Q. 110. Why there is no limit on the length of the cable for dc system while it is in case of ac system ?

Ans. Because of absence of charging currents in dc system.

Q. 111. Why HVDC line do not require any reactive power compensation ?

Ans. Because of absence of charging currents and unity power factor operation.

Q. 112. Why dc systems invariably use ground or sea return ?

Ans. Because of economy and reliability.

Q. 113. Why dc transmission is economical and preferable over ac transmission for large distances only ?

Ans. Because with larger distances, the saving in cost of dc overhead lines becomes greater than the additional expenditure on terminal equipment.

Q. 114. What is normal value of inductance of the dc reactor ?

Ans. The value of inductance of the dc reactor should be such that a resonance of the dc circuit does not occur at power frequency and is in the range of 0.4–1.0 H.

Q. 115. What are the equipments that supply reactive power in HVDC converter stations ?

Ans. AC filters, static shunt capacitors, synchronous condensers, static VAR compensators etc.

Q. 116. Can corona loss be ignored in the design of HVDC transmisson lines ?

Ans. No.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Transmission line connects
(a) generating station to a switching station/step-down transformer station.
(b) step-down transformer station to service transformer banks.
(c) distribution transformer to consumer premises.
(d) service points to consumer premises.

2. A 3-phase, 4-wire system is commonly used for
(a) primary distribution. (b) secondary distribution.
(c) primary transmission. (d) secondary transmission.

3. The rated voltage of a 3-phase power system is given as
(a) rms phase voltage. (b) peak phase voltage.
(c) rms line to line voltage. (d) peak line to line voltage.
[GATE E.E. 2004]

4. Which of the following is usually not the generating voltage ?
(a) 6.6 kV. (b) 9.9 kV. (c) 11 kV. (d) 13.2 kV.
[A.M.I.E. Sec B. Power Systems Winter 1999]

5. In a transmission system the feeder supplies power to
(a) transformer substations (step-up).
(b) service mains.
(c) distributors. (d) all of the above.

6. Feeder is designed mainly from the point of view of
(a) its current carrying capacity.
(b) voltage drop in it.
(c) operating voltage. (d) operating frequency.

7. Distributors are designed from the point of view of
(a) its current carrying capacity.
(b) operating voltage.
(c) voltage drop in it. (d) operating frequency.

8. Transmission and distribution of electric power by underground system is superior to overhead system in respect of
(a) appearance and public safety.
(b) maintenance cost.
(c) frequency of faults, power failure and accidents.
(d) all of the above.

9. The main drawback(s) of underground system over overhead system is/are
(a) exposure to lightning. (b) heavy initial cost.
(c) exposure to atmospheric hazards such as smoke, ice, wind etc.
(d) inductive interference between power and communication circuits.

10. The main drawback(s) of overhead system over underground system is/are
(a) underground system is more flexible than overhead system.
(b) higher charging current.
(c) surge problem. (d) high initial cost.

11. By increasing the transmission voltage double of its original value, the same power can be despatched keeping the line loss
(a) equal to its original value.
(b) half of original value.
(c) double the original value.
(d) one-fourth of original value.
[A.M.I.E. Sec B. Summer 1993; W.B. Univ. of Technology Power System-I, 2009-10]

12. If a fixed amount of power is to be transmitted over certain length with fixed power loss, it can be said that volume of conductor is
(a) inversely proportional to magnitude of the voltage and that of power factor of the load.
(b) inversely proportional to square of the voltage and square of power factor of the load.
(c) proportional to square of voltage and that of power factor of the load.
(d) proportional to magnitude of the voltage only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

13. For the same voltage drop, increasing the voltage of a distributor n-times
(a) reduces the x-section of the conductor by n times.
(b) increases the x-section of the conductor by n times.
(c) reduces the x-section of the conductor by n^2 times.
(d) increases the x-section of the conductor by n^2 times.
[A.M.I.E. Sec B. Summer 1994]

14. In a transmission system, the weight of copper used is proportional to
(a) E^2. (b) E. (c) $1/E^2$. (d) 1/E.
(e) none of the above. [A.M.I.E. Sec B. Winter 1994]

15. The volume of copper required for an ac transmission line is inversely proportional to
(a) current. (b) voltage.
(c) pf. (d) both (b) and (c).

16. Improving pf
(a) reduces current for a given output.
(b) increases losses in line.
(c) increases the cost of station equipment.
[A.M.I.E. Sec B. Power Systems Summer 1997]

17. For a given amount of power to be transmitted over a certain distance with fixed power loss, the volume of copper required is
(a) directly proportional to voltage.
(b) inversely proportional to voltage.
(c) inversely proportional to the square of voltage and pf of the load.
(d) directly proportional to the square of the voltage and pf of the load.

18. For the same conductor length, same amount of power, same losses and same maximum voltage to earth, which system requires minimum conductor area?
(a) single phase ac (b) 3 phase ac
(c) 2 wire ac (d) 3 wire dc
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

19. Which of the following distribution systems is preferred for good efficiency and high economy?
(a) Single-phase, 2-wire system. (b) 2-phase, 3-wire system.
(c) 3-phase, 3-wire system. (d) 3-phase, 4-wire system.

Answers: **1.** (a), **2.** (b), **3.** (c), **4.** (b), **5.** (c), **6.** (a), **7.** (c), **8.** (d), **9.** (b), **10.** (c), **11.** (d), **12.** (b), **13.** (a), **14.** (c), **15.** (d), **16.** (a), **17.** (c), **18.** (d), **19.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

20. The approximate cost ratio of a 220 kV, underground cable transmission and 220 kV O/H transmission is
(a) 50 (b) 25 (c) 13 (d) 5
[A.M.I.E. Sec B. Power Systems Summer 2000]

21. With the same maximum voltage to earth, which of the following ac systems with 0.8 pf will need more copper in comparison to dc 2-wire system?
(a) Single-phase, 2-wire (midpoint earthed).
(b) Single-phase, 3-wire (neutral half of outer).
(c) Three-phase, 3-wire.
(d) Three-phase, 4-wire (neutral = outer).

22. The main reason for using high voltage for long distance power transmission is
(a) reduction in transmission losses.
(b) reduction in time of transmission.
(c) increase in system reliablility.
(d) none of the above.

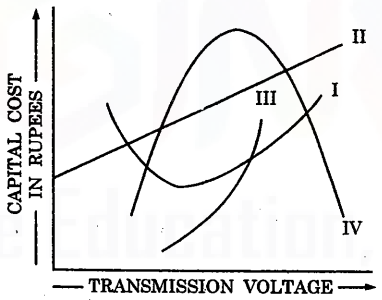
23. 66 kV is suitable for transmission of power over
(a) 30 km (b) 60 km (c) 120 km (d) 200 km
[A.M.I.E. Sec B. Power Systems Winter 1993]

24. If 3 MW power is to be transmitted over a distance of 30 km, the desirable transmission voltage will be
(a) 11 kV (b) 33 kV (c) 66 kV (d) 3.3 kV
[A.M.I.E. Sec B. Power Systems Winter 1999]

25. The highest transmission voltage used in India is
(a) 400 kV (b) 220 kV
(c) 132 kV (d) 765 kV
[U.P.T.U. Odd Semester 2008-09; W.B. Univ. of Technology Power System-III, 23009-10]

26. If variable part of annual cost on account of interest and depreciation on the capital out lay is equal to the annual cost of electrical energy wasted in the conductors, the total annual cost will be minimum and the corresponding size of conductor will be the most economical. This statement is known as
(a) Lenz's law. (b) Kelvin's law.
(b) Faraday's law. (d) Ohm's law.

27. Which of the curves shown in the figure represents the relation between capital cost and the transmission voltage ?
(a) Curve I.
(b) Curve II.
(c) Curve III.
(d) Curve IV.



28. For high-voltage transmission lines, conductors are suspended from towers so as to
(a) increase clearance from ground.
(b) reduce clearance from ground.
(c) take care of increase in length.
(d) reduce wind and snow effects.

29. The supports used for transmission lines should have the characteristic(s) of
(a) high mechanical strength and longer life.
(b) good looking, light in weight and easily accessible for painting and erection of line conductors.
(c) cheap in initial as well in maintenance cost.
(d) all of the above.

30. The wooden poles well impregnated with creosite oil or any preservative compound have life of
(a) 25-30 years. (b) 20-25 years.
(c) 10-15 years. (d) 5-10 years.

31. Steel poles for transmission lines need protection against
(a) borer. (b) termites.
(c) corrosion. (d) all of these.

32. RCC poles usually have the spans of
(a) 250-400 m. (b) 80-150 m.
(c) 50-80 m. (d) 25-50 m.

33. In India for distribution of electric power we usually use
(a) wooden poles. (b) steel poles.
(c) RCC poles. (d) both (b) and (c).

34. Conductors used in *ht* transmission lines are stranded because of
(a) increased tensile strength. (b) ease in handling.
(c) cheaper in cost. (d) reduced resistivity.

35. Consider the following materials for line conductors :
1. Hard drawn copper. 2. Cadmium copper.
3. Aluminium. 4. Galvanised steel.
The correct sequence of the descending order of their electrical conductivities is
(a) 1, 2, 4, 3 (b) 2, 1, 4, 3 (c) 2, 1, 3, 4 (d) 1, 2, 3, 4
[U.P.S.C. I.E.S. E.E.-II, 1995]

36. Which of the following properties has got higher value for aluminium in comparison to that of copper ?
(a) Electrical resistivity. (b) Melting point.
(c) Thermal conductivity. (d) Specific gravity.

37. In a 7/30 ACSR conductor why is grease put between steel and aluminium conductors?
(a) To reduce corrosion by electrolytic action between zinc (galvanising agent on steel) and aluminium.
(b) To reduce friction between the strands.
(c) To reduce leakage of current from aluminium strands to steel strands.
(d) To eliminate air pockets. [U.P.S.C. I.E.S. E.E.-II, 2006]

38. ACSR is used in place of copper in overhead lines because of
(a) higher current carrying capacity.
(b) being lighter in weight.
(c) economy. (d) higher tensile strength.

39. ACSR conductors have
(a) all conductors made of aluminium.
(b) outer conductors made of aluminium.
(c) inner conductors made of aluminium.
(d) no conductors made of aluminium. [A.M.I.E. Sec B. Summer 1993]

40. "Expanded ACSR" are conductors composed of
(a) larger diameter individual strands for a given cross section of the aluminium strands.
(b) larger diameter of the central steel strands for a given overall diameter of the conductor.
(c) larger diameter of the aluminium strands only for a given overall diameter of conductor.
(d) A filter between the inner steel and the outer aluminium strands to increase the overall diameter of the conductor.
[U.P.S.C. I.E.S. E.E.-II, 1998]

41. The function of steel wire in an ACSR conductor is to
(a) compensate for skin effect.
(b) take care of surges.
(c) provide additional mechanical strength.
(d) reduce inductance.

Answers: **20.** (c), **21.** (d), **22.** (a), **23.** (b), **24.** (c), **25.** (d), **26.** (b), **27.** (a), **28.** (a), **29.** (d), **30.** (a), **31.** (c), **32.** (b), **33.** (d), **34.** (b), **35.** (d), **36.** (a), **37.** (a), **38.** (c), **39.** (b), **40.** (b), **41.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

42. The material used for the manufacture of ground wire is
(a) aluminium. (b) galvanised steel.
(c) cast iron. (d) stainless steel.

43. Guy wire is employed for
(a) providing protection against surges.
(b) providing emergency earth route.
(c) supporting the pole. (d) all of the above.

44. The sag of a transmission line is least affected owing to
(a) weight of the conductor.
(b) current through the conductor.
(c) atmospheric temperature.
(d) ice deposition on the conductor.

45. Effect of temperature rise in overhead lines is to
(a) increase the sag and decrease the tension.
(b) decrease the sag and increase the tension.
(c) increase both.
(d) decrease both. **[A.M.I.E. Sec B. Power Systems Winter 1996]**

46. The sag of a transmission line conductor in summer is
(a) less than that in winter. (b) more than that in winter.
(c) same as in winter. **[A.M.I.E. Sec B. Power Systems Summer 1999]**

47. In a transmission line, sag depends upon
(a) span length. (b) tension in conductors.
(c) weight of the conductor per unit length.
(d) all of the above.

48. Which of the following statements is correct ?
(a) Ice on conductors increases skin effect.
(b) Wind pressure reduces corona effect.
(c) Wind pressure is taken to act at perpendicular to that for ice.
(d) Ice on conductors reduces sag.

49. Wind loading in coastal regions is in the range of
(a) 40-50 kg/m^2 (b) 150 kg/m^2
(c) 96 kg/m^2 **[A.M.I.E. Sec B. Power Systems Summer 1997]**

50. The maximum tension in a section of overhead line conductor between two supports of unequal height occurs at
(a) the higher support. (b) the lower point.
(c) the midpoint of the conductor.
(d) None of the above. **[A.M.I.E. Sec B. Power Systems Winter 1996]**

51. Stringing chart is useful
(a) for finding the sag in the conductor.
(b) in the design of tower.
(c) in the design of insulator string.
(d) finding the distance between towers.
[A.M.I.E. Sec. B Summer 1995]

52. Hot template curves are plots of
(a) temperature and humidity.
(b) conductor sag and span lengths.
(c) conductor weight and sag.
(d) none of the above.

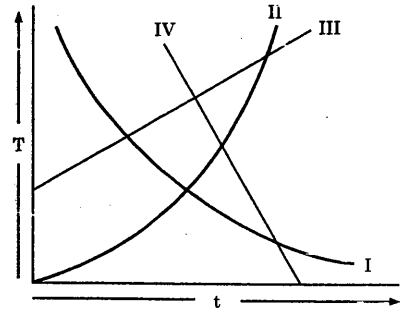
53. The effect of wind pressure is more predominant on
(a) insulators. (b) transmission lines.
(c) supporting towers. (d) none of the above.

54. Galloping in transmission line conductors arises due to
(a) asymmetrical layers of ice formation.
(b) vortex phenomenon in light winds.
(c) heavy weight of the line conductors.
(d) adoption of horizontal conductor configuration.
[U.P.S.C. I.E.S. E.E.-II, 1997]

55. Which one of the following is reduced by using stock bridge dampers on power overhead transmission lines?
(a) Sag. (b) Conductor vibration.
(c) Line losses. (d) Mechanical tension.
[U.P.S.C. I.E.S. E.E.-II, 2009]

56. The sag of the conductors of a transmission line is 2.5 m when the span is 250 m. Now if the height of supporting tower is increased by 25%, the sag will
(a) reduce by 25% (b) increase by 25%
(c) reduce by 12.5% (d) remain unchanged.

57. In an overhead transmission line with the conductors supported between two supports, the variation in tension T with atmospheric temperature t is represented by



(a) curve I. (b) curve II. (c) curve III. (d) curve IV.

58. For a 400 kV line, the spacing between phase conductors is around
(a) 8 m. (b) 11 m. (c) 14 m. (d) 17 m.
[A.M.I.E. Sec B. Power Systems Summer 1996, 1998]

59. Stranded conductors usually have a central wire around which there are successive layers of 6,12,18,24 wires. For n-layers, the total number of individual wires is
(a) $3n(n+1)$ (b) $2n(n+1)$
(c) $3n(n+1)+1$ (d) $2n(n+1)+1$

60. The diameter of each strand is d then the diameter of n-layer stranded conductor will be
(a) $(2n+1)d$ (b) $3(n+1)d$
(c) $(2n-1)d$ (d) $3(n-1)d$

61. Strain type insulators are used
(a) at dead ends. (b) at intermediate anchor towers.
(c) on straight runs. (d) any of (a) or (b).

62. Wavy structure of pin insulator increases its
(a) mechanical strength. (b) puncture strength.
(c) flash-over voltage. (d) thermal strength.
[A.M.I.E. Sec B. Power Systems Summer 1993]

63. The voltage rating of a multiple shell (petticoat or rainshed) pin type insulator unit cannot be increased beyond a limiting value by increasing the number of shells, because
(a) the internal voltage distribution between shells becomes unequal.
(b) the leakage path resistance starts diminishing.
(c) the disruptive critical voltage for the material of the insulator is reached.
(d) the puncture voltage of the material of the insulator is reached.
[U.P.S.C. I.E.S. E.E.-II, 1993]

64. Which type of insulators are used on 132 kV transmission lines ?
(a) Pin type. (b) Disc type.
(c) Shackle type. (d) Pin and Shackle type.
[A.M.I.E. Sec B. Power Systems Winter 1999]

65. Whenever the conductors are dead-ended or there is a change in the direction of transmission line, the insulators used are of the

Answers: **42.** (b), **43.** (c), **44.** (b), **45.** (a), **46.** (b), **47.** (d), **48.** (c), **49.** (b), **50.** (a), **51.** (a), **52.** (b), **53.** (c), **54.** (a), **55.** (b), **56.** (d), **57.** (a), **58.** (a), **59.** (c), **60.** (a), **61.** (d), **62.** (c), **63.** (a), **64.** (b), **65.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Pin type. (b) Suspension type.
(c) Strain type. (d) Shackle type.
[U.P.S.C. I.E.S. E.E.-II, 1998]

66. Post type insulators are generally used in lines operating
(a) above 100 kV. (b) below 33 kV.
(c) at any voltage level, *hv* or *ehv*.
[A.M.I.E. Sec B. Power Systems Summer 1999]

67. The number of discs in a string of insulators for 400 kV ac overhead transmission line lies in the range of
(a) 32 to 33 (b) 22 to 23 (c) 15 to 16 (d) 9 to 10
[U.P.S.C. I.E.S. E.E.-II, 1999]

68. The non-uniform distribution of voltage across the units in a string of suspension type insulators is due to
(a) unequal self-capacitance of the units.
(b) non-uniform distance of separation of the units from the tower body.
(c) the existence of stray capacitance between the metallic junctions of the units and the tower body.
(d) non-uniform distance between the cross-arms and the units.
[U.P.S.C. I.E.S. E.E.-II, 1998]

69. The voltages across the various discs of a string of suspension insulators having identical discs is different due to
(a) surface leakage currents. (b) series capacitance.
(c) shunt capacitance to ground.
(d) series and shunt capacitances. [U.P.S.C. I.E.S. E.E.-II, 1995]

70. The string efficiency of a string of suspension insulators is dependent on
(a) size of the insulators. (b) number of discs in the string.
(c) size of tower. [A.M.I.E. Sec B. Winter 1994]

71. 100 per cent string efficiency means
(a) one of the insulator discs shorted.
(b) zero potential across each disc.
(c) equal potential across each insulator disc.
(d) none of the above.

72. In a suspension type insulator the potential drop is
(a) maximum across the lowest disc.
(b) maximum across the topmost disc.
(c) uniformly distributed over the discs.
[A.M.I.E. Sec B. Power Systems Summer 1999]

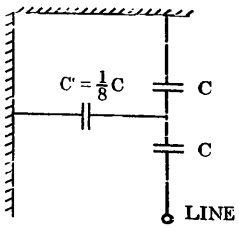
73. If the frequency of a transmission system is changed from 50 Hz to 100 Hz, the string efficiency
(a) will increase. (b) will decrease.
(c) remain unchanged.
(d) may increase or decrease depending on the line parameters.
[A.M.I.E. Sec B. Winter 1994]

74. The string efficiency of a high-voltage line is around
(a) 100% (b) 80% (c) 40% (d) 10%
[A.M.I.E. Sec B. Power Systems Summer 1996]

75. In three-unit insulator string, voltage across the lowest unit is 17.5 kV and string efficiency is 84.28%. The total voltage across the string will be equal to
(a) 8.285 kV (b) 44.25 kV (c) 88.25 kV (d) 442.5 kV
[U.P.S.C. I.E.S. E.E.-II, 2001]

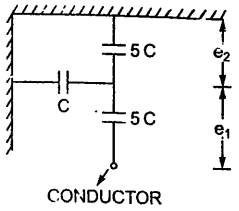
76. Two-insulator discs of identical capacitance value C makes up a string for a 22 kV, 50 Hz, single-phase overhead line insulation system. If the pin to earth capacitance is also C, then the string efficiency is
(a) 50% (b) 75% (c) 90% (d) 86%
[U.P.S.C. I.E.S. E.E.-II, 2003]

77. The equivalent capacitor arrangement of a two-string insulator is shown in the figure. The maximum voltage that each unit can withstand should not exceed 17.5 kV. The line voltage of the complete string is
(a) 17.5 kV (b) 33 kV
(c) 35 kV (d) 37.3 kV



[U.P.S.C. I.E.S. E.E.-II, 1999]

78. Consider a three-phase, 50 Hz, 11 kV distribution system. Each of the conductors is suspended by an insulator string having two identical porcelain insulators. The self-capacitance of the insulator is 5 times the shunt capacitance between the link and the ground, as shown in the figure. The voltage across the two insulators are
(a) $e_1 = 3.74$ kV, $e_2 = 2.61$ kV
(b) $e_1 = 3.46$ kV, $e_2 = 2.89$ kV
(c) $e_1 = 6.0$ kV, $e_2 = 4.23$ kV
(d) $e_1 = 5.5$ kV, $e_2 = 5.5$ kV [GATE, E.E. 2010]



79. In a cable the sheath radius is R and conductor radius is r. As r changes from 0.5 R to 0.25 R the maximum voltage gradient in the dielectric
(a) decreases by about 6%. (b) increases by about 6%.
(c) increases by about 15%. (d) decreases by about 15%
[A.M.I.E. Sec B. Power Systems Summer 2000]

80. Consider the following statements :
In the case of suspension type insulators, the string efficiency can be improved by
1. using a longer cross arm. 2. using a guard ring.
3. grading the insulator discs. 4. reducing the cross-arm length.
Of these statements
(a) 1, 2, and 3 are correct. (b) 2, 3 and 4 are correct.
(c) 2 and 4 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1998]

81. The ratio of puncture voltage to the flash-over voltage of a line insulator is
(a) equal to 1 (b) lower than 1
(c) much greater than 1 [A.M.I.E. Sec B. Winter 1993]

82. The insulators may fail due to
(a) flash over. (b) short-circuits.
(c) deposition of dust. (d) any of the above.

83. The purpose of guard ring in transmission lines is to
(a) reduce the earth capacitance of the lowest unit.
(b) increase the earth capacitance of the lowest unit.
(c) reduce the transmission line losses.
(d) none of the above.

