work ratio. (d) unpredictable.

344. With the increase in pressure ratio thermal efficiency of a simple gas turbine power plant with fixed turbine inlet temperature
(a) increases. (b) reduces.
(c) first increases and then falls.
(d) first falls and then increases.

345. The combined cycle power plants are more appropriate for
(a) base loads. (b) peak loads.
(c) intermediate loads. (d) for both base and peak loads.

346. The combined cycle power plants are more appropriate for capacity factors of
(a) less than 20% (b) 20 to 50%
(c) 50 to 70% (d) 100%

347. In a two stage gas turbine plant reheating after first stage
(a) improves thermal efficiency but reduces the work ratio.
(b) increases work ratio but reduces thermal efficiency.
(c) reduces both of the work ratio and thermal efficiency.
(d) increases both of the work ratio and thermal efficiency.

348. In a two stage gas turbine power plant intercooling and reheating
(a) improves the work ratio but reduces the thermal efficiency.
(b) reduces the work ratio but improves the thermal efficiency.
(c) improves both of the work ratio and thermal efficiency.
(d) reduces both of the work ratio and thermal efficiency.

349. A jet aircraft is powered by
(a) petrol engine. (b) diesel engine.
(c) gas turbine. (d) solar cells.
(e) batteries. **[A.M.I.E. Sec B. Summer 1994]**

350. For a jet propulsion unit, ideally the work of compressor and that of gas turbine are
(a) different. (b) equal.
(c) not related to each other. (d) unpredictable.

351. In a closed cycle operation of gas turbines
(a) load variation is affected by controlling the absolute pressure and the mass flow of the circulating air.
(b) high efficiency is maintained over the complete range of operating loads.
(c) maximum unit capacity is increased.
(d) all of the above.

352. Coal and peat is not generally used in gas turbines as fuel because of
(a) coal handling and ash handling problems.
(b) their higher costs. (c) their non-availability.
(d) all of the above.

353. The gas turbine power plant can be used in combination with steam power plants by
(a) using exhaust gases from gas turbine power plant in heating of feed water coming from the steam turbine condenser.
(b) using exhaust gases from gas turbine power plant as combustion air in steam boiler.
(c) using gas from a supercharged boiler for expansion in gas turbine.
(d) any of the above.

354. In an MHD generator the conductor is made of
(a) copper or aluminium. (b) liquid metal.
(c) gas. (d) liquid metal or gas.

355. The nature of the current developed in MHD generator is
(a) ac. (b) dc. (c) either dc or ac.

356. Power output per unit volume of an MHD generator is proportional to
(a) specific electrical conductivity of gas.
(b) square of the magnetic field strength.
(c) square of the fluid velocity.
(d) all of the above.

357. Seeding material is injected into the working fluid, in MHD generator, in order to
(a) increase the conductivity of the gas.
(b) reduce the conductivity of the gas.
(c) reduce the temperature of the gas.
(d) none of the above.

Answers: **334.** (c), **335.** (a), **336.** (c), **337.** (b), **338.** (c), **339.** (a), **340.** (a), **341.** (b), **342.** (d), **343.** (c), **344.** (c), **345.** (d), **346.** (b), **347.** (b), **348.** (a), **349.** (c), **350.** (b), **351.** (d), **352.** (a), **353.** (d), **354.** (d), **355.** (b), **356.** (d), **357.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

358. Seeding material commonly used in MHD generator is
(a) sodium. (b) aluminium.
(c) potassium. (d) cesium.

359. Which of the following liquid metal is not used as an MHD working fluid ?
(a) Potassium. (b) Sodium
(c) Lithium (d) all of the above

360. The exhaust from an MHD generator is at a temperature of about
(a) 800°C (b) 2,200°C (c) 3,500°C (d) 1,200°C

361. In an MHD generator the ionization potential of the seeding material should be
(a) very high. (b) the lowest possible.
(c) neither high or low. (d) either high or low.

362. An MHD system for efficient operation needs
(a) a magnet capable of producing high magnetic flux density.
(b) injection and recovery of seed material
(c) arrangement for superheating of air.
(d) all of the above.

363. The advantage(s) of an MHD system is/are
(a) low pollution. (b) good efficiency.
(c) conservation of fuel. (d) absence of moving parts.
(e) all of the above.

364. The concept of MHD generation depends much more on the _____ of the gas in the duct.
(a) permeability (b) permittivity
(c) conductivity (d) none of these

365. The materials used for electrodes in thermoelectric generators are
(a) metal conductors. (b) carbon.
(c) semiconductors. (d) insulators.

366. Thermionic convertor utilizes
(a) Seebeck effect. (b) thermionic emission effect.
(c) Peltier effect. (d) Thomson effect.

367. The solar or photovoltaic cell converts
(a) chemical energy into electrical energy.
(b) solar radiations into electrical energy.
(c) solar radiations into thermal energy.
(d) thermal energy into electrical energy.

368. Photovoltaic solar energy conversion system makes use of
(a) solar pond. (b) fuel cell.
(c) Edison cell. (d) none of the above.

369. The efficiency of solar cell is about
(a) 25% (b) 15% (c) 40% (d) 60%

370. Solar cells are made of
(a) aluminium. (b) germanium.
(c) silicon. (d) cadmium.

371. The voltage of a solar cell is
(a) 0.5–1 V (b) 1–2 V (c) 2–3 V (d) 4–5 V

372. The output of a solar cell is of the order of
(a) 0.5 W (b) 1.0 W (c) 5.0 W (d) 10.0 W

373. Solar cells, for power generation, have the mains drawback(s) of
(a) low efficiency. (b) lack of availability.
(c) high cost and maintenance problems.
(d) all of the above.

374. A module is a
(a) series-arrangement of solar cells.
(b) parallel arrangement of solar cells.
(c) series-parallel arrangement of solar cells.
(d) none of the above.

375. For satellites the source of energy is
(a) solar cell. (b) fuel cell.
(c) Edison cell. (d) cryogenic storage.

376. Fuel cells have conversion efficiencies of about
(a) 25% (b) 40% (c) 65% (d) 85%

377. Fuel cell converts chemical energy into
(a) heat energy.
(b) low-voltage direct current electrical energy.
(c) low-voltage alternating current electrical energy.
(d) mechanical energy. **[A.M.I.E. Sec B. Winter 1993]**

378. Fuel cells for power generation have the drawbacks of
(a) very high development costs.
(b) low service life and low voltage.
(c) noise, pollution and maintenance problems.
(d) both (a) or (b).

379. The disadvantage(s) of renewable sources of energy is/are
(a) intermittency. (b) lack of dependability.
(c) availability in low energy densities.
(d) all of the above.

380. Biogas consists of
(a) only methane.
(b) methane and carbon dioxide with some impurities.
(c) only ethane. (d) a special organic gas.

381. The main source(s) of production of biogas is /are
(a) wet cow dung. (b) human waste.
(c) wet livestock waste. (d) all of the above.

382. The main by-product of the biogas plant is
(a) biomass. (b) biogas.
(c) organic manure. (d) none of the above.

383. Biogas plants are suitable for
(a) metallurgical industries. (b) commercial complexes.
(c) rural areas. (d) coal mines.
[A.M.I.E. Sec B. Summer 1993]

384. The energy radiated by Sun on a bright sunny day is about
(a) 2.5 kW/m^2 (b) 1.0 kW/m^2
(c) 500 W/m^2 (d) 200 W/m^2

385. Most of solar radiations received on earth surface is within the range of
(a) 0.25-0.4 micron. (b) 0.4-0.8 micron.
(c) 0.6-0.95 micron. (d) 0.1-0.25 micron.

386. Which of the following area is preferred for solar plants ?
(a) Coastal areas. (b) Hot arid zones.
(c) Mountain tops. (d) High rainfall zones.

387. In solar power plants the solar heat is transferred to
(a) molten salts. (b) liquid metals.
(c) water steam. (d) any of the above.

388. Main applications of solar energy may be considered as
(a) direct thermal applications.
(b) fuel from biomass. (c) solar-electric applications.
(d) all of the above.

389. Insulation is referred to as
(a) diffuse radiations received at any time.
(b) direct radiations received at any time.
(c) both of the above. (d) none of the above.

Answers: **358.** (c), **359.** (b), **360.** (b), **361.** (b), **362.** (d), **363.** (e), **364.** (c), **365.** (c), **366.** (b), **367.** (b), **368.** (a), **369.** (b), **370.** (c), **371.** (a), **372.** (b), **373.** (c), **374.** (c), **375.** (a), **376.** (c), **377.** (b), **378.** (d), **379.** (d), **380.** (b), **381.** (d), **382.** (c), **383.** (c), **384.** (b), **385.** (a), **386.** (b), **387.** (d), **388.** (d), **389.** (c),

390. Solar thermal power generation can be had by using
(a) flat plate collectors.
(b) focussing or concentrating collectors.
(c) solar ponds. (d) any of the above.

391. The function of a solar collector is of converting solar energy into
(a) radiations. (b) electrical energy directly.
(c) thermal energy. (d) any of the above.

392. In a solar collector, the transparent cover is provided to
(a) protect the collector from dust.
(b) reduce the heat losses from collector beneath to atmosphere.
(c) transmit solar radiation only .
(d) all of the above.

393. Flat plate collector
(a) has plate blackened in order to absorb maximum amount of direct radiations.
(b) is placed at a proper inclination to the Sun so as to absorb solar radiations.
(c) is mainly used for water heating,space-heating, and drying.
(d) all of the above.

394. The flat plate collector gives a
(a) temperature of about 90°C with an efficiency of 30–35%.
(b) temperature of about 120°C with an efficiency of 45%.
(c) temperature of about 150°C with an efficiency of 52% .
(d) none of the above.

395. Temperature attained by cylindrical parabolic collector is of the order of
(a) 50–100°C (b) 100–150°C
(c) 150–200°C (d) 200–300°C and above.

396. Reflector mirrors employed for exploiting solar energy are called the
(a) mantle. (b) heliostats. (c) diffusers. (d) ponds.

397. Sun tracking is required in case of
(a) cylindrical parabolic and paraboloid.
(b) flat plate collector. (c) both (*a*) and (*b*).
(d) none of the above.

398. A pyrometer can be used for measurement of
(a) diffuse radiations only. (b) direct radiations only.
(c) both, direct as well as diffuse radiations.
(d) none of the above.

399. Wind as a source of power
(a) is non-steady and unreliable.
(b) does not possess the basic requirements of any energy source.
(c) is plentiful, inexhaustible, renewable. and non-polluting.
(d) all of the above.

400. The drawback(s) of wind power plant is/are
(a) unreliability and non-steadiness.
(b) unwieldy size, high structural area and quite large finance requirements.
(c) output voltage and frequency fluctuations.
(d) all of the above.

401. Maximum wind energy available is proportional to
(a) air density. (b) cube of the wind velocity.
(c) square of the rotor diameter.
(d) all of the above.

402. Under favourable conditions, use of wind power for _____ is possible.
(a) small sized plants (b) medium sized plants
(c) large scale generation (d) (a) or (b).

403. Tidal power schemes, could not be found economically justified because of
(a) high cost of civil engineering works.
(b) non-availability of tidal energy in India.
(c) both (a) and (b).

404. Tidal energy utilizes
(a) kinetic energy of water. (b) potential energy of water.
(c) both potential as well as kinetic energy of water.
(d) none of the above.

405. The turbine normally employed in tidal power plants is
(a) simple impulse type. (b) propeller type.
(c) reaction type. (d) reversible type.

406. A tidal power plant is installed in India near
(a) Bay of Bengal. (b) Visakhapatnam.
(c) Goa. (d) Gulf of Cambay.
[A.M.I.E. Sec B. Summer 1994]

407. Geothermal energy is
(a) inexhaustible energy source. (b) a renewable energy source.
(c) alternative energy source. (d) all of the above.

408. A geothermal field may yield
(a) dry steam. (b) wet steam.
(c) hot water. (d) all of the above.

409. Geothermal steam and hot water may contain
(a) NH_3 (b) CO_2 (c) H_2S
(d) H_2S, CO_2, NH_3 and random gas.

410. When geothermal energy is available in the form of saline water, power is developed using
(a) binary cycle system. (b) flashed-steam system.
(c) total flow system. (d) any of the above.

411. In hydrothermal source of geothermal energy
(a) hot water or steam is available.
(b) molten leva is available. (c) hot gases are available.
(d) all of the above.

412. A potential geothermal source region should have
(a) low thermal gradient. (b) high thermal gradient.
(c) high thermal conductivity.
(d) none of the above.

413. In hydrothermal systems when steam, water and dissolved solids are available as source of energy, the entrained solid are removed by
(a) strainers. (b) centrifugal separators.
(c) filters. (d) any of the above.

414. In comparison to conventional steam power plants geothermal power plants have
(a) lower load factor. (b) the same load factor.
(c) higher load factor. (d) unpredictable.

415. Presence of sand in geopressured water is likely to cause
(a) erosion problem. (b) water circulation problem.
(c) heat exchange problem. (d) none of the above.

416. Presence of non-condensable gases in geo-pressured water causes
(a) pollution problem. (b) corrosion problem.
(c) flow problem. (d) all of the above.

417. Petrothermal systems are composed of hot dry rock with
(a) petrochemicals. (b) no underground water.
(c) large underground water. (d) dense gases.

418. In petrothermal systems of geothermal energy having hot dry rock but no underground water, the energy is obtained by

Answers: **390.** (d), **391.** (c), **392.** (d), **393.** (d), **394.** (a), **395.** (d), **396.** (b), **397.** (a), **398.** (c), **399.** (d), **400.** (d), **401.** (d), **402.** (d), **403.** (a), **404.** (b), **405.** (d), **406.** (d), **407.** (d), **408.** (d), **409.** (d), **410.** (d), **411.** (a), **412.** (b), **413.** (b), **414.** (c), **415.** (a), **416.** (d), **417.** (b), **418.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) creating water wells. (b) circulating compressed air.
(c) pumping water. (d) any of the above.

419. In geothermal power plants waste water is
(a) discharged back to earth. (b) discharged into sea.
(c) recirculated after cooling in cooling towers.
(d) evaporated in ponds.

420. In a fuel cell cathode is of
(a) oxygen. (b) ammonia.
(c) hydrogen. (d) carbon monoxide.

421. In a fuel cell electrical energy is produced by
(a) reaction of hydrogen with oxygen.
(b) thermionic action.
(c) combustion of fuel in absence of oxygen.
(d) any of the above.

422. Direct conversion of heat energy into electrical energy is possible through
(a) MHD generators. (b) thermionic converters.
(c) fuel or solar cell. (d) both (a) and (b).

423. Which of the following power plants can generate power at unpredictable or uncontrollable time ?
(a) Tidal power plant. (b) Wind power plant.
(c) Solar power plant. (d) Any of the above.

424. For under water movement of a submarine the power is provided by
(a) tidal energy. (b) MHD generator.
(c) batteries. (d) diesel engine.
(e) thermionic generator. [A.M.I.E. Sec B. Winter 1993]

425. The power station that does not require any moving part is
(a) Thermionic convertor. (b) Wind power generation.
(c) Tidal power plant. (d) Solar power generation.

426. A generating station which has a high investment cost and low operating cost is usually operated as a
(a) peak load station. (b) base load station.
(c) medium load station. (d) None of the above.
[A.M.I.E. Sec B. Summer 1994]

427. Which of the following power plants normally operates at high speeds ?
(a) Hydroelectric. (b) Steam-turbine.
(c) Petrol engine. (d) Diesel engine.

428. Which of the following power plants is free from environmental problems ?
(a) Diesel engine. (b) Nuclear.
(c) Hydroelectric. (d) Steam.

429. Which power plant cannot have single unit of 100 MW capacity ?
(a) Steam power plant. (b) Nuclear power plant.
(c) Hydroelectric power plant.
(d) Diesel engine power plant.
[A.M.I.E. Sec B. Power Systems, Winter 1999]

430. Which of the following plants will take least time in starting from cold conditions to full-load operation ?
(a) Nuclear power plant. (b) Steam power plant.
(c) Hydroelectric plant. (d) Gas turbine plant
[A.M.I.E. Sec B. Power Systems, Winter 1999]

431. Which of the following generating plants has the minimum operating cost ?
(a) Steam plant. (b) Hydroelectric plant.
(c) Nuclear plant. (d) Diesel plant.
[A.M.I.E. Sec B. Power Systems, Winter 1998]

432. Which of the following plants has the maximum capital cost ?
(a) Steam plants. (b) Hydro-plants.
(c) Diesel plants. (d) Nuclear plants.
[A.M.I.E. Sec B. Power Systems, Winter 1996]

433. In a steam power plant, which of its following components needs maximum maintenance attention ?
(a) Condenser. (b) Boiler.
(c) Steam turbine. (d) Superheater.

434. A steam power plant is being supplied with coal having much more ash content than that for which it was designed. Which of its following units needs major modifications ?
(a) Ash handling unit. (b) Pulverising unit.
(c) Condenser. (d) Cooling towers.

435. A diesel power plant is generally used as a /an
(a) base load plant. (b) peak load plant.
(c) standby plant/emergency plant.
(d) any of the above.

436. A gas turbine power plant is best suited for
(a) base loads. (b) peak loads.
(c) emergency. (d) none of the above.

437. For the same cylinder dimensions and same rpm, which of the following engines will produce least power ?
(a) Petrol engine. (b) Diesel engine.
(c) Supercharged engine.

438. Ships are usually supplied power by
(a) steam accumulators. (b) hydraulic turbine.
(c) diesel engines. (d) none of the above.

439. Gas turbine power plants for maximum efficiency may have
(a) heat exchangers. (b) multistage compression.
(c) reheating. (d) all of the above.

440. Air will not be the working substance in a
(a) closed cycle gas turbine. (b) open cycle gas turbine.
(c) petrol engine. (d) diesel engine.