84. The use of a guard ring
(a) equalises the voltage division between insulator discs.
(b) is unnecessary complication.
(c) decreases string efficiency.
[A.M.I.E. Sec B. Power Systems Summer 1997]

85. Corona is
(a) partial breakdown of air. (b) complete breakdown of air.
(c) sparking between lines. [A.M.I.E. Sec B. Power Systems Summer 1997]

86. Which of the following statements is true regarding corona ?
(a) Corona takes place at a voltage lower than breakdown voltage.
(b) Corona takes place at a voltage higher than breakdown voltage.

Answers: **66.** (c), **67.** (b), **68.** (c), **69.** (c), **70.** (b), **71.** (c), **72.** (a), **73.** (c), **74.** (b), **75.** (b), **76.** (b), **77.** (b), **78.** (b), **79.** (b), **80.** (a), **81.** (c), **82.** (d), **83.** (a), **84.** (a), **85.** (b), **86.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Corona is a current phenomenon.
(d) Corona increases the transmission line efficiency.

87. Which of the following statements regarding corona are true ?
1. It causes radio interference.
2. It attenuates lightning surges.
3. It amplifies switching surges.
4. It causes power loss.
5. It is more prevalent in the middle conductor of a transmission line employing a flat conductor configuration.

Select the correct answer using the codes given below.
Codes:
(a) 1, 3, 5 (b) 2, 3, 4 (c) 1, 2, 4, 5 (d) 2, 3, 4, 5
[U.P.S.C. I.E.S. E.E.-II, 1993]

88. Corona is accompanied by
(a) violet visible discharge in darkness
(b) hissing sound. (c) vibration.
(d) power loss. (e) radio-interference.
(f) ozone. (g) all of the above.
[A.M.I.E. Sec B. Power Systems Winter 1993]

89. Ozone effect can be detected by
(a) presence of ozone detected by odour.
(b) hissing sound.
(c) faint luminous glow of bluish colour.
(d) all of the above.

90. Corona loss increases with
(a) decrease in conductor size and increase in supply frequency.
(b) increase in both conductor size and supply frequency.
(c) decrease in both conductor size and supply frequency.
(d) increase in conductor size and decrease in supply frequency.
[U.P.S.C. I.E.S. E.E.-II, 2004]

91. The good effect of corona on overhead lines is to
(a) increase the line carrying capacity due to conducting ionised air envelope around the conductor.
(b) increase the power factor due to corona loss.
(c) reduce the radio interference from the conductor.
(d) reduce the steepness of surge fronts. [U.P.S.C. I.E.S. E.E.-II, 2001]

92. Compared with a solid conductor of the same radius, corona appears on a stranded conductor at a lower voltage, because stranding
(a) assists ionisation.
(b) makes the current flow spirally about the axis of the conductor.
(c) produces oblique sections to a plane perpendicular to a axis of the conductor.
(d) produces surfaces of smaller radius. [U.P.S.C. I.E.S. E.E.-II, 1997]

93. Corona loss can be reduced by the use of hollow conductors because
(a) the current density is reduced.
(b) the eddy current in the conductor is eliminated.
(c) for a given cross section, the radius of the conductor is increased.
(d) of better ventilation in the conductor. [U.P.S.C. I.E.S. E.E.-II, 1994]

94. Bundled conductors reduce
(a) surface electric stress of conductor.
(b) increases the line reactance.
(c) decreases the line capacitance.
[A.M.I.E. Sec B. Power Systems Summer 1997]

95. Corona loss in a transmission line is dependent on
(a) diameter of the conductor. (b) material of the conductor.
(c) height of the conductor. [A.M.I.E. Sec B. Winter 1994]

96. Corona occurs between two transmission conductors when they
(a) have high potential difference. (b) are closely spaced.
(c) carry dc power. (d) both (a) and (b).

97. In humid weather, the corona occurs at a voltage
(a) much less than that needed in fair weather.
(b) much higher than that needed in fair weather.
(c) equal to that needed in fair weather.
(d) none of the above.

98. The effect of corona is
(a) increased energy loss. (b) increased reactance.
(c) increased inductance. (d) all of the above.
[A.M.I.E. Sec B. Power Systems Winter 1999]

99. The charging current in a transmission line increases due to corona effect because corona increases
(a) line current. (b) effective line voltage.
(c) power loss in lines. (d) the effective conductor diameter.
[U.P.S.C. I.E.S. E.E.-II, 1996]

100. The chances of occurrence of corona are maximum during
(a) humid weather. (b) dry weather.
(c) winter. (d) hot summer.

101. Corona is likely to occur maximum in case of
(a) distribution lines. (b) transmission lines.
(c) domestic wiring. (d) service mains.

102. Corona is affected by
(a) size of conductor.
(b) shape and surface condition of the conductor.
(c) operating voltage. (d) all of the above.

103. The only advantage of corona is that it
(a) produces a pleasing luminous glow.
(b) makes line current sinusoidal.
(c) works as a safety valve for surges.
(d) ozone gas is produced.

104. Presence of ozone owing to corona
(a) improves the pf. (b) reduces the pf.
(c) corrodes the material. (d) improves regulation.

105. What is the approximate breakdown strength of atmospheric air at N.T.P.?
(a) 0.3 kV/cm. (b) 1.0 kV/cm.
(c) 3 kV/cm. (d) 30 kV/cm.
[U.P.S.C. I.E.S. E.E.-II, 2007]

106. The dielectric strength of air under normal condition is about
(a) 100 kV_p/cm (b) 21.1 kV_p/cm
(c) 30 kV_p/cm (d) 200 kV_p/cm
[W.B. Univ. of Technology Power System-I, 2009-10]

107. Disruptive corona begins in smooth cylindrical conductors in air at NTP if the electric field intensity at the conductor surface goes up to
(a) 21.1 kV (rms)/cm. (b) 21.1 kV (peak)/cm.
(c) 21.1 kV (average)/cm (d) 21.1 kV (rms)/m.
[U.P.S.C. I.E.S. E.E.-II, 2000]

108. The dielectric strength of air is
(a) proportional to barometric pressure.
(b) proportional to absolute temperature.
(c) inversely proportional to barometric pressure.
(d) none of the above.

109. Visual critical voltage is
(a) lower than disruptive critical voltage.
(b) higher than disruptive critical voltage.
(c) equal to critical voltage. (d) none of the above.

Answers: **87.** (c), **88.** (g), **89.** (d), **90.** (a), **91.** (d), **92.** (d), **93.** (c), **94.** (a), **95.** (a), **96.** (d), **97.** (a), **98.** (a), **99.** (d), **100.** (a), **101.** (b), **102.** (d), **103.** (c), **104.** (c), **105.** (d), **106.** (c), **107.** (a), **108.** (a), **109.** (b),

110. Critical voltage limit of a transmission line is increased by
(a) increasing the radius of the conductors.
(b) increasing the spacing between conductors.
(c) reducing the spacing between conductors.
(d) reducing the radius of the conductors.

111. The maximum permissible value of fair weather corona loss for an HV line is
(a) 0.6 kW/3-phase km. (b) 1.2 kW/3-phase km.
(c) 0.3 kW/3-phase km. (d) 2.4 kW/3-phase km.
[A.M.I.E. Sec B. Power Systems Summer 1998]

112. Corona losses are minimised when
(a) conductor size is reduced. (b) smooth conductor is used.
(c) sharp points are provided in the line hardware.
(d) current density in conductors is reduced. [GATE E.E. 1999]

113. The corona loss on a particular system at 50 Hz is 1 kW/km per phase. What is the corona loss at 60 Hz in kW/km per phase?
(a) 0.83 (b) 1.0 (c) 1.13 (d) 1.2
[GATE E.E., 2000; U.P.S.C. I.E.S. E.E.-II, 2005]

114. Corona loss can be reduced by using
(a) solid conductor of diameter 'd'.
(b) hollow conductor of diameter '$d + \delta d$'.
(c) bundle conductor. (d) both (a) and (b).
(e) both (b) and (c).
[W.B. Univ. of Technology Power System-I, 2009-10]

115. In a transmission line the distributed constants are
(a) resistance and shunt conductance only.
(b) resistance and inductance only.
(c) resistance, inductance and capacitance only.
(d) resistance, inductance, capacitance and shunt conductance.

116. Skin effect depends upon
(a) x-section of conductor. (b) supply frequency.
(c) permeability of conductor material.
(d) all of the above.

117. Skin effect in transmission line is due to
(a) supply frequency. (b) self inductance of conductor.
(c) high sensitivity of material in the centre.
(d) both (a) and (b).

118. The effective resistance of a conductor will be the same as ohmic resistance when
(a) voltage is low. (b) current is true sinusoidal.
(c) current is uniformly distributed in the x-section of the conductor.

119. When an alternating current flows through a conductor
(a) entire current passes through the core of the conductor.
(b) portion of conductor near the surface carries more current in comparison to the core.
(c) current remains uniformly distributed over the whole x-section of the conductor.
(d) portion of conductor near the surface carries less current in comparison to the core.

120. The conductor carries more current on the surface in comparison to its core. This phenomenon is called the
(a) skin effect. (b) corona.
(c) Ferranti effect. (d) Lenz's effect.

121. Increasing the frequency of transmission line will
(a) increase shunt reactance. (b) decrease line resistance.
(c) increase line resistance. (d) decrease series reactance.
[A.M.I.E. Sec B. Power Systems Summer 1994]

122. Skin effect exists in
(a) cable carrying dc current. (b) dc transmission line only.
(c) ac transmission line only.
(d) dc as well as a c transmission lines.

123. Skin effect in a conductor becomes more pronounced
(a) at higher frequency. (b) at lower frequency.
(c) at dc. [A.M.I.E. Sec B. Winter 1996]

124. The skin effect in conductor results in
(a) increases in its dc resistance. (b) decrease in its ac resistance.
(c) increase in its ac resistance.
[A.M.I.E. Sec B. Power Systems Summer 1999]

125. Skin effect
(a) increases the effective resistance and effective internal reactance.
(b) reduces the effective resistance and effective internal reactance.
(c) increases the effective resistance but reduces the effective internal reactance.
(d) reduces the effective resistance but increases the effective internal reactance.

126. The skin effect of a conductor reduces with the increase in
(a) supply frequency.
(b) resistivity of the conductor material.
(c) x-section of conductor.
(d) permeability of conductor material.

127. Skin effect in conductor is proportional to
(a) (diameter of conductor)$^{1/2}$. (b) diameter of conductor.
(c) (diameter of conductor)^2. (d) (diameter of conductor)^4.

128. In order to reduce the skin effect at UHF
(a) copper tubes with silver plating are used.
(b) copper rods with silver plating are used.
(c) anodised conductors are used.
(d) painted conductors are used.

129. A 100 km long transmission line is loaded at 110 kV. If the loss of line is 15 MW and the load is 150 MVA, the resistance of the line is
(a) 8.06 ohms per phase. (b) 0.806 ohms per phase.
(c) 0.0806 ohms per phase. (d) 80.6 ohms per phase.
[U.P.S.C. I.E.S. E.E.-II, 2003]

130. The component inductance due to the internal flux-linkage of a non-magnetic straight solid circular conductor per metre length, has a constant value, and is independent of the conductor diameter, because
(a) All the internal flux due to a current remains concentrated on the peripheral region of the conductor.
(b) The internal magnetic flux density along the radial distance from the centre of the conductor increases proportionately to the current enclosed.
(c) The entire current is assumed to flow along the conductor axis and the internal flux is distributed uniformly and concentrically.
(d) The current in the conductor is assumed to be uniformly distributed throughout the conductor cross section.
[U.P.S.C. I.E.S. E.E.-II, 2003]

131. Consider a long, two-wire line composed of solid round conductors. The radius of both conductors is 0.25 cm and the distance between their centres is 1 m. If this distance is doubled, then the inductance per unit length.
(a) doubles. (b) halves.
(c) increases but does not double.
(d) decreases but does not halve. [GATE E.E. 2002]

Answers: **110.** (a), **111.** (d), **112.** (b), **113.** (c), **114.** (e), **115.** (d), **116.** (d), **117.** (d), **118.** (c), **119.** (b), **120.** (a), **121.** (c), **122.** (c), **123.** (a), **124.** (c), **125.** (c), **126.** (b), **127.** (c), **128.** (a), **129.** (a), **130.** (d), **131.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

132. The inductance of single-phase two-wire power transmission line per km gets doubled when the
(a) distance between the wires is doubled.
(b) distance between the wires is increased four fold.
(c) distance between the wires is increased as square of the original distance.
(d) radius of the wire is doubled. **[U.P.S.C. I.E.S E.E.-II, 1994]**

133. Inductance of an overhead line, in comparison to that of a cable of same capacity is
(a) larger. (b) smaller. (c) of the same order.
[A.M.I.E. Sec B. Power Systems Summer 1999]

134. The inductance of a single-phase two-wire line is given by (D is the distance between conductors and r is the radius of conductor)
(a) $0.4 \log_e \frac{D}{r}$ mH/km (b) $0.55 \log_e \frac{D}{r}$ mH/km
(c) $0.4 \log_e \frac{r}{D}$ mH/km (d) $0.55 \log_e \frac{r}{D}$ mH/km
[A.M.I.E. Sec B. Power Systems Winter 1998]

135. For 11 kV line, the inductance per km per phase will be of the order of
(a) 1 H (b) 0.1 H (c) 1 mH (d) 0.1 mH
[A.M.I.E. Sec B. Power Systems Winter 1999]

136. For a single-phase overhead line having solid copper conductors of diameter 1 cm spaced 60 cm between centres, the inductance in mH/km is
(a) $0.05 + 0.2 \log 60$ (b) $0.2 \log 60$
(c) $0.05 + 0.2 \log \frac{60}{0.5}$ (d) $0.2 \log \frac{60}{0.5}$ **[GATE E.E. 1999]**

137. A 3-phase transmission line has its conductors at the corners of an equilateral triangle with side 3 m. The diameter of each conductor is 1.63 cm. The inductance of the line per phase per km is
(a) 1.232 mH (b) 1.182 mH (c) 1.093 mH (d) 1.043 mH
[U.P.S.C. I.E.S. E.E.-II, 2002]

138. The conductors of a 10 km long, single-phase, two-wire line are separated by a distance of 1.5 m. The diameter of each conductor is 1 cm. If the conductors are of copper, the inductance of the circuit is
(a) 50.0 mH (b) 45.3 mH (c) 23.8 mH (d) 19.6 mH
[GATE E.E.-II, 2004]

139. The inductance of a power transmission line increases with
(a) decrease in line length.
(b) increase in diameter of conductor.
(c) increase in spacing between the phase conductors.
(d) increase in load current carried by the conductors.
[GATE E.E. 1992]

140. The inductance of a transmission line is minimum when
(a) GMD is high. (b) GMR is high.
(c) both GMD and GMR are high.
(d) GMD is low and GMR is high. **[A.M.I.E. Sec B. Summer 2000]**

141. For a given conductor the value of GMR is
(a) larger for capacitance calculation.
(b) larger for inductance calculation.
(c) same for both capacitance and inductance calculation.
[A.M.I.E. Sec B. Power Systems Summer 1999]

142. The self GMD of a conductor with three strands each of radius r and touching each other is
(a) $r\,(0.7788 \times 2 \times 2)^{1/3}$ (b) $r\,(0.7788 \times 2 \times 2 \times 2)$
(c) $r\,(0.7788 \times 2 \times 2 \times 2)^3$ (d) $r\,(0.7788 \times 2 \times 2)^3$
[U.P.S.C. I.E.S. E.E.-II, 2000]

143. Hollow conductors are used in transmission lines to
(a) reduce weight of copper. (b) improve stability.
(c) reduce corona.
(d) increase power transmission capacity.
[U.P.S.C. I.E.S. E.E.-II, 1997]

144. Bundled conductors are employed to improve
(a) appearance of the transmission line.
(b) mechanical stability of the line.
(c) current carrying capacity of the line.
(d) corona performance of the line. **[GATE E.E. 1997]**

145. In hv transmission, the spacing between subconductors of a bundle is approximately
(a) 20 cm (b) 40 cm (c) 80 cm (d) 3.5 cm
[A.M.I.E. Sec B. Power Systems Summer 2000]

146. For a stranded conductor, the ratio of GMR to actual radius is
(a) equal to 1. (b) more than 1.
(c) equal to 0.7788. (d) less than 0.7788
[A.M.I.E. Sec B. Power Systems Summer 2000]

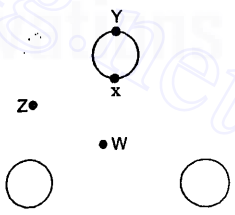
147. Bundled conductors in EHV transmission system provide
(a) reduced capacitance. (b) increased capacitance.
(c) increased inductance. (d) increased voltage gradient.
[U.P.S.C. I.E.S. E.E.-II, 1996]

148. Which one of the following statements is not correct for the use of bundled conductors in transmission lines?
(a) Control of voltage gradient.
(b) Reduction in corona loss.
(c) Reduction in radio interference.
(d) Increase in interference with communication lines.
[U.P.S.C. I.E.S. E.E. 2003]

149. Bundled conductors are mainly used in high voltage overhead transmission lines to
(a) reduce transmission line losses.
(b) increase mechanical strength of the line.
(c) reduce corona. (d) reduce sag. **[GATE E.E. 2003]**

150. D_s is the GMR of each subconductor of a four subconductor bundle conductor and d is the bundle spacing. What is the GMR of the equivalent single conductor?
(a) $1.09\sqrt{D_s \times d^3}$ (b) $1.09\sqrt{D_s^3 \times d^3}$
(c) $1.09\sqrt[4]{D_s^3 \times d^3}$ (d) $1.09\sqrt[4]{D_s \times d^3}$
[GATE E.E. 2004]

151. Consider a bundled conductor of an overhead line, consisting of three identical subconductors placed at the corners of an equilateral triangle as shown in the figure. If we neglect the charges on the other phase conductors and ground, and assume that spacing between subconductors is much larger than their radius, the maximum electric field intensity is experienced at
(a) Point X (b) Point Y
(c) Point Z (d) Point W



[GATE E.E. 2007]

152. Proximity effect
(a) is more pronounced for large conductors, high frequencies and close proximity.
(b) increases the resistance of the conductors and reduces the self reactance.
(c) is substantially eliminated with stranded conductors.
(d) all of the above.

Answers: **132.** (c), **133.** (a), **134.** (a), **135.** (c), **136.** (c), **137.** (a), **138.** (c), **139.** (c), **140.** (d), **141.** (a), **142.** (a), **143.** (c), **144.** (d), **145.** (b), **146.** (d), **147.** (b), **148.** (d), **149.** (c), **150.** (d), **151.** (b), **152.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

153. Following effects are associated with transmission lines
1. Skin effect. 2. Corona effect. 3. Proximity effect.
The effective resistance of a conductor is increased by
(a) 1 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.

154. Capacitance in equivalent circuit of a transmission line is due to
(a) current in the line. (b) difference in potential of line.
(c) leakage of current. (d) presence of magnetic flux.

155. If the separation between the three phases of a transmission line is increased then
(a) the inductance will increase and capacitance will remain unchanged.
(b) both the inductance and capacitance will increase.
(c) the inductance will increase and the capacitance will decrease.
(d) the inductance will decrease and the capacitance will increase.
[A.M.I.E. Sec B. Power Systems Winter 1994]

156. The capacitance of an overhead transmission line increases with
1. increases in mutual geometrical mean distance.
2. increase in height of conductors above ground.
Select the correct answer from the following:
(a) Both 1 and 2 are true. (b) Both 1 and 2 are false.
(c) Only 1 is true. (d) Only 2 is true.
[U.P.S.C. I.E.S. E.E.-II, 2002]

157. The charging reactance of 50 km length of the line is 1500 Ω. What is the charging reactance for 100 km length of the line?
(a) 1500 Ω (b) 3000 Ω (c) 750 Ω (d) 600 Ω
[U.P.S.C. I.E.S. E.E.-II, 2005]

158. Bundled conductors are used to
(a) reduce inductance of the line.
(b) reduce both inductance and capacitance.
(c) reduce corona loss.
(d) reduce corona loss and the line inductance.
[A.M.I.E. Sec B. Power Systems Winter 1994]

159. A 3-phase overhead transmission line has its conductors horizontally spaced with spacing between adjacent conductors equal to '*d*.' If now the conductors of the line are rearranged to form an equilateral triangle of sides equal to '*d*' then
(a) average capacitance and inductance will increase.
(b) average capacitance will decrease and inductance will increase.
(c) average capacitance will increase and inductance will decrease.
(d) surge impedance loading of the line increases.
[GATE E.E. 1993]

160. Proximity of a line to the earth surface
(a) does not affect its capacitance to neutral.
(b) increases the capacitance to neutral.
(c) decreases the capacitance to neutral.
[A.M.I.E. Sec B. Power Systems Summer 1999]

161. If the effect of earth is taken into account, then the capacitance of line to ground
(a) decreases. (b) increases.
(c) remains unaltered. (d) becomes infinite.
[U.P.S.C. I.E.S. E.E.-II, 1993]

162. h = half centre to centre spacing, r = conductor radius and ϵ = permittivity of the medium. Which one of the following is equal to the capacitance per unit length of a two-wire transmission line?
(a) $\log_e \dfrac{\pi\epsilon}{\left\{\left(\frac{h}{r}\right)+\left(\sqrt{\frac{h^2}{r^2}-1}\right)\right\}}$ (b) $\log_e \dfrac{2\pi\epsilon}{\left\{\left(\frac{h}{r}\right)+\left(\sqrt{\frac{h^2}{r^2}-1}\right)\right\}}$
(c) $\log_e \dfrac{3\pi\epsilon}{\left\{\left(\frac{h}{r}\right)+\left(\sqrt{\frac{h^2}{r^2}-1}\right)\right\}}$ (d) $\log_e \dfrac{4\pi\epsilon}{\left\{\left(\frac{h}{r}\right)+\left(\sqrt{\frac{h^2}{r^2}-1}\right)\right\}}$
[U.P.S.C. I.E.S. E.E.-I, 2007]

163. For equilateral spacing of conductors of an untransposed 3-phase line, we have
(a) balanced receiving-end voltage and no communication interference.
(b) unbalanced receiving-end voltage and no communication interference.
(c) balanced receiving-end voltage and communication interference.
(d) unbalanced receiving-end voltage and communication interference.
[GATE E.E. 1996]

164. Transmission lines are transposed to
(a) reduce corona loss. (b) reduce skin effect.
(c) prevent interference with neighbouring telephone lines.
(d) prevent short-circuit between any two lines.
[U.P.S.C. I.E.S. E.E.-II, 1996]

165. Transposition of transmission line is done to
(a) reduce line loss. (b) reduce skin effect.
(c) balance line voltage drop.
(d) reduce corona. [W.B. Univ. of Technology Power System-I, 2009-10]

166. High voltage transmission lines are transposed because then
(a) corona losses can be minimized.
(b) computation of inductance becomes easier.
(c) voltage drop in the lines can be minimized.
(d) phase voltage imbalances can be minimized.
[A.M.I.E. Sec B. Winter 1994]

167. The concept of an electrically short, medium and long line is primarily based on the
(a) nominal voltage of the line. (b) physical length of the line.
(c) wavelength of the line.
(d) power transmitted over the line. [GATE E.E. 2006]

168. Equivalent π model is quite suitable for analyzing the performance of transmission line of
(a) 50 km length. (b) 150 km length.
(c) 250 km length. (d) All of the above lengths.
[U.P.S.C. I.E.S. E.E.-II, 2005]

169. Which of the following is neglected while analysing a short transmission line ?
(a) Shunt admittances. (b) Power losses.
(c) Series impedance. (d) None of the above.

170. In modelling the equivalent circuit of a short length overhead transmission line, the line resistance and inductance are only considered because line capacitance to ground is
(a) equal to zero. (b) finite but very small.
(c) finite but very large. (d) infinite.
[U.P.S.C. I.E.S. E.E.-II, 2010]

171. For some given transmission line expression for voltage regulation is given $\dfrac{|V_S|-|V_R|}{|V_R|}\times 100\%$. Hence,
(a) this must be a 'short line'.
(b) this may either be a 'medium line' or 'short line'.
(c) this expression is true for any line.
(d) this may either be a 'medium line' or 'long line'.
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **153.** (d), **154.** (b), **155.** (c), **156.** (b), **157.** (c), **158.** (d), **159.** (c), **160.** (b), **161.** (b), **162.** (a), **163.** (a), **164.** (c), **165.** (c), **166.** (d), **167.** (b), **168.** (c), **169.** (a), **170.** (b), **171.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

172. As compared to sending-end voltage, the receiving-end voltage of a short line under no-load condition is
(a) higher. (b) lower (c) remains the same.
[U.P.S.C. I.E.S. E.E.-II, 2000]

173. If a short transmission line is delivering to lagging pf load, the sending-end pf would be (notations having their usual meaning)
(a) $\frac{V_R \cos\phi + IR \sin\phi}{V_S}$ (b) $\frac{V_R \cos\phi + IR}{V_S}$
(c) $\frac{V_R \sin\phi + IR}{V_S}$ (d) $\frac{V_R \sin\phi + IR\cos\phi}{V_S}$
[U.P.S.C. I.E.S. E.E.-II, 2000]

174. Which of the following voltage regulation is considered to be the best ?
(a) 2% (b) 30% (c) 70% (d) 98%
[A.M.I.E. Sec B. Power Systems Winter 1999]

175. The regulation of a line at full load 0.8 pf lagging is 12%. The regulation at full-load 0.8 pf leading can be
(a) 24% (b) 18% (c) 12% (d) 4%
[A.M.I.E. Sec B. Power Systems Summer 1996]

176. If in a short transmission line, resistance and inductive reactance are found to be equal and regulation appears to be zero, then the load will
(a) have unity power factor. (b) have zero power factor.
(c) be 0.707 leading. (d) be 0.707 lagging.
[U.P.S.C. I.E.S. E.E.-II, 1997]

177. A short transmission line, having its line impedance angle as θ, is delivering a given power at the receiving end at a lagging power factor angle of ϕ. Which one of the following is a set of conditions for which this line will have maximum and zero regulation ?

	Maximum Regulation	Zero Regulation
(a)	$\phi = \theta$	$\phi - \theta = \frac{\pi}{2}$
(b)	$\phi - \theta = \frac{\pi}{2}$	$\phi = \theta$
(c)	$\phi = \theta$	$\phi + \theta = \frac{\pi}{2}$
(d)	$\phi + \theta = \frac{\pi}{2}$	$\phi = \theta$

[U.P.S.C. I.E.S. E.E.-II, 1996]

178. In a short transmission line, voltage regulation is zero what the power factor angle of the load at the receiving end side is equal to
(a) $\tan^{-1}\left(\frac{X}{R}\right)$ (b) $\tan^{-1}\left(\frac{R}{X}\right)$
(c) $\tan^{-1}\left(\frac{X}{Z}\right)$ (d) $\tan^{-1}\left(\frac{R}{Z}\right)$
[U.P.S.C. I.E.S. E.E.-II, 2001]

179. If *X* is the inductive reactance/phase and R is the resistance/phase of a short transmission line, what is the power factor angle of the load for maximum voltage regulation?
(a) $\cos^{-1}$ X/R (b) $\tan^{-1}$ X/R
(c) $\cos^{-1}$ R/X (d) $\tan^{-1}$ R/X
[U.P.S.C. I.E.S. E.E.-II, 2006]

180. For a short line if the receiving-end voltage is equal to sending-end voltage under loaded conditions
(a) the sending-end power factor is unity.
(b) the receiving-end power factor is unity.
(c) the sending-end power factor is leading.
(d) the receiving-end power factor is leading.
[A.M.I.E. Sec B. Summer 1994]

181. A single phase transmission line of impedance *j* 0.8 ohm supplies a resistive load of 500 A at 300 V. The sending-end power factor is
(a) unity. (b) 0.8 lagging.
(c) 0.8 leading (d) 0.6 lagging.
[U.P.S.C. I.E.S. E.E.-II, 1996]

182. For an ac transmission line of length not exceeding 80 km, it is usual to lump the line capacitance at
(a) the sending end. (b) the receiving end.
(c) the midpoint. (d) any convenient point.

183. The active and the reactive power delivered at the receiving end of a short transmission line of impedance $Z \angle \Psi$ are respectively given by

$$P_R = \frac{V_S V_R}{Z}\cos(\Psi - \delta) - \frac{V_R^2}{Z}\cos\Psi, \text{ and}$$

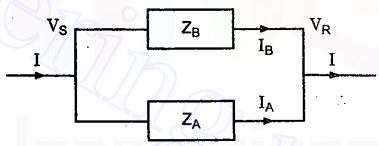
$$Q_R = \frac{V_S V_R}{Z}\sin(\Psi - \delta) - \frac{V_R^2}{Z}\sin\Psi, \text{ with}$$

V_S and V_R being the magnitude of voltages at the sending and receiving ends, δ the power-angle. At the power-limit condition i.e. for maximum P_R
(a) leading VARs (Q_R) goes to the load for any value of V_S and V_R.
(b) leading VARs (Q_R) goes to the load ONLY for $V_S = V_R$.
(c) lagging VARs (Q_R) goes to the load for any value of V_S and V_R.
(d) lagging VARs (Q_R) goes to the load ONLY for $V_S = V_R$.
[U.P.S.C. I.E.S. E.-II, 2001]

184. If L,C and Y are the inductance, capacitance and shunt admittance of a line per unit length, then for length *l*.
(a) the shunt admittance is Y.*l*. (b) the inductance is L/*l*.
(c) the capacitance is C/*l*. (d) the shunt admittance is Y/*l*.
[A.M.I.E. Sec B. Summer 1994]

185. Transmission efficiency of a transmission line increases with the
(a) decrease in power factor and voltage.
(b) increase in power factor and voltage.
(c) increase in power factor but decrease in voltage.
(d) increase in voltage but decrease in power factor.

186. Consider two parallel short transmission lines of impedances Z_A and Z_B respectively. Currents I_A and I_B are both lagging and the sending-end voltage is V_S. If the reactance to resistance ratio of both the impedances Z_A and Z_B are equal, then the total current I will



(a) lag both I_A and I_B. (b) lead both I_A and I_B.
(c) lag one of I_A and I_B but lead the other.
(d) be in phase with both I_A and I_B. [U.P.S.C. I.E.S. E.E.-II, 1997]

187. Under no-load conditions, the current in a transmission line is because of
(a) capacitance effect. (b) corona effect.
(c) proximity effect. (d) back flow from earth.

188. Which of the following statements are correct ?
(a) Flow of unduly heavy current is Ferranti effect.
(b) Ferranti effect occurs under unloaded condition of line.
(c) The rise in receiving-end voltage is Ferranti effect.
(d) Both (b) and (c) combined is Ferranti effect.

Answers: **172.** (c), **173.** (b), **174.** (a), **175.** (d), **176.** (c), **177.** (c), **178.** (b), **179.** (b), **180.** (d), **181.** (d), **182.** (b), **183.** (a), **184.** (a), **185.** (b), **186.** (d), **187.** (a), **188.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

189. In a long transmission line under no-load condition
(a) the receiving-end voltage is less than the sending-end voltage.
(b) the sending-end voltage is less than the receiving-end voltage.
(c) the sending-end voltage is equal to the receiving-end voltage.
(d) none of these. [A.M.I.E. Sec B. Winter 1993]

190. When is the Ferranti effect on long overhead lines experienced?
(a) The line is lightly loaded. (b) The line is heavily loaded.
(c) The line is fully loaded. (d) The power factor is unity.
[U.P.S.C. I.E.S. E.E.-II, 2008]

191. Ferranti effect happens in transmission line when the line is
(a) short and loaded. (b) long and loaded.
(c) long and unloaded. (d) none of these.
[W.B. Univ. of Technology Power Systems-II, 2009-10]

192. The ABCD constants of a 3 phase transposed transmission line with linear and passive elements
(a) are always equal. (b) never equal.
(c) A and D are equal. (d) B and C are equal.
[A.M.I.E. Sec B. Winter 1993]

193. The values of A, B, C and D constants for a short transmission line are respectively
(a) Z, 0, 1 and 1. (b) 0, 1, 1 and Z.
(c) 1, Z, 0 and 1. (d) 1, 1, Z and 0.
[U.P.S.C. I.E.S. E.E.-II, 2000]

194. The angle of A, constant of the transmission line normally lies between
(a) 90°-70° (b) 70°-40° (c) 40°-10° (d) 10°-0°
[A.M.I.E. Sec B. Power Systems Summer 1993]

195. For a transmission line with resistance R, reactance X and negligible capacitance, the generalised constant A is
(a) 0 (b) 1 (c) $R + jX$ (d) $R + X$
[U.P.S.C. I.E.S. E.E.-II, 1996]

196. The value of the 'A' parameter of a transmission line
(a) increases with the increase in length of the line.
(b) decreases with the increase in line length.
(c) is independent of line length.
[A.M.I.E. Sec B. Power Systems Winter 1996]

197. For a medium length transmission line, A is
(a) equal to B. (b) equal to C. (c) equal to D.
(d) not equal to any of the above. [A.M.I.E. Sec B. Summer 1994]

198. The generalised constant A for a medium line has magnitude
(a) close to but less than 1. (b) close to but greater than 1.
(c) nearly equal to the series impedance of the line.
[A.M.I.E. Sec B. Power Systems Summer 1999]

199. For transmission line which one of the following relations is true?
(a) $AD - BC = 1$ (b) $-AD - BC = 1$
(c) $AD - BC = -1$ (d) $AD - BC = 0$
[U.P.S.C. I.E.S. E.E.-II, 2002]

200. Which one of the following equations is correct?
(a) $-AB + CD = -1$ (b) $AD + CD = 1$
(c) $AB - CD = -1$ (d) $-AD + BC = -1$
where A, B, C and D are generalized circuit constants.
[U.P.S.C. I.E.S. E.E.-II, 2004]

201. A 10 km long lossless transmission line has a reactance of 0.3 Ω/km and negligible shunt capacitance. The value of $\begin{bmatrix} A & B \\ C & D \end{bmatrix}$ is
(a) $\begin{bmatrix} 1 & 0 \\ j3 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 \\ 0.3 & 1 \end{bmatrix}$
(c) $\begin{bmatrix} 1 & j3 \\ 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} j3 & 0 \\ 1 & 1 \end{bmatrix}$
[U.P.S.C. I.E.S. E.E.-II, 2010]

202. The ABCD constants of a 3-phase transmission line are
$A = D = 0.8 \angle 1°$ $B = 170 \angle 85°$ Ω $C = 0.002 \angle 90.4°$ mho
The sending-end voltage is 400 kV. The receiving-end voltage under no-load condition is
(a) 400 kV (b) 500 kV (c) 320 kV (d) 417 kV
[U.P.S.C. I.E.S. E.E.-II, 2001]

203. The A, B, C, D constants of a 220 kV line are:
$A = D = 0.94 \angle 10°$, $B = 130 \angle 73°$, $C = 0.001 \angle 90°$. If the sending-end voltage of the line for a given load delivered at a nominal voltage is 240 kV, the % voltage regulation of the line is
(a) 5 (b) 9 (c) 16 (d) 21
[U.P.S.C. I.E.S. E.E.-II, 2006]

204. The ABCD parameters of a 3-phase overhead transmission line are $A = D = 0.9 \angle 0°$. $B = 200 \angle 90°$ Ω and $C = 0.95 \times 10^{-3} \angle 90°$ S. At no-load condition a shunt inductive reactor is connected at the receiving end of the line to limit the receiving-end voltage to be equal to the sending-end voltage. The ohmic value of the reactor is
(a) ∞ Ω (b) 2000 Ω (c) 105.26 Ω (d) 1052.6 Ω
[GATE E.E. 2003]

205. The generalized circuit constants of a 3-phase, 220 kV rated voltage medium length transmission line are
$A = D = 0.936 + j\,0.016 = 0.936 \angle 0.98°$
$B = 33.5 + j\,138 = 142.0 \angle 76.4°$ Ω
$C = (-5.18 + j\,914) \times 10^{-6}$ ℧
If the load at the receiving end is 50 MW at 220 kV with a power factor of 0.9 lagging, then magnitude of line to line sending-end voltage should be
(a) 133.23 kV (b) 220.00 kV
(c) 230.78 kV (d) 246.30 kV [GATE E.E. 2004]

206. A 220 kV, 20 km long 3-phase transmission line has the following A, B, C, D constants.
$A = D = 0.96 \angle 3°$, $B = 55 \angle 65°$ Ω/phase,
$C = 0.0005 \angle 80°$ S/phase. Its charging current per phase is
(a) $\frac{11}{\sqrt{3}}$ A (b) 11 A (c) 220 A (d) $\frac{220}{\sqrt{3}}$ A
[GATE E.E. 1999]

207. The velocity of propagation of electromagnetic waves on overhead lines is
(a) 3×10^8 m/s (b) 3×10^8 km/s
(c) 3×10^{10} m/s (d) 3×10^8 km/hour
[A.M.I.E. Sec B. Power Systems Summer 1996]

208. A cable has the following characteristics :
L = 0.20/μH/m and C = 196.2 pF/m.
The velocity of wave propagation through the cable is
(a) 32 m/s (b) 159.24 m/μs
(c) 0.0312 m/s (d) 159.24 m/s

209. The characteristic impedance of a transmission line with series impedance Z ohms per unit length and shunt admittance Y mhos per unit length, is given by
(a) $(Z + Y)^2$ (b) $\sqrt{(Z.Y)}$ (c) $\sqrt{\left(\frac{Z}{Y}\right)}$ (d) $\sqrt{\left(\frac{Z}{Y}\right)^2}$
[U.P.S.C. I.E.S. E.E.-II, 1999]

Answers: **189.** (b), **190.** (a), **191.** (c), **192.** (c), **193.** (c), **194.** (d), **195.** (b), **196.** (a), **197.** (c), **198.** (a), **199.** (a), **200.** (d), **201.** (c), **202.** (b), **203.** (c), **204.** (b), **205.** (c), **206.** (a), **207.** (a), **208.** (b), **209.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

210. If the open-and short-circuit input impedance of a lossless line are respectively Z_1 and Z_2, its characteristic impedance will be

(a) $Z_1 + Z_2$ (b) $\sqrt{Z_1^2 + Z_2^2}$ (c) $\frac{Z_1^2 + Z_2^2}{Z_1 + Z_2}$ (d) $\sqrt{Z_1 Z_2}$

[U.P.S.C. I.E.S. E.E.-I. 2006]

211. A transmission line section shows an input impedance of 36 Ω and 64 Ω respectively, when short-circuited and open-circuited. What is the characteristic impedance of the transmission line?

(a) 100 Ω (b) 50 Ω
(c) 45 Ω (d) 48 Ω [U.P.S.C. I.E.S. E.E.-I, 2009]

212. The open-circuit and short-circuit impedances of a line are 100 Ω each. What is the characteristic impedance of the line?

(a) $100\sqrt{2}\ \Omega$ (b) 100 Ω (c) $\frac{100}{\sqrt{2}\ \Omega}$ (d) 50 Ω

[U.P.S.C. I.E.S. E.E.-I, 2005]

213. A lossless transmission line of characteristic impedance 300 Ω and length λ/2 is shorted at one end and is terminated in its characteristic impedance at the other. The input impedance measured at the mid section of the line is

(a) 0 Ω (b) 100 Ω
(c) 300 Ω (d) 150 Ω [U.P.S.C. I.E.S. E.E.-I. 2011]

214. A cable has inductance of 0.22 mH per km and capacitance of 0.202 μF per km. The surge impedance of the cable is

(a) 28 Ω (b) 33 Ω (c) 42 Ω (d) 50 Ω

[U.P.S.C. I.E.S. E.E.-II, 2002]

215. A 50 Ω distortionless transmission line has a capacitance of 10^{-10} F/m. What its inductance per metre?

(a) 0.25 μH (b) 500 μH (c) 5000 pH (d) 50 μH

[U.P.S.C. I.E.S. E.E.-I, 2005]

216. Consider the following statements:
The characteristic impedance of a transmission line can increase with the increase in
1. resistance per unit length.
2. conductance per unit length.
3. capacitance per unit length.
4. inductance per unit length.

Which of the statements are correct?

(a) 1 and 2 (b) 2 and 3 (c) 1 and 4 (d) 3 and 4

[U.P.S.C. I.E.S. E.E.-I, 2001]

217. Which of the following statements is correct ?

(a) Surge impedance is the impedance at the time of breakdown of voltage.
(b) Surge impedance and characteristic impedance for a transmission line are the same.
(c) Surge impedance is the impedance of transmission line when corona takes place.
(d) None of the above.

218. The characteristic impedance of a transmission line depends upon

(a) shape of the conductor.
(b) conductivity of the conductor material.
(c) geometrical configuration of the conductors.
(d) none of the above.

219. For a lossy transmission line, the characteristic impedance does *not* depend on

(a) the operating frequency of the line.
(b) the conductivity of the conductors.
(c) conductivity of the dielectric separating the conductors.
(d) length of the line. [U.P.S.C. I.E.S. E.E.-I, 2011]

220. In case the characteristic impedance of a transmission line is equal to the load impedance

(a) the system will resonate badly.
(b) all the energy sent will be absorbed by the load.
(c) all the energy sent will pass to the earth.
(d) all the energy will be lost in transmission line as transmission losses.

221. In a transmission line having negligible resistance, the surge impedance is

(a) $\sqrt{L+C}$ (b) $\sqrt{C/L}$
(c) $\sqrt{\frac{1}{LC}}$ (d) $\sqrt{L/C}$

[W.B. Univ. of Technology Power System-I, 2009-10]

222. Characteristics of an overhead line is usually in the range of

(a) 100 ohms–200 ohms. (b) 200 ohms–300 ohms.
(c) 400 ohms–500 ohms. (d) 0 ohm–100 ohms.

[W.B. Univ. of Technology Power System-I, 2009-10]

223. Surge impedance of a transformer is in the range of

(a) 80-100 Ω. (b) 400-500 Ω.
(c) 1,000-2,000 Ω. [A.M.I.E. Sec B. Summer 1997]

224. The surge impedance of a 400 kV, 100 km transmission line is 300 ohms. For a 200 km length the line surge impedance will be

(a) 300 ohms. (b) 150 ohms.
(c) 600 ohms. (d) 400 ohms.

[U.P.S.C. I.E.S. E.E.-II, 2005]

225. The characteristic impedance of a 250 km long overhead line is 400 Ω. For a line of 200 km length of the same line, the characteristics impedance will be

(a) 50 Ω (b) 400 Ω
(c) 200 Ω (d) 800 Ω

[W.B. Univ. of Technology Power Systems-III, 2009-10]

226. Surge impedance values for cables are

(a) higher than those of overhead lines.
(b) lower than those of overhead lines.
(c) of the same order as those of overhead lines.

[A.M.I.E. Sec B. Winter 1996]

227. Multiple conductor lines have

(a) lower surge impedance than single conductor lines.
(b) higher surge impedance than single line conductors.
(c) higher surge impedance than single conductor lines for short lengths and lower surge impedance for long lines.

[A.M.I.E. Sec B. Winter 1996]

228. A transmission line is distortionless if

(a) RG = LC (b) RC = GL
(c) $\frac{R}{C} = \frac{G}{L}$ (d) R = G

[U.P.S.C. I.E.S. E.E.-I, 2011]

229. The propagation constant of a transmission line is given as

(a) $j\omega\sqrt{LC}$ (b) $j\sqrt{LC}$
(c) $j\sqrt{L/C}$ (d) $j\sqrt{C/L}$

230. The transmission capacity of a line at 50 Hz frequency as compared to that at 60 Hz frequency is

(a) lower. (b) higher.
(c) the same. [A.M.I.E. Sec B. Power Systems Summer 1998]

231. As the line inductance increases the transmission capacity

(a) increases. (b) decreases.
(c) remains the same. [U.P.S.C. I.E.S. E.E. 2000]

Answers: **210.** (d), **211.** (d), **212.** (b), **213.** (c), **214.** (b), **215.** (a), **216.** (c), **217.** (b), **218.** (c), **219.** (d), **220.** (b), **221.** (d), **222.** (c), **223.** (c), **224.** (a), **225.** (b), **226.** (b), **227.** (a), **228.** (b), **229.** (a), **230.** (b), **231.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

232. What is the characteristic impedance Z_0 of a line having resistance R, inductance L, capacitance C and conductance G?