441. Which of the following plants can never have 100 percent load factor ?
(a) Nuclear power plant. (b) Hydroelectric power plant.
(c) Base load plant. (d) Peak load plant.

442. Which of the following power plants needs highly skilled/qualified engineers for its operation ?
(a) Hydro. (b) Steam. (c) Nuclear. (d) Gas turbine.

443. Which of the following power plants will take long period in erection and installation ?
(a) Steam. (b) Hydro. (c) Nuclear. (d) Gas-turbine.

444. Major share of power generated in India is through
(a) hydroelectric power plants.
(b) nuclear power plants.
(c) thermal power plants. (d) gas turbine power plants.

445. When a 'pumped storage' power plant is operated in conjunction with a steam power plant
(a) The operating cost of the steam plant becomes optimum.
(b) Load factor of the steam plant is increased.
(c) Chances of the tripping of the system decrease because of the use of two heterogeneous types of plants.
(d) Operation of the storage plant in the pumping-mode during the low-load period improves the steam-plant stability.
[U.P.S.C. I.E.S. E.E.-II, 2003]

Answers: **419.** (a), **420.** (c), **421.** (a), **422.** (d), **423.** (d), **424.** (c), **425.** (a), **426.** (b), **427.** (b), **428.** (c), **429.** (d), **430.** (c), **431.** (b), **432.** (d), **433.** (b), **434.** (a), **435.** (c), **436.** (b), **437.** (a), **438.** (c), **439.** (d), **440.** (a), **441.** (d), **442.** (c), **443.** (b), **444.** (c), **445.** (b),

Downloaded From : www.EasyEngineering.net

446. Out of the following plant categories
(i) Nuclear (ii) Run-off-river
(iii) Pump Storage (iv) Diesel
The base load power plants are
(a) (i) and (ii). (b) (ii) and (iii).
(c) (i), (ii) and (iv). (d) (i), (iii) and (iv).
[GATE E.E. 2009]

447. The essential requirement(s) for power plants to be operated as base load plants is /are
(a) low operating cost.
(b) capability of operating continuously for long periods.
(c) requirement of few operating personnel and economical repair.
(d) all of the above.

448. The generating station suitable to operate as peak load plant is
(a) Thermal power station. (b) Nuclear power station.
(c) Pumped storage power station.
(d) none of these. [W.B. Univ. of Technology Power System III, 2009]

449. Which of the following power stations is mainly used to cover peak load on the system?
(a) Coal based thermal power plant.
(b) Nuclear power plant.
(c) Gas based thermal power plant.
(d) Pumped storage hydropower plant. [U.P.S.C. I.E.S. E.E.-II, 2010]

450. The essential requirement(s) for power plants to be operated as peak load plants are
(a) capability of quick start, synchronisation and taking up of system load.
(b) quick response to load variations.
(c) low capital cost. (d) all of the above.

451. Efficiency is of little importance in case of
(a) base load power plants.
(b) peak load plants.
(c) standby plants. (d) both (b) and (c).

452. The annual cost of generating station can be expressed in the form of Rs (A + B × kW + C × kWh) where A, B, C are constants and kW and kWh represent capacity of the station and energy generated per year respectively. The choice between the "base-load station" and the "peak-load station" basically depends on the fact that
(a) factor B should be less for the peak-load station and factor C should be less for the base-load station.
(b) factor C should be less for the peak-load station and factor B should be less for the base load station.
(c) the factors B and C should both be less for the base-load station.
(d) the factors B and C should both be less for the peak-load station. [U.P.S.C. I.E.S. E.E.-II, 1993]

453. The modern trend in electric power generation is
(a) to have a large number of small size thermal plants located at different places.
(b) to have large size thermal plants near load centre.
(c) to have large size thermal plants located near coal fields.
(d) none of the above. [A.M.I.E. Sec B. Power Systems, Winter 1998]

454. Which of the following are the advantages of interconnected operation of power systems ?
1. Less reserve capacity requirement.
2. More reliability. 3. High power factor.
4. Reduction in short-circuit level.
Select the correct answer using the codes given below:
(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1998]

455. Interconnected systems have the advantage(s) of
(a) reduced reserve plant capacity, capital cost per kW and economy in operation.
(b) improved load factor, diversity factor and operation efficiency and increased reliability of supply.
(c) all of the above. (d) none of the above.

456. An interconnected system has the following power plants
1. Nuclear, 2. Steam, 3. Diesel, 4. Gas turbine, 5. Hydro with storage, 6. Run-off the river, 7. Pumped storage.
Which of the above three power plants are used exclusively for supplying peak loads ?
(a) 1, 2, 3 (b) 3, 4, 7
(c) 4, 5, 6 (d) 2, 3, 5

457. Which two of the power plants mentioned in Q. 440 are used exclusively for supplying base load ?
(a) 1, 5 (b) 1, 2 (c) 1, 6 (d) 4, 6

458. In a moderate size steam power station, electrical power is generated at
(a) 440 V (b) 1.1 kV (c) 11 kV (d) 33 kV

459. If two synchronous generators are connected, loss of synchronism will result in
(a) stalling of generators. (b) wild fluctuations in current.
(c) wild fluctuations in current and voltage.
(d) none of the above. [A.M.I.E. Sec B. Summer 1995]

460. A large synchronous generator is feeding power into an infinite bus at slightly lagging power factor. If a total loss of field occurs and the system can supply sufficient reactive power without a large terminal voltage drop, the unit will
(a) continue to run as a synchronous generator and no tripping is necessary.
(b) get short-circuited and it should be tripped instantaneously.
(c) run as an induction generator and it should be tripped after a time delay.
(d) run as a synchronous motor and it should be tripped after a time delay. [U.P.S.C. I.E.S. E.E.-II, 1993]

461. Unit of regulation of speed governor is
(a) Hz/MW (b) MW/Hz
(c) Unitless (d) km/sec
[W.B. Univ. of Technology Power System III 2009-10]

462. A turbine-generator set has a regulation constant of 6% on the generator rating of 120 MVA, 50 Hz. The generator frequency decreases by 0.01 Hz. The increase in turbine output for steady-state operation is:
(a) 0.8 MW (b) 0.4 MW
(c) 0.2 MW (d) 40 MW
[U.P.S.C. I.E.S. E.E.-II, 2011]

463. Three identical generators supply power in a system having lossless transmission lines. Generator 1 is equipped with a speed governor that maintains its speed constant at the rated value while generators 2 and 3 have governors with droops of 5% and 4% respectively. For a given increase in system load in the steady state
(a) Generators 1, 2, 3 will share the increased load in the ratio of 0 : 5 : 4.
(b) Generators 1, 2, 3 will share the increased load equally.
(c) Generators 1, 2, 3 will share the increased load in the ratio of 0 : 4 : 5.

Answers: **446.** (a), **447.** (d), **448.** (c), **449.** (d), **450.** (d), **451.** (d), **452.** (a), **453.** (c), **454.** (a), **455.** (c), **456.** (b), **457.** (c), **458.** (c), **459.** (a), **460.** (c), **461.** (a), **462.** (b), **463.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(d) Generator 1 will alone take the entire increased load and the output of generators 2 and 3 will remain unchanged.
[U.P.S.C. I.E.S. E.E.-II, 2019]

464. Three generators are feeding a load of 100 MW. The details of the generators are

	Rating (MW)	Efficiency(%)	Regulation (pu) on 100 MVA base
Generator-1	100	20	0.02
Generator-2	100	30	0.04
Generator-3	100	40	0.03

In the event of increased load power demand, which of the following will happen?
(a) All the generators will share equal power
(b) Generator-3 will share more power compared to Generator-1
(c) Generator-1 will share more power compared to Generator-2
(d) Generator-2 will share more power compared to Generator-3
[GATE E.E. 2009]

465. Two generators rated at 200 MW and 400 MW are operating in parallel. Both the governors have a drop of 4% when the total load is 300 MW. They share the load as (suffix 1 is used for generator 200 MW and suffix 2 is used for generator 400 MW)
(a) $P_1 = 100$ MW and $P_2 = 200$ MW
(b) $P_1 = 150$ MW and $P_2 = 150$ MW
(c) $P_1 = 200$ MW and $P_2 = 100$ MW
(d) $P_1 = 200$ MW and $P_2 = 400$ MW [U.P.S.C. I.E.S. E.E.-II, 1999]

466. For stable operation of interconnected system, the passive element that can be used as the interconnecting element is
(a) reactor. (b) resistor. (c) capacitor.
(d) resistor and capacitor. [A.M.I.E. Sec B. Winter 1993, Summer 1995]

467. To meet the reactive power requirements at load centres usually
(a) shunt capacitors are used.
(b) series capacitors are used.
(c) tap changing transformers are used.
(d) shunt reactors are used. [A.M.I.E. Sec B. Summer 1994]

468. A power system needs injection of VARs at
(a) off-peak load. (b) peak load.
(c) both peak and off-peak load.
(d) full load.

469. The injection of VARs is required to
(a) compensate for line losses.
(b) get a good voltage profile.
(c) increase the voltage at the receiving end.
(d) all of the above.

470. Shunt capacitors in a substation
(a) consume lagging VARs. (b) deliver lagging VARs.
(c) consume active power. (d) deliver active power.
[A.M.I.E. Sec B. Power Systems, Summer 1993]

471. In a 400 kV power network, 360 kV is recorded at a 400 kV bus. The reactive power absorbed by a shunt reactor rated for 50 MVAR, 400 kV connected at the bus is
(a) 61.73 MVAR (b) 55.56 MVAR
(c) 45.0 MVAR (d) 40.5 MVAR
[U.P.S.C. I.E.S. E.E.-II, 1995]

472. The principle of incremental costs is employed for deciding the
(a) sequence of adding units.
(b) load allocation between units in operation.
(c) total plant capacity to be operated.
(d) all of the above.

473. For a thermal power plant the input output characteristic is given by
$Q = 8 + P + 0.08\ P^2$
where Q and P are heat input and power output, respectively in MW. The maximum thermal efficiency would be
(a) 26.5% (b) 30.5% (c) 34.5% (d) 38.5%
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1994]

474. For economy measure the generators at a power plant operate at
(a) equal loads. (b) load proportional to the ratings.
(c) equal incremental cost. [A.M.I.E. Sec B. Power Systems, Summer 1999]

475. Two generating plants feed a load centre through a transmission network. For maximum economy
(a) the incremental cost of power supplied at the load centre should be the same for both the plants.
(b) the incremental fuel cost should be the same for both the plants.
(c) the more efficient plant should share more load.
(d) none of the above.

476. In the optimum generator scheduling different power plants, the minimum fuel cost is obtained when
(a) only the incremental fuel cost of each plant is the same.
(b) the penalty factor of each plant is the same.
(c) the ratio of the incremental fuel cost to the penalty factor of each plant is the same.
(d) the incremental fuel cost of each plant multiplied by its penalty factor is the same. [U.P.S.C. I.E.S. E.E.-II, 1994]

477. In terms of power generation and B_{mn} coefficients, the transmission loss for a two-plant system is (notations having their usual meanings)
(a) $P_1^2 B_{11} + 2P_1P_2 B_{12} + P_2^2 B_{22}$
(b) $P_1^2 B_{11} - 2P_1P_2 B_{12} + P_2^2 B_{22}$
(c) $P_2^2 B_{11} + 2P_1P_2 B_{12} + P_1^2 B_{22}$
(d) $P_1^2 B_{11} + P_1P_2 B_{12} + P_2^2 B_{22}$ [U.P.S.C. I.E.S. E.E.-II, 2000]

478. If the generating station is situated very close to the load centre, the penalty factor for this unit is
(a) zero. (b) almost unity.
(c) negative. (d) very high.

479. The cost function of a 50 MW generator is given by (P_1 is the generating loading)
$F(P_1) = 225 + 53\ P_1 + 0.02\ P_1^2$
When 100% loading is applied, the incremental fuel cost (IFC) will be
(a) Rs 55 per MWh (b) Rs 55 per MW
(c) Rs 33 per MWh (d) Rs 33 per MW
[U.P.S.C. I.E.S. E.E.-II, 2000]

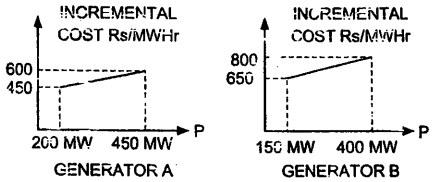
480. Two generating stations connected to a load centre having capacity of 50 MVA and 75 MVA deliver 100 MW to the load. The incremental cost of plant 1 is $15 + 0.15P_1$ and that of the plant 2 is $18 + 0.15\ P_2$. What are the values of P_1 and P_2, respectively?
(a) 60 MW and 40 MW (b) 50 MW each.
(c) 72 MW and 28 MW (d) 30 MW and 70 MW
[U.P.S.C. I.E.S. E.E.-II, 2008]

481. The incremental cost curves in Rs/MWhr for two generators supplying a common load of 700 MW are shown in the figures. The maximum and minimum generation limits are also indicated. The optimum generation schedule is:

Answers: **464.** (c), **465.** (a), **466.** (a), **467.** (a), **468.** (c), **469.** (b), **470.** (b), **471.** (d), **472.** (b), **473.** (b), **474.** (c), **475.** (a), **476.** (d), **477.** (a), **478.** (b), **479.** (a), **480.** (b), **481.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net



(a) Generator A : 400 MW, Generator B : 300 MW
(b) Generator A : 350 MW, Generator B : 350 MW
(c) Generator A : 450 MW, Generator B : 250 MW
(d) Generator A : 425 MW, Generator B : 275 MW

[GATE E.E. 2007]

482. A lossless power system has to serve a load of 250 MW. There are two generators (G_1 and G_2) in the system with cost curves C_1 and C_2 respectively defined as follows:

$$C_1(P_{G1}) = P_{G1} + 0.055 \times P_{G1}^2$$

$$C_2(P_{G2}) = 3P_{G2} + 0.03 \times P_{G2}^2$$

where P_{G1} and P_{G2} are the MW injections from generator G_1 and G_2 respectively. Thus, the minimum cost dispatch will be

(a) $P_{G1} = 250$ MW; $P_{G2} = 0$ MW
(b) $P_{G1} = 150$ MW; $P_{G2} = 100$ MW
(c) $P_{G1} = 100$ MW; $P_{G2} = 150$ MW
(d) $P_{G1} = 0$ MW; $P_{G2} = 250$ MW [GATE E.E. 2008]

483. The incremental cost characteristics of two generators delivering a total load of 200 MW are as follows :

$$\frac{dF_1}{dP_1} = 2.0 + 0.01P_1 \qquad \frac{dF_2}{dP_2} = 1.6 + 0.02P_2$$

What should be the values of P_1 and P_2, for economic operation?

(a) $P_1 = P_2 = 100$ MW (b) $P_1 = 80$ MW, $P_2 = 120$ MW
(c) $P_1 = 200$ MW, $P_2 = 0$ (d) $P_1 = 120$ MW, $P_2 = 80$ MW

[U.P.S.C. I.E.S. E.E.-II, 2007]

484. The incremental cost characteristics of two generators delivering a load of 200 MW are as follows:

$$\frac{dF_1}{dP_1} = 2.0 + 0.01\ P_1$$

$$\frac{dF_2}{dP_2} = 1.6 + 0.02\ P_2$$

For economic operation the generators P_1 and P_2 should be

(a) 120 MW and 80 MW (b) 80 MW and 120 MW
(c) 120 MW and 120 MW (d) 80 MW and 80 MW

[U.P.S.C. I.E.S. E.E.-II, 2011]

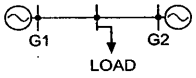
485. The incremental fuel costs for two generating units G_1 and G_2 are given by:

$IC_1 = 25 + 0.2\ PG_1$ and $IC_2 = 32 + 0.2\ PG_2$ where PG_1 and PG_2 are real powers generated by the units. The economic allocation for a total load of 250 MW, neglecting transmission loss, is given by

(a) $PG_1 = 142.5$ MW and $PG_2 = 107.5$ MW
(b) $PG_1 = 109.75$ MW and $PG_2 = 140.25$ MW
(c) $PG_1 = 125$ MW and $PG_2 = 125$ MW
(d) $PG_1 = 100$ MW and $PG_2 = 150$ MW

[U.P.S.C. I.E.S. E.E.-II, 2011]

486. A load centre is at an equidistant from the two thermal generating stations G_1 and G_2 as shown in the figure. The fuel cost characteristics of the generating stations are given by

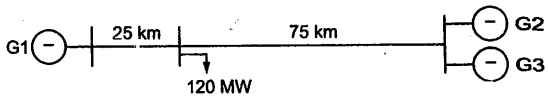


$F_1 = a + bP_1 + cP_1^2$ Rs/hour
$F_2 = a + bP_2 + cP_2^2$ Rs/hour

where P_1 and P_2 are the generation in MW of G_1 and G_2, respectively. For most economic generation to meet 300 MW of load, P_1 and P_2, respectively, are

(a) 150, 150 (b) 100, 200
(c) 200, 100 (d) 175, 125 [GATE E.E. 2005]

487. A load center of 120 MW derives power from two power stations connected by 220 kV transmission lines of 25 km and 75 km as shown in the figure below. The three generators G1, G2 and G3 are of 100 MW capacity each and have identical fuel cost characteristics. The *minimum loss generation schedule* for supplying the 120 MW load is



(a) P1 = 80 MW + losses
P2 = 20 MW
P3 = 20 MW
(b) P1 = 60 MW
P2 = 30 MW + losses
P3 = 30 MW
(c) P1 = 40 MW
P2 = 40 MW
P3 = 40 MW + losses
(d) P1 = 30 MW + losses
P2 = 45 MW
P3 = 45 MW

[GATE E.E.. 2011]

488. Incremental fuel costs (in some appropriate unit) for a power plant consisting of three generating units are

$IC_1 = 20 + 0.3\ P_1$, $IC_2 = 30 + 0.4\ P_2$, $IC_3 = 30$

where P_1 is the power in MW generated by unit *i*, for $i = 1, 2$ and 3. Assume that all the three units are operating all the time. Minimum and maximum loads on each unit are 50 MW and 300 MW respectively. If the plant is operating on economic load dispatch to supply the total power demand of 700 MW, the power generated by each unit is

(a) $P_1 = 242.86$ MW; $P_2 = 157.14$ MW; and $P_3 = 300$ MW
(b) $P_1 = 157.14$ MW; $P_2 = 242.86$ MW; and $P_3 = 300$ MW
(c) $P_1 = 300.0$ MW; $P_2 = 300.0$ MW; and $P_3 = 100$ MW
(d) $P_1 = 233.3$ MW; $P_2 = 233.3$ MW; and $P_3 = 233.4$ MW

[GATE E.E. 2003]

489. Consider a power system with three identical generators. The transmission losses are negligible. One generator (G_1) has a speed governor which maintains its speed constant at the rated value, while the other generators (G_2 and G_3) have governors with a droop of 5%. If the load of the system is increased, then in steady state.