(a) $\sqrt{\frac{R + j\omega L}{G + j\omega C}}$ (b) $\sqrt{\frac{G + j\omega C}{R + j\omega L}}$

(c) $R + j\omega L - \frac{G}{\omega C}$ (d) $\sqrt{R^2 + \left(\omega L - \frac{1}{\omega C}\right)^2}$

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

233. A transmission line has R, L, G, C distributed parameters per unit length of line. If γ is the propagation constant of the line, which one of the following expressions represents the characteristic impedance of the line?

(a) $\frac{\gamma}{R + j\omega L}$ (b) $\frac{R + j\omega L}{\gamma}$

(c) $\frac{G + j\omega C}{\gamma}$ (d) $\sqrt{\frac{G + j\omega C}{R + j\omega L}}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

234. When the load on a transmission line is equal to the surge impedance loading

(a) the receiving-end voltage is less than the sending-end voltage.
(b) the sending-end voltage is less than the receiving-end voltage.
(c) the receiving-end voltage is equal to the sending-end voltage.
(d) none of these. [A.M.I.E. Sec B. Winter 1993]

235. The recieving-end voltage of a transmission line will be greater than the sending-end voltage if the load is

(a) greater than SIL (surge impedance loading).
(b) less than SIL. (c) equal to SIL.

[A.M.I.E. Sec B. Winter 1996]

236. The SIL of a single circuit 220 kV line is around

(a) 120 MW (b) 90 MW (c) 220 MW (d) 400 MW

[A.M.I.E. Sec B. Summer 1998]

237. What is the surge impedance loading of a lossless 400 kV, 3-phase, 50 Hz overhead line of average of surge impedance of 400 ohms?

(a) 400 MW (b) $400\sqrt{3}$ MW (c) $\frac{400}{\sqrt{3}}$ MW (d) 400 kW

[U.P.S.C. I.E.S. E.E.-II, 2008]

238. Consider the following statements:
Surge impedance loading of a transmission line can be increased by

1. increasing its voltage level.
2. addition of lumped inductance in parallel.
3. addition of lumped capacitance in series.
4. reducing the length of the line.

Of these statements

(a) 1 and 3 are correct. (b) 1 and 4 are correct.
(c) 2 and 4 are correct. (d) 3 and 4 are correct.

[U.P.S.C. I.E.S. E.E.-II, 2001]

239. The L/C ratio for 132 kV and 400 kV lines are typically 160×10^3 and 62.5×10^3 respectively. The natural 3-phase loading for the two lines will be respectively

(a) 108.9 and 2,560 MW (b) 44 and 2,560 MW
(c) 44 and 640 MW (d) 640 and 44 MW

[U.P.S.C. I.E.S. E.E.-II, 1996]

240. Which one of the following is the correct expression for the propagation constant in a transmission line?

(a) $(R - j\omega L)(G - j\omega C)$ (b) $\sqrt{\frac{(R - j\omega L)}{(G - j\omega C)}}$

(c) $\sqrt[3]{\frac{(R + j\omega L)}{(G + j\omega C)}}$ (d) $\sqrt{(R + j\omega L)(G + j\omega C)}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

241. A lossless radial transmission line with surge impedance loading

(a) takes negative VAR at sending end and zero VAR at receiving end.
(b) takes positive VAR at sending end and zero VAR at receiving end.
(c) has flat voltage profile and unity power factor at all points along it.
(d) has sending-end voltage higher than receiving-end voltage and unity power factor at sending end.

[U.P.S.C. I.E.S. E.E.-I, 2001]

242. What does the standing wave ratio (SWR) of unity imply ?

(a) Transmission line is open-circuited.
(b) Transmission line is short-circuited.
(c) Transmission line's characteristic impedance is equal to load impedance.
(d) Transmission line's characteristic impedance is not equal to load impedance. [U.P.S.C. I.E.S. E.E.-I, 2007]

243. Consider the following statements:

1. Equivalent-T circuit of a long line is preferred to equivalent-π circuit.
2. The nature of reactive power compensation is different for peak load and off-peak load conditions.
3. Ferranti effect is significant only on medium and long lines.

Which of the statements given above are correct?

(a) 1 and 2 only (b) 1 and 3 only
(c) 2 and 3 only (d) 1, 2 and 3

[U.P.S.C. I.E.S. E.E.-II, 2008]

244. The propagation constant of a transmission line is $0.15 \times 10^{-3} + j\ 1.5 \times 10^{-3}$.

The wavelength of the travelling wave is

(a) $\frac{1.5 \times 10^{-3}}{2\pi}$ (b) $\frac{2\pi}{1.5 \times 10^{-3}}$

(c) $\frac{1.5 \times 10^{-3}}{\pi}$ (d) $\frac{\pi}{1.5 \times 10^{-3}}$

[U.P.S.C. I.E.S. E.E.-II, 1997]

245. For a good voltage profile under no-load condition, a long line needs

(a) shunt capacitors at receiving end.
(b) shunt reactors at the receiving end.
(c) shunt resistance at receiving end. [A.M.I.E. Sec B. Summer 1996]

246. No-load compensation of a high voltage line involves

(a) shunt capacitors. (b) shunt reactors.
(c) series capacitors. [A.M.I.E. Sec B. Summer 1997]

247. Full-load compensation in a line requires

(a) shunt capacitors. (b) series capacitors.
(c) transformers. (d) shunt reactors.

[A.M.I.E. Sec B. Summer 1997]

248. Use of additional shunt capacitor can be made for increasing the capability of line as it

(a) reduces surge impedance Z_0.
(b) increases phase shift β.
(c) increase in α. (d) all of the above.

249. To increase the transmission capability of a high voltage long line

(a) the resistance can be increased.
(b) the resistance can be decreased.

Answers: **232.** (a), **233.** (b), **234.** (c), **235.** (b), **236.** (a), **237.** (a), **238.** (a), **239.** (c), **240.** (d), **241.** (c), **242.** (c), **243.** (c), **244.** (b), **245.** (b), **246.** (b), **247.** (a), **248.** (a), **249.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the series reactance can be reduced.
(d) the shunt admittance can be reduced.
[A.M.I.E. Sec B. Summer 1994]

250. Power despatch through a line can be increased by
(a) installing series capacitors. (b) installing shunt capacitors.
(c) installing series reactor. (d) installing shunt reactor.
[A.M.I.E. Sec B. Summer 1993]

251. The power transmitted will be maximum when
(a) line reactance is high. (b) corona losses are minimum.
(c) sending-end voltage is more.
(d) receiving-end voltage is more.

252. For constant voltage transmission, the voltage drop along the line is maintained constant by installing
(a) capacitors. (b) inductors.
(c) resistors.
(d) synchronous phase modifiers at the receiving end.

253. Constant voltage transmission have the drawback(s) of
(a) increase of short-circuit current of the system.
(b) lower reserve of lines in case of line trouble.
(c) increased risk of interruption of supply due to falling of synchronous motors out of synchronism.
(d) all of the above.

254. Constant voltage transmission have the advantage(s) of
(a) availability of steady voltage at all loads at the receiving end.
(b) possibility of better protection for the line due to possible use of higher terminal reactances.
(c) possibility of carrying increased power for a given conductor size in case of long distance heavy power transmission.
(d) all of the above.

255. Constant voltage transmission have the advantage(s) of
(a) increase of short-circuit current of the system.
(b) large reserve of lines in case of line trouble.
(c) improvement of power factor at the times of moderate and heavy loads.
(d) all of the above.

256. A synchronous condensor is a
(a) synchronous generator. (b) paper condensor.
(c) synchronous motor. (d) none of these.
[W.B. Univ. of Technology Power System-III, 2009-10]

257. A synchronous compensator absorbs inductive reactive power. It is
(a) overexcited. (b) normally excited.
(c) underexcited. (d) none of these.
[W.B. Univ. of Technology Power Systems-I, 2009-10]

258. A synchronous phase modifier supplies
(a) both active and reactive powers.
(b) both lagging and leading reactive power.
(c) inductive reactive power only. [A.M.I.E. Sec B. Summer 1999]

259. A synchronous phase modifier as compared to synchronous motor of the same rating has
(a) larger shaft diameter and higher speed.
(b) smaller shaft diameter and higher speed.
(c) larger shaft diameter and smaller speed.
(d) smaller shaft diameter and smaller speed.
[A.M.I.E Sec B. Winter 1993]

260. Phase modifier is normally installed in case of
(a) short transmission lines. (b) medium length lines.
(c) long lines. (d) for any length of lines.
[A.M.I.E Sec B. Winter 1994; Summer 1995]

261. Which of the following statements is not true ?
(a) Synchronous phase modifiers are installed at sending end.
(b) Synchronous phase modifiers are installed at load end.
(c) Synchronous phase modifiers are nothing but synchronous motors (specially designed).
(d) Synchronous phase modifiers do not carry load.

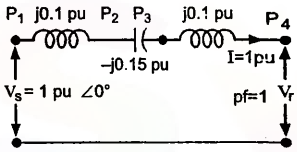
262. Capacitors are used in power system to
(a) improve supply power factor.
(b) improve voltage regulation.
(c) change the load characteristics. (d) all of the above.

263. Series capacitors on transmission lines are of little use when
(a) the load VAR requirement is small.
(b) the load VAR requirement is large.
(c) the load VAR requirement is fluctuating.
(d) series capacitors are never used in transmission lines.
[A.M.I.E. Sec B. Winter 1998]

264. The reactive power transfer over a line mainly depends on
(a) power angle δ. (b) $|V_S| - |V_R|$
(c) V_S. (d) V_R. [A.M.I.E. Sec B. Summer 1998]

265. For a fixed value of complex power flow in a transmission line having a sending end voltage V, the real power loss will be proportional to
(a) V (b) V^2 (c) $\frac{1}{V^2}$ (d) $\frac{1}{V}$
[GATE E.E. 2009]

266. Consider the model shown in figure of a transmission line with a series capacitor at its mid-point. The maximum voltage on the line is at the location

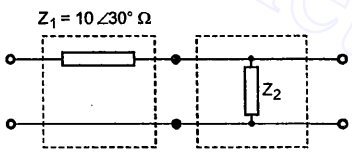


(a) P_1 (b) P_2 (c) P_3 (d) P_4 [GATE E.E. 2001]

267. A transmission line has equal voltages at the two ends, maintained constant by two sources. A third source is to be provided to maintain constant voltage (equal to end voltages) at either the midpoint of the line or at 755 of the distance from the sending end. Then the maximum power transfer capabilities of the line in the original case and the other two cases respectively will be in the following ratios.
(a) 1 : 1 : 1. (b) 1 : 2 : 1/0.75.
(c) 1 : 2 : 4. (d) 1 : 4 : 16. [GATE E.E. 2000]

268. For a fixed receiving-end and sending-end voltages in a transmission system, what is the locus of the constant power?
(a) A straight line. (b) An ellipse.
(c) A parabola. (d) A circle.
[U.P.S.C. I.E.S. E.E.-II, 2004]

269. Two networks are connected in cascade as shown in the figure. With the usual notations the equivalent A, B, C and D constants are obtained.



Given that, C = 0.025 ∠45°, the value of Z_2 is
(a) 10 ∠30° Ω (b) 40 ∠–45° Ω
(c) 1 Ω (d) 0 Ω [GATE E.E.-II, 2005]

270. Transmission of power by ac cables is impossible beyond
(a) 35-45 km (b) 500 km
(c) 300 km [A.M.I.E. Sec B. Power Systems Winter 1998]

Answers: **250.** (a), **251.** (d), **252.** (d), **253.** (d), **254.** (d), **255.** (c), **256.** (c), **257.** (c), **258.** (b), **259.** (b), **260.** (c), **261.** (a), **262.** (b), **263.** (a), **264.** (b), **265.** (c), **266.** (c), **267.** (a), **268.** (d), **269.** (b), **270.** (a),

Downloaded From : www.EasyEngineering.net

271. Conduit pipe is generally employed for protection of
(a) unsheathed cables. (b) armoured cables.
(c) PVC sheathed cables. (d) all of above.

272. Sheaths are used in cables to
(a) provide proper insulation. (b) provide mechanical strength.
(c) prevent ingress of moisture. (d) none of the above.
[A.M.I.E Sec B. Winter 1993; Summer 1995]

273. The bedding on a cable consists of
(a) jute strands. (d) hessian tape.
(c) paper tape compounded with a fiberous material.
(d) any of the above.

274. The material(s) used for armouring of an underground cable is/are
(a) galvanised steel wire. (b) steel tape.
(c) aluminium. (d) either (a) or (b).

275. Metallic shielding is provided on underground cables to
(a) reduce thermal resistance.
(b) reduce corona effect.
(c) control the electrostatic voltage stress.
(d) all of the above.

276. Metallic shielding provided on cables is usually of thickness.
(a) 0.1–0.8 mm. (b) 3–5 mm.
(c) 10–15 mm. (c) 15–25 mm.

277. The effect of bonding the cable is
(a) to increase the effective resistance and inductance.
(b) to increase the effective resistance but reduce inductance.
(c) to reduce the effective resistance and inductance.
(d) to reduce the effective resistance but increase the inductance.
[A.M.I.E Sec B. Winter 1994]

278. The thickness of insulation layer provided on the conductor, in cables, depends upon
(a) operating voltage. (b) current to be carried.
(c) power factor. (d) both (a) and (b).

279. The insulating material used for cables should have all of the following except
(a) high dielectric strength, high mechanical strength, high tensile strength and plasticity, high resistivity and high viscosity at impregnation temperature.
(b) low thermal coefficient, low permittivity, acid proof, non-inflammable and non-hygroscopic.
(c) high water absorption.
(d) capability of withstanding high rupturing voltages.

280. Empire tape is
(a) varnished cambric. (b) impregnated paper.
(c) vulcanised rubber. (d) enamel insulation.

281. Paper as an insulating material has the main drawback that it
(a) is hygroscopic. (b) has poor dielectric strength.
(c) has low insulation resistivity.
(d) has high capacitance.

282. In paper insulated cables, the conductor x-section is usually limited to
(a) 50 mm^2 (b) 250 mm^2 (c) 600 mm^2 (d) 1200 mm^2

283. The dielectric strength of impregnated paper is about
(a) 30 kV/mm (b) 20kV/mm
(c) 15 kV/mm (d) 5 kV/mm

284. Paper used as an insulating material is usually treated with oily compound because it
(a) is hygroscopic.
(b) gets electrostatically charged at high voltage.
(c) is porous. (d) all of the above.

285. Single-core cables are usually not provided with armouring in order to
(a) avoid excessive loss in the armour.
(b) make the cable more flexible.
(c) make the cable non-hygroscopic.
(d) none of the above.

286. Single-core cable should have armour made of
(a) magnetic material.
(b) non-magnetic and non-conducting material.
(c) non-magnetic but conducting material.
[A.M.I.E. Sec B. Summer 1993]

287. Multi-core cables generally use
(a) oval shaped conductors. (b) sector shaped conductors.
(c) square conductors. (d) either (a) or (b).

288. In a 3-phase, 4-wire cable, the x-sectional area of neutral conductor is
(a) half of the area of phase conductor.
(b) equal to the area of phase conductor.
(c) double the area of phase conductor.
(d) 1.5 times the area of phase conductor.

289. The belted type construction is not suitable for cables used for voltages exceeding 22 kV because of
(a) development of both radial and tangential stresses.
(b) formation of vacuous spaces and voids on loading and unloading owing to non-homogenity of dielectric in belted construction.
(c) local heating caused by power loss at the centre filling owing to leakage current produced by tangential stresses along the impregnated paper insulation resulting in breakdown at any time.
(d) all of the above.

290. SL type cables, over H-type cables, have the advantage(s) of
(a) possibility of bending of cables owing to no overall lead sheath.
(b) less tendency for oil drainage on hilly routes owing to elimination of filler spaces containing compound.
(c) easy manufacturing.
(d) both (a) and (b).

291. Screened type cables, over belted cables, have the advantage(s) of
(a) reduced possibility of core to core faults.
(b) uniform radial electric stresses in all sections of the dielectric.
(c) no possibility of formation of voids within the dielectric.
(d) increased current carrying capacity.
(e) all of the above.

292. Solid type cables are not considered suitable for operating voltages exceeding 66 kV because
(a) skin effect dominates on the conductor.
(b) there is a danger of breakdown of insulation because of formation of voids in the layers of dielectric.
(c) there is a corona loss between conductor and sheath material.
(d) insulation may melt due to heating.

293. In a 3-core extra high voltage cable, a metallic screen around each core insulation is provided to
(a) facilitate heat dissipation. (b) give mechanical strength.
(c) obtain radial electric stress.
(d) obtain longitudinal electric stress. [U.P.S.C. I.E.S. E.E.-II, 1997]

Answers: **271.** (a), **272.** (c), **273.** (d), **274.** (d), **275.** (d), **276.** (b), **277.** (b), **278.** (a), **279.** (c), **280.** (a), **281.** (a), **282.** (c), **283.** (a), **284.** (b), **285.** (a), **286.** (c), **287.** (d), **288.** (b), **289.** (d), **290.** (d), **291.** (e), **292.** (b), **293.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

294. As the operating voltage and consequently the electric stress on the dielectric of solid type cable is increased from a low value, the dielectric power factor cos ϕ remains almost unchanged up to a certain value of the stress beyond which cos ϕ increases very rapidly. This is due to increase in
(a) resistivity of dielectric material.
(b) ionisation in the voids present in the dielectric.
(c) core-to-core capacitance of the cable.
(d) core-to-earth capacitance of the cable. [U.P.S.C. I.E.S. E.E.-II, 1993]

295. At higher voltages, belted cables are more suitable than screened cables
(a) yes, because
(b) no, because at high voltages a breakdown may occur due to non-radial dielectric stresses. [A.M.I.E. Sec B. Winter 1996]

296. Oil-filled cables have the advantage(s) of
(a) no ionisation, oxidation and formation of voids.
(b) possibility of increased temperature range in service.
(c) more maximum permissible stresses .
(d) all of the above.

297. Oil-filled cables have the advantage(s) of
(a) smaller overall size. (b) most perfect impregnation.
(c) easy detection of fault. (d) all of the above.

298. Oil-filled cables have the drawback(s) of
(a) no possibility of impregnation after sheathing.
(b) greater cost and complicated laying of cables and maintenance.
(c) high thermal resistance.
(d) all of the above.

299. Cables used for 220 kV lines are invariably
(a) compressed oil or compressed gas insulated.
(b) paper insulated.
(c) mica insulated. (d) none of the above.

300. The insulation used in a cable designed for use on 1,000 kV is usually
(a) impregnated paper. (b) compressed SF_6 gas.
(c) PVC. (d) any of the above.

301. Sulphur hexafluoride cable is insulated by
(a) impregnated paper. (b) polyvinyl chloride.
(c) high pressure oil. (d) compressed gas. [A.M.I.E. Sec B. Winter 1993]

302. In compressed gas insulated cable SF_6 has the gas pressure in the range of
(a) 10–20 mm Hg (b) 80–100 mm Hg
(c) 3–5 kg/cm^2 (d) 40–50 kg/cm^2

303. At bridge crossings and near the railway track ternary lead cables are used because they
(a) are of high tensile strength.
(b) are of low coefficient of thermal expansion.
(c) are of low specific gravity.
(d) can withstand shocks and vibrations.

304. Internal pressure cables have the advantage(s) of
(a) elimination of external accessories.
(b) suitability for vertical run without any fear of drainage with suitable designs.
(c) marked improvement in the pf of the cable dielectric with the increased pressure.
(d) all of the above.

305. With the rise in temperature, the insulation resistivity
(a) remains unchanged. (b) decreases linearly.
(c) increases linearly. (d) reduces exponentially.

306. The insulation resistance of a single-core cable is 200 MΩ/km. The insulation resistance for 5 km length is
(a) 40 MΩ (b) 1000 MΩ (c) 200 MΩ (d) 8 MΩ [U.P.S.C. I.E.S. E.E.-II, 1999]

307. The power factor of an open-ended cable can be improved by
(a) increasing the capacitance.
(b) decreasing the capacitance.
(c) increasing the conductor resistance.
(d) increasing the insulation resistance. [A.M.I.E. Sec B. Summer 1994]

308. The capacitance of a cable increases
(a) linearly with the increase in cable length.
(b) linearly with the decrease in cable length.
(c) exponentially with the increase in cable length.
(d) none of the above.

309. The capacitance of a cable depends upon the
(a) length of the cable.
(b) relative permittivity of dielectric used in cable.
(c) ratio of sheath diameter and core diameter.
(d) all of the above.

310. The charging current drawn by the cable
(a) lags behind the voltage by 90°. (b) leads the voltage by 90°.
(c) leads the voltage by 180°. (d) none of the above.

311. In underground cables, the electrostatic stress is
(a) maximum at conductor surface and minimum at the sheath.
(b) minimum at conductor surface and maximum at the sheath.
(c) same at the conductor and sheath.
(d) zero at the conductor as well as on the sheath.

312. In a cable of conductor diameter 'd' and overall diameter with dielectric material 'D', the maximum dielectric stress.
(a) occurs at the conductor surface and is proportional to d.
(b) occurs at the conductor surface and is proportional to 1/d.
(c) occurs at the middle of the dielectric and is proportional to 1/D.
(d) occurs at the outer surface of the dielectric and is proportional to D. [A.M.I.E Sec B. Winter 1994]

313. To obtain the minimum value of stress in cables, the ratio (R/r) should be
(a) 2.13 (b) 2.718 (c) 1.96 (d) 1.5 [W.B. Univ. of Technology Power System-I, 2009-10]

314. The surge impedance of a 50 miles long underground cable is 50 Ω. For a 25 miles length it will be
(a) 25 Ω (b) 50 Ω (c) 100 Ω (d) none of these. [A.M.I.E. Sec B. Summer 1995]

315. The breakdown of insulation of a cable can be avoided economically by using
(a) insulation layers of different dielectrics.
(b) intersheath.
(c) either (a) or (b). (d) none of the above.

316. Capacitance grading of cable means
(a) use of dielectrics in different concentrations.
(b) introduction of capacitances at various lengths of cable to counter the effect of inductance.
(c) use of dielectrics of different permittivities.
(d) grading according to capacitance per km length of the cable.

317. Grading of cables
(a) reduces insulation cost and increases current rating.
(b) reduces insulation cost but decreases current rating.
(c) increases both. (d) none of the obove. [A.M.I.E. Sec B. Winter 1996]

Answers: **294.** (b), **295.** (b), **296.** (d), **297.** (d), **298.** (b), **299.** (a), **300.** (b), **301.** (d), **302.** (c), **303.** (c), **304.** (d), **305.** (d), **306.** (a), **307.** (d), **308.** (a), **309.** (d), **310.** (b), **311.** (a), **312.** (b), **313.** (b), **314.** (b), **315.** (c), **316.** (c), **317.** (a),

Downloaded From : www.EasyEngineering.net

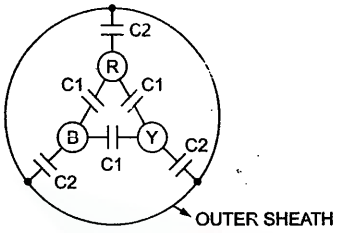
Downloaded From : www.EasyEngineering.net

318. The intersheaths in cables are used to
(a) provide proper stress distribution.
(b) minimize the stress. (c) use inferior insulation.
(d) provide protection against moisture and voltage surges.
(e) provide protection against current and voltage surges.

319. The desired overall diameter of the conductor without increasing its x-sectional area can be had by
(a) using aluminium core instead of copper.
(b) stranding the copper conductors around a hemp centre.
(c) stranding the copper conductors over a lead tube.
(d) any of the above.

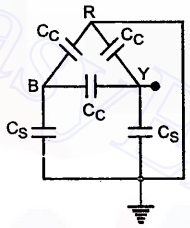
320. In a 3-core cable, the capacitance between two conductors (with sheath earthed) is 3 μF. The capacitance per phase will be
(a) 1.5 μF (b) 3 μF (c) 6 μF (d) 12 μF
[A.M.I.E. Sec B. Summer 2000]

321. Consider a three-core, three-phase, 50 Hz, 11 kV cable whose conductors are denoted as R, Y and B in the figure. The inter-phase capacitance (C1) between each pair of conductors is 0.2 μF and the capacitance between each line conductor and the sheath is 0.4 μF. The per-phase charging current is



(a) 2.0 A (b) 2.4 A (c) 2.7 A (d) 3.5 A
[GATE E.E. 2010]

322. For the circuit shown in figure, the capacitance measured between terminals *B* and *Y* will be



(a) $C_c + (C_s/2)$
(b) $C_s + (C_c/2)$
(c) $(C_s + 3C_c)/2$
(d) $3C_c + 2C_s$ [GATE E.E. 1999]

323. Underground cables are laid at sufficient depth so as to
(a) minimise temperature stresses.
(b) minimise effects of shocks and vibrations owing to passing vehicles etc.
(c) avoid being unearthed easily owing to removal of soil.
(d) both (a) and (c).

324. In case the communication cables are to be laid parallel to power cables the distance between the two should be at least so that there is no interference.
(a) 0.5 m (b) 2.0 m (c) 4.0 m (d) 0.05 m

325. While crossing the road the cable should be
(a) buried in trenches.
(b) surrounded by sawdust to absorb vibrations.
(c) laid in conduits or pipes. (d) none of the above.

326. Consider the following statements :
1. The insulation resistance of cable will increase if the length of cable is increased.
2. For the same overall diameter of cable, the grading of cable will increase the safe working voltage.
3. The normal operating temperature of PVC cable is 70°C.
4. The thermal resistance of soil increases as the moisture content of soil increases.

Of these statements
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1995]

327. The source(s) of heat generation in cables is/are
(a) copper loss in conductor.
(b) dielectric losses in cable insulation.
(c) losses in metallic sheathings and armourings.
(d) all of the above.

328. A cable carrying ac has
(a) leakage losses only. (b) hysteresis losses only.
(c) hysteresis and leakage losses only.
(d) hysteresis, leakage and friction losses.

329. Dielectric hysteresis loss in a cable varies as
(a) impressed voltage. (b) (impressed voltage)^2.
(c) (impressed voltage)$^{1/2}$. (d) (impressed voltage)$^{3/2}$.

330. A 110 kV, single-core coaxial, XLPE insulated power cable delivering power at 50 Hz, has a capacitance of 125 nF/km. If the dielectric loss tangent of XLPE is 2×10^{-4}, then dielectric power loss in this cable in W/km is
(a) 5.0 (b) 31.7 (c) 37.8 (d) 95.0
[GATE E.E. 2004]

331. The current carrying capacity of cables in dc is more than that in ac. It is mainly due to
(a) smaller hysteresis losses. (b) absence of harmonics.
(c) absence of ripples. (d) none of the above.

332. The fault(s) which are likely to occur in cables is/are
(a) breakdown of cable insulation.
(b) cross- or short-circuit fault.
(c) open-circuit fault. (d) all of the above.

333. The lead sheath of the cable may get damaged due to
(a) mechanical injury.
(b) crystallisation of lead through vibrations.
(c) chemical action with impurities present in the soil when buried in earth.
(d) any of the above.

334. The cables should not be operated too hot otherwise
(a) expansion of oil may cause sheath to burst.
(b) the oil may loose its viscosity and it may start drawing off from higher levels.
(c) unequal expansion may create voids in the insulation leading to ionization.
(d) rapid increase in dielectric losses with temperature may cause thermal instability.
(e) all of the above.

335. The breakdown voltage of a cable depends upon
(a) presence of moisture. (b) operating temperature.
(c) time of application of the voltage.
(d) all of the above.

336. Breakdown of cable insulation may occur due to
(a) thermal instability. (b) puncture.
(c) tracking. (d) any of the above.

337. Fibre-optic cables are used in power system applications mainly for
(a) SCADA.
(b) communication between power station and substation.
(c) communication between power station and load control centre.
(d) all of these. [U.P.S.C. I.E.S. E.E.-II, 2010]

Answers: **318.** (a), **319.** (d), **320.** (c), **321.** (a), **322.** (c), **323.** (b), **324.** (a), **325.** (c), **326.** (b), **327.** (d), **328.** (c), **329.** (b), **330.** (b), **331.** (a), **332.** (d), **333.** (d), **334.** (e), **335.** (d), **336.** (d), **337.** (d),

338. The main criterion for selection of the size of a distributor for a radial distribution system is
(a) voltage drop. (b) corona loss.
(c) temperature rise. (d) capital cost. **[GATE E.E. 1995]**

339. The distribution systems in India are mostly
(a) radial. (b) parallel.
(c) network. (d) either (b) or (c).
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

340. Why is a ring main distribution system preferred to a radial system?
1. Voltage drop in the feeder is less.
2. Power factor is higher.
3. Supply is more reliable.
Select the correct answer using the code given below:
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

341. As per electricity regulations in India the maximum permissible voltage change at consumer premises should be
(a) ±5% of declared voltage. (b) ±6% of declared voltage.
(c) ±10% of declared voltage.
(d) ±12% of declared voltage.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

342. The cost of material used in a distribution circuit per kVA of distributed power varies as
(a) square of linear dimensions of supply area
(b) directly according to (supply area)^2
(c) cube of linear dimensions of supply area
(d) none of the above
[A.M.I.E Sec B. Design of Electrical Systems Summer 2005]

343. An approximate formula for loss factor in a distribution system is
(a) Loss factor = 0.3 × load factor + 0.7 (load factor)^2
(b) Loss factor = 0.5 (load factor)
(c) Loss factor = load factor
(d) Loss factor = 0.7 × load factor + 0.3 (load factor)^2
[A.M.I.E Sec B. Design of Electrical System Summer 2005]

344. In a distribution system, which of the following items shares the major cost?
(a) Conductors. (b) Earthing system.
(c) Distribution transformer. (d) Insulators.

345. The distributors in residential areas are
(a) single phase, two-wire. (b) three phase, three-wire.
(c) three phase, four-wire. (d) two phase, four-wire.

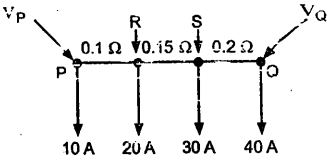
346. The loads on 3-phase, 4-wire distributors are usually
(a) balanced. (b) unbalanced.
(c) either of above. (d) none of above.

347. A uniformly loaded dc distributor is fed at both ends with equal voltages. In comparison to a similar distributor fed at one end only, the maximum voltage drop will be
(a) one-fourth. (b) one-half. (c) one-third. (d) one-sixth.

348. The null point of a uniformly loaded distributor fed at equal voltage at both ends lies at
(a) midpoint. (b) either end.
(c) two-third distance from one end.
(d) one-fourth distance from one end. **[A.M.I.E. Sec B. Summer 1993]**

349. A uniformly loaded dc distributor is fed at both ends with equal voltages. In comparison to a similar distributor fed at one end only, the drop at the mid point will be
(a) one-fourth. (b) one-half.
(c) one-third. (d) one-sixth.

350. A dc distribution system is shown in figure with load currents as marked. The two ends of the feeder are fed by voltage sources such that $V_P V_Q = 3$ V. The value of the voltage V_P for a minimum voltage of 220 V at any point along the feeder is



(a) 225.89 V (b) 222.89 V (c) 220.0 V (d) 228.58 V
[GATE E.E. 2003]

351. In a dc 3-wire distributor using balancers and having unequal loads on the two sides
(a) both balancers operate as generators.
(b) both balancers operate as motors.
(c) balancer connected to lightly loaded side operates as a generator.
(d) balancer connected to heavily loaded side operates as a generator.

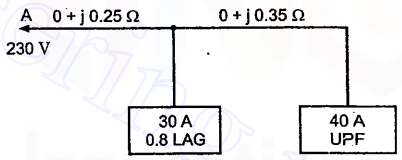
352. In a dc 3-wire distribution system, balancer fields are cross-connected in order to
(a) equalise voltages on +ve and –ve outers.
(b) boost the generated voltage.
(c) make both machines operated as unloaded motors.
(d) all of the above.

353. The booster
(a) is a series wound dc generator driven by dc shunt motor.
(b) is a low voltage and high current generator operating on straight or linear portion of its voltage-current characteristic.
(c) is a high voltage and low circuit machine.
(d) both (a) and (b).

354. The booster is inserted in the circuit to
(a) reduce current. (b) increase current.
(c) reduce voltage drop. (d) compensate for voltage drop.

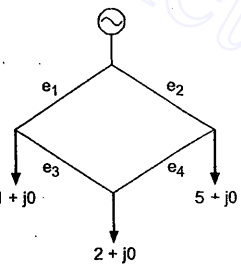
355. Floating neutral in a 3-phase supply is considered undesirable as it causes
(a) high voltage across the load.
(b) low voltage across the load.
(c) unequal line voltages across the load.
(d) none of the above.

356. A single-phase ac distributor supplies two single-phase loads as shown in the figure. The voltage drop from A to C is



(a) 4.5 V (b) 31.5 V (c) 30 V (d) 20 V
[GATE E.E. 1999]

357. Single line diagram of a 4-bus single source distribution system is shown in figure. Branches e_1, e_2, e_3 and e_4 have equal impedances. The load current values indicated in the figure are in per unit. Distribution company's policy requires radial system operation with minimum loss. This can be achieved by opening of the branch



(a) e_1 (b) e_2 (c) e_3 (d) e_4
[GATE E.E. 2008]

358. A 230 V (Phase), 50 Hz, three-phase, 4-wire, system has a sequence ABC. A unity power-factor load of 4 kW is connected

Answers: **338.** (a), **339.** (a), **340.** (c), **341.** (b), **342.** (b), **343.** (a), **344.** (c), **345.** (c), **346.** (b), **347.** (a), **348.** (a), **349.** (c), **350.** (a), **351.** (d), **352.** (a), **353.** (d), **354.** (d), **355.** (c), **356.** (c), **357.** (d), **358.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

between phase A and neutral N. It is desired to achieve zero neutral current through the use of a pure inductor and impure capacitor in the other two phases. The value of inductor and capacitor is
(a) 72.95 mH in phase C and 139.02 μF in Phase B.
(b) 72.95 mH in phase B and 139.02 μF in Phase C.
(c) 42.12 mH in phase C and 240.79 μF in Phase B.
(d) 42.12 mH in phase B and 240.79 μF in Phase C.
[GATE E.E. 2007]

359. In order to reduce the inductive interference to parallel communication circuits to the minimum.
(a) the conductors are transposed at regular intervals.
(b) bundle conductors are used.
(c) thick conductors are used.
(d) either (a) or (b).

360. When there is interference in an overhead communication line running parallel and in close proximity to an overhead power line, the voltage induced in the communication line in the longitudinal and lateral directions by the power line are due to
(a) magnetic induction and electric induction respectively.
(b) electric induction and magnetic induction respectively.
(c) both magnetic induction and electric induction.
(d) magnetic induction only. [U.P.S.C. I.E.S. E.E.-2000]

361. A single-phase transmission line and a telephone line are both symmetrically strung one below the other, in horizontal configurations, on a common tower. The shortest and logest distances between the phase and telephone conductors are 2.5 m and 3 m respectively. The voltage (volt/km) induced in the telephone circuit, due to 50 Hz current of 100 amps in the power circuit is
(a) 4.81 (b) 3.56 (c) 2.29 (d) 1.27
[GATE E.E. 2006]

362. A long wire composed of a smooth round conductor runs above and parallel to the ground (assumed to be a large conducting plane). A high voltage exists between the conductor and the ground. The maximum electric stress occurs at
(a) the upper surface of the conductor.
(b) the lower surface of the conductor.
(c) the ground surface
(d) midway between the conductor and ground. [GATE E.E. 2002]

363. Extra high voltage transmission means
(a) voltage less than 400 kV.
(b) voltage in the range of 400-750 kV.
(c) voltage greater than 750 kV. [A.M.I.E. Sec B. Summer 1997]

364. Bundled conductors are used for EHV transmission lines primarily for reducing the
(a) corona loss. (b) surge impedance of the line.
(c) voltage drop across the line.
(d) I^2R losses. [U.P.S.C. I.E.S. E.E.-II, 2001]

365. For an extra high voltage overhead transmission line, four conductors are used per phase (in a bundle) at the corners of a square of side s metre. The GMR (Geometric Mean Radius) of each conductor is r'_m metre.
What is the GMR of the bundle conductor?
(a) $\left(r'_m \times s^2 \times \sqrt{2s}\right)^{1/4}$ (b) $\left(r'_m \times s^3\right)^{1/4}$
(c) $\left(r'_m \times 3s^3\right)^{1/4}$ (d) $[r'_m \times (\sqrt{2}\, s^3]^{1/4}$
[U.P.S.C. I.E.S. E.E.-II, 2008]

366. Use of bundled conductors reduces
(a) power loss due to corona.
(b) surge impedance.
(c) radio interference. (d) line inductance.
(e) all of these.

367. With bundled conductors
(a) the corona inception voltage increases.
(b) the corona inception voltage decreases.
(c) the corona inception voltage remains unaffected.
[A.M.I.E. Sec B. Winter 1993]

368. Consider the following statements :
1. By using bundle conductors in an overhead line, the corona loss is reduced.
2. By using bundle conductors, the inductance of transmission line increases and capacitance reduces.
3. Corona loss causes interference in adjoining communication lines.
Which of the these statements are correct ?
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 1999]

369. The conductor of an EHV line is selected on the basis of
(a) current carrying capacity.
(b) corona and RI performance.
(c) line voltage. (d) none of these.
[A.M.I.E. Sec B. Summer 1998]

370. Frequency of resonant vibrations lies in the range of
(a) 10-20 Hz (b) 100-200 Hz
(c) 50-100 Hz (d) 200-300 Hz
[A.M.I.E. Sec B. Summer 1996]

371. On what basis is the insulation level of a 400 kV, EHV overhead transmission line decided?
(a) Lightning overvoltage. (b) Corona inception voltage.
(c) Switching overvoltage. (d) Radio and TV interference.
[U.P.S.C. I.E.S. E.E.-II, 2005]

372. The total reactance and total susceptance of a lossless overhead EHV line, operating at 50 Hz, are given by 0.045 pu and 1.2 pu respectively. If the velocity of wave propagation is 3×10^5 km/s, then the approximate length of the line is
(a) 122 km. (b) 172 km. (c) 222 km. (d) 272 km.
[GATE E.E. 2007]

373. An extra high voltage transmission line of length 300 km can be approximated by a lossless line having propagation constant β = 0.00127 radians per km. Then the percentage ratio of line length to wavelength will be given by
(a) 24.24% (b) 12.12% (c) 19.05% (d) 6.06%
[GATE E.E. 2008]

374. A lossless transmission line of length 50 cm with L = 10 μH/m, C = 40 pF/m is operated at 30 MHz. What is the electric length (βl)?
(a) 20λ (b) 0.2λ (c) 108° (d) 40π
[U.P.S.C. I.E.S. E.E.-I, 2004]

375. A surge of 20 kV magnitude travels along a lossless cable towards its junction with two identical lossless overhead transmission lines. The inductance and the capacitance of the cable are 0.4 mH and 0.5 μF per km. The inductance and capacitance of the overhead transmission lines are 1.5 mH and 0.015 μF per km. The magnitude of the voltage at the junction due to surge is
(a) 36.72 kV (b) 18.36 kV (c) 6.07 kV (d) 33.93 kV
[GATE E.E. 2003]

Answers: **359.** (d), **360.** (c), **361.** (d), **362.** (b), **363.** (b), **364.** (a), **365.** (a), **366.** (e), **367.** (a), **368.** (c), **369.** (b), **370.** (c), **371.** (c), **372.** (b), **373.** (d), **374.** (c), **375.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

376. Series capacitor is used in a transmission line to
(a) compensate the voltage drop. (b) reduce line loss.
(c) limit short-circuit current.
(d) improve load power factor.

377. Series capacitive compensation in EHV transmission lines is used to
(a) reduce the line loading.
(b) improve the stability of the system.
(c) reduce the voltage profile.
(d) improve the protection of the line. **[GATE E.E. 1998]**

378. Series capacitors
(a) increase the power transmission capability of an EHV long line.
(b) provide voltage control.
(c) increase the shunt admittance of the line.
[A.M.I.E. Sec B. Summer 1997]

379. Series capacitors can be used in distribution lines
(a) to provide reactive power compensation.
(b) to reduce the receiving-end voltage under light load conditions.
(c) to reduce the voltage drop.
(d) to reduce line losses. **[A.M.I.E. Sec B. Summer 1994]**

380. Shunt compensation in an EHV line is used to improve
(a) stability and fault level.
(b) fault level and voltage profile.
(c) voltage profile and stability.
(d) stability, fault level and voltage profile.
[U.P.S.C. I.E.S. E.E.-II, 2000]

381. The most accurate and versatile method of achieving reactive power compensation is by using
(a) switched capacitors.
(b) fixed capacitor with controlled reactor.
(c) saturable reactor with capacitor bank.
(d) switched capacitor with controlled reactors.
[U.P.S.C. I.E.S. E.E.-II, 2000]

382. Installation of capacitors at suitable locations and of optimum size in a distribution system results in
1. improved voltage regulation.
2. reduction in distribution power losses.
3. reduction of kVA rating of distribution transformers.
Select the correct answer from the codes given below :
(a) 1 alone (b) 1 and 2 (c) 1, 2 and 3 (d) 3 alone
[U.P.S.C. I.E.S. E.E.-II, 2601]

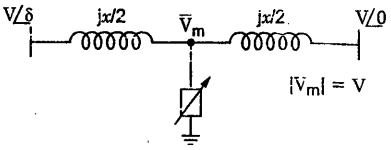
383. Insulation coordination for UHV lines (above 500 kV) is done based on
(a) lightning surges.
(b) lightning surges and switching surges.
(c) switching surges. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-II, 1999]

384. At an industrial substation with a 4 MW load, a capacitor of 2 MVAR is installed to maintain the load power factor at 0.97 lagging. If the capacitor goes out of service, the load power factor becomes
(a) 0.85 (b) 1.00 (c) 0.80 lag (d) 0.90 lag
[GATE E.E. 2005]

385. Consider two buses connected by an impedance of $(0 + j5)\ \Omega$. The bus 1 voltage is $100\ \angle 30°$ V, and bus 2 voltage is $100\ \angle 0°$ V. The real and reactive power supplied by bus 1, respectively, are
(a) 1000 W, 268 VAr. (b) −1000 W, −134 VAr.
(c) 276.9 W, −56.7 VAr. (d) −276.9 W, 56.7 VAr.
[GATE E.E. 2010]

386. For enhancing the power transmission in a long EHV transmission line, the most preferred method is to connect a
(a) series inductive compensator in the line.
(b) shunt inductive compensator at the receiving end.
(c) series capacitive compensator in the line.
(d) shunt capacitive compensator at the sending end.
[GATE E.E. 2011]

387. In a transmission line, the midpoint voltage is maintained to V by a compensating device as shown in the circuit above.