(a) generation of G_2 & G_3 is increased equally while generation of G_1 is unchanged.
(b) generation of G_1 alone is increased while generation of G_2 and G_3 is unchanged.
(c) generation of G_1, G_2 and G_3 is increased equally.
(d) generation of G_1, G_2 and G_3 is increased in the ratio 0.5 : 0.25 : 0.25. [GATE E.E. 2002]

490. The unit of transmission loss coefficient is

(a) MW (b) $(MW)^{-1}$
(c) $(MW)^{-2}$ (d) unitless.
(e) none of these. [W.B. Univ. of Technology Power System 2009-10]

491. If penalty factor of a plant is unity, its incremental transmission loss is

(a) 1.0 (b) −1.0
(c) 0.0 (d) 2.0

[W.B. Univ. of Technology Power System 2009-10]

Answers: **482.** (c), **483.** (d), **484.** (a), **485.** (a), **486.** (c), **487.** (a), **488.** (a), **489.** (b), **490.** (b), **491.** (c),

492. The main objectives of load frequency control in a power system are:
1. to bring the steady state error to zero after load change.
2. to maintain the net tie-line flow.
3. to maintain voltages on all buses.
4. to economize the cost of generation.

(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

493. In AGC, the voltage and frequency is controlled by
(a) excitation control. (b) turbine control.
(c) turbine speed control and excitation control respectively.
(d) excitation control and turbine speed control respectively.
[W.B. Univ. of Technology Power System III 2009-10]

494. The main objective of load frequency controller is to apply control of:
(a) frequency alone.
(b) frequency and at the same time of real power exchange via the outgoing lines.
(c) frequency and at the same time of reactive power exchange via the outgoing lines.
(d) frequency and bus voltages. [U.P.S.C. I.E.S. E.E.-II, 2011]

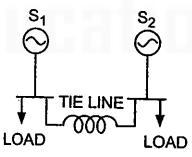
495. Load frequency control uses
(a) proportional controllers alone.
(b) integral controllers alone.
(c) both proportional and integral controllers.
(d) either proportional or integral controllers.
[U.P.S.C. I.E.S. E.E.-II, 1999]

496. Load frequency controls are carried out with
(a) P controllers only. (b) I controllers only.
(c) D controllers only. (d) PID controllers.
[U.P.S.C. I.E.S. E.E.-II, 2010]

497. Consider the following statements regarding load frequency control:
1. Time constant of automatic load frequency control is about 15 seconds.
2. Integral control eliminates static frequency drop.
3. In tie-line load bias control, the control signal for each area is proportional to change in frequency as well as change in tie-line power.

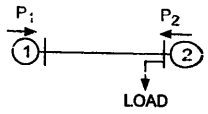
Which of the statements given above are correct?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2004]

498. Consider a power system with two plants S_1 and S_2 connected through a tie line as shown in the figure.



When the load-frequency control of the system is considered, the Flat tie line control system is preferred over the 'Flat frequency regulation system', because
(a) It is advantageous to control the frequency from any one particular plant without disturbing the other one during load-swings on either S_1 or S_2 areas.
(b) This ensures that only the more efficient plant's input is controlled for load variation in any area.
(c) Only the tie line is required to absorb the load-swings.
(d) The load-change in a particular area is taken care of by the generator in that area resulting in the tie-line loading to remain constant. [U.P.S.C. I.E.S. E.E.-II, 2003]

499. Two power plants interconnected by a tie-line as shown in the figure have loss formula coefficient $B_{11} = 10^{-3}$ MW^{-1}. Power is being despatched economically with plant '1' as 100 MW and plant '2' as 125 MW. The penalty factors for plants 1 and 2 are respectively



(a) 1 and 1.25 (b) 1.25 and 1
(c) 1 and zero (d) zero and 1
[U.P.S.C. I.E.S. E.E.-II, 2001]

500. An isolated 50 Hz synchronous generator is rated at 15 MW which is also the maximum continuous power limit of its prime mover. It is equipped with a speed governor with 5% droop. Initially, the generator is feeding three loads of 4 MW each at 50 Hz. One of these loads is programmed to trip permanently if the frequency falls below 48 Hz. If an additional load of 3.5 MW is connected then the frequency will settle down to
(a) 49.417 Hz (b) 49.917 Hz
(c) 50.083 Hz (d) 50.583 Hz [GATE E.E. 2007]

501. A power system has two synchronous generators. The Governor-turbine characteristics corresponding to the generators are
$P_1 = 50\,(50 - f)$, $P_2 = 100\,(51 - f)$
where f denotes the system frequency in Hz, and P_1 and P_2 are, respectively, the power outputs (in MW) of turbines 1 and 2. Assuming the generators and transmission network to be lossless, the system frequency for a total load of 400 MW is
(a) 47.5 Hz (b) 48.0 Hz
(c) 48.5 Hz (d) 49.0 Hz [GATE E.E. 2001]

502. For a synchronous generator connected to an infinite bus through a transmission line, how are the change of voltage (ΔV) and the change of frequency (Δf) related to the active power (P) and the reactive power (Q)?
(a) ΔV is proportional to P and Δf to Q.
(b) ΔV is proportional to Q and Δf to P.
(c) Both ΔV and Δf are proportional to P.
(d) Both ΔV and Δf are proportional to Q.
[U.P.S.C. I.E.S. E.E.-II, 2006]

503. The speed regulation parameter R of a control area is 0.025 Hz/MW and load frequency constant D is 2 MW/Hz. The area frequency response characteristic (AFRC) is
(a) 42.0 MW/Hz (b) 40.0 MW/Hz
(c) 20 MW/Hz (d) 2 MW/Hz
[U.P.S.C. I.E.S. E.E.-II, 2001]

504. What is the correct expression for Area Control Error (ACE) for an interconnected 2-area power system, if ΔP_t is incremental tie line power deviation, Δf is frequency deviation and b is frequency bias coefficient?
(a) $ACE = b\Delta P_t + \Delta f$ (b) $ACE = \Delta P_t + b\Delta f$
(c) $ACE = \frac{1}{b}\Delta P_t + \Delta f$ (d) $ACE = \Delta P_t + \frac{1}{b}\Delta f$
[U.P.S.C. I.E.S. E.E.-II, 2007]

505. The voltage of a bus can be controlled by controlling the
(a) phase angle. (b) reactive power of the bus.
(c) active power of the bus.
(d) phase angle and the reactive power. [A.M.I.E. Sec B. Summer 1995]

506. The permissible variation of frequency in power system is
(a) ± 1% (b) ± 3% (c) ± 5% (d) ± 10%
[A.M.I.E. Sec B. Winter 1993; Summer 1999]

507. When there is a change in load in a power station having a number of generator units operating in parallel, the system frequency is controlled by

Answers: **492.** (a), **493.** (c), **494.** (b), **495.** (c), **496.** (d), **497.** (d), **498.** (b), **499.** (b), **500.** (a), **501.** (b), **502.** (b), **503.** (a), **504.** (b), **505.** (b), **506.** (b), **507.** (a),

(a) adjusting the steam input to the units.
(b) adjusting the field excitation of the generators.
(c) changing the load divisions between the units.
(d) injecting reactive power at the station bus-bar.
[U.P.S.C. I.E.S. E.E.-II, 1994]

508. Load frequency control is achieved by properly matching the individual machine's
(a) reactive powers. (b) generated voltages.
(c) turbine inputs. (d) turbine and generator ratings.
[U.P.S.C. I.E.S. E.E.-II, 1998]

509. In the load-frequency control system with free governor action, the increase in load-demand under steady conditions is met
(a) only by increased generation due to opening of steam valve.
(b) only by decrease of load-demand due to drop in system frequency.
(c) partly by increased generation and partly by decrease of load demand.
(d) partly by increase generation and partly by increased excitation. [U.P.S.C. I.E.S. E.E.-II, 1996]

510. During load shedding
(a) system voltage is reduced.
(b) system frequency is reduced.
(c) system loads are switched off.
(d) system power factor is changed.
[A.M.I.E. Sec B. Power Systems, Winter 1999]

511. When the power system is not in a position to meet the load it will resort to
(a) power factor improvement at the generators.
(b) load shedding. (c) efficient plant operation.
(d) penalising high load consumers by increasing the charges.

512. Load shedding is done for
(a) reducing peak demand on the system.
(b) repairing of machines. (c) power factor improvement.
(d) efficient operation of equipment.

513. When load shedding is resorted to, it can be concluded that
(a) plant is under repair.
(b) load on the system is more than the installed capacity.
(c) both of the above (a) and (b).
(d) none of the above.

514. Generators for base load plants are usually designed for maximum efficiency around
(a) 20% over-load. (b) full-load.
(c) 75% full-load. [A.M.I.E. Sec B. Power Systems, Winter 1998]

515. Generators for power plants to supply exclusively peak loads are usually designed for maximum efficiency to occur at
(a) full load. (b) 50 – 75% full load.
(c) 25 – 50% full load. (d) 10% full load.

516. A pilot exciter is provided on synchronous generator to
(a) provide starting torque to the generator.
(b) to supplement the power generated by the main generator.
(c) excite the main exciter. (d) none of the above.

517. Annual operating cost of a generating plant consists of
(a) fixed charges. (b) semifixed charges.
(c) operating or running charges.
(d) all of the above.

518. For a power plant the expenditure on which of the following items is expected to be almost negligible ?
(a) Publicity. (b) Taxes.
(c) Insurance. (d) Maintenance.

519. In a steam power station which of the following is not a **fixed** cost ?
(a) Interest on capital cost of land and buildings.
(b) Salaries of high officials.
(c) Fuel and lubricating oil cost.
(d) Insurance charges.

520. In a power plant which of the following items does not fall in the category of operating cost ?
(a) Salaries of operational and maintenance staff.
(b) Maintenance and repair cost.
(c) Salaries of supervisory staff engaged on the running of the plant.
(d) Salaries of management and clerical staff.

521. In a power plant, which of the following items fall in the category of semifixed charges ?
(a) Annual interest and depreciation on capital cost.
(b) All types of taxes and insurance charges.
(c) Salaries of management and clerical staff.
(d) All of the above.

522. For a nuclear power plant, the useful life is expected to be about
(a) 10 years. (b) 30 years.
(c) 60 years. (d) 80 years.

523. The interest on the capital cost is included in
(a) annual fixed cost. (b) annual operating cost.
(c) both (a) and (b). (d) neither (a) nor (b).

524. The capital cost of a power plant depends on
(a) total installed capacity only. (b) total number of units only.
(c) total installed capacity and number of units as well.
(d) neither the installed capacity nor number of units.
[A.M.I.E. Sec B. Power Systems Summer 1998; Summer 2000]

525. The long term load forecast is required for
(a) operation of plant. (b) economic operation of plant.
(c) planning the addition in generation capacity.
(d) both (b) and (c).

526. The annual depreciation reserve depends on
(a) capital cost only. (b) salvage value only.
(c) on the method of calculation depreciation reserve.
(d) all of the above.

527. Salvage value of a plant
(a) is always positive. (b) is always zero.
(c) is always negative. (d) may be any of the above.

528. An equipment purchased for Rs 25 lakhs, 3 years before, has now market value of 32 lakhs, It shows that
(a) the value has depreciated as per straight line method.
(b) the value has depreciated as per diminishing value method.
(c) the value has depreciated as per sinking fund method.
(d) the value has appreciated with the time.

529. Ideally depreciated value of the plant plus the accumulation in the depreciation fund should be equal to
(a) obsolescence rate. (b) sinking fund.
(c) original invested value. (d) salvage value.

530. In a straight line method, annual depreciation charges are calculated by
(a) the capital cost minus salvage value divided by the number of years of life.
(b) the capital cost divided by the number of years of life.
(c) making a provision for setting each year a fixed rate, first applied to the original cost and then to the diminishing value, depending upon the useful life of the plant.
(d) none of the above.

Answers: **508.** (c), **509.** (c), **510.** (c), **511.** (b), **512.** (a), **513.** (b), **514.** (b), **515.** (b), **516.** (c), **517.** (d), **518.** (a), **519.** (c), **520.** (d), **521.** (d), **522.** (b), **523.** (a), **524.** (c), **525.** (c), **526.** (d), **527.** (d), **528.** (d), **529.** (c), **530.** (a),

531. Annual instalment towards depreciation increases with the decrease in interest rate in case of
(a) straight line depreciation. (b) sink fund depreciation.
(c) reducing balance depreciation.
(d) all of the above.

532. Annual depreciation of the plant is proportional to the earning capacity of the plant in case of
(a) straight line depreciation. (b) sinking fund depreciation.
(c) reducing balance depreciation.
(d) none of the above.

533. Annual estimated depreciation charges for a plant are heavy during early years in case of
(a) diminishing value method.
(b) sinking fund method. (c) straight line method.
(d) none of the above.

534. In a power plant insurance cover is provided for
(a) equipment only. (b) unskilled workers only.
(c) unskilled and skilled workers.
(d) equipment and skilled and unskilled workers.

535. A company can raise funds through
(a) fixed deposits. (b) shares.
(c) bonds. (d) any of the above.

536. All of the following are the sources of borrowing money except
(a) shares. (b) debentures.
(c) bonds. (d) fixes deposits.

537. Which of the following are not repayable after a stipulated period ?
(a) Fixed deposits. (b) Shares.
(c) Bonds. (d) Cash certificates.

538. During summer season load on the system increases, this is due to
(a) increase in demand of water supply.
(b) increased business activity.
(c) increased use of fans, air coolers and air conditioners.
(d) vacations in schools and institutions.

539. The connected load of a domestic consumer (medium income group) is usually about
(a) 2–5 kW (b) 10–20 kW
(c) 20–30 kW (c) below 1 kW

540. Power demand can be estimated approximately by
(a) load survey method. (b) mathematical method.
(c) statistical method. (d) economic parameters.
(e) all of the above.

541. A load curve is a plot of
(a) load versus duration of time.
(b) load versus current. (c) load versus time.
(d) total number of units generated versus time.

542. The chronological load curve indicates
(a) variation in demand factor during 24 hours.
(b) variation in demand from instant to instant during 24 hours.
(c) the total energy consumed upto different times of the day.
(d) the total number of hours for which a particular load lasts during the day.

543. The area under the load curve represents
(a) system voltage. (b) current.
(c) energy consumed. (d) maximum demand.
(e) average demand. [A.M.I.E. Sec B. Summer 1994]

544. The area under daily load curve divided by 24 gives
(a) average load for the day. (b) maximum demand.
(c) connected load. (d) demand factor.

545. Which of the following statements regarding load curve is true ?
(a) The area under the curve gives average demand.
(b) The ratio of area under the load curve to the total area of the rectangle in which it is contained gives the load factor for the day.
(c) The area of the load curve divided by the number of hours gives the load factor.
(d) The area of the load curve divided by the number of hours gives the demand factor.

546. Load curve of a power generating station is of always
(a) negative slope. (b) zero slope.
(c) positive slope.
(d) any combination of (a), (b) and (c).

547. Load curve helps in deciding the
(a) total installed capacity of the plant.
(b) size of the generating units.
(c) operating schedule of the generating units.
(d) all of the above.

548. Load duration curve gives
(a) the variations of load during diffcrent hours of the day.
(b) average load.
(c) the number of hours for which a particular load lasts during the day.
(d) none of the above.

549. The load duration curve for unity load factor will be of
(a) rectangular shape. (b) triangular shape.
(c) L-shape. (d) I-shape.

550. The mass curve represents
(a) average load.
(b) the total energy consumed by the load upto a particular time in a day.
(c) the number of hours for which a particular load lasts during the day.
(d) the variation of load during different hours of the day.

551. A mass curve can be plotted from
(a) load duration curve. (b) chronological load curve.
(c) energy load curve.
(d) both load duration curve and chronological load curve.
[A.M.I.E. Sec B. Summer 1998, 2000]

552. Integrated load duration curve representing total number of units (kWh) generated for a given demand in kW can be plotted directly from
(a) load curve. (b) load duration curve.
(c) mass curve. (d) any of these.

553. In a load duration curve for an integrated power system, the uppermost crest represents the energy contributed by which one of the following?
(a) Base power stations. (b) Major thermal stations.
(c) Peaking hydro or gas turbine stations.
(d) Non-conventional power stations. [U.P.S.C. I.E.S. E.E.-II, 2007]

554. During which season the load on a power system is maximum ?
(a) Autumn. (b) Rainy. (c) Summer. (d) Winter.

555. Maximum demand on the power system is
(a) the greatest of all 'short time interval averaged' demand during a period.
(b) instantaneous maximum value of kW supplied during a period.
(c) instantaneous maximum value of kVA supplied during a period.
(d) maximum value of units (kWh) supplied during a period.

Answers: **531.** (b), **532.** (c), **533.** (a), **534.** (d), **535.** (d), **536.** (a), **537.** (b), **538.** (c), **539.** (a), **540.** (c), **541.** (c), **542.** (b), **543.** (c), **544.** (a), **545.** (b), **546.** (d), **547.** (d), **548.** (c), **549.** (a), **550.** (b), **551.** (b), **552.** (b), **553.** (d), **554.** (d), **555.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

556. The power system experiences peak demand from
(a) midnight to 8 A.M. (b) 8 A.M. to 2 P.M.
(c) 2 P.M. to 6 P.M. (d) 6 P.M. to 10 P.M.

557. Connected load means
(a) installed electrical load in the premises of a consumer.
(b) maximum load a consumer draws.
(c) load drawn by consumer at any instant.
(d) none of the above.

558. The maximum demand of a power station is
(a) sum of the maximum demands of all its consumers.
(b) greatest average load in a specified time.
(c) peak value of load in a specified time.
(d) all of the above.

559. Demand factor is defined as the ratio of
(a) average load to maximum demand.
(b) maximum demand to connected load.
(c) connected load to maximum demand.
(d) maximum demand to average load.

560. Demand factor on a power system is
(a) always greater than unity. (b) normally greater than unity.
(c) always lesser than unity. (d) normally lesser than unity.

561. The load factor is equal to
(a) average load/peak load. (b) peak load/average load.
(c) average load/connected load. (d) average load/base load.
[A.M.I.E Sec B Design of Electrical Systems Summer 2005]

562. A power station's plant load factor is defined as the ratio of
(a) the energy generated to that of maximum energy that could have been generated.
(b) average load to peak load.
(c) minimum load to peak load.
(d) minimum load to average load. [U.P.S.C. I.E.S. E.E.-II, 2006]

563. Load factor of a power plant is
(a) generally equal to unity. (b) always less than unity.
(c) always more than unity. (d) normally more than unity.

564. The load factor for domestic loads may be taken as
(a) about 85% (b) 50 – 60%
(c) 25–50% (d) 10 – 15%

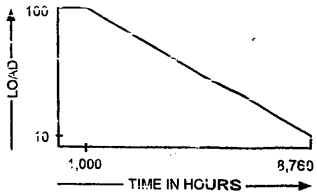
565. Load factor for heavy industries may be taken as
(a) 70–80% (b) 40–50%
(c) 25–40% (d) 20–25%

566. The annual load duration curve of a power supply system may be considered as a straight line from 40 MW to 8 MW. The load factor of the system is
(a) 20% (b) 40% (c) 60% (d) 83.33%
(e) none of the above. [A.M.I.E. Sec B. Winter 1993]

567. An industrial consumer has a load pattern of 2,000 kW 0.8 lag for 12 hours and 1,000 kW unity power factor for 12 hours. The load factor is
(a) 0.5 (b) 0.75 (c) 0.6 (d) 2.0
[GATE E.E. 1999]

568. The maximum demand of a consumer is 2 kW and the corresponding daily energy consumption is 30 units. What is the corresponding load factor?
(a) 25% (b) 50% (c) 62.5% (d) 75%
[U.P.S.C. I.E.S. E.E.-II, 2009]

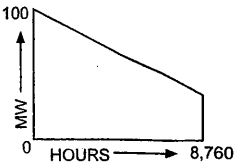
569. The load curve of a system is shown in the figure. The load factor of the system is
(a) 1.66%
(b) 6.013%
(c) 16.5%
(d) 60.13%



[U.P.S.C. I.E.S. E.E.-II, 1997]

570. Diversity factor is the ratio of
(a) sum of maximum demands of consumers/system maximum demand.
(b) maximum demand of consumers/average demand.
(c) demand of all consumers/average demand.
(d) none of the above. [A.M.I.E. Sec B. Power Systems, Winter 1998]

571. The curve shown in the figure is
(a) chronological load curve.
(b) annual load duration curve.
(c) mass curve.
(d) energy load curve.



[A.M.I.E Sec B Design of Electrical Systems Summer 2005]

572. The daily energy produced in thermal power station is 720 MWh at a load factor of 0.6. What is the maximum demand of the station?
(a) 50 MW (b) 30 MW (c) 72 MW (d) 720 MW
[U.P.S.C. I.E.S. E.E.-II, 2008]

573. Diversity factor in a power system is
(a) always less than unity. (b) normally less than unity.
(c) always more than unity. (d) normally more than unity.
[A.M.I.E. Sec B. Summer 1993]

574. Diversity factor × maximum demand is
(a) average demand.
(b) sum of consumer's maximum demands.
(c) installed capacity. (d) generated power.
[A.M.I.E. Sec B. Summer 1994]

575. Diversity factor has direct effect on
(a) fixed cost per unit generated.
(b) operating cost per unit generated.
(c) both (a) and (b). (d) neither (a) nor (b).

576. The knowledge of diversity factor helps in computing
(a) plant capacity. (b) average load.
(c) units (kWh) generated. (d) peak demand.

577. Plant capacity factor is
(a) actual energy produced/maximum possible energy that could have been produced (based on installed capacity).
(b) actual energy produced /plant capacity hours for which the plant has been in operation.
(c) energy generated in a given period/ (maximum demand x hours of operation in given period).
(d) none of the above. [A.M.I.E. Sec B. Winter 1993]

578. Which of the following statement is correct ?
(a) Load factor = Capacity factor × utilisation factor.
(b) Utilisation factor = Capacity factor × load factor.
(c) Capacity factor = $\frac{\text{Load factor}}{\text{Utilisation factor}}$
(d) Capacity factor = Load factor × utilisation factor.
[A.M.I.E. Sec B. Power Systems, Summer 2000]

579. Utilisation factor is defined as the ratio of
(a) average demand to rated capacity of the power plant.
(b) maximum demand on the power plant to the rated capacity of the power plant.

Answers: **556.** (d), **557.** (a), **558.** (b), **559.** (b), **560.** (c), **561.** (a), **562.** (b), **563.** (b), **564.** (d), **565.** (a), **566.** (c), **567.** (b), **568.** (c), **569.** (d), **570.** (a), **571.** (b), **572.** (a), **573.** (c), **574.** (b), **575.** (a), **576.** (a), **577.** (a), **578.** (d), **579.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

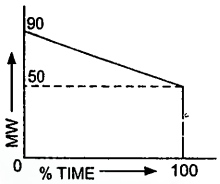
(c) rated capacity of the power plant to the maximum demand.
(d) none of the above.

580. Capacity factor will be very low when the power plant
(a) is operated as base load plant.
(b) is operated for supplying base loads as well as peak loads.
(c) is operated in emergency only.
(d) is under maintenance.

581. A thermal generating station has an installed capacity of 15 MW and supplies a daily load of 10 MW for 12 hours and 5 MW of remaining 12 hours. The plant capacity factor for this station is
(a) 1 (b) 0.75 (c) 0.67 (d) 0.5
[U.P.S.C. I.E.S. E.E.-II, 1999]

582. A generating station has a maximum demand of 30 MW, a load factor of 60% and a plant capacity factor of 50%. The reserve capacity of the plant is
(a) 5 MW (b) 4 MW (c) 6 MW (d) 10 MW
[U.P.S.C. I.E.S. E.E.-II, 2003]

583. The load duration curve for a power station is as shown in the given figure. The reserve capacity in the plant at 70% capacity factor is



(a) zero.
(b) 10 MW
(c) 30 MW
(d) 50 MW [U.P.S.C. I.E.S. E.E.-II, 2001]

584. If the rated plant capacity and maximum load of a power station are equal then
(a) load factor is unity. (b) capacity factor is unity.
(c) utilisation factor is unity.
(d) load factor and capacity factor are equal.
(e) both (c) and (d).

585. Spinning reserve is
(a) the reserve generating capacity which is available for service but not in operation.
(b) the reserve generating capacity which is connected to the bus and is ready to take load.
(c) the reserve generating capacity which is in operation but is not in service.
(d) none of the above. [A.M.I.E. Sec B. Winter 1993]

586. The power which must be available ever under emergency conditions is known as
(a) spinning reserve. (b) cold reserve.
(c) firm reserve. (d) hot reserve.
[A.M.I.E. Sec B. Power Systems, Summer 2000]

587. In a power plant, a reserve generating capacity which is in operation but not in service, in called the
(a) cold reserve. (b) hot reserve.
(c) spinning reserve. (d) firm reserve.

588. In a power plant, a reserve generating capacity, which is in operable condition and available for service, but not in operation is called the
(a) spinning reserve. (b) firm reserve.
(c) cold reserve. (d) hot reserve.

589. A power plant has a maximum demand of 15 MW. The load factor is 50% and the plant factor is 40%. The operating reserve is
(a) 3 MW (b) 3.75 MW
(c) 6 MW (d) 7.5 MW
[U.P.S.C. I.E.S. E.E.-II, 1996]

590. Which of the following relations holds good ?
(a) Maximum demand = Connected load × demand factor.
(b) Average load = Maximum load × load factor.
(c) Capacity factor = Utilisation factor × load factor.
(d) All of the above.

591. Two areas A and B have equal connected loads. However, load diversity in area A is more than in area B. Then
(a) maximum demands of the two areas would be equal.
(b) maximum demand of A would be more than that of B.
(c) maximum demand of B would be more than that of A.
(d) maximum demand of A may be more or less than that of B.
[A.M.I.E. Sec B. Power Systems, Summer 1998]

592. A large diversity factor of the load in a power system
(a) reduces the installation cost.
(b) increases the installation cost.
(c) does not affect the installation cost.
[A.M.I.E. Sec B. Power Systems, Summer 1999]

593. As the load factor of a generating plant increases, the generation cost per kWh generated
(a) decreases. (b) increases.
(c) remains same. (d) none of these.
[W.B. Univ. of Technology Power System I 2009-10]

594. In order to have a lower cost of electrical energy generation
(a) the load factor and diversity factor should be low.
(b) the load factor should be low but diversity factor should be high.
(c) the load factor should be high but the diversity factor should be low.
(d) the load factor and diversity factor should be high.
[GATE E.E. 1995]

595. In a power station, the cost of generation of power reduces most effectively when
(a) diversity factor alone increases.
(b) both diversity factor and load factor increase.
(c) load factor alone increases.
(d) both diversity factor and load factor decrease.
[U.P.S.C. I.E.S. E.E.-II, 1994]

596. The economics of power plant is greatly influenced by:
1. load factor 2. utilization factor
3. unit capacity 4. type of load
(a) 1, 2, 3 and 4. (b) 1, 3 and 4.
(c) 1, 2 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

Questions 597 and 598 refer to the following data:
A region has a maximum demand of 500 MW at a load factor of 50 per cent. The load-duration curve can be assumed to be a triangle. The utility has to meet this load by setting up a generating system which has partly hydro and partly thermal. The costs are as under:
Hydro plant-Rs. 600 per kW per annum plus 3 p per kWh.
Thermal plant-Rs. 300 per kW per annum plus 13 p per kWh.

597. The respective capacity of hydro and thermal power plants, for minimum cost, are
(a) 330 MW and 170 MW (b) 170 MW and 330 MW
(c) 93.75 MW and 406.25 MW
(d) 406.25 MW and 93.75 MW

598. The energy generated annually by hydro and thermal power plant, for minimum cost, are
(a) $1{,}935 \times 10^6$ kWh and 255×10^6 kWh.
(b) 255×10^6 kWh and $1{,}935 \times 10^6$ kWh.
(c) 187.5×10^6 kWh and $2{,}002.5 \times 10^6$ kWh.
(d) $2{,}002.5 \times 10^6$ kWh and 187.5×10^6 kWh.

Answers: **580.** (c), **581.** (d), **582.** (c), **583.** (b), **584.** (e), **585.** (b), **586.** (c), **587.** (b), **588.** (c), **589.** (b), **590.** (d), **591.** (c), **592.** (a), **593.** (a), **594.** (d), **595.** (b), **596.** (a), **597.** (a), **598.** (a),

599. Flat rate tariff can be charged on the basis of
(a) connected load. (b) units consumed.
(c) maximum demand. (d) both (a) and (b).

600. Domestic consumers are usally charged
(a) flat demand tariff. (b) block rate tariff.
(c) flat rate tariff. (d) off peak tariff.

601. If the tariff for electrical energy charges provides incentive by way of reduced charges for higher consumption, then it may be concluded that the
(a) load factor is high. (b) power factor is high.
(c) plant has sufficient reserve capacity.
(d) power is generated through hydropower plant.

602. Two part tariff is charged on the basis of
(a) connected load. (b) units consumed.
(c) maximum demand. (d) both (a) and (b).

603. Block rate tariff, where energy charge decreases with the increase in energy consumption,
(a) encourages the consumers for more consumption.
(b) discourages the consumers for more consumption.
(c) encourages the consumers to restrict their demands.
(d) encourages the consumers to improve the power factor.

604. The penalty for low power factor is imposed on
(a) residential and commercial consumers.
(b) industrial consumers. (c) agricultural consumers.
(d) all of the above.

605. Doherty rate tariff is applied to
(a) domestic consumers. (b) medium industrial consumers.
(c) bulk supplies. (d) municipal loads.

606. Maximum demand tariff is generally not applied to the domestic consumers owing to their
(a) low maximum demand. (b) low load factor.
(c) low power factor. (d) low energy consumption.

607. Low power factor is usually not due to
(a) discharge lamps. (b) incandescent lamps.
(c) arc lamps. (d) induction furnaces.

608. The primary reason for low power factor is owing to installation of
(a) synchronous motors. (b) dc motors.
(c) induction motors. (d) commutator motors.

609. Low power factor has the drawback(s) of
(a) increased transmission and distribution losses.
(b) poor voltage regulation.
(c) high cost of equipment for a given load.
(d) all of the above.

610. The low power factor of an industrial plant is uneconomical for
(a) electric supply utility only.
(b) owner of the plant only.
(c) both the owner of the plant and the electric supply utility.
(d) either (a) or (b).

611. For a consumer the most economical power factor is usually
(a) 0.25–0.5 lagging. (b) 0.25–0.5 leading.
(c) 0.85–0.95 lagging. (d) 0.85–0.95 leading.

612. Power factor can be improved by using
(a) static capacitors. (b) synchronous condensers.
(c) phase advancers. (d) all of the above.

613. Static capacitors are rated in terms of
(a) kVAR (b) kW (c) kVA (d) kWh

614. For power factor improvement static capacitors have the advantage(s) of
(a) small losses. (b) easy installation.
(c) low initial cost and little maintenance.
(d) all of the above.

615. For power factor improvement static capacitors have the drawback(s) of
(a) short-service life.
(b) getting damaged by high voltage.
(c) not repairable. (d) all of the above.

616. For power factor improvement synchronous condensers have the drawback(s) of
(a) comparatively higher maintenance and operating costs.
(b) requirement of auxiliary equipment for their starting.
(c) possibility of falling out of synchronism causing in interruption of supply.
(d) all of the above.

617. Advantages of the improved power factor are
(a) increase in operating efficiency of the power system.
(b) improvement in voltage regulation.
(c) reduction in overall cost per unit.
(d) better utilization of kW capacities of prime movers, transformers, switchgear and the lines.

618. The most suitable location for a power factor improvement device is
(a) near the electrical appliance which is responsible for the poor power factor.
(b) at the receiving end, in case of a transmission line.
(c) at the sending end. (d) any where in the circuit.
(e) both (a) and (b).

619. An industrial installation has a power factor of 0.8 lagging. It would be economical to improve pf to
(a) unity. (b) about 0.8 leading.
(c) about 0.95 lagging. (d) about 0.95 leading.
[A.M.I.E. Sec B. Power Systems, Summer 2000]

620. A 3-phase, 11 kV, 50 Hz, 200 kW load has a power factor of 0.8 lag. A delta-connected 3-phase capacitor is used to improve the pf to unity. The capacitance per phase of the capacitor in microfarads is
(a) 3.948 (b) 1.316 (c) 0.439 (d) 11.844
[GATE E.E. 1999]

621. The most economical limit of power factor correcting is governed by
(a) original power factor.
(b) relative costs of the supply and power factor correction equipment.
(c) both (a) and (b). (d) none of the above.

622. There is a limit beyond which it is not economical still further to improve the power factor in order to meet the increased demand on the generating station. The maximum value to which the pf can be economically raised entirely depends upon
(a) the cost of the power factor correction equipment.
(b) the cost of the generating plant.
(c) the relative costs of the generating plant and phase advancing plant.
(d) none of the above.

623. A consumer requires an induction motor of 50 metric bhp. He is offered two motors of the following specifications:
Motor A – efficiency 88% and pf 0.9(lag). Motor B – efficiency 90% and pf 0.81.

Answers: **599.** (b), **600.** (b), **601.** (c), **602.** (d), **603.** (a), **604.** (b), **605.** (c), **606.** (a), **607.** (b), **608.** (c), **609.** (d), **610.** (c), **611.** (c), **612.** (d), **613.** (a), **614.** (d), **615.** (d), **616.** (d), **617.** (d), **618.** (e), **619.** (c), **620.** (b), **621.** (b), **622.** (c), **623.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The consumer is being charged on a two part tariff of Rs 1,050 per kVA of maximum demand plus 75 paise per unit. The pf of the motor B is raised to 0.9 by installing condensers. The motor B costs Rs 2,250.00 less than A. The cost of condenser is Rs 900 per kVAR. Assume rate of interest and depreciation as 10% and working hours of motor as 2,400 hours in a year. Which of the two motors A and B is cheaper and by how much ?

(a) Motor B is more economical with annual saving of Rs 1,666.50.