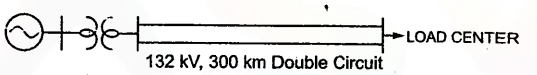


What is the real power flow through the line?
(a) $\frac{V^2}{X}\sin\frac{\delta}{2}$ (b) $\frac{2V^2}{X}\sin\delta$
(c) $\frac{V^2}{X}\sin\delta$ (d) $\frac{2V^2}{X}\sin\frac{\delta}{2}$
[U.P.S.C. I.E.S. E.E.-II, 2009]

388. A short transmission line having zero resistance and total series reactance of 0.4 pu is provided with reactive power compensation at the midpoint of the line such that the midpoint voltage is held at 0.96 pu when the voltage at both ends are 1.0 pu. What is the steady state power transmission limit of such a system?
(a) 4.8 pu (b) 0.0 pu
(c) 2.4 pu (d) 9.6 pu
[U.P.S.C. I.E.S. E.E.-II, 2009]

389. A nuclear power station of 500 MW capacity is located at 300 km away from a load center. Select the most suitable power evacuation transmission configuration among the following options

(a)



132 kV, 300 km Double Circuit

(b)

132 kV, 300 km Single Circuit With 40% Series Capacitor Compensation

(c)

400 kV, 300 km Single Circuit

(d)

400 kV, 300 km Double Circuit

[GATE E.E. 2011]

390. A lossless transmission line having Surge Impedance Loading (SIL) of 2,280 MW is provided with a uniformly distributed series capacitve compensation of 30%. Then, SIL of the compensated transmission line will be
(a) 1,835 MW (b) 2,280 MW
(c) 2,725 MW (d) 3,257 MW **[GATE E.E. 2008]**

391. As compared to ac transmission dc transmission is free from
(a) inductance. (b) capacitance.
(c) phase displacement. (d) all of the above.
[A.M.I.E. Sec B. Winter 1998]

392. Out of considerations (i) to (iv) listed below :
(i) no distance limitation related to steady-state stability.
(ii) no reactive power requirement from the system at the two terminals.
(iii) no substantial effect on fault level of the two systems at the terminals inspite of the interconnection.
(iv) no corona problems.
The considerations which constitute advantages of HVDC transmission are

Answers: **376.** (a), **377.** (b), **378.** (a), **379.** (a), **380.** (c), **381.** (d), **382.** (c), **383.** (c), **384.** (c), **385.** (a), **386.** (c), **387.** (c), **388.** (c), **389.** (d), **390.** (b), **391.** (d), **392.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) all of the above (b) (i) and (iii).
(c) (iii) and (iv). (d) (ii) and (iv). [GATE E.E. 2000]

393. In an HVDC system:
(a) both generation and distribution are dc.
(b) generation is ac and distribution is dc.
(c) generation is dc and distribution is ac.
(d) both generation and distribution are ac.
[U.P.S.C. I.E.S. E.E.-II, 2011]

394. In a dc transmission line
(a) it is necessary for the sending end and receiving end to be operated in synchronism.
(b) the effects of inductive and capacitive reactances are greater than in an ac transmission line of the same rating.
(c) there are no effects due to inductive and capacitive reactances.
(d) power transfer capability is limited by stability considerations.
[GATE E.E. 1999]

395. HVDC transmission is preferred to EHV AC because
(a) HVDC terminal equipment are inexpensive.
(b) VAR compensation is not required in HVDC system.
(c) system stability can be improved.
(d) harmonics problem is avoided. [GATE E.E. 1994]

396. High Voltage DC (HVDC) transmission is mainly used for
(a) bulk power transmission over very long distances.
(b) interconnecting two systems with the same nominal frequency.
(c) eliminating reactive power requirement in the operation.
(d) minimizing harmonics at the converter stations.
[GATE E.E. 2005]

397. Consider the following statements regarding HVDC power transmission:
1. The modern HVDC systems use 12-pulse converters.
2. DC systems never use ground or sea return.
3. Most of present-day dc schemes are two-terminal links.
Which of the statements given above is/are correct?
(a) 1, 2 and 3. (b) 1 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-II, 2008]

398. Choose the appropriate auxiliary components of HVDC transmission system from the following
1. DC line inductor. 2. AC line inductor.
3. Reactive power sources. 4. Distance relays on dc line.
5. Series capacitance on AC line.
(a) 1 and 2 (b) 1 and 3 (c) 2 and 4 (d) 4 and 5
[GATE E.E. 2003]

399. Bulk power transmission over long HVDC lines are preferred an account of
(a) low cost of HVDC terminals.
(b) no harmonic problems. (c) minimum line power losses.
(d) simple protection. [GATE E.E. 1998]

400. Consider the following statements:
HVDC transmission is superior to HVAC transmission due to
1. Lack of reliable dc circuit breakers.
2. Lesser number of conductors for same power carrying capacity.
3. Non-synchronous link between two different systems simplifying the problem of voltage stability and frequency control.
4. No costly terminal equipments such as converters and inverters are required.
Which of the above statements is/are correct?
(a) 4 only. (b) 4 and 3.
(c) 1 and 2. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2009]

401. For bulk power transmission over long distance HVDC transmission is
(a) is economically and technically superior to ac transmission.
(b) not good alternative to ac transmission.
(c) not economically viable.
[A.M.I.E. Sec B. Power Systems Winter 1998]

402. Corona loss in a dc line is
(a) less than that in ac line operating at same rms voltage.
(b) more than that in ac line at the same rms voltage.
(c) same as in ac linear equal rms voltage.
[A.M.I.E. Sec B. Power Systems Summer 1999]

403. In the case of an HVDC system, there is
(a) charging current but no skin effect.
(b) no charging current but skin effect.
(c) neither charging current nor skin effect.
(d) both charging current and skin effect.
[U.P.S.C. I.E.S. E.E.-II, 2000]

404. Which one of the following statements in respect of HVDC transmission line is not correct ?
(a) The power transmission capability of bipolar line is almost the same as that of single circuit ac line.
(b) HVDC link can operate between ac systems whose frequencies need not be equal.
(c) There is no distance limitation for HVDC transmission by UG cable.
(d) Corona loss is much higher in HVDC transmission line.
[U.P.S.C. I.E.S. E.E.-II, 1999]

405. A dc line carries
(a) less power than an equivalent ac line.
(b) more power than the ac line.
(c) same power as an ac line.
[A.M.I.E. Sec B. Power Systems Summer 1997]

406. The pu impedance of a line to 50 MVA, 132 kV base is 0.4, the pu impedance to a 100 MVA, 132 kV base will be
(a) 0.2 (b) 0.4 (c) 0.8 (d) 1.6
[A.M.I.E. Sec B. Power Systems Summer 2000]

407. Back to back HVDC is used to
(a) increase the transmission capability.
(b) decrease line losses.
(c) provide stable interconnection.
(d) reduce voltage drop. [A.M.I.E. Sec B. Summer 1994]

408. HVDC transmission needs
(a) pulse converters. (b) dc generators.
(c) ac filters. (d) dc filters.
(e) transformers. [A.M.I.E. Sec B. Power Systems Summer 1997]

409. In an HVDC link, power flows
(a) from the rectifier end to the inverter end.
(b) from the inverter end to the rectifier end.
[A.M.I.E. Sec B. Power Systems Winter 1996]

410. In HVDC system a converter acts as a rectifier when the firing angle α has a value

Answers: **393.** (d), **394.** (c), **395.** (c), **396.** (a), **397.** (d), **398.** (b), **399.** (c), **400.** (d), **401.** (a), **402.** (a), **403.** (c), **404.** (d), **405.** (b), **406.** (c), **407.** (c), **408.** (a), **409.** (a), **410.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $0 < \alpha < 120^\circ$ (b) $0 < \alpha < 90^\circ$
(c) $90^\circ < \alpha < 180^\circ$ [A.M.I.E. Sec B. Power Systems Winter 1996]

411. In a 3-phase converter used in HVDC transmission, the three anodes conduct sequentially. Due to overlap caused by circuit inductance, two anodes conduct simultaneously during overlap period. The output voltage waveform during this period is the
(a) voltage of the 1st anode, because the second anode has not completely taken over.
(b) mean of the two anode voltages, as they conduct together.
(c) voltage of second anode, because the voltage of this anode is greater than that of the 1st.
(d) sum of 1st and the second anode voltages because both the anodes are conducting. [U.P.S.C. I.E.S. E.E.-II, 1999]

412. The capital cost on a HVDC converter is
(a) less than ac substation.
(b) more than ac substation.
(c) same as that of ac substation.
[A.M.I.E. Sec B. Power Systems Summer 1997]

413. Consider the following statements regarding the suitable choice of HVDC converter configuration:
1. Pulse number should be high.
2. Ratio of peak inverse voltage to no-load dc output voltage should be as high as possible
3. Transformer utilization factor should be nearly unity.
Which of the statements given above are correct?
(a) 1 and 2 (b) 1, 2 and 3 (c) 2 and 3 (d) 1 and 3
[U.P.S.C. I.E.S. E.E.-II, 2004]

414. Consider the following statements:
The suitable configuration of HVDC converter is decided on the requirements of
1. high pulse number.
2. converter transformer utilization factor should be near to unity.
Which of the above statements is/are correct?
(a) 1 only. (b) Both 1 and 2.
(c) Neither 1 nor 2. (d) 2 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

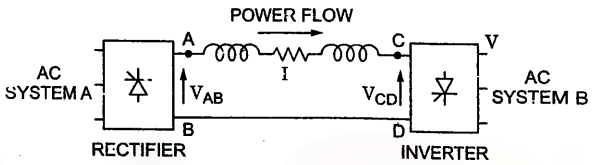
415. In HVDC transmission there are predominant
(a) voltage harmonics on dc side and current harmonics on ac side of converters.
(b) current harmonics on dc side and voltage harmonics on ac side of converters.
(c) current harmonics only on the dc side of converters.
(d) voltage harmonics only on the ac side of converters.
[U.P.S.C. I.E.S. E.E.-II, 2003]

416. High voltage dc transmission requires filters for
(a) current harmonics on ac side and voltage harmonics on dc side.
(b) voltage harmonics on ac side and current harmonics on dc side.
(c) voltage harmonics on both ac and dc sides.
(d) current harmonics on both ac and dc sides.
[U.P.S.C. I.E.S. E.E.-II, 2006]

417. An HVDC link consists of rectifier, inverter, transmission line and other equipments. Which one of the following is true for this link?
(a) The transmission line produces/supplies reactive power.
(b) The rectifier consumes reactive power and the inverter supplies reactive power from/to the respective connected ac systems.
(c) Rectifier supplies reactive power and the inverter consumes reactive power to/from the respective connected ac systems.
(d) Both the converters (rectifier and inverter) consume reactive power from the respective connected ac systems.
[GATE E.E. 2006]

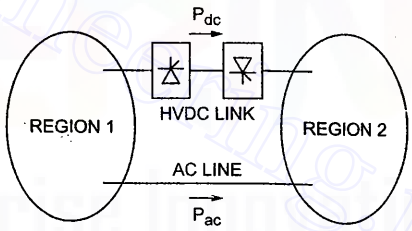
418. In the HVDC system, the ac harmonics which gets effectively eliminated with 12 pulse bridge converters, are
(a) triplen harmonics.
(b) triplen and 5th harmonics.
(c) triplen, 5th and 7th harmonics.
(d) 5th and 7th harmonics. [U.P.S.C. I.E.S. E.E.-II, 2001]

419. Power is transferred from system A to system B by an HVDC link as shown in the figure. If the voltages V_{AB} and V_{CD} are as indicated in the figure, and $I > 0$, then



(a) $V_{AB} < 0, V_{CD} < 0, V_{AB} > V_{CD}$
(b) $V_{AB} > 0, V_{CD} > 0, V_{AB} < V_{CD}$
(c) $V_{AB} > 0, V_{CD} > 0, V_{AB} > V_{CD}$
(d) $V_{AB} > 0, V_{CD} < 0$ [GATE E.E. 2010]

420. Two regional systems, each having several synchronous generators and loads are interconnected by an ac line and a HVDC link as shown in the figure. Which of the following statements is true in the steady state:



(a) Both regions need not have the same frequency.
(b) The total power flow between the regions ($P_{ac} + P_{dc}$) can be changed by controlling the HVDC converters alone.
(c) The power sharing between the ac line and the HVDC link can be changed by controlling the HVDC converters alone.
(d) The direction of power flow in the HVDC link (P_{dc}) cannot be reversed. [GATE E.E. 2007]

Answers: **411.** (b), **412.** (b), **413.** (d), **414.** (d), **415.** (b), **416.** (b), **417.** (b), **418.** (d), **419.** (c), **420.** (c).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): Feeders are designed mainly from the point of view of the voltage drop in them.
(R): Current loading of the feeder remains the same along its length.

2. (A): Transmission of electrical power by dc is economical than that with ac.
(R): In case of dc transmission, there is no charging current which contributes to continuous load, even on no load.

3. (A): The maximum operating temperature of overhead line conductors made of aluminium or copper is restricted to 75°C.
(R): Conductor temperature beyond 75°C may shatter procelain insulators. [U.P.S.C. I.E.S. E.E.-II, 2000]

4. (A): Glazing is done on ceramic insulators to make the surface smooth and non-absorbent.
(R): Moisture from the atmosphere can collect on the surface discontinuities on a ceramic and result in electrical breakdown. [U.P.S.C. I.E.S. E.E.-I, 2003]

5. (A): A glazed ceramic insulator has a lower breakdown strength than an unglazed one.
(R): Glazing covers pores and cracks and makes the surface non-absorbent. [U.P.S.C. I.E.S. E.E.-I, 1998]

6. (A): The string efficiency can be improved by using long cross arms.
(R): Use of long cross arms reduces the ratio of capacity to earth to capacity per insulator thereby increasing the string efficiency.

7. (A): Capacitance grading method of improving string efficiency is not used above 220 kV.
(R): In capacitance grading method the units used are of different capacitances and so are not interchangeable.

8. (A): Corona reduces the effects of transients produced by lightning and other causes.
(R): Charges induced on the line by lightning or other causes are partially dissipated as a corona loss.

9. (A): Corona causes interference with neighbouring communication circuits.
(R): Owing to distortion of waveform, the harmonics predominately third harmonics are introduced into the transmission line.

10. (A): Normally it is not advisable to operate a line above its fair weather disruptive critical voltage.
(R): It is usually more economical to pay for corona loss for a fraction of the year (storms are experienced at intervals) than if corona was to be entirely avoided by using heavy conductors.

11. (A): The electric field intensity E is proportional to x, the distance from the axis of the conductor of radius r, for $x \geq r$.
(R): Bundled conductors increase the line capacitance from that of a single conductor of the same cross-sectional area. [U.P.S.C. I.E.S. E.E.-II, 1993]

12. (A): The concept of self GMD is applicable for the calculation of inductance of transmission lines.
(R): The radius of a conductor of transmission lines, in the expression for inductance is not the self GMD of the conductor. [U.P.S.C. I.E.S. E.E.-II, 1998]

13. (A): Transposition of conductors in a transmission line is necessary.
(R): Corona losses are reduced by transposition of conductors.

14. (A): With a constant applied voltage at the sending end of a long transmission line, the voltage at the receiving end rises to a high value at light load at the other end.
(R): The large charging capacitive current flowing through the line causes the voltage rise. [U.P.S.C. I.E.S. E.E.-II, 1993]

15. (A): In a good power supply, the percentage of voltage regulation should be close to zero.
(R): Zero percentage regulation means that there will be no change in output voltage if the load resistance varies between the limit 0 to ∞. [U.P.S.C. I.E.S. E.E.-II, 2006]

16. (A): In the modelling of medium and long transmission lines the nominal-π and T circuits are not equivalent to each other.
(R): A star-delta transformation can be used to derive the one circuit from the other. [U.P.S.C. I.E.S. E.E.-II, 2002]

17. (A): One-phase supply can be converted to a 3-phase supply with the help of a suitable transformer.
(R): 3-phase supply can be converted to a 1-phase supply by a suitable transformer. [U.P.S.C. I.E.S. E.E.-II, 1998]

18. (A): The bulk supply into the large urban areas if often carried out by underground cables operating at 132 kV and above. This results in large generation of VARs by the cable and consequent rise in voltage at the receiving end.
(R): These VARs may be neutralised by using series capacitance in the line at appropriate intervals. [U.P.S.C. I.E.S. E.E.-II, 1998]

19. (A): High and extra high voltages are adopted for transmission of bulk power over long distances.
(R): The maximum true power transferred over a given line increases with the increase in V_S and V_R.

20. (A): Control of reactive power is essential for maintaining a desired voltage profile.

Answers: **1.** (d), **2.** (b), **3.** (c), **4.** (a), **5.** (a), **6.** (a), **7.** (d), **8.** (a), **9.** (b), **10.** (a), **11.** (d), **12.** (b), **13.** (c), **14.** (a), **15.** (a), **16.** (c), **17.** (a), **18.** (c), **19.** (a), **20.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): The reactive power transferred over a transmission line depends on load or power angle.

21. (A): The conductor used in cables should be stranded one.
(R): The skin effect is much smaller with stranded conductor than with solid conductors.

22. (A): In a high-voltage cable, concentric conducting surfaces are provided in an insulating medium throughout the cross-section of the cable to reduce the ratio of maximum to minimum electric stress.
(B): The potential differences between the conducting surfaces redistribute the charge distribution. [U.P.S.C. I.E.S. E.E.-II, 1993]

23. (A): Screened type cables have lesser possibilities of core to core fault in comparison to belted type cables.
(R): The metal sheathed core cable has a greater core to core thickness for a given overall diameter in comparison to a plain cable.

24. (A): The modern trend is to avoid grading of cables as far as possible and use gas pressure or oil-filled cables.
(R): With intersheath grading, the main objection is the possibility of damage to the intersheath during transportation and installation and with capacitance grading the chief handicap is non-availabilities of high grade insulating materials whose permittivities can be made to vary over the required range.

25. (A): 3-wire dc distribution system is preferred over 2-wire dc distribution system.
(R): The 3-wire dc system of distribution is more safe.

26. (A): EHV transmission lines make use of bundled conductors.
(R): Bundled conductors reduce the line inductance per phase and increase the capacitance.

27. (A): The insulation of modern EHV lines is designed based on the lightning voltage.
(R): With the developments in the design of relay breaker systems, it is possible to control and minimise switching over-voltages.

28. (A): It is not necessarily desirable to compensate by a series capacitance for all the line reactance.
(R): Power can be transformed only if reactance is present. [U.P.S.C. I.E.S. E.E.-II, 2011]

29. (A): The determination of cross section of conductor for EHV lines is based on corona, not on thermal considerations.
(R): The choice of cross section of conductor with reference to corona considerations is generally above the economic cross-section based on thermal considerations.

30. (A): In lossless transmission line the voltage and current distributions along the line are always constant.
(R): The voltage and current distributions in an open line are such that at a distance $\lambda/4$ from the load end, the line looks like a series resonant circuit. [U.P.S.C. I.E.S. E.E.-II, 2004]

31. (A): In HVDC systems, the dc voltage should be as high as possible and the rectifier control angle α should be as low as possible.
(R): Control of dc voltage is exercised by the rectifier and inverter control angles α and γ respectively. [U.P.S.C. I.E.S. E.E.-II, 1997]

Answers: **21.** (b), **22.** (a), **23.** (a), **24.** (a), **25.** (c), **26.** (b), **27.** (a), **28.** (c), **29.** (a), **30.** (d), **31.** (c).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1	List 2
A. Skin effect	1. Increase in resistance but decrease in self inductance.
B. Proximity effect	2. Increase in ac resistance.
C. Ferranti effect	3. Owing to voltage drop across line inductance due to flow of a charging current.
D. Surge impedance	4. Square root of ratio of line impedance and shunt admittance.

Codes:	A	B	C	D
(a)	2	1	3	4
(b)	1	2	4	3
(c)	3	4	2	1
(d)	4	3	1	2

2.

List 1 (Design parameters)	List 2 (Factor(s) on which they depend)
A. Number of suspension insulator discs.	1. Voltage and tower footing resistance.
B. Permissible sag of transmission line conductor for a given tower.	2. Voltage.
C. Corona discharge.	3. Voltage and conductor configuration.
D. Inductance of transmission line conductor.	4. Conductor configuration and tower configuration.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	4	3	2	1
(c)	1	3	2	4
(d)	4	2	3	1 [U.P.S.C. I.E.S. E.E.-II, 2002]

3.

List 1	List 2
A. Per cent power lost in transmission.	1. Decreases with system voltage.
B. For a given current density, the conductor size.	2. Reduces with line length.
C. Power handling capacity of a line at a given voltage.	3. Remains independent of line length.
D. Surge impedance of a transmission line.	4. Increases with line length.

Answers: **1.** (a), **2.** (a), **3.** (d),

Codes:	A	B	C	D
(a)	1	2	4	3
(b)	3	4	2	1
(c)	3	2	4	1
(d)	1	4	2	3

[U.P.S.C. I.E.S. E.E.-II, 1998]

4.

	List 1	List 2
A.	improve power factor.	1. shunt reactor.
B.	reduce the current ripples.	2. shunt capacitor.
C.	increase the power flow in line.	3. series capacitor.
D.	reduce the Ferranti effect.	4. series reactor.

(a) a → 2, b → 3, c → 4, d → 1
(b) a → 2, b → 4, c → 3, d → 1
(c) a → 4, b → 3, c → 1, d → 2
(d) a → 4, b → 1, c → 3, d → 2 [GATE E.E. 2009]

5.

	List 1	List 2
A.	Great Bridge Converter.	1. EHV/UHV AC Transmission.
B.	Series Compensation.	2. HVDC Transmission.
C.	Sag Templates.	3. Insulators.
D.	Grading Ring.	4. Tower Location.

Codes:	A	B	C	D
(a)	2	1	3	4
(b)	1	2	4	3
(c)	2	1	4	3
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-II, 2003]

6.

	List 1 (Different Configurations for Asynchronous Interconnection)		List 2 (Corresponding Figures)
A.	Two-terminal DC Link	1.	B.	Back to back HVDC Link along with AC feeder	2.	C.	Back to back HVDC Link at border	3.	
Codes:	A	B	C
(a)	3	2	1
(b)	2	3	1
(c)	3	1	2
(d)	2	1	3

[U.P.S.C. I.E.S. E.E.-II, 2003]

Answers: **4.** (b), **5.** (c), **6.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Single phase ac power pulsates around the average value at the supply frequency.
2. Normally distribution of electrical energy is through 3-phase 4-wire system.
3. In India the primary transmission voltages are 110, 132, 220, 400 or 765 kV depending upon the distance, the amount of power to be transmitted and the system stability.
4. The voltages for primary distribution are 11, 6.6 or 3.3 kV.
5. For secondary distribution usuable voltage is 230 V.
6. In a distribution system, the feeder supplies power to distributors.
7. The electric power can be transmitted by either overhead system or underground system.
8. The best method is to employ dc system for generation and distribution and ac system for transmission.
9. Overhead system is more safer than under ground system.
10. Underground system is more flexible than overhead system.
11. The underground system cannot be operated above 66 kV.
12. Underground system is less expensive in comparison to overhead system.
13. The voltage drop in underground system is very low as compared to that in overhead system.
14. Maintenance cost of underground system is quite high in comparison with that of overhead system.
15. Mostly the high voltage transmission is carried out by overhead system due to low cost.
16. Underground system is used for distribution only either in conjested areas or modern cities.
17. 3-phase 4-wire system is usually adopted for transmission of electrical power.
18. With the increase in voltage of transmission, the insulation needed between the conductors and earthed tower increases.
19. With the increase in voltage of transmission the line support cost reduces.
20. With the increase in voltage of transmission, longer cross arms and higher towers are required.
21. Economical cross section of conductor can be determined by Ferranti effect.
22. Wooden poles are used as line supports for voltages up to 22 kV.
23. The conductors used in *ht* overhead lines are stranded ones.
24. ACSR conductor implies aluminium conductor steel reinforced.
25. In ACSR conductors, the resistance of the conductor due to the steel core decreases.
26. The skin effect is very predominating in ACSR conductor and so the resistance of the composite conductor is taken equal to that of the aluminium alone.
27. The ACSR conductor gets deteriorated in service to the atmospheric corrosion due to bimetallic action of zinc and aluminium, electrochemical in nature.
28. ACSR conductor being of high tensile strength and lighter in weight produces small sag and so longer spans can be used.