(b) Motor A is more economical with annual saving of Rs 163.00.

(c) Overall annual operating cost are almost same in both cases.

(d) None of the above.

624. The medium sized induction motor will operate at maximum power factor while operating at

(a) full load. (b) 50 per cent full load.

(c) 25 per cent full load. (d) any load.

625. A synchronous condenser is virtually a/an

(a) induction motor.

(b) over-excited synchronous motor.

(c) under-excited synchronous motor.

(d) commutator motor.

Answers: **624.** (a), **625.** (b).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:

Codes : (a) Both A and R are true and R is a correct explanation of A.

(b) Both A and R are true but R is not a correct explanation of A.

(c) A is true but R is false.

(d) A is false but R is true.

1. (A): The major power development programmes in Bihar, should be primarily based on conventional steam power plants.
(R): Bihar has abundant coal reserves.

2. (A): The operating cost of hydroelectric power plants are the lowest.
(R): There are no standby losses in hydroplants.

3. (A): The hydroplants have constant speed and constant frequency.
(R): Very acute governing is possible with water turbines.

4. (A): Availablility of storage may convert an uneconomical hydro-project into an economical one.
(R): Storage increases the firm capacity of the power plant and increase in firm capacity of hydroplant means dispensing with the alternative steam capacity.

5. (A): Pelton turbine is not suitable for heads below 200 m.
(R): The diameter of a pelton wheel runner, for the same output but low head becomes large and unwieldy.

6. (A): The draft tube in hydropower stations permits a negative of suction head to be established at the runner exit.
(R): The turbine can be installed above the tail-race level without loss of head. [U.P.S.C. I.E.S. E.E.-II, 1995]

7. (A): In a high or medium head hydroelectric power station having a long penstock, a surge tank is provided near the turbine.
(R): A surge tank stores additional water to be released during the peak load period. [U.P.S.C. I.E.S. E.E., 2000]

8. (A): Hydroelectric plants with large storage can be best used as base load plants with high load factor.
(R): For a plant to be used as a base load plant, the unit cost of energy generated by the plant should be low. [U.P.S.C. I.E.S. E.E.-II, 2003]

9. (A): A pumped storage plant is very suitable for supplying peak loads. During off peak period, water is pumped back from tail race pond to head water pond.
(R): The starting time of pumped storage plant is very short. [U.P.S.C. I.E.S. E.E.-II, 2005]

10. (A): Huge amount of coal is required for raising the steam (about 2,000 tonnes per day for a 200 MW station) in a steam power station.
(R): As per government policy only low grade coal with 30-40 percent ash content can be used in steam power plants for generation purposes.

11. (A): Fire tube boilers are commonly used in central steam power plants.
(R): Fire tube boilers are compact in size, have low initial cost and have the ability to raise rapidly large quantities of steam per unit area of fire grate.

12. (A): Regenerative air preheaters are widely used in steam power plants.
(R): The rotor elements, in regenerative air preheaters, provide large surface area to the flue gases.

13. (A): Commercial steam turbines use series combination of impulse and reaction types of turbines.
(R): Impulse-reaction turbines are cheaper in initial cost.

14. (A): For the optimum loading of a number generating units in a power plant, the units must operate at the same incremental fuel cost.
(R): When units operate at the same incremental fuel cost, the active and reactive load diversions are equal. [U.P.S.C. I.E.S. E.E.-II, 1993]

15. (A): Nuclear power plants are not well suited for varying loads.
(R): The nuclear reactor does not respond to the load fluctuations efficiently.

16. (A): Diesel electric power plants are usually used as base load plants.
(R): Such plants can be located any where and there are no standby losses.

Answers: **1.** (a), **2.** (b), **3.** (a), **4.** (a), **5.** (a), **6.** (b), **7.** (d), **8.** (d), **9.** (a), **10.** (a), **11.** (d), **12.** (a), **13.** (c), **14.** (c), **15.** (a), **16.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

17. (A): Gas turbine power plants are generally used as base load power plants.
(R): The gas turbine power plants have some what higher fuel costs and low initial cost.

18. (A): Petroleum fuels such as kerosine, gas oil, diesel oil, residual oil have limited use, in gas turbines, as fuels.
(R): Petroleum fuels like gas oil, diesel oil, residual oil and kerosine have low calorific value.

19. (A): Intercooling in gas turbines reduces the size of the turbine and compressor for the same output.
(R): Intercooling removes the heat from the compressed air before it is sent to the combustion chamber.

20. (A): In almost all the fields open cycle turbine power plants are employed.
(R): Closed cycle gas turbine plants have the additional complexity of the plant including externally fired heater, gas cooler and various heat exchangers.

21. (A): The seeding material ionizes more readily than the gas and increases the conductivity of the gas.
(R): Seeding material have comparatively higher ionization potential.

22. (A): Now great emphasis is being given for the development of new and alternative (non-conventional) methods of power generation.
(R): Non-conventional methods of power generation give low cost of production of electrical energy and also these methods are more reliable.

23. (A): Optimum loading of the power stations interconnected by transmission line is obtained when the incremental fuel cost of each station divided by its penalty factor is the same for all the stations in the system.
(R): The total load demand and transmission losses at any instant must be met by the total generation at that instant and the penalty factor is a function of the incremental transmission loss. [U.P.S.C. I.E.S. E.E.-II, 1993]

24. (A): During winter season the load on the system increases.
(R): There is an increase of load on the system during winter season due to heaters and geysers.

25. (A): As the load factor of the power plant increases, the cost per kWh of the energy generated decreases.
(R): Higher load factor means greater average load, resulting in larger number of units generated for a given maximum demand or capacity, and thus there is a distribution of standing charges over a large number of units supplied and therefore reduction in unit cost.

26. (A): Synchronous condensers are used for pf improvement only when kVAR requirement exceeds 5,000.
(R): Initial as well as operating costs of synchronous condensers are much higher than those of static capacitors and do not justify their installation for low ratings.

27. (A): The best location for the pf correction equipment to be installed is the generating end.
(R): Generators are relieved of carrying excessive current due to poor power factor.

28. (A): It is not economical to raise the power factor to unity or leading one .
(R) As the pf approaches unity, the capacity of pf correction device increases more rapidly.

Answers: **17.** (d), **18.** (c), **19.** (c), **20.** (a), **21.** (c), **22.** (c), **23.** (d), **24.** (a), **25.** (a), **26.** (a), **27.** (d), **28.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Classification of Head)	List 2 (Type of Turbines)
A. Low head, 2–15 m	1. Propeller or Kaplan.
B. Medium head, 15–17 m	2. Kaplan or Francis.
C. High head, 70–500 m	3. Pelton.
D. Very high head > 500 m	4. Francies or Pelton.

Codes:	A	B	C	D
(a)	1	3	4	2
(b)	4	2	1	3
(c)	1	2	4	3
(d)	4	3	1	2

[U.P.S.C. I.E.S. E.E.-II, 2005]

2.

List 1 (Classification Based on Head)	List 2 (Types of Turbine)
A. Low head, 2 – 15 m	1. Pelton.
B. Medium head, 16 – 70 m	2. Francis or Pelton.
C. High head, 71 – 500 m	3. Kaplan or Francis.
D. Very high head, > 500 m	4. Propeller or Kaplan.

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	3	4	1	2
(c)	4	3	1	2
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-II, 2004]

3.

List 1 (Type of Fuel)	List 2 (Nuclear Fuel)
A. Fertile	1. U-238
B. Fissile	2. Pu-239
	3. U-235
	4. Th-232

Codes:	A	B
(a)	1, 2	3, 4
(b)	2, 3	1, 4
(c)	3, 4	1, 2
(d)	1, 4	2, 3

[U.P.S.C. I.E.S. E.E.-II, 1993]

Answers: **1.** (c), **2.** (a), **3.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

4.

List 1 (Material)	List 2 (Use)
A. Deuterium	1. A fissile fuel of nuclear reactor.
B. Heavy water	2. A fertile fuel of nuclear reactor.
C. Uranium-235	3. Used as fuel in fusion reactor.
D. Thorium-232	4. Used as a mod erator in nuclear reactor.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	3	2	4	1
(c)	3	4	1	2
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 1995]

5.

List 1 (Components)	List 2 (Materials)
A. Moderator	1. Boron
B. Control Rod	2. Concrete
C. Coolant	3. Graphite
D. Shield	4. Sodium

Codes:	A	B	C	D
(a)	3	1	4	2
(b)	1	3	2	4
(c)	3	1	2	4
(d)	1	3	4	2

[U.P.S.C. I.E.S. E.E.-II, 2003]

6. Nuclear reactors are classified on different basis, namely (A) Neutron energy (B) Fuel used (C) Moderator used (D) Coolant used (E) Type of core used.

The correct combination of reactors corresponding to their respective basis of classification is

Codes:	Thermal reactors	Beryllium reactor	Homogeneus reactors
(a)	(A)	(C)	(E)
(b)	(B)	(D)	(C)
(c)	(A)	(C)	(D)
(d)	(B)	(D)	(E)

[U.P.S.C. I.E.S. E.E.-II, 1996]

7.

List 1 (Power Station)	List 2 (Component)
A. Hydroelectric power	1. Grate and stokers station.
B. Nuclear power station	2. Forebay.
C. Steam power station	3. Pressurized water reactor.
D. Pressure gasification combined cycle power plant.	4. Fluidized bed gasifier.

Codes:	A	B	C	D
(a)	1	4	2	3
(b)	2	3	1	4
(c)	1	3	2	4
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-II, 2006]

8.

List 1 (Name of Power Plant)	List 2 (Plant Features)
A. Thermal	1. High operating cost.
B. Nuclear	2. High capital cost.
C. Hydro	3. High plant life.
D. Diesel	4. High fuel transportation cost.

Codes:	A	B	C	D
(a)	3	1	4	2
(b)	4	2	3	1
(c)	3	2	4	1
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E.-II, 2004]

9.

List 1 (Name of Power Plant)	List 2 (Feature)
A. Hydro	1. High maintenance cost.
B. Nuclear	2. High transmission and distribution cost.
C. Steam	3. High overall generation cost.
D. Diesel	4. Less efficient.

Codes:	A	B	C	D
(a)	2	1	4	3
(b)	1	2	3	4
(c)	2	3	4	1
(d)	3	4	2	1

10.

List 1 (Power Plant)	List 2 (Application)
A. Nuclear	1. Base load
B. Diesel	2. Standby
C. Gas turbine	3. Base or peak load
D. Hydro	4. Peak load

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	4	2	1
(d)	1	2	4	3

11.

List 1 (Power Generating Unit)	List 2 (Efficiency)
A. Hydraulic turbine	1. 10–12%
B. Solar cell	2. 60–70%
C. Diesel engine	3. 85–90%
D. Fuel cell	4. 25%

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	1	4	2
(d)	3	4	1	2

[A.M.I.E. Sec B. Winter 1993]

12.

List 1 (Type of Tariff)	List 2 (Type of Consumers)
A. Block rate	1. Large industrial
B. Flat rate	2. Medium industrial
C. Two part tariff	3. Domestic and commercial
D. Power factor tariff	4. Agricultural and street lighting

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	1	2	3	4
(c)	2	3	4	1
(d)	4	1	2	3

Answers: **4.** (c), **5.** (a), **6.** (c), **7.** (b), **8.** (b), **9.** (a), **10.** (d), **11.** (c), **12.** (a).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Kerala, Karnataka and J&K are very rich in water power resources and so power development programmes should be based on this source.
2. The power plant should be set up near the load centre as far as possible.
3. In India per capita consumption of electricity is above 1,000 kWh.
4. The present trend, all over the world, is to encourage private sector in energy sector.
5. Generally hydro projects are multipurpose.
6. Hydroelectric power plants are usually located at the load centres.
7. Hydropower plants have low operating cost but construction cost is enormously high.
8. Availability of head of water has considerable effect on the cost and economics of generation.
9. The cost of hydro energy is almost independent of load factor.
10. The firm capacity of hydroelectric power plants is low and so needs to be backed up by steam plants.
11. Availability of storage facility increases the firm capacity of the hydroelectric power plant.
12. The whole area behind the dam draining into a river stream across which the dam has been constructed at a suitable place is called the catchment area.
13. Hydrology is a science which deals with the depletion and replenishment of water resources.
14. The precipitation includes all the water that falls from atmosphere to earth.
15. Total volume of discharge upto any time is given by the area under the hydrograph up to that time.
16. "Flow duration curve" gives the relation between flows and lengths of time during which they are available.
17. Flow duration curve cannot be used for preliminary studies.
18. The basic concept of unit hydrograph is that the hydrographs of run-off from two identical storms would not be the same.
19. Mass curves are used in determination of capacity of storage reservoir in hydro-projects.
20. The "firm power" is also called the primary power.
21. Water held in upstream reservoir is called the pondage.
22. The water behind the dam at the power station is called the storage.
23. Necessity of pondage arises because of plant operation at a load factor less than 100%.
24. A weir is a low overflow dam across a stream to measure flow or maintain water level, at a lake outlet.
25. An emergency spillway comes into action when the occurring flood discharge exceeds the designed flood discharge.
26. A head race is a channel that conducts water from the wheels.
27. A flume is a closed channel erected on the surface or supported above ground on a trestle.
28. A tunnel is an open channel excavated through a natural obstruction.
29. The tunnels are generally the least costly type of conduit for a given length.
30. Exposed penstocks last longer and are easily accessible for inspection and maintenance.
31. Over flow surge tank is very satisfactory and economical.
32. Steel penstocks can be designed for any head with thickness varying with pressure and diameter.
33. Inclined surge tank is cheaper than ordinary one.
34. Hydro turbines can be classified as Pelton, Francis and propeller turbines.
35. The cavitation effect cannot be reduced by polishing the surfaces.
36. The ratio of the volume of water actually striking the runner to the volume of water supplied to the turbine is called the volumetric efficiency.
37. Specific speed of a turbine is the speed of a scale model of turbine which develops 1 metric horse power under a head of 1.0 m.
38. The runner of too low specific speed turbine with low available head increases the cost of the generator because of low turbine speed.
39. An increase in specific speed of turbine is accompanied by lower maximum efficiency and greater depth of excavation of the draft tube.
40. Turbines with low specific speeds operate under a low head and high discharge condition.
41. Specific speed of a hydraulic turbine is directly proportional to power output.
42. Most of the hydro-machines have horizontal configuration.
43. In a Pelton wheel the angle of deflection of the jet through the buckets is taken as 120° if it is not given.
44. Pelton turbines are essentially low head high capacity machines.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1998]
45. In case of large sized impulse turbines, vertical shaft arrangement is commonly used.
46. Compared to Francis turbine the efficiency of a Pelton turbine is less affected by variation of load.
[A.M.I.E. Sec B. Power Plant Engineering, Summer 2000]
47. In a reaction turbine the pressure energy of water is converted into kinetic energy.
48. In reaction turbiness the runner utilises both potential and kinetic energies.

Answers: **1.** (T), **2.** (T), **3.** (F), **4.** (T), **5.** (T), **6.** (F), **7.** (T), **8.** (T), **9.** (T), **10.** (T), **11.** (T), **12.** (T), **13.** (T), **14.** (T), **15.** (T), **16.** (T), **17.** (F), **18.** (F), **19.** (T), **20.** (T), **21.** (F), **22.** (F), **23.** (T), **24.** (T), **25.** (T), **26.** (F), **27.** (F), **28.** (F), **29.** (F), **30.** (T), **31.** (F), **32.** (T), **33.** (F), **34.** (T), **35.** (F), **36.** (T), **37.** (T), **38.** (T), **39.** (T), **40.** (F), **41.** (F), **42.** (F), **43.** (F), **44.** (F), **45.** (F), **46.** (T), **47.** (F), **48.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

49. In a propeller turbine the blades are adjustable.

50. Fixed blades and moving blades are provided on reaction turbines.

51. Francis turbine is used for high head low discharge hydroelectric plants.

52. Cavitation is a serious problem in a Francis turbine as in all reaction turbines.

53. A Kaplan runner is also capable of reverse operation and is ideally suitable for a pumped storage scheme.

54. For low heads, propeller turbines are favoured.

55. Kaplan turbines have variable angle blades for giving high efficiency.

56. Bulb turbines are suitable for small hydroelectric power plants.

57. Standardised bulb sets with unit output ranging from 100 to 1,000 kW operating under heads between 1.5 to 10 m are used in micro-hydel plants.

58. The starting time of a pumped storage plant is very short.

59. Steam power plants have low maintenance and operating costs.

60. Steam power plants are costlier in initial cost in comparison with other types of power plants of same capacity.

61. Regenerative heating improves the thermal efficiency of the cycle.

62. Regenerative cycle thermal efficiency is always lesser than simple Rankine cycle thermal efficiency.

63. The boilers producing steam at pressures of 20 bar and above are called the high pressure boilers.

64. Fire tube boilers use is limited to low cost, small size and low pressure (to about 10 kg/cm^2) plants.

65. Boilers used in central steam power plants of large capacity are invariably water tube boilers.

66. Super-critical pressure boilers with pressures as high as 350 atm, temperature 600° C and capacity 10,00,000 kg/hour are available.

67. In case of oil fired boilers, the excess air is usually 5-12%.

68. Steam generated in boilers for power plants is invariably dry and saturated.

69. Feed water heating with steam at low pressure than boiler pressure usually reduces the overall plant efficiency.

70. For good performance feed water heaters must be drained and vented.

71. Water solids carried over in the steam leaving a boiler drum are called "Carry over".

72. The steam pipes for high temperature applications are made of mild steel.

73. The plain refractory walls are suitable for small plants where the furnace temperature may not be high.

74. Heat recovery equipment does not include superheater and economiser.

75. The superheater tubes are heated by the heat of the combustion gases during their passage from the furnace to the chimney.

76. Superheaters consist of groups of tubes made of carbon steel for steam temperature of 650°F.

77. Superheaters are mainly of two types viz. radiant superheater and convection superheater. Radiant superheaters are more commonly used.

78. Modern steam plants have reheaters as well as superheaters in the same gas passage of the boiler in order to have steam dry as far as possible through the last stage of the turbine.

79. The economiser utilizes the waste heat of the fluc gases to reheat the steam.

80. In an economiser, the flue gases flow through the tubes and water outside the tubes across it.

81. Preheating of feed water removes dissolved oxygen and carbon dioxide which corrode boiler.

82. Air from air preheater is sent to the forced draught fans.

83. Corrosion of air preheater tubes can be minimised by limiting the cooling of flue gases to a temperature above the dew point.

84. The recuperative type air preheaters are compact, lighter in weight, occupy less space and provide enormous amount of heat transfer surface and therefore widely used in steam plants.

85. In a jet condenser the exhaust steam and cooling water do not come in direct contact with each other and so do not mix.

86. In counter-flow jet condenser the steam and cooling water enter the condenser from opposite directions.

87. In a surface condenser cooling water flows through the tubes, the steam enters from the top and get condensed due to contact with the tube surfaces and the condensate leaves from the bottom.

88. Maintenance of high vacuum in the condenser is essential for efficient operation.

89. An air pump that removes the moist alone is called a dry air pump.

90. The cooling water supply to the condenser helps in maintaining a low pressure in it.

91. The function of a steam separator is to remove the entrained water particles from the steam conveyed to the steam turbines.

92. In a cooling pond some spray or cooling devices are used.

93. In a cooling tower water is made to trickle down drop by drop so as to come in contact with air moving in the opposite direction.

94. The steam turbine efficiency is considerably reduced when throttle governing is done at low loads.

95. A steam nozzle may be defined as a passage of varying x-section, through which heat energy of steam is converted into potential energy.

96. Fixed and moving blades are provided on impulse turbine.

97. Nozzles are provided on reaction turbines.

98. In an impulse turbine there is a gradual pressure drop and occur continuously on fixed and moving blades.

99. The velocity compounded impulse turbine has high steam consumption and poor efficiency.

100. The blades of impulse steam turbines are of symmetrical profile.

101. In steam turbines, governing may be centrifugal or hydraulic.

102. Steam turbines are manufactured in different sizes up to 1,000,000 hp or even more and have horizontal configuration.

103. For the same turbine output, the coal feed rate to the boiler decreases on implementing regenerative feed heating in a steam power cycle. **[A.M.I.E. Sec B. Winter 1998]**

Answers: **49.** (F), **50.** (T), **51.** (F), **52.** (T), **53.** (T), **54.** (T), **55.** (T), **56.** (T), **57.** (T), **58.** (T), **59.** (F), **60.** (F), **61.** (T), **62.** (F), **63.** (F), **64.** (T), **65.** (T), **66.** (T), **67.** (T), **68.** (F), **69.** (F), **70.** (T), **71.** (T), **72.** (F), **73.** (T), **74.** (F), **75.** (T), **76.** (F), **77.** (F), **78.** (T), **79.** (F), **80.** (F), **81.** (T), **82.** (F), **83.** (T), **84.** (F), **85.** (F), **86.** (T), **87.** (T), **88.** (T), **89.** (T), **90.** (T), **91.** (T), **92.** (F), **93.** (T), **94.** (T), **95.** (T), **96.** (F), **97.** (F), **98.** (F), **99.** (T), **100.** (T), **101.** (T), **102.** (T), **103.** (T),

Downloaded From : www.EasyEngineering.net

104. Bituminous coal has low percentage of volatile matter.
105. Anthracite is very soft coal.
106. Peat is the first stage in the formation of coal from wood.
107. An orsat analysis gives volumetric analysis of exhaust gases.
108. A belt conveyor is very suitable means for transporting small quantities of coal over small distances.
109. Belt conveyor is not suitable for greater heights and shorter distances.
110. Chain grate stokers are quite suitable for high ash content coal feeding.
111. In stoker firing fuel of cheaper grade cannot be used.
112. Spreader stokers can be used for burning any type coal from lignite to semi-bituminous.
113. Overfeed stoker feeds the fuel into the grate below the point of air admission.
114. Chain grate and travelling grate stokers are similar in appearance but differ in the grate construction.
115. The underfeed stoker is suitable for burning semi-bituminous and bituminous coals.
116. Bucket elevators are used for carrying coal in horizontal direction.
117. Overfeed stoker is used when unpulverised coal is to be used in large capacity boiler.
118. In burners, too much secondary air may cool the mixture and prevent its heating to the ignition temperature.
119. Excess air requirements in case of pulverised fuels are high in comparison to those in stoker firing.
120. Pulverised coal is fed to the boiler through burners.
121. Coal is pulverised so as to increase its surface exposure, thus resulting in fast combustion without using large quantities of excess air.
122. Most of the steam power plants use pulverised coal in India because of low ash content of coal used.
123. The air supplied for complete combustion is called the primary air.
124. In an electrostatic precipitator dust particles are ionised.
125. Forced draught is a negative pressure drop.
126. Steam jet draught is simple and easy method of producing artificial draught.
127. A balanced draught combines the advantages of both induced and forced draughts.
128. Presence of sulphur in the fuel is considered desirable.
129. For minimizing pollution occurring because of gases discharged from the chimney the chimney height is increased.
130. Dissolved oxygen from water can be removed by adding sodium sulphite.
131. Foaming and priming of the boiler water forms the carry over.
132. Blow down of boiler reduces concentration of solids within the drum.
133. Chromium improves corrosion and oxidation resistance.
134. Zeolite removes hardness almost completely but cannot remove alkalinity.
135. Sodium carbonate is essentially responsible for the scale formation.
136. The scale formation reduces heat transfer and simultaneously increases the metal wall temperature.
137. "Foaming" is the weakening of boiler steel owing to inner crystalline cracks.
138. Demineralisation is usually the most costly method of producing make-up water for high pressure boilers.
139. Nuclear power plants have higher capital cost but lower fuel cost in comparison to those of a conventional coal-fired power plants.
140. A nuclear power plant needs less cooling water as compared to conventional thermal power plants.
141. There is maximum flexibility in the site selection for a nuclear power station.
142. Slow neutrons are very efficient in causing fission of U_{235}.
143. A moderator is used to absorb gamma rays in nuclear power plants.
144. The function of moderator in a nuclear reactor is to slow down the neutron from high velocities.
145. Two principal natural isotopes of uranium are U_{238} and U_{231}.
146. Radioactivity is the phenomenon of spontaneous emission of powerful radiations exhibited by light elements.
147. Radioactive radiations are less penetrating.
148. During a nuclear reaction, the change in mass of the particle represents the release or absorption of energy.
149. 'Nuclear fusion' is the process of combining or fusing two lighter nuclei into a stable and heavier nuclide.
150. Nuclear fission is accompanied by the emission of neutrons and gamma rays.
151. The function of reflector in a nuclear reactor is to stop the chain reaction.
152. In nuclear reactors heavy water is used to slow down neutrons.
153. Graphite, heavy water and light water are the most commonly used moderators in nuclear reactors.
154. The control rods of the reactor absorb the excess electrons produced by fissioning in a nuclear reactor.
155. Half life represents the rate of decay of the radioactive isotopes.
156. The average life is twice of half life.
157. The proportion of fissile material in the fuel is considerably important in determining the critical size of the reactor.
158. Chain reaction is that process in which the number of neutrons goes on increasing in geometrical progression during fission till whole of the fissionable material is disinte- grated.
159. In light water reactor water acts as coolant as well as moderator.
160. A fast breeder reactor produces less fissionable material than that consumed by it.
161. A breeder reactor converts fertile materials into fissionable materials.
162. In a gas cooled reactor there is ample corrosion problem.
163. In a boiling water reactor the feed water acts both as a coolant and a moderator and an enriched uranium is used as fuel.

Answers: **104.** (F), **105.** (F), **106.** (T), **107.** (T), **108.** (F), **109.** (T), **110.** (F), **111.** (F), **112.** (T), **113.** (F), **114.** (T), **115.** (T), **116.** (F), **117.** (T), **118.** (T), **119.** (F), **120.** (T), **121.** (T), **122.** (F), **123.** (F), **124.** (T), **125.** (F), **126.** (T), **127.** (T), **128.** (F), **129.** (T), **130.** (T), **131.** (T), **132.** (T), **133.** (T), **134.** (T), **135.** (F), **136.** (T), **137.** (F), **138.** (F), **139.** (T), **140.** (F), **141.** (T), **142.** (T), **143.** (F), **144.** (T), **145.** (F), **146.** (F), **147.** (F), **148.** (T), **149.** (T), **150.** (T), **151.** (F), **152.** (T), **153.** (T), **154.** (T), **155.** (T), **156.** (F), **157.** (T), **158.** (T), **159.** (T), **160.** (F), **161.** (T), **162.** (F), **163.** (T),

164. Zirconium clad enriched uranium is used as fuel in pressurized water reactor.

165. In an heterogeneous reactor the fuel and moderator are mixed to give a homogeneous material.

166. Water can be used as a coolant in a fast nuclear reactor.

[A.M.I.E. Sec B. Power Plant Engineering, Summer 2000]

167. For the same heating value liquid fuels occupy more space in comparison to solid fuels.

168. A chemical fuel does not release heat energy on combustion.

169. The amount of excess air supplied varies with the type of fuel and the firing conditions.

170. Diesel power plants cannot respond to varying loads easily.

171. Standby losses in diesel electric power plants are enormously high.

172. Maintenance and lubrication cost in case of diesel power plants is quite low in comparison to that in other plants.

173. There is less fire hazard in case of diesel electric power plants.

174. Engines driving electrical generators are of lower speed and simple combustion chamber.

175. No spark plug is used in diesel engines .

176. In an IC engine the combustion of fuel takes place outside the engine cylinder.

177. The top position of the piston towards cover end side of the cylinder is known as bottom dead centre.

178. In a petrol engine the power is produced by compression ignition.

179. Depreciation grows faster in diesel power plant.

[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

180. Dry sump lubrication is usually used for high capacity engines.

181. Semi-pressure system of lubrication is combination of splash and pressure systems.

182. The gas turbine is different from the diesel engine in the respect of combustion region being external to the prime mover.

183. Nowadays the gas turbine power plants use mainly gas oil and residual oil.

184. In gas turbines thermal efficiency is lower in case of closed cycle in comparison to that of open cycle.

185. The efficiency of coal fired gas turbine power plant is higher than that of oil fired plant.

186. The problem of ash disposal does not arise in case of gas turbine plants.

187. A combined cycle power generating plant utilizes the waste heat from gas turbines.

188. Gas turbines are self starting.

189. In almost all the fields closed cycle gas turbine plants are used.

190. A heat exchanger is usually employed in large gas turbine units for industrial power.

191. Minerals such as sodium and calcium prove very harmful for turbine blades.

192. Combined cycle power plants are less efficient than single cycle power plants.

193. The MHD power generator consists of a pipe whose diameter increases gradually from beginning to end.

194. If a liquid metal is used as a working fluid in an MHD system the conductivity can be increased many times, and can also be used at low temperatures under low magnetic fields.

195. MHD power generator operates on the principle that when a hot, partially ionized and compressed gas is expanded in a duct, and forced through a strong magnetic field, electric potential is generated in the gas.

196. An MHD generator cannot be used in combination with a conventional thermal power plant because its overall efficiency will decrease.

197. The process of adding a material of low ionization potential to the gas to increase its conductivity is called regenerating.

198. MHD power plants are less efficient in comparison to conventional steam power plants.

199. An ionic gas is capable of carrying current.

200. Solar cells convert solar energy directly into electrical energy.

201. In a fuel cell hydrogen reacts with oxygen to produce electricity.

202. Operating cost of a wind mill is negligible.

203. The winds as source of power generation are quite steady and dependable.

204. Fuel cells are particularly suited for low voltage and high current applications.

205. India has geothermal resources such as hot spring water of base temperatures of 180 to 200°C in the Himalyan ranges in Himachal Pradesh.

206. The run-off river power plants have very high firm capacity.

207. Bengal and Bihar are ideal for nuclear power plants.

208. A super thermal power plant has units of 500 MW and above.

209. Among the operating costs of a steam power plant fuel has the largest share.

210. Maximum potential for hydropower plants is in northern India.

211. Plant heat rate can be improved by using fuel of better quality or by adopting better thermodynamic conditions in the plant design.

212. Diesel power plants have low operation efficiency than that of steam power plants.

213. In a generating station it is always desirable to have two or more units.

214. Single peak in load curve means high load factor.

215. High load factor can be expected in peak load plants.

216. Major part of electrical power generated in India is shared by nuclear power plants.

217. In an interconnected power system the peak load is supplied by hydropower plants when the maximum flow demand is less than stream flow while the base load is supplied by thermal power plants.

218. The penalty factor is always less than 1.

219. Generally the alternators employed in hydropower stations have vertical configuration.

Answers: **164.** (T), **165.** (F), **166.** (F), **167.** (F), **168.** (F), **169.** (T), **170.** (F), **171.** (F), **172.** (F), **173.** (T), **174.** (T), **175.** (T), **176.** (F), **177.** (F), **178.** (F), **179.** (T), **180.** (T), **181.** (T), **182.** (T), **183.** (F), **184.** (F), **185.** (F), **186.** (T), **187.** (T), **188.** (F), **189.** (F), **190.** (T), **191.** (T), **192.** (F), **193.** (T), **194.** (T), **195.** (T), **196.** (F), **197.** (F), **198.** (F), **199.** (T), **200.** (T), **201.** (T), **202.** (T), **203.** (F), **204.** (T), **205.** (T), **206.** (F), **207.** (F), **208.** (T), **209.** (T), **210.** (T), **211.** (T), **212.** (F), **213.** (T), **214.** (F), **215.** (F), **216.** (F), **217.** (F), **218.** (F), **219.** (T),

220. In modern power stations each generator has its own transformer.
221. A plant layout is the first step in installing a power plant.
[A.M.I.E. Sec B. Winter 1996]
222. The annual depreciation of a hydropower plant is about 5 per cent.
223. The power plant capacity can be determined by studying the load duration curve and anticipated future demands.
224. Maximum demand on a power system is the instantaneous maximum value of kVA supplied during a given period.
225. Higher the maximum demand, better is the utilisation of total plant capacity.
226. The main purpose of design and operation of the power plant is to generate the electrical energy at minimum possible cost.
227. Transmission lines also form a part of capital cost of the power plant.
228. Depreciation is a fixed cost for a power plant.
229. The salaries of high officials is accounted for as running charges.
230. Fuel consumption depends upon the installed capacity of the power plant.
231. Cost of labour is considered as operating cost where as the depreciation is taken as fixed cost.
232. Obsolescence is because of technological advancements.
233. Salvage value of a plant is always zero.
234. Depreciation accounts for the wear and tear with use.
235. Operating cost of a nuclear plant is more than that of a hydroplant.
236. Operating cost of a nuclear plant is more than that of a steam power plant.
237. Operating cost of a diesel power plant is less than that of a gas turbine plant.
238. The peak of the load curve represents the maximum demand on the power station on the particular day.
239. Load curve is derived from the load duration curve.
240. Higher the value of load factor, lower is the cost of generation.
241. Higher the value of the diversity factor lesser will be the value of fixed charges per unit generated.
242. Domestic consumers have maximum demand during early night hours.
243. There is an inherent reserve in most electrical supply systems in that the load can be reduced by reducing the voltage.
244. A power plant having maximum demand more than installed capacity will have utilisation factor of lesser than unity.
245. While selecting units continuous rating of generators is taken into account.
246. In a generating station it is always desirable to have two or more generating units.
247. For a generator at a particular load, when incremental heat rate is equal to heat rate, it will operate at maximum efficiency.
248. In two part tariff, the consumer with low power factor will be charged more on account of demand charges.
249. In a two part tariff energy charges do not depend on power factor.
250. In a power factor tariff, charge per unit to be recovered from a consumer having high power factor is less.
251. Hopkinson demand rate is a three part tariff.
252. Doherty rate tariff is a two part tariff.
253. Industrial plants usually operate on leading power factor .
254. Power factor tariff is charged on the basis of maximum demand in kVA.
255. Low power factor leads to higher energy loss.
256. Low power factor results in poor voltage regulation.
257. It is advisable to improve power factor to unity.
258. Improvement in power factor of an installation results in increase in kVA demand of the installation.
259. Capacitor banks are installed for improvement of power factor.
260. For smaller kVAR requirements it is economical to use static capacitors rather than synchronous capacitors.