Answers: **1.** (F), **2.** (T), **3.** (T), **4.** (T), **5.** (F), **6.** (T), **7.** (T), **8.** (F), **9.** (F), **10.** (F), **11.** (T), **12.** (F), **13.** (T), **14.** (F), **15.** (T), **16.** (T), **17.** (F), **18.** (T), **19.** (F), **20.** (T), **21.** (F), **22.** (T), **23.** (T), **24.** (T), **25.** (F), **26.** (T), **27.** (T), **28.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

29. The ACSR conductor has largest diameter than any other type of conductor of same resistance and so corona losses are reduced but stronger supports are required for a given span.
30. Composite conductors are principally used for shorter spans, not exceeding 100 m.
31. Galvanised iron and steel conductors have been used for comparatively shorter spans.
32. Guy wires are generally galvanised.
33. Guy wires generally make an angle of 45° to 60° with the surface of the earth.
34. Guy wire should have high electrical conductivity.
35. Addition of 1 or 2% of cadmium in copper increases the conductivity but reduces the tensile strength.
36. Addition of about 1/2% each of silicon and magnesium to aluminium increases its tensile strength but reduces its resistance to corrosion.
37. Increase in temperature in overhead transmission line causes decreases in stress but increase in length.
38. Copper clad steel conductors are quite suitable for shorter spans.
39. The choice of economic span length of transmission line depends upon working voltage, size, material and number of conductors.
40. Supports for conductors may have unequal heights in hilly areas.
41. Heavier the conductors smaller will be the sag.
42. Sag is directly proportional to the square of the span.
43. Sag reduces and tension in the conductors increases with the rise in temperature.
44. For transmission line conductors, maximum sag occurs when temperature is maximum and there is no wind pressure.
45. For transmission line conductors the lowest tension and maximum sag occurs when temperature is minimum and wind maximum.
46. The top most conductor in HV transmission line is earth conductor.
47. V-strings are suitable for single circuit lines.
48. Dancing of conductors can be seen in high temperature regions.
49. Eddies produced behind the conductors by the action of low velocity winds result in resonant vibrations.
50. Armour rods and stock bridge dampers are used to minimise vibrations in a conductor.
51. Overhead lines should be earthed at every 1.6 km.
52. Allowable variation in declared voltage is 12½ % in case of high or extra high voltage.
53. For 400 kV transmission lines the clearance from ground should be nearly 8.5 m.
54. The material used for insulator materials should be nonporous, free from internal impurities and cracks and impervious to the fluids and gases present in the atmosphere.
55. As an insulator material, toughened glass insulator have greater puncture strength.
56. Glass is cheaper and have longer life in comparison to porcelain.
57. Pin type insulators give more flexibility to the line and the mechanical stresses are reduced.
58. Suspension type insulators are used on EHT transmission lines.
59. The insulators used in guy cables are egg or stay insulators.
60. The corona increases with the increase in diameter of the conductor.
61. The corona effect decreases with the decrease in spacing between the conductors.
62. A solid conductor gives rise to more corona than a stranded conductor.
63. At low voltage, there is no corona effect.
64. Line voltage largely affects the corona.
65. If the spacing between the conductors is made very large in comparison to their diameters, there may not be any corona effect.
66. Corona increases the surge effects.
67. Corona discharges emit radiations inducing noise signals in the communication channels.
68. Due to corona, the probability of flashover is increased.
69. Corona increases the effects of transients produced due to lightning and other causes.
70. Corona does not involve any power loss.
71. The value of disruptive critical voltage is considerably increased during bad atmospheric conditions such as fog, sleet, rain and snow storms.
72. Corona occurs on short transmission lines.
73. Corona losses are minimized when current density in conductors is reduced.
74. At high frequencies the skin effect is very small.
75. Capacitance of a transmission line increases with the increase in its length.
76. The proximity effect results in uniform distribution of current in cross section of a conductor.
77. The charging current of a 400 kV transmission line is more than that of a 220 kV line of the same length. [GATE E.E. 1994]
78. The presence of earth in case of overhead lines increases the capacitance.
79. Transposition of transmission line is done to reduce corona.
80. In short transmission lines, the shunt capacitance is totally neglected and the series impedance is a lumped parameter.
81. The phenomenon of rise in voltage at the receiving end of the open-circuited or lightly loaded line is known as the proximity effect.
82. In short transmission lines

$$\mathbf{A = D = 1;\ B = Z}\ \text{and}\ \mathbf{C = 0}$$

83. In nominal T line

$$\mathbf{A = D = 1 + \frac{ZY}{2};\ B = Z + \frac{Z^2Y}{4}}\ \text{and}\ \mathbf{C = Y}$$

84. In nominal π-line

$$\mathbf{A = D = 1 + \frac{1}{2}YZ;\ B = Z}\ \text{and}\ \mathbf{C = 1 + \frac{1}{4}YZ}$$

Answers: **29.** (T), **30.** (F), **31.** (F), **32.** (T), **33.** (T), **34.** (F), **35.** (F), **36.** (F), **37.** (T), **38.** (F), **39.** (T), **40.** (T), **41.** (F), **42.** (T), **43.** (F), **44.** (T), **45.** (F), **46.** (T), **47.** (T), **48.** (F), **49.** (T), **50.** (T), **51.** (F), **52.** (T), **53.** (T), **54.** (T), **55.** (T), **56.** (T), **57.** (F), **58.** (T), **59.** (T), **60.** (F), **61.** (F), **62.** (F), **63.** (T), **64.** (T), **65.** (T), **66.** (F), **67.** (T), **68.** (F), **69.** (F), **70.** (F), **71.** (F), **72.** (F), **73.** (F), **74.** (F), **75.** (T), **76.** (F), **77.** (T), **78.** (T), **79.** (F), **80.** (T), **81.** (F), **82.** (T), **83.** (T), **84.** (F),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

85. Power loss in each of the line conductor of open-circuited line due to charging current is equal to 1/3 I_C^2 R wattswhere $I_C/\sqrt{3}$ is the rms value of charging current and R is the resistance of conductor.
86. On inductive loads, as usual in practice, the effect of capacitance is to reduce voltage drop and also the copper losses of the line.
87. For a lossless line the characteristic impedance is called the surge impedance.
88. Surge impedance of a transmission line is independent of its length.
89. The reactive power transfer over a line mainly depends on $|V_S| - |V_R|$.
90. Insulation resistance of the cable increase with the increase its length.
91. A metallic sheath of lead or lead alloy or of aluminium is provided around the insulation in an underground cable for reducing the capacitance.
92. The thickness of metallic sheath on the cables is usually of the order of 0.5 mm.
93. A layer of bedding consisting of paper tape compounded with a fibrous material is provided over the metallic sheaths in underground cables in order to protect the metallic sheath from mechanical injury from the armouring.
94. The size of power cable conductor depends upon the operating voltage and type of insulation used.
95. The operating voltage for low tension cables is up to 400 V.
96. In single core cable copper used is tinned stranded.
97. Multi-core cables are used up to 11 kV.
98. For voltages up to 6,600 V, electrostatic stresses developed in cable are very small.
99. The belted type construction is not suitable for the cables for use on operating voltage exceeding 22 kV.
100. The high tension cables are so designed that the ionization effects are maximum.
101. In the belted type cables the dielectric does not remain homogeneous and may result into formation of voids.
102. H-type cables are used up to 66 kV.
103. The disadvantage of SL type cable is that the manufacturing is difficult because of thinner lead sheaths.
104. Maintenance of oil-filled cables is difficult.
105. The operating voltage for extra supertension power cables is beyond 66 kV.
106. The sheath loss in open-circuited sheath is about 2 % of the total loss.
107. Capacitance is important in cables because of narrow spacing between the conductors.
108. The disadvantages of oil-filled cables are higher cost and complicated laying and maintenance.
109. The insulation resistance of a single-core sheathed cable increases with the increase in its length.
110. The breakdown strength of the cable depends upon the maximum stress it can bear.
111. The electrostatic stress in a single core cable is minimum at the conductor surface.
112. In capacitance grading of cables a homogeneous dielectric is used.
113. Grading of cables is only useful for very high voltage cables where the ratio of external diameter to internal diameter is very small.
114. When a cable is to cross a road, it should be laid in conduits, ducts or tubes made up of iron, glazed stone wares, clay or cement concrete.
115. Direct laying of underground cables is rarely used because of its high maintenance cost.
116. When two or more generating stations are connected together, the system is known as the ring main system.
117. A distributor arranged to form a closed circuit and fed at one or more than one point is called the ring distributor.
118. For transmission of same amount of power with same efficiency over a given distance with same consumer voltage, three-wire dc distribution system takes much more copper than that required by two-wire dc distribution system.
119. The cross-sectional area of the neutral wire in a 3-wire dc distribution system is usually one-half of that of outer.
120. The effect of corona can be reduced by making use of stranded conductors.
121. Bundle conductors are mainly used for reducing corona losses and radio interference.
122. Surge impedance of a transmission line is independent of its length.
123. The size of conductor for modern EHV lines is determined on the basis of current density.
124. The insulation for EHV lines is designed on the basis of corona.
125. The insulation for EHV lines is designed on the basis of switching surges.
126. Series compensation is provided in EHV transmission lines to overcome the Ferranti effect.
127. Synchronous compensation is being preferred over static compensation in EHV lines.
128. The dc output voltage magnitude is controlled by varying the firing angle of the thyristor valves in the converter.
129. Corona loss and radio interference are much more in dc system in comparison to those in ac system.
130. The dc line terminal equipment is considerably less costly than ac line terminal equipment.
131. In dc system, skin effect is absent and line losses are less than that ac system.
132. The ac systems interconnected by a dc line can be controlled independently.
133. Maintenance of insulators in HVDC transmission line is less.
134. In case of agricultural loads, the distribution transformer should be located at the load centre.
135. The overhead lines should not cross the road at an angle less than 60°.

Answers: **85.** (T), **86.** (T), **87.** (T), **88.** (T), **89.** (T), **90.** (F), **91.** (F), **92.** (F), **93.** (T), **94.** (F), **95.** (F), **96.** (T), **97.** (T), **98.** (T), **99.** (T), **100.** (F), **101.** (T), **102.** (T), **103.** (T), **104.** (T), **105.** (F), **106.** (T), **107.** (T), **108.** (T), **109.** (F), **110.** (T), **111.** (F), **112.** (F), **113.** (F), **114.** (T), **115.** (F), **116.** (F), **117.** (T), **118.** (F), **119.** (T), **120.** (F), **121.** (T), **122.** (T), **123.** (F), **124.** (F), **125.** (T), **126.** (F), **127.** (F), **128.** (T), **129.** (F), **130.** (F), **131.** (T), **132.** (T), **133.** (F), **134.** (T), **135.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Generation voltages are 3.3 kV, 6.6 kV, 11 kV or 33 kV, most usual adopted voltage for generation in practice is ____ ____ kV.
2. The maximum generation voltage in advance countries is _____ kV while that in India is 11 kV.
3. Secondary transmission is usually carried at _____ or 66 kV.
4. The highest transmission voltage in India is _____ kV. (220/132/400/765)
5. Large industrial consumers are supplied power at _____ kV. (11/66/132/400)
6. 750 kV falls under the category of _____ high voltage.
7. The conductor connecting consumer's terminals to the distributor is called the _____. (feeder/distributor/service mains)
8. The permissible variation of frequency in power system is _____.
9. The distribution by ac system is undoubtedly _____ to that by dc system.
10. _____ poles are generally used for distribution purposes in rural areas, steel tubular poles and _____ poles are usually used for distribution purposes in urban areas to give good appearance and steel rails, or narrow base lattice steel towers are used for transmission at _____ kV or 33 kV and broad base lattice steel towers are used for transmission at _____ kV and above.
11. Transmitted power remaining the same, if the supply voltage of a two-wire distributor is doubled saving in copper will be _____ %. (25, 50, 75, 100)
12. In a 2-wire dc feeder, voltage drop per wire is 2.5%, transmission efficiency of the feeder will be _____ %. (93.75, 95, 97.5, 98.75)
13. With the same maximum voltage between conductors, the ratio of copper volume required is 3-phase, 3-wire system and 1-phase, two-wire system is _____. $\left(\frac{4}{3}, \frac{3}{4}, \frac{5}{3}, \frac{3}{5}\right)$
14. The most economical voltage for transmitting given amount of power over a known distance by overhead transmission lines is about _____ kV/km.
15. Maximum permissible span with wooden poles is _____ m. (20, 30, 50, 100)
16. Steel poles need galvanizing for longer life. Galvanizing is the process of applying a layer of _____. (zinc/tarcoal/paint/varnish)
17. RCC poles are _____ in weight and need _____ maintenance.
18. In an overhead system, the number of cross arms carried by a pole depends on the number of _____ it has to carry.
19. For installations of switchgear and power transformers we usually use _____ type structure. (A, L, H, V)
20. The conductor material used for transmission and distribution of electrical power must be of _____ conductivity, _____ tensile strength, _____ specific gravity and _____ cost.
21. Stranded conductors are preferred over solid conductors for overhead lines owing to _____.
22. _____ conductor is the best conductor owing to its high electrical conductivity and greater tensile strength for all types of transmission.
23. The conductivity of aluminium is _____ times of that of copper.
24. The tensile strength of aluminium is _____ times of that of copper.
25. _____ conductor consists of a core of galvanised steel strand surrounded by a number of aluminium strands.
26. In ACSR conductor aluminium carries the bulk of _____ and steel core takes a greater percentage of _____.
27. In overhead lines we generally use _____ conductors.
28. ACSR conductors having 70 aluminium conductors and 6 steel conductors will be specified as _____. (6/70, 6/76, 70/6, 70/76)
29. The difference in level between the points of supports and the lowest point is called the_____.
30. Between two supports, due to sag the conductor takes the form of _____. (semicircle, catenary, parabola)
31. The minimum clearance of hv lines from ground across streets is _____ m. (3, 5, 6, 8)
32. Minimum horizontal clearance of a lv line from residential building is _____ m. (0.6, 0.9, 1.2, 1.6)
33. If a 132 kV line passes over a residential building, the minimum vertical clearance from the roof of the building shall be _____ m. (3, 4.57, 6, 9)
34. The minimum clearance between 132 kV transmission line and ground is about _____ m. (3.2, 6.4, 7.5, 10.5)
35. The horizontal spacing between phase conductors of a 132 kV transmission line is about _____ m. (8, 11, 14, 17)
36. The colour of the neutral wire of 3-core fluxible cable is _____. (black, blue, red, brown)
37. _____ chart is helpful in knowing the sag and tension at any temperature.
38. The insulators employed in overhead lines must be mechanically _____ and of _____ relative permittivity and _____ insulation resistance.
39. _____ is extensively used material for insulators and is produced by firing at a controlled temperature a mixture of kaolin, feldspar and quartz.
40. Glass insulators can be used up to _____ kV under ordinary atmospheric conditions and well up to _____ kV in dry atmosphere.
41. Pin type insulators are generally not used for voltages exceeding _____ kV. (11, 25, 33, 66)
42. Shackle insulators are used on _____ lines.
43. _____ or _____ insulators are used in guy cables.
44. Wet flash-over voltage is _____ than dry flash-over voltage of an insulator. [A.M.I.E. Sec B. Summer 1993]
45. Lowest disc in a string of suspension insulators has _____ pd across it. [A.M.I.E. Sec B. Summer 1994]
46. The whole phenomenon, the hissing noise, the violet glow and production of ozone gas is known as _____.
47. In case of ac system, the current due to corona is _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

48. In stormy weather corona occurs at _____ voltage as compared with fair weather.
49. The effect of dirt on the surface of the conductor is to _____ irregularity and thereby _____ the breakdown voltage.
50. Corona _____ the probability of flashover and _____ the system performance.
51. In case of overhead lines spacing between the conductors is to be increased in order to provide adequate insulation and avoid _____ loss.
52. An electric transmission line has four parameters viz resistance, inductance, capacitance and _____.
53. The increase in resistance due to non-uniform distribution of current in a conductor is known as _____ effect. [GATE E.E. 1994]
54. Any two conductors separated by an insulating medium constitute a _____.
55. The transmission lines are basically electrical circuits having _____ constants.
56. The ratio of line-to-line capacitance and line-to-neutral capacitance is _____.

$\left(\frac{1}{4}, \frac{1}{2}, \frac{1}{3}, 2\right)$

57. In short transmission lines the effect of _____ is negligible.
58. 120 km long transmission line is considered to be _____ line.
59. A 25 km, 33 kV transmission line is considered to be a _____ transmission line.
60. A 160 km, 220 kV transmission line falls under the category of _____ transmission lines.
61. The effect of capacitance can be neglected when the length of overhead transmission line does not exceed _____ km.

(20, 60, 120, 250)

62. For a 500 Hz frequency excitation, a 50 km long power line will be modelled as _____ line. (short, medium, long)
63. For 11 kV transmission line the capacitance per km will be about _____ μF. (0.01, 0.1, 1, 10)
64. The phenomenon of rise in receiving-end voltage of the open-circuited or lightly loaded line is called the _____ effect.
65. The regulation of a transmission line, for any given load power factor can be graphically determined by _____ regulation diagram.
66. The velocity of propagation of electromagnetic waves is _____ on overhead lines and on cables it depends on _____. [A.M.I.E. Sec B. Winter 1997]
67. The velocity of propagation of electromagnetic waves on underground cables with relative permittivity of 3 will be _____ m/s. [GATE E.E. 1997]
68. The square root of the ratio of line impedance and shunt admittance is called the _____ impedance.
69. The load (of unity pf) that can be delivered by the line of negligible resistance is called the surge impedance loading or _____.
70. The rated load of an underground cable is always _____ its natural load. [GATE E.E. 1995]
71. A line which has same voltage all along its length is known as _____ line. [A.M.I.E. Sec B. Summer 1994]
72. For constant voltage transmission specially designed synchronous motors called the synchronous _____ are installed at the receiving end which maintains the voltage drop along the line constant.
73. Overexcited synchronous phase modifier draws _____ current.
74. The real power transfer over a line mainly depends on _____ angle.
75. The SIL of a line is proportional to _____. (V^2, V, $\sqrt{V}$)
76. The most economical load on an overhead line is _____ than the natural load.
77. The most economical load on an underground cable is _____ than the surge loading.
78. In underground cables, over and above armouring a layer of fibrous material is again provided, which is similar to that of bedding in order to protect the armouring. Such a layer of fibrous material is called the _____.
79. The breakdown strength of air at NTP is _____. [A.M.I.E. Sec B. Winter 1997]
80. Insulating materials are classified for different temperature rise such as _____.
81. The insulating materials most commonly used in a cable are _____. [A.M.I.E. Sec B. Winter 1997]
82. The multi-core cables for use up to 11,000 V are of _____ type.
83. Single core oil-filled cables can be employed up to _____ kV.
84. _____ gas is often used in external pressure cables.
85. The energy losses occuring in the dielectric of cables are due to leakage and so called _____.
86. In internal pressure cables the pressure of nitrogen is about _____ atmosphere for EHT cables and about _____ atmosphere for super voltage cables.
87. The process of achieving uniformity in dielectric stress is known as _____ of cables.
88. There are two methods of grading viz intersheath grading and _____ grading.
89. The material commonly used for sheaths of underground cables is _____. (copper/lead/steal/rubber)
90. _____ protects the underground cables against mechanical injury. (Armouring/Sheath/Bedding)
91. Cables generally used beyond 66 kV is _____. (oil-filled, belted, SL type)
92. The cables used for 132 kV are _____.
93. _____ system of laying underground cables is rarely used because of its higher cost.
94. While laying 11 kV underground cables the minimum bending radius must be _____ D. (3, 6, 12, 18)
95. The depth of trench required for laying underground cables by direct laying method is about _____ m. (0.2, 0.5, 0.8, 1.2)
96. While laying 33 kV underground cable the minimum bending radius should be _____ D. (12, 30, 100)
97. A 250 V cable after installation should be checked for about _____ minutes at a voltage not less than _____ V.
98. An 11 kV cable after installation should be checked for short duration at a voltage of _____ kV. (11, 20, 33, 110)
99. A booster is connected in _____ with the feeder.
100. Balancers are used for _____. [A.M.I.E. Sec B. Winter 1997]
101. The low value of insulation resistance between any core of cable and earth indicates the _____ fault.
102. The highest transmission voltage in the world is _____ kV.
103. One of the advantage of high voltage dc transmission is that there is no _____ effect.
104. The main source of radio and television interference near EHV system is _____.
105. The size of conductor for EHV transmission line is based on _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

106. SIL means _____.
107. By using bundled conductors, the critical voltage for formation of corona will _____. (decrease/increase)
108. Bundle conductors in transmission lines _____ radio interference. (reduce/increase)
109. The dc transmission is mainly at _____ kV. (50, 66, 132, 500)
110. For a 400 kV line, the spacing between phase conductors is about _____ m. (8, 11, 14, 20)
111. _____ conductors are invariably employed for overhead transmission lines.
112. For a 400 kV the economical value of span is _____ metres.
113. _____ configuration has been found the most economical for double circuit lines.
114. _____ and _____ voltage lines are confined within the limits of towns and cities and within small distance in rural areas.
115. Normally an overhead line should cross the railway track at _____ angle. However, a deviation to the extent of _____ can be permitted under unavoidable circumstance.