Answers: **220.** (T), **221.** (T), **222.** (F), **223.** (T), **224.** (F), **225.** (T), **226.** (T), **227.** (T), **228.** (T), **229.** (F), **230.** (F), **231.** (T), **232.** (T), **233.** (F), **234.** (T), **235.** (T), **236.** (F), **237.** (F), **238.** (T), **239.** (F), **240.** (T), **241.** (T), **242.** (T), **243.** (T), **244.** (F), **245.** (T), **246.** (T), **247.** (T), **248.** (F), **249.** (T), **250.** (T), **251.** (F), **252.** (F), **253.** (F), **254.** (T), **255.** (T), **256.** (T), **257.** (F), **258.** (F), **259.** (T), **260.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. In India more than 60% of electric power is generated by _____ power plants.
2. The installed capacity as on 31-3-99 was _____ MW while total electrical energy generation as on 31-3-99 was _____ million kWh per year.
3. An hydroelectric power plant operates under an effective head of 50 m and discharge of 94 m^3/s. The power developed will be _____ MW.
4. The _____ power plant will give least running cost of production of electricity. [A.M.I.E. Sec B. Summer 1994]
5. Useful life of hydroelectric power plants is about _____ years.
6. A hydrograph is a plot of _____ vs _____.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1998]
7. One day-second metre of run-off = _____ m^3/day.
8. _____ is a curve which indicates the total volume of run-off in m^3 up to a certain time.
9. Storage capacity should be determined with the help of _____ curve.
10. _____ is a closed conduit for supplying water under pressure to the turbine.
11. _____ are employed where the slope is too great for a canal.
12. The main purpose of _____ in a pipeline is to relieve the pressure due to water hammer. [A.M.I.E. Sec B. Winter 1993]
13. _____ is provided to absorb sudden changes in water requirements.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

14. An earth dam has a very _____ base as compared to its height.
15. In a _____ turbine the ratio of width of the wheel to its diameter varies from 0.1 to 0.4.
16. In a _____ turbine the flow ratio varies from 0.4 to 0.6.
17. Pelton turbine uses _____ energy of water and is suitable for _____ heads. [A.M.I.E. Sec B. Power Plant Engineering, Winter 1999]
18. In case of reaction turbines _____ shaft arrangement is universally adopted.
19. The efficiency of Pelton turbine is _____ than that of a Kaplan turbine. [A.M.I.E. Sec B. Summer 1993]
20. High specific speed turbines work under _____ head and _____ discharge conditions. [A.M.I.E. Sec B. Power Plant Engineering, Winter 1999]
21. The _____ turbine can be operated both in the turbine mode and pump mode. [A.M.I.E. Sec B. Power Plant Engineering, Summer 2000]
22. Bulb turbines are used for _____ head plants. [A.M.I.E. Sec B. Summer 1993.]
23. The efficiency of a pumped storage plant is in the range of _____ per cent.
24. Hydro alternators are of a _____ type. [A.M.I.E. Sec B. Summer 1996]
25. Steam power plants are _____ in operating cost in comparison to hydro and nuclear power plants.
26. Industrial power plants or captive power plants are normally _____ .
27. In water tube boilers water flows _____ the tube and hot gases _____ .
28. All modern high pressure boilers use _____ circulation of water.
29. _____ is the largest heat exchanger in a steam power plant. [A.M.I.E. Sec B. Summer 1998]
30. The furnace wall containing water circulating pipes is called _____. [A.M.I. E. Sec B. Winter 1994]
31. The function of superheater is to _____ the steam temperature.
32. A _____ is a device which removes the last traces of moisture from the saturated steam leaving the boiler tubes and also increases the temperature above the saturation temperature.
33. The function of the _____ is to superheat the partly expanded steam from the turbine.
34. An _____ is a device that utilises the waste heat of the flue gases to heat the feed water.
35. Economiser and _____ are such devices which recover the heat from the flue gases on their way to chimney and raise the temperature of feed water and air supplied for combustion respectively.
36. Generally economisers improve boiler efficiency by _____ % to _____ %. [A.M.I.E. Sec B. Summer 1998]
37. Air preheaters utilises the _____ left in the _____ gases before they are discharged to the atmophere. [A.M.I.E. Sec B. Summer 1998]
38. Air preheater improves the _____ of a steam power plant. [A.M.I.E. Sec B Summer 1994]
39. A feed water heater is basically a _____.
40. The make-up water in a modern steam power plant is about _____ to _____ per cent.
41. The removal of the mud and other impurities of water from the lowest part of the boiler is called the _____.
42. With the addition of heat recovery apparatus, the efficiency of modern boilers can be increased to between _____ % and _____%. [A.M.I.E. Sec B. Summer 1994]
43. In a steam power plant the upper limit of feed water heaters may be _____ to _____. [A.M.I.E. Sec B. Winter 1994]
44. Regenerative feed water heating improves _____ of the cycle [A.M.I.E. Sec B. Summer 1996]
45. _____ is a device in which the steam condenses and heat so released is absorbed by the cooling water.
46. _____ consists of a water tank in which hot water is distributed by pipes throughout and is sprayed in air through nozzles at a suitable pressure.
47. The blades of steam reaction type turbines are of _____ section.
48. There are two material problems of steam turbine blades, namely _____ and stress corrosion cracking. [A.M.I.E. Sec B. Winter 1993]
49. The percentage of ash content in the coal varies from about _____ per cent in good quality coals to _____ per cent in poor quality coals.
50. Lignite is _____ calorific value coal. [A.M.I.E. Sec B. Summer 1994]
51. Any natural fuel of any organic nature such as coal, crude oil and natural gas is called the _____ fuel.
52. Coaking coal is a form of _____ coals.
53. Hydrogeneous oil contains excess of _____.
54. The average coal consumption varies from _____ kg per kWh generated for plants using high grade coal and operating at high load factor to _____ kg per kWh generated for plants using low grade coal and operating at low load factor.
55. A _____ is power operated fuel feeding mechanism and grate.
56. Travelling grate stokers are of two types namely bar grate and _____ grate.
57. The equipment used for pulverising the coal is _____. [A.M.I.E. Sec B. Summer 1994]
58. _____ removes particulate matter by giving electrical charge to the particles.
59. The electrostatic precipitators are most effective on _____. [A.M.I.E. Sec B. Summer 1994]
60. In electrostatic precipitator the applied voltage is of the order of _____ to _____ V dc.
61. The small pressure difference that causes a flow of gas to take place is called the _____.
62. In _____ the water is allowed to stand at stand-still in large tanks inorder to allow solid matter to settle down.
63. The efficiency of large turbo-alternator can be taken as _____% with hydrogen cooling. [A.M.I.E. Sec B. Summer1996]
64. _____ is the basic unit for describing the intensity of radioactivity.
65. In a nuclear power plant, the power is produced by nuclear fission _____ . [A.M.I.E. Sec B. Summer 1994]
66. _____ or _____ is used to suppress the rate of nuclear reaction. [A.M.I.E. Sec B. Winter 1994]
67. Natural uranium mainly consists of _____, however, it is only _____ isotope that fissions readily. [A.M.I.E. Sec B. Winter 1999]
68. CANDU PHW stands for _____. [A.M.I.E. Sec B. Winter 1999]
69. _____ type reactors do not require any moderator. [A.M.I.E. Sec B. Winter 1998]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

70. The fuel used in diesel engine power plant is _____. [A.M.I.E. Sec B. Winter 1993]
71. The overall efficiency of diesel engine is from _____ % to _____ %. [A.M.I.E. Sec B. Power Plant Engineering, Summer 1996]
72. A turbocharger is a part of _____. [A.M.I.E. Sec B. Summer 1994]
73. In diesel engines _____ are provided to remove dust and other suspended impurities from the air to be supplied to the engines.
74. The efficiency of open cycle gas turbine plant can be improved to _____ per cent by using regenerator, intercooler and reheater.
75. The thermal efficiency of diesel plant is _____ than the gas turbine plant. [A.M.I.E. Sec B. Summer 1993]
76. Combined cycle plants are _____ efficient than single cycle plants.
77. Aero-derivative turbine has _____ fan(s).
78. Aero-derivative turbine uses _____ fuel.
79. The main constituents of natural gas are methane and _____.
80. The process of adding a material of low ionization potential to the gas to increase its conductivity is called _____.
81. _____ and _____ salts are used as seed materials for MHD generation. [A.M.I.E. Sec B. Summer 1998]
82. Thermoelectric converters operate on the principle of _____.
83. Modern solar cells are made of _____. [A.M.I.E. Sec B. Winter 1993]
84. An ordinary fuel cell uses _____ as fuel and _____ as oxidizer. [A.M.I.E. Sec B. Winter 1998]
85. The maximum possible theoretical efficiency of a wind energy convertor is _____ %. [A.M.I.E. Sec B. Winter 1998]
86. Tidal plants can give only _____ supply of power. [A.M.I.E. Sec B. Summer 1993]
87. Peak load plants operate at _____ load factor.
88. The unit of heat rate is _____.
89. The penalty factor is always _____.
90. The unit of incremental cost is _____.
91. For most economic generation of power in a thermal station having several units, _____ should be same for all units.
92. When the power system is not in a position to meet the demand it will resort to _____.
93. Standard frequency for power supply in India is _____ Hz.
94. H_2 cooled generators are _____ than the air cooled generators. [A.M.I.E. Sec B. Summer 1993]
95. Modern alternators use _____ regulators.
96. The value of the plant at the end of its useful life is known as _____ value.
97. A load curve is the relationship between _____. [A.M.I.E. Sec B. Summer 1994]
98. Load curve is a graph between _____ on X-axis and _____ on Y-axis. [A.M.I.E. Sec B. Summer 1999]
99. _____ curve gives the number of hours for which a particular load lasts during the day.
100. The sum of continuous ratings of all the electrical equipment connected to the supply system is known as _____ load.
101. The greatest of all 'short time interval averaged' during a given period on the power station is called the _____.
102. Load factor is the ratio of _____ to _____. [A.M.I.E. Sec B. Summer 1999]
103. Demand factor is the ratio of _____ to _____. [A.M.I.E. Sec B. Summer 1999]
104. Diversity factor is the ratio of _____ to _____. [A.M.I.E. Sec B. Summer 1999]
105. The peak load of a 40 MW capacity power station is 30 MW. The loads having maximum demands of 25 MW, 10 MW, 5 MW and 7 MW are connected to the system. The diversity factor of the plant is _____. [A.M.I.E. Sec B. Summer 1993]
106. In Q. 105, if the load factor for the year is 50%, the energy supplied by the system is _____ kWh/year. [A.M.I.E. Sec B. Summer 1993]
107. Plant capacity factor is the ratio of _____ to _____. [A.M.I.E. Sec B. Summer 1999]
108. The utilisation factor is defined as the ratio of _____ to _____. [A.M.I.E. Sec B. Summer 1999]
109. Firm power is the power intended to be available _____ even under _____ condition. [A.M.I.E. Sec B. Summer 1999]
110. Cold reserve is the reserve generating capacity which is available for _____ but is not in _____. [A.M.I.E. Sec B. Summer 1999]
111. Hot reserve is the reserve generating capacity which is in _____ but not in _____. [A.M.I.E. Sec B. Summer1999]
112. Spining reserve is that generating capacity which _____ and is ready to _____. [A.M.I.E. Sec B. Summer 1999]
113. Most of the power generating units are conservatively rated. They can be easily overloaded by about _____ percent for short durations.
114. _____ load includes domestic lights, power for domestic appliances and small motors for pumping water.
115. _____ load includes lighting for commercial establishments, advertising, and electrical appliances used in shops and restaurants.
116. _____ load consists of street lighting, power required for water supply and drainage purposes.
117. _____ load includes electrical power required for driving water pumps to supply water to fields.
118. _____ are the different methods of charging the consumers for electrical energy consumed by them.
119. _____ is applied to medium industrial consumers.
120. _____ is applied to bulk supplies.

ANSWERS

1. steam
2. 94,055; 448,000
3. 46.1
4. hydroelectric
5. 40
6. discharge or flow; time
7. 86,400
8. Mass curve
9. mass curve
10. Penstock
11. Penstocks
12. a surge tank
13. Surge tank
14. wide
15. Francis
16. Francis
17. kinetic; high
18. vertical
19. lower
20. low; large
21. Kaplan
22. low
23. 60-70
24. salient pole
25. costlier
26. non-condensing
27. inside; outside
28. forced
29. Boiler
30. water wall
31. raise
32. superheater
33. reheaters
34. economiser
35. air preheaters
36. 4; 6
37. heat; flue
38. efficiency
39. heat exchanger
40. 2; 5
41. blowing off
42. 10, 13
43. 5, 9
44. thermal efficiency
45. Condenser
46. Spray pond
47. aerofoil
48. pitting
49. 5; 40
50. low
51. fossil
52. bituminous
53. moisture
54. 0.16; 1.6
55. stoker
56. chain
57. ball mill
58. Electrostatic precipitator
59. fine dust particles
60. 25,000; 100,000
61. draught
62. coagulation
63. 98-99
64. Curie
65. of heavy atom like U_{238}
66. Moderator; control rod
67. U_{238} ; U_{235}
68. Canadian deuterium uranium pressurised heavy water.
69. Fast breeder
70. light diesel oil
71. 28; 35
72. diesel engine
73. air filters
74. 30
75. more
76. more
77. no
78. clean
79. ethane
80. seeding
81. Cesium; potassium
82. Seebeck effect
83. silicon
84. hydrogen; oxygen
85. 59
86. uneven
87. low
88. kcal/MWh;
89. more than 1
90. Rs per MWh
91. incremental costs
92. load shedding
93. 50
94. of large size
95. electronic
96. salvage
97. load on the power system with the time.
98. time; kW
99. Load duration
100. connected
101. maximum demand
102. average load; maximum demand
103. maximum demand; connected load
104. sum of individual maximum demand; maximum demand of power plant
105. 1.5667
106. 1314×10^5
107. average load; rated capacity
108. maximum demand; rated plant capacity
109. always; emergency
110. service; operation
111. operation; service
112. is connected to bus; take load
113. 10–15
114. Domestic
115. Commercial
116. Municipal
117. Irrigation
118. Tariffs
119. Hopkinson demand rate
120. Doherty rate.

CHAPTER 9

Transmission and Distribution of Electrical Power

Short Answer Type Questions With Answers

Q. 1. What is the voltage that has been selected for HVDC transmission ?

Ans. ± 500 kV

Q. 2. What is an electric power supply system ?

Ans. The system of generation, transmission and distribution of electrical power is called the electrical power supply system.

Q. 3. What is the usable voltage for secondary distribution ?

Ans. 415/240 V (415 volts for 3-phase loads and 240 V for single phase loads).

Q. 4. What is the legal requirement to which a distributor is subjected ?

Ans. A distributor is subject to the legal requirement that the voltage at the consumer's terminals should be maintained within ± 6% of the declared (or rated) voltage.

Q. 5. State the empirical formula for determining the system voltage of transmission line.

Ans. Approximate economical voltage for transmission in

$$kV = 5.5\sqrt{\frac{km}{1.6} + \frac{\text{Load in kVA}}{150}}$$

Q. 6. What is modified Kelvin's law ?

Ans. Modified Kelivn's law states that the most economical cross-sectional area of transmission line conductor makes the variable part of annual cost on account of interest and depreciation on the capital outlay equal to the annual cost of electrical energy wasted in the conductor.

Q. 7. What are the various components of an overhead line ?

Ans. The main components of an overhead line are supports/towers, cross-arms and clamps, insulators, conductors, guys and stays, lightning arresters, earth wire, V-guards, guard wires, phase plates, bird guards, danger plates, anticlimbing devices, vibration dampers etc.

Q. 8. What is the function of line support ?

Ans. The function of a line support is to support the line conductors and keep them at a safe distance from the ground.

Q. 9. What are the main requirements of line supports ?

Ans. The main requirements of line supports are high mechanical strength, lighter in weight, low maintenance cost, longer life, cheaper in cost, good appearance, easy accessibility for painting and erection of line conductors and immune to damage from lightning and fire.

Q. 10. What are four types of line supports ?

Ans. The four types of line supports are wooden poles, RCC or PCC poles, rail poles and steel structures or towers.

Q. 11. What are the drawbacks of wooden poles ?

Ans. The main drawbacks of wooden poles are comparatively smaller life, poor mechanical strength, tendency to rot below the ground level and requirement of periodical inspection.

Q. 12. What are the main requirements of good conductor material used for overhead lines ?

Ans. Main requirements of good conductor material used for overhead lines are high electrical conductivity, high tensile strength, low specific gravity, low cost, easy availability, free from brittleness and the material should not react with atmospheric condition.

Q. 13. What for ACSR conductor stands ?

Ans. ACSR conductor stands for aluminium conductor steel reinforced conductor.

Q. 14. Why are conductors for transmission line stranded ?

Ans. All conductors used for overhead transmission lines are stranded so as to increase the flexibility. Solid wires, except of smaller sizes, are difficult to handle when used for long spans and tend to crystallise at the points of supports because of swinging in winds.

Q. 15. Why is galvanised steel wire not suitable for EHT lines for the purpose of transmitting large amounts of power over a long distance ?

Ans. The galvanised steel wire is not suitable for EHT lines for the purpose of transmitting large amounts of power over a long distance because of poor conductivity, high internal reactance and eddy current and hysteresis.

Q. 16. What is the function of cross-arms ?

Ans. The function of cross-arms is to keep the line conductors at a safe distance from each other and from the pole.

Q. 17. What are the factors on which conductor spacings and ground clearance depend ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Factor affecting conductor spacings is voltage while factors affecting ground clearance are voltage and area (living or non-living, urban or suburban, along the streets or across the streets, river crossings/hill crossings, railway track/bridge etc.).

Q. 18. What is sag ?

Ans. The difference in level between the points of line supports and the lowest point on the conductor is known as sag.

Q. 19. What are the factors affecting the sag in a transmission line ?

Ans. Factors affecting the sag in a transmission line are weight of conductor, span length (distance between the poles), working tensile strength, ice coating, wind pressure and temperature.

Q. 20. What is stringing chart ?

Ans. Stringing chart gives the data for sag and tension to be allowed at a particular temperature. It is very useful while erecting the transmission line conductors for adjusting the sag and tension properly.

Q. 21. What are the important properties that an overhead line insulator must possess ?

Ans. The most important properties that an overhead line insulator must possess are : High mechanical strength, high relative permittivity, high insulation resistance, high ratio of rupturing strength to flash-over voltage and capability of withstanding temperature variations.

Q. 22. What types of insulators are used for overhead transmission and distribution lines ?

Ans. The insulators used for overhead line are pin type, suspension type, strain type and shackle insulators.

Q. 23. What are the causes of failure of insulators ?

Ans. The insulator failure may occur due to cracking of porcelain, porosity, puncture, mechanical stresses, flash-over etc.

Q. 24. How do the insulators fail ? **[A.M.I.E. Sec B. Summer 1993]**

Ans. Electric failure of insulators may occur either by puncture or flash-over. In the case of puncture the arc passes through the insulator body while flash-over is caused by an arc discharge between the line conductor and earth through air surrounding the insulator.

Q. 25. How are insulators tested to determine flash-over voltages ?

Ans. For determination of flash-over voltage of a given insulator high voltage supply terminals are connected to the pin and insulator and the test voltage is gradually raised to a specified value in approximate 10 seconds and is maintained for one minute. The voltage is then gradually raised till a flash-over takes place. The flash-over voltage depends upon barometric pressure, temperature, humidity etc.

Q. 26. What is meant by birdage ?

Ans. Birdage means the short-circuiting of the line conductor to earth through the large birds or similar objects.

Q. 27. What is meant by efficiency of an insulator string ?

Ans. The efficiency of an insulator string, called the *string efficiency*, is the ratio of voltage across the whole string and the product of the number of units and voltage across the unit nearest to the line conductor.

Q. 28. How are voltage distribution and the string efficiency affected by rain ?

Ans. More uniform voltage distribution is obtained and the string efficiency is improved because of reduction in value of K [when insulators are wet, mutual capacitance C increases while the shunt capacitance C_1 (except for the unit nearest the cross-arm) remains constant].

Q. 29. What are the methods, that are used for improving string efficiency ?

Ans. Various methods used for improving string efficiency are by using insulators with larger discs or by providing each insulator unit with a metal cap, by using longer cross-arms, by capacitance grading or by static shielding.

Q. 30. What are the two functions that are performed by grading ring ?

Ans. The grading ring performs two functions viz equalizes the voltage distribution across the insulator units and when used in conjunction with arcing horn fixed at the top end of the string serves the purpose of arcing shield and protects the insulator string from flash-over.

Q. 31. What is corona ?

Ans. When the voltage between conductors of an overhead line exceeds the disruptive critical voltage value, a hissing noise accompanied by a violet glow appears. This phenomenon is called the corona.

Q. 32. What are the various factors which affect corona ?

Ans. Factors affecting corona are (*i*) number of ions,size and charge per ion, mean free path depending on atmospheric conditions, (*ii*) line voltage, (*iii*) ratio of conductor spacing to conductor radius, (*iv*) contour of the conductor surface, and (*v*) state of the conductor surface.

Q. 33. What are the adverse effects of corona ?

Ans. Adverse effects of corona are (*i*) power loss but not very important except under abnormal weather conditions, (*ii*) corrosion due to production of ozone gas, and (*iii*) interference with neighbouring communication circuits.

Q. 34. What do you mean by dielectric strength of air ?

Ans. The value of potential gradient at which complete disruption of air occurs, is called the dielectric strength of air.

Q. 35. What is meant by disruptive critical voltage ?

Ans. The disruptive critical voltage is defined as the minimum phase to neutral voltage at which corona occurs.

Q. 36. What is visual critical voltage ?

Ans. Visual critical voltage is defined as the minimum phase to neutral voltage at which glow appears all along the line conductors.

Q. 37. What are the various factors which affect corona loss ?

Ans. The factors affecting corona loss are system frequency, system voltage, air conductivity, air density, conductor diameter, conductor surface condition, atmospheric conditions and load current.

Q. 38. How can the corona effect be minimised ?

Ans. Corona effect can be minimised in a transmission line by using large diameter conductors which may be accomplished by using hollow conductors with a hemp core, ACSR conductors or bundled conductors. Corona effect can also be reduced but to a limited extent, by increasing the spacing between the conductors.

Q. 39. What is skin effect ?

Ans. The phenomenon of concentration of an electric current near the surface of the conductor is known as skin effect.

Q. 40. On what factors does the skin effect depend ?

Ans. The skin effect depends upon the type of material, frequency of current, diameter of conductor and shape of conductor. It increases with the increase of x-section, permeability and supply frequency.

Q. 41. What is meant by GMR of a conductor ?

Ans. The product $r\,e^{-1/4}$ is known as GMR of a conductor and is equal to 0.7788 times the conductor radius.

Q. 42. What is self GMD of a conductor consisting of seven identical strands, each having a radius r ?

Ans. $2.176r$.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 43. What is bundling of conductors ?

Ans. The use of more than one conductor per phase is called the bundling of conductors.

Q. 44. What is meant by transposition of line conductors ?

Ans. Transposition of line conductors means changing the positions of the three phases on the line supports twice over the total length of the line. The line conductors in practice, are so transposed that each of the three possible arrangements of conductors exist for one-third of the total length of the line.

Q. 45. What are the factors which govern the performance of a transmission line ?

Ans. The factors governing the performance of a transmission line are series resistance R and inductance L, shunt capacitance C and conductance G. However, the effect of conductance is negligible.

Q. 46. How do you classify transmission lines ?

Ans. Transmission lines are classified depending upon the manner in which capacitance is taken into account.

Q. 47. What are the causes of voltage drop and line loss in a transmission line ?

Ans. The voltage drop in a transmission line is due to its resistance and inductance whereas the line loss is due to its resistance.

Q. 48. What is Ferranti effect ?

Ans. The phenomenon of rise in voltage at the receiving end of the open-circuited or lightly loaded line is called the Ferranti effect.

Q. 49. How does rise in voltage at the receiving end of an open-circuited line depend upon the length of the line and system operating voltage ?

Ans. Rise in voltage at the receiving end of an open-circuited line is proportional to the square of the length of the line and varies directly in proportion to the system operating voltage.

Q. 50. How do the terms 'impedance drop' , 'voltage drop' and 'voltage regulation' , in connection with transmission lines differ ?

Ans. The impedance drop in a line is the voltage drop in the line impedance and is equal to the phase difference between the sending-ending voltage and the receiving-end voltage.

The voltage drop in a line is the arithmetical difference between the sending-end and receiving-end voltages.

The voltage regulation is defined as the change in voltage at the receiving-end when full-load is thrown off, the sending-end voltage being held constant.

Q. 51. Why in medium and long transmission lines, regulation is greater than voltage drop ?

Ans. The regulation is greater than voltage drop in a medium/long transmission line due to rise in voltage owing to Ferranti effect.

Q. 52. What are the units of generalised constants of a transmission line ?

Ans. Generalised constants A and D are dimensionless whereas the units of generalised constants B and C are ohms and siemens (mho) respectively.

Q. 53. What is the range of surge impedance for an overhead transmission line ?

Ans. 400–600 Ω.

Q. 54. What is the range of surge impedance in case of underground cables ?

Ans. 40–60 Ω.

Q. 55. What is the surge impedance loading of a line ?

Ans. The unity power factor load, that can be delivered by a line of negligible resistance, is called the surge impedance loading.

Q. 56. What is meant by 'natural load' as applied in connection with a transmission line ?

Ans. Natural load of a transmission line is defined as the load (of unity power factor) that can be delivered by the line of negligible resistance.

Q. 57. How does synchronous phase modifier differ from a synchronous motor ?

Ans. Synchronous phase modifier differs from an ordinary synchronous motor in as much as they are built for the highest economical speeds, and provided with smaller shafts and bearings and special attention is paid for securing a high overall efficiency.

Q. 58. How does the reactive power of a transmission line vary for given values of V_S, V_R and X ?

Ans. For fixed values of V_S, V_R and X, the reactive power is proportional to the magnitude of voltage drop in the line (*i.e.* $V_S - V_R$).

Q. 59. Why high and extra voltages are adopted for transmission of bulk power over long distances ?

Ans. This is because the maximum power transferred over a given line increases with the increase in V_S and V_R.

Q. 60. What is meant by receiving-end power circle diagram ?

Ans. The circle diagram drawn with receiving-end true and reactive power components as the horizontal and vertical ordinates is called the receiving-end power circle diagram.

Q. 61. What is meant by sending-end power circle diagram ?

Ans. The circle diagram drawn with sending-end true and reactive power components as the horizontal and vertical ordinates is called the sending-end power circle diagram.

Q. 62. For what purpose metallic sheath is provided in underground cables ?

Ans. The metallic sheath is provided around the insulation to protect it against ingress of moisture, gas or other damaging liquids (acid or alkalies) from the soil and atmosphere.

Q. 63. Why is a layer of bedding provided over the metallic sheath in underground cables ?

Ans. A layer of bedding is provided over the metallic sheath for the protection of metallic sheath against corrosion and from mechanical injury.

Q. 64. Why are copper conductors not used in power cables ?

Ans. Copper conductors are not used in power cables because of scarcity of copper.

Q. 65. What are the main requirements of insulating materials used for underground cables ?

Ans. The main requirements of the insulating materials used for underground cables are high insulation resistivity, high dielectric strength, good mechanical properties, non-hygroscopic, non-inflammable, immune to attacks by acids and alkalies.

Q. 66. Why single core cables are usually not provided with armouring ?

Ans. Single core cables are usually not provided with armouring in order to avoid excessive loss in the armour.

Q. 67. On what factors does the insulation resistance of a cable depend ?

Ans. The insulation resistance of a cable depends upon core radius, insulation thickness, length of cable and resistivity of insulating material.

Q. 68. How does the insulation resistance of a cable vary with its length ?

Ans. Insulation resistance of a cable varies inversely as the length of the cable.

Q. 69. On what factors does the capacitance of a single core depend ?

Ans. The capacitance of a single core depends upon its length, relative permittivity of its dielectric and the ratio of core diameter to sheath inner diameter.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 70. How does electric stress vary in the dielectric of a cable ?

Ans. The electric stress in the dielectric of a cable varies inversely as the distance from the centre of the cable and hence minimum at the sheath and maximum at the conductor surface.

Q. 71. For what value of R/*r* the minimum value of stress is obtained in a cable ? [A.M.I.E. Sec B. Winter 1997]

Ans. For value of $\frac{R}{r} = e$ *i.e.* 2.71828 the minimum value of stress is obtained in a cable.

Q. 72. What is the modern practice adopted to avoid grading of cables ?

Ans. The modern practice adopted to avoid grading of cables is to employ oil-filled or gas-pressure cables.

Q. 73. Why loss angle of a cable should be very small ? [A.M.I.E. Sec B. Summer 1998]

Ans. As the dielectric losses occurring in a cable are very small, the value of loss angle δ is small.

Q. 74. How does dielectric loss vary with the change in voltage, frequency of supply and capacitance of cable ? [Pb. Univ. April 1981]

Ans. The dielectric loss in a cable varies in proportion with the capacitance of a cable and frequency of supply and varies as the square of the voltage.

Q. 75. What are the factors, which are to be considered while selecting a cable for a particular service ?

Ans. The factors to be considered in selection of a cable are continuous current rating, voltage grade, permissible voltage drop and short-circuit current rating (in case of *ht* cables only) and operating cost.

Q. 76. On what factors does the primary distribution voltage depend ?

Ans. The voltage employed for primary distribution system depends upon the amount of power to be supplied and distances of the substations required to be supplied.

Q. 77. What is/are the primary distribution voltage/voltages adopted in India ?

Ans. The usual value of primary distribution voltage in India is 11 kV but in case of high load density area it may be higher (33 or 66 kV) even.

Q. 78. What is the declared consumer voltage as per IE rules ?

Ans. The declared consumer voltage, according to IER is 415/240 V (*i.e.* 415 V between phases and 240 V between phase and neutral) with a permissible voltage variation of $\pm 6\%$.

Q. 79. Why is it necessary to keep voltage variation at the consumer's terminals as low as possible ?

Ans. All the appliances and motors are designed to be operated at a particular or declared value of voltage. Large voltage variation means either a too high or a too low voltage. Low voltage will cause not only in burning of motors/appliances/ equipment and insufficient lighting but also loss of revenue to the supplier. On the other hand high voltage will cause the lamps to burn out permanently and also may cause failure of other appliances. So the primary requirement of a distribution system is that voltage variations at the consumer's terminals should be the lowest possible (not more than $\pm 6\%$ of the rated value).

Q. 80. What is a feeder ?

Ans. Feeder is a line which supplies a point of distribution network without being tapped at any intermediate point. In simple terms, the feeder may be defined as the line carrying current from the secondary substation to the distribution substations or as a primary distribution line.

Q. 81. What is a distributor ?

Ans. Distributor is a line from which tappings are taken along its length for providing supply to the consumers.

Q. 82. Why dc 2-wire system is never employed for transmission purpose ?

Ans. Because of poor efficiency.

Q. 83. Why is radial system of distribution is not generally used ?

Ans. Because of poorest service reliability.

Q. 84. What are the advantages of ring main distributor ?

Ans. Better flexibility, greater reliability, better voltage regulation and less power losses.

Q. 85. Why is neutral wire taken of half cross-section of either outer in a 3-wire dc distribution system ?

Ans. Since only out of balance current flows through the middle or neutral wire, so generally neutral wire is taken of half x-section of either outer.

Q. 86. What is a booster ?

Ans. Booster is a low-voltage, high-current series wound dc generator inserted into a dc circuit to add or inject a certain voltage proportional to circuit current.

Q. 87. For what purpose a booster is employed ?

Ans. A booster (low-voltage, high-current series wound dc generator) is used for compensating voltage drop in the feeder.

Q. 88. What are the faults that are likely to occur in cables ?

Ans. The faults which are likely to occur in cables are open-circuit, short-circuit and ground faults.

Q. 89. What is meant by 'ground fault' in cables ?

Ans. When the current starts flowing from core to earth or to cable sheath because of damage to the cable insulation, the fault is known as ground or earth fault.

Q. 90. What is meant by 'short-circuit' fault in cables ?

Ans. When the current starts flowing from one cable to another cable or from one core to another -core of a multi-core cable due to damage to the cable insulation, the fault is called the cross or short-circuit fault.

Q. 91. What is meant by 'open-circuit fault' in cables ?

Ans. When the conductor of a cable is broken or joint is pulled out, the fault is called the open-circuit fault.

Q. 92. What principle do Murray loop and Varley loop tests employ ?

Ans. Murray loop and Varley loop tests employ the principle of Wheatstone bridge.

Q. 93. What is the essential difference between Murray and Varley loop tests ? [Pb. Univ. Nov. ; 1977]

Ans. The difference between Murray and Varley loop tests is that in Varley loop test provision is made for the measurement of total loop resistance instead of obtaining it from the relation $R = \rho\frac{l}{a}$.

Q. 94. In what way Varley loop test is advantageous over Murray loop test?

Ans. In Murray loop test sound cable resistance must be known whereas in Varley loop test it is not so.

Q. 95. What is the essential requirement for performing capacity tests on cables ?

Ans. The essential requirement for performing capacity tests on cables is that the core to be tested has a good insulation resistance.

Q. 96. What are the transmission voltages that are used in India ?

Ans. 33, 66, 110, 132, 220 and 400 kV. 765/800 kV is also in used in India.

Q. 97. What are the advantages of adopting extra high voltage / ultra high voltage for transmission of ac electric power.

Ans. Advantages of adopting of EHV/UHV for transmission of ac electric power are reduced line losses, high transmission efficiency, improved voltage regulation, reduced conductor material requirement, flexibility for future system growth, increase in transmission capacity of the line, increase of SIL and reduction in ROW.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 98. Why does surge impedance loading (SIL) increase with the increase in voltage level ?

Ans. SIL varies as the square of the operating voltage, so SIL increases with the increase in voltage level.

Q. 99. What are the problems associated with an EHV transmission ?

Ans. The problems associated with EHV transmission are corona loss and radio interference, requirements of heavy supporting structures and erection difficulties and insulation requirements.

Q. 100. On what basis the conductor size is determined for transmission lines upto 220 kV ?

Ans. For overhead transmission lines operating at voltages up to 220 kV, the conductor size is determined on the basis of its current carrying capacity.

Q. 101. On what basis the conductor size of EHV line is determined ?

Ans. The conductor size of an EHV line is decided on the basis of corona.

Q. 102. What are the sources of audible noise generation in EHV transmission systems ?

Ans. The sources of noise generation in EHV transmission systems are corona, humming of transformers, cooling systems and mechanical and electrical auxiliaries.

Q. 103. What material is universally employed for overhead transmission lines ?

Ans. ACSR conductors.

Q. 104. What is economical value of span for 400 kV transmission line ?

Ans. 350-400 m.

Q. 105. How does the use of bundle conductors reduce corona loss in an EHV line? **[U.P.S.C. IES. E.E-II, 2002]**

Ans. The bundle conductor acts, as far as the electric field is concerned, like a conductor of diameter much larger than that of the equivalent single conductor. This reduces the voltage gradient and so the corona.

Q. 106. What for series and shunt compensation provided in EHV lines ?

Ans. Series compensation is provided in EHV lines to artificially reduce the series reactance of line so as to improve stability, voltage regulation and transmission efficiency where as shunt compensation is provided to artificially reduce the line susceptance so as to improve voltage regulation under light load conditions.

Q. 107. Why shunt capacitors are preferred over series capacitors for improvement of power factor in distribution systems? **[U.P.S.C. I.E.S. E.E-II, 2002]**

Ans. The problems associated with the use of series capacitor for power factor improvement are:

1. Switching-in of an an loaded transformer may develop ferroresonance.
2. Series capacitors develop high recovery voltage across the circuit breaker contacts.
3. Series compensated line has a tendency to cause series resonance, called subsynchronous resonance of frequencies lower than power frequencies.
4. The effect of series capacitors is less than that of shunt capacitors in power factor improvement.

Q. 108. Why is dc used for HV transmission of electric power? **[U.P.S.C. I.E.S. E.E.-II, 2004]**

Ans. There is a limit to distance over which power can be transmitted by ac using overhead lines. This is because of surge impedance limitation producing high voltage at the receiving end. That is why dc is used for HV transmission of electric power as an alternative.

Q. 109. Why is voltage regulation better in case of dc transmission ?

Ans. Because of absence of inductance in dc systems.