ANSWERS

1. 11
2. 33
3. 33
4. 765
5. 11
6. ultra
7. service mains
8. ± 3%
9. superior

CHAPTER 10

Switchgear and Protection

Short Answer Type Questions With Answers

Q. 1. What is meant by short-circuit ?

Ans. When conductors of different phases come into contact with each other in a power line, power transformer, or any other circuit element, part of the impedance of the system is shunted out of the circuit, a large current flows in one or more phases, a short-circuit is said to have occurred.

Q. 2. What is difference between a short-circuit and an overload ?

Ans. On occurrence of a short-circuit, the voltage at the fault point is reduced to zero and current of abnormally high magnitude flows through the network to the fault point. On the other hand, an overload means that load greater than the designed value have been imposed on the system. In case of an overload, the voltage at the overload point may become low, but cannot be zero. The undervoltage conditions may extend to some distance beyond the overload point in the remainder of the system. In case of an overload, the currents are high but are substantially lower than in the case of a short-circuit.

Q. 3. The probability of the failure or occurrence of abnormal conditions is more on the power line. Why ?

Ans. The probability of the failure or occurrence of abnormal conditions is more on the power line. This can be explained by the fact that the power lines are widely branched, have greater length, operate under variable weather conditions and are subject to the action of atmospheric disturbances of electrical nature.

Q. 4. Name the different faults likely to occur in an overhead transmission line.

Ans. The different faults likely to occur in an overhead transmission line are (1) Single phase to ground, (2) Phase to phase, (3) Two phases to ground, (4) Phase to phase and third phase to ground, (5) All the three phases shorted and (6) All the three phases to ground.

Q. 5. Which type of fault occurs more frequently in overhead lines ?

Ans. Single phase to ground (L-G) fault occurs more frequently in overhead lines.

Q. 6. Which type of faults are taken into account while determining the rating of the circuit breaker ?

Ans. The balanced three-phase fault, though its occurrence in quite rare (only about 5 percent of the total), imposes most severe duty on circuit breakers and is, therefore, used in determination of the circuit-breaker rating.

Q. 7. What are the sources of short-circuit power in a power system ?

Ans. Mainly there are three sources viz. synchronous generators, synchronous motors and synchronous condensers and induction motors, which can feed into the short-circuit.

Q. 8. What are the basic requirements of a protection system ?

Ans. The basic requirements of a protection system are essentially reliability and simplicity, selectivity and discrimination, sensitivity, speed of operation and economy.

Q. 9. Why current transformers are required in a protective relaying scheme ?

Ans. The primary circuit currents which are of high magnitudes are to be reduced to values suitable for relay operation and current transformers are used for this purpose. In addition to this CTs provide insulation against the high voltage of the power circuit and protect the apparatus and the operating personnels from contact with the high voltages of the primary circuits.

Q. 10. Why potential transformers are required in a protective relaying scheme ?

Ans. It is not possible to connect the potential coils of the protective devices directly into the system in case of high voltage systems. It is, therefore, necessary to stepdown the voltage and also to insulate the protective equipment from the primary circuit (high voltage power circuit). This is achieved by employing potential (or voltage) transformers (PTs).

Q. 11. What is meant by percentage reactance ?

Ans. Percentage reactance can be defined as the voltage drop across the given reactance expressed as percentage of normal voltage when carrying full-load current pertaining to normal rating.

Q. 12. Which of the electrical quantities are chosen as base values ?

Ans. For common representation, base kVA (or MVA) and base voltage (kV) are chosen as base values.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 13. What is meant by per-unit value of any quantity ?

Ans. Per-unit value of any quantity is defined as the ratio of the actual value of the quantity in any unit to the base or reference value in the same unit.

Q. 14. What is the relationship between base kVA, base kV and percentage reactance ?

Ans. Percentage reactance

$$= \text{Actual reactance} \times \frac{\text{base kVA}}{(\text{base kV})^2 \times 1{,}000} \times 100$$

Q. 15. Why the per-unit method is considered superior to per cent method for short-circuit calculations ?

Ans. Per cent value is not convenient for use as the factor of 100 has to be carried in computations.

Q. 16. Define base impedance of a power system element and write an expression for it in terms of base MVA and kV.

[Bharathidasan Univ. November 1996]

Ans. Base impedance is defined as the ratio of base voltage in volts and base current in amperes and it is expressed in terms of base MVA and kV as follows :

$$\text{Base impedance in ohms} = \frac{(\text{Base kV})^2}{\text{Base MVA}}$$

Q. 17. What is meant by base quantities ? **[Bharathiyar Univ. April 1997]**

Ans. For common representation, the quantities (voltage, current, power or impedance) choosen as common or reference quantities are called the base quantities.

Q. 18. Define pu impedance. **[Bharathiyar Univ. Nov. 1996]**

Ans. Per-unit impedance is defined as the ratio of voltage drop across the given impedance to the normal voltage when carrying full-load current pertaining to normal rating.

Q. 19. What is relation between percentage impedance and pu impedance ? **[Bharathiyar Univ. November 1996]**

Ans. Percentage impedance = PU impedance × 100

Q. 20. What is meant by fault level ? **[Bharathidasan Univ. November 1996]**

Ans. When fault occurs at a point in a power system, the corresponding MVA is referred to as the fault level at that point.

Q. 21. What are current limiting reactors ?

Ans. Current limiting reactors are inductive coils having large inductive reactances in comparison to their resistances and are commonly installed on large power systems to limit the magnitude of short-circuit currents and reduce the resulting voltage disturbances on the rest of the system.

Q. 22. Why it is not necessary to insert current limiting reactor between the generator and the generator bus ?

Ans. Since modern generators have sufficient inherent transient reactance to protect themselves against dead 3-phase short-circuit at their terminals, insertion of current limiting reactors between the generators and their bus is not necessary.

Q. 23. What are symmetrical components ?

[Madurai Kamaraj Univ. November 1996]

Ans. According to the theory of symmetrical components, any unbalanced system of phasors (voltages, currents or impedances etc.) can be resolved into balanced systems of phasors equal in number to the number of phases. These balanced systems of phasors are called the symmetrical components of the original unbalanced system.

Q. 24. What are the uses of symmetrical components in power systems ?

[Bharathidasan Univ. November 1996]

Ans. Symmetrical component method provides a useful analytical tool for the protection engineer and is useful in system fault calculation and system stability problems etc.

Q. 25. Differentiate between the positive-sequence system and zero-sequence system.

Ans. The positive–sequence system is a set of three symmetrical voltages (*i.e.*, all numerically equal and all displaced from each other by 120°) having the same phase sequence as the original set of three unbalanced voltages *i.e.*, A-B-C where as the zero–sequence system is a set of three voltages, all equal in magnitude and in phase with each other.

Q. 26. Define negative–sequence impedance. **[Madras Univ. April 1997]**

Ans. The impedance of the network offered to the flow of negative–sequence currents is called the negative–sequence impedance of the network.

Q. 27. What are sequence networks ?

[Madurai Kamaraj Univ. November 1996]

Ans. The single phase equivalent circuit composed of impedances to current of any one sequence only is called the sequence network for that particular sequence. Hence corresponding to positive–, negative–and zero-sequence currents we have positive-, negaive– and zero–sequence networks.

Q. 28. What are the different types of faults which occur in a power system ? **[Madurai Kamaraj Univ. November 1996]**

Ans. The most common and dangerous faults that occur in a power system are the short-circuit or shunt faults such as L-G, L-L, L-L-G, L-L-L and L-L-L-G faults. The other type of faults that occur in a power system are series type such as one conductor open fault and two conductor open fault.

Q. 29. What are unsymmetrical faults ? **[Bharathiyar Univ. November 1996]**

Ans. The faults giving rise to unsymmetrical currents i.e., currents differing in magnitude and phases in the three phases of the power system are known as unsymmetrical faults. Unsymmetrical faults may also be defined as the faults involving one or two phases (not involving 3 phases) such as L-G, L-L, L-L-G faults.

Q. 30. For a fault at a given location rank the various faults in the order of severity. **[Madras Univ. October 1996]**

Ans. The faults in increasing order of severity are L-G, L-L, L-L-G, and symmetrical three-phase faults (L-L-L or L-L-L-G).

Q. 31. Name the faults which do not have zero–sequence currents flowing. **[Madras Univ. October 1996]**

Ans. In line-to-line faults and symmetrical faults (L-L-L or L-L-L-G faults) no zero–sequence current flows.

Q. 32. Name the fault in which all the three sequence currents are present and are equal to each other. **[Madras Univ. October 1996]**

Ans. In L-G fault all the three sequence currents are present and are equal to each other.

Q. 33. Which of the faults would cause a greater electromagnetic interference between the power line and a nearby communication line ? **[Bharathidasan Univ. November 1996]**

Ans. Single phase-to-ground (L-G) fault, due to heavy unbalancing of line currents, causes greater electromagnetic interference between the power line and a nearby communication line.

Q. 34. What is meant by a fuse ?

Ans. Fuse is a device used in an electrical circuit for protecting electrical equipments against overloads and/or shor-circuits.

Q. 35. On what principle does the fuse operate ?

Ans. The action of a fuse is based upon the heating effect of the electric current. During overloads or short-circuits the fuse gets

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

heated up to melting point due to excessive current and breaks the circuit.

Q. 36. What kind of protection is offered by a fuse ?

Ans. The fuse provides protection against short-circuits and overloads.

Q. 37. What function does the fuse perform ?

Ans. The function of a fuse wire is (*i*) to carry the normal working current safely without heating and (*ii*) to break the circuit when current exceeds the limiting current.

Q. 38. Give the names of five materials with their melting points which are used for fuse element.

Ans. The materials commonly used for fuse elements are silver, tin, lead, copper and aluminium. Their melting points are 980°C, 240°C, 328°C, 1,090°C and 665°C respectively.

Q. 39. What material is mostly used for an ordinary fuse wire ?

Ans. Copper or lead-tin alloy.

Q. 40. What is fuse link ?

Ans. Fuse link is that part of the fuse which needs replacement when the fuse blows out.

Q. 41. On what factors does the current carrying capacity of a fuse depend ?

Ans. The current carrying capacity of a fuse depends upon the permissible temperature rise of the contacts of the fuse holder, size of fuse wire, fuse material and the surrounding of the fuse.

Q. 42. On what factors does the fusing current depend ?

Ans. The fusing current depends upon (*i*) diameter of wire (*ii*) length of wire (*iii*) fuse material (*iv*) x-sectional area (round or rectangular) (*v*) size and location of terminals (*vi*) type of enclosure used (*vii*) type of surface etc.

Q. 43. What are the purposes of using quartz sand as filler material in the construction of HRC fuse ?

Ans. The purposes of using quartz sand as filler material in the construction of HRC fuse are to absorb heat at a very high rate, to produce a substance of high resistance and avoid the oxidation of silver element.

Q. 44. What is meant by discrimination ?

Ans. Discrimination means the breaking of the faulty section of the line to an extent restricted to minimum; healthy sections of the circuit remaining in operation.

Q. 45. Can the HRC fuse be used for both ac and dc circuits. If so under what condition ?

Ans. In general an HRC fuse meant for ac circuit may not be used for dc circuits; but however, a fuse satisfying the requirement of arc voltage can be used on both ac and dc circuits.

Q. 46. What do you understand by switchgear ?

Ans. The apparatus employed for switching, controlling and protecting the electrical circuits and equipment is known as switchgear.

Q. 47. What is a circuit breaker ?

Ans. Circuit breaker is a mechanical device designed to close or open contact members, thus closing or opening an electrical circuit under normal or abnormal conditions.

Q. 48. How does a circuit breaker differ from a switch ?

Ans. A circuit breaker is a device that interrupts the abnormal or fault currents and in addition performs the function of a switch.

Q. 49. What for isolating switches are provided along with circuit breakers ?

Ans. Isolating switches are provided for separating the disconnected element from the live portion of the system for the purposes of safety.

Q. 50. Which of the gases are employed in commercial gas–blast circuit breakers ?

Ans. SF_6 and air are used in commercial gas–blast circuit beakers.

Q. 51. What is meant by current chopping ?

Ans. Current chopping is a phenomenon of current interruption before the natural current zero is reached.

Q. 52. Why is current chopping considered a serious drawback in a circuit breaker ?

Ans. The current chopping is considered a serious drawback because it sets up high voltage transient across the breaker contacts.

Q. 53. How is the effect of overvoltage developed due to current chopping overcome ?

Ans. By using resistance switching *i.e.*, by connecting a resistance across the circuit breaker contacts.

Q. 54. Why current chopping is not common in oil circuit breakers ?

Ans. Current chopping is not common in oil circuit breakers because in most of the oil circuit breakers the arc extinguishing power is proportional to the magnitude of current to be interrupted.

Q. 55. What is meant by kilometric fault ?

Ans. The fault occuring between a distance of a few km to few tens km from the circuit breaker arc called kilometric faults.

Q. 56. Name the materials used for contacts of vacuum circuit breakers ?

Ans. Copper-bismuth, copper-lead, copper-tellurium, copper-thallium, silver-bismuth, silver-lead and silver-tellurium are some of alloys employed as contact materials in vacuum circuit breakers.

Q. 57. What is meant by breaking or rupturing capacity of a circuit breaker ?

Ans. Breaking capacity of a circuit breaker is the highest rms value of current that it is capable of breaking under specified conditions of transient recovery voltage and power frequency voltage. It is expressed in k A_{rms} at contact separation.

Q. 58. Why asymmetrical breaking current is higher than symmetrical breaking current in a circuit breaker ?

Ans. Asymmetrical breaking current is the rms value of the combined sum of ac and dc components of short-circuit current at the instant of separation of breaker contacts while symmetrical braking current is the rms value of the ac component alone. Thus asymmetrical breaking current is higher than symmetrical breaking current.

Q. 59. What is meant by making capacity of a circuit breaker ?

Ans. The making capacity of a circuit breaker, when closed on a short circuit, is the peak value of the maximum current wave (including dc component) in the first cycle of the current after the circuit is closed by the circuit breaker.

Rated making capacity = 2.55 × symmetrical rated breaking capacity

Q. 60. What is meant by rated voltage of a circuit breaker ?

Ans. The rated maximum voltage of a circuit breaker is the highest rms voltage, above nominal system voltage, for which the circuit breaker is designed and is the upper limit for operation.

Q. 61. Name the three problems encountered in HVDC circuit breakers ?

Ans. The three problems encountered in HVDC circuit breakers are:

1. How to create artificial current zero ?
2. How to prevent restriking of arc ?
3. How to dissipate the stored energy ?

Q. 62. Why a decaying dc offset current wave appears when ac circuit breaker is suddenly switched to an inductive circuit at the instant when voltage wave is passing through zero?

[U.P.S.C. I.E.S. E.E.-II, 2000]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. In an inductive circuit, current lags behind the voltage by a large angle *i.e.* when voltage is passing through zero, current is around maximum value. Also current in an inductive circuit cannot change instantaneously. So when ac circuit breaker is suddenly switched on to an inductive circuit, the current may be around maximum value which cannot change instantaneously, to compensate this dc off current appears which dies out as time passes and a steady-state condition is reached.

Q. 63. What is a protective relay ?

Ans. Protective relay is an electrical device designed to initiate isolation of a part of an electrical installation, or to operate an alarm signal, in the event of an abnormal condition or a fault,

Q. 64. What are the functions of a protective relay ?

Ans. The main functions of protective relays are to detect the presence of faults, their locations and initiate the action for quick removal from service of the faulty section of the system. Relays operate to trip the power circuit breakers to disconnect the faulty section.

Q. 65. What are the essential elements of a protective relay ?

Ans. The essential elements of a protective relay are (*i*) sensing element (*ii*) comparison element, and (*iii*) control element.

Q. 66. What are the fundamental requirements of protective relaying ?
[A.M.I.E. Sec B. Summer 1999]

Ans. The fundamental requirements of protective relaying are speed, selectivity, sensitivity, reliability, simplicity, and economy.

Q. 67. Define the terms 'sensitivity' and 'selectivity' of a relay.
[A.M.I.E. Sec B. Winter 1994]

Ans. Sensitivity of a relay means its capacity to operate reliably under the actual conditions that produce the least operating tendency while the selectivity means the ability to determine the point at which the fault occurs and select the nearest circuit breaker in the system to trip so that the fault is cleared with minimum or no damage to the system.

Q. 68. What is meant by "relay setting "?

Ans. Relay setting means actual value of the energizing or characteristic quantity at which the relay is designed to operate under given conditions.

Q. 69. What is meant by operating time of a protective relay ?

Ans. The operating time of a protective relay means the time which elapses between the instant when the actuating quantity exceeds the pick-up value to the instant when the relay contacts close.

Q. 70. What is meant by 'relay time' ?

Ans. Time interval between occurrence of fault and closure of relay contacts is called the relay time.

Q. 71. How are relay time, breaker time and fault clearing time related ?

Ans. Relay time plus breaker time equals the fault clearing time.

Q. 72. What are the shortcomings in elecromagnetic relays ?
[A.M.I.E. Sec B. Summer 1994]

Ans. The vibration of relay armature at double the supply frequency, due to pulsating nature of electromagnetic force, causes the relay to hum and produce noise and also is a source of damage to the relay contacts. This leads to sparking and unreliable operation of the relay operative circuit contacts due to make and break of the circuit.

Q. 73. How definite time lag is achieved in attraction-armature relays ?

Ans. The instantaneous type attraction armature relays can be made a definite time lag or inverse-time lag by using an oil dash pot, an air-escapment chamber, a clockwork mechanism or by placing a fuse in parallel with it.

Q. 74. How induction cup type construction is superior to induction disc type ?

Ans. Induction cup type construction develops more efficient torque than either shaded pole or watt-hour meter constructions. Such relays are very fast in operation and may have an operating time of less than 0.01 second.

Q. 75. What is Buchholz relay ? Which equipment is protected by it ?
[A.M.I.E. Sec B. Summer 2000]

Ans. Buchholz relay is a gas actuated relay and is used for the protection of power transformers of ratings exceeding 500 kVA.

Q. 76. For what type of fault Buchholz relay is employed ?

Ans. Buchholz relay provides protection only against transformer internal faults.

Q. 77. Define PSM ?

Ans. PSM stands for plug-setting multiplier and is defined as the ratio of fault current in relay coil to the pick-up value.

Q. 78. What are the main features of directional relays ?

Ans. Directional relays must have the following features: (*i*) High speed operation, (*ii*) high sensitivity, (*iii*) adequate short-time thermal rating, (*iv*) ability to operate with low values of voltage (*v*) burden must not be excessive and (*v*) there should be no voltage and current creep.

Q. 79. Where is directional relay used?

Ans. Directional relays are used when graded-time overload protection is applied to ring mains and interconnected networks.

Q. 80. What is distance protection ?

Ans. Distance protection is the name given to the protection, whose action depends upon the distance of the feeding point to the fault point. It is non-unit type protection and the protection zone is not exact. It can be used as primary as well as backup protection.

Q. 81. In what way a distance relay is superior to overcurrent protection for the protection of transmission lines ?
[A.M.I.E. Sec B. Winter 1998]

Ans. Distance relay is superior to overcurrent protection for the protection of transmission lines. The reasons are faster protection, simpler coordination, simpler application, permanent setting without need for readjustments, less effect of amount of generation and fault levels, fault current magnitude, permits the high line loading.

Q. 82. Why directional feature provided for impedance relay cannot be used for reactance relay ? **[A.M.I.E. Sec B. Winter 1994]**

Ans. The directional feature provided for impdance relay cannot be used for reactance relay because the reactance relay will trip even under normal operating conditions at or near unity power factor. The reactance type distance relay needs a directional unit that is inoperative under normal load conditions.

Q. 83. Why reactance type relay is very suitable as a ground relay for ground fault ?

Ans. Reactance type relay is very suitable as a ground relay for ground fault because its reach is not affected by fault impedance (*i.e.*, arcing resistance).

Q. 84. For what type of protection will you recommend (*i*) impedance relay (*ii*) reactance relay and (*iii*) mho relay ?

Ans. The impedance type relay is suitable for phase fault relaying for lines of moderate length; reactance type relays are preferred for ground fault relaying while mho type relays are best suited for long lines and particularly where a severe synchronising power surge may occur.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 85. Why a 'Mho relay' is normally used for the protection of a long distance transmission line? [U.P.S.C. I.E.S. E.E.-II, 2009]

Ans. Mho type relays are best suited for phase fault relaying for long lines and particularly where a severe synchronising power surge may occur. They are most sensitive of all the distance relays. The mho relay is reliable because it combines both the directional and distance measuring functions in one unit.

Q. 86. What is meant by a differential relay ?

Ans. A differential relay is defined as the relay that operates when phasor difference of two or more similar electrical quantities exceeds a predetermined amount.

Q. 87. Where differential protection principle is employed ?

Ans. Differential protection principle is employed for the protection of generators, generator-transformer units, transformers, feeders, large motors and bus-bars.

Q. 88. Why is percentage-differential relay named so ?

Ans. Percentage-differential relay is known by this name because the operating current required to trip can be expressed as a percentage of load current.

Q. 89. Why a biased-differential relay is preferred over a simple differential relay ?

Ans. Biased-differential relay is preferred over a simple differential relay because its operation is not affected by the trouble arising out of difference in CTs ratios for high values of external short-circuit currents.

Q. 90. Where is negative phase sequence relay employed ?

Ans. Negative phase sequence relay is essentially employed for the protection of generators and motors against unbalanced loading that may arise due to phase-to-phase faults.

Q. 91. What are the common types of generator faults ? [A.M.I.E. Sec. B. Winter 1986]

Ans. The common types of faults occuring in synchronous generators are enumerated below.

1. Stator winding faults – phase-to-phase faults, phase-to-earth faults and inter-turn faults.
2. Rotor winding faults – conductor-to-earth faults, open-circuit faults, inter-turn faults.

The other abnormal operating conditions are (*i*) failure of prime mover (*ii*) failure of field (*iii*) unbalanced loading (*iv*) overloading (*v*) overvoltage at generator terminals (*vi*) over-speed (*vii*) ventilation failure (*viii*) current leakage in the generator body.

Q. 92. The occurrence of short-circuiting between the stator windings is quite rare. Why so ?

Ans. The occurrence of short-circuiting between the stator windings is quite rare because the insulation in a slot between coils of different phases is at least twice as thick as the insulation between one coil and the iron core.

Q. 93. What is differential protection ?

Ans. The differential protection is that which responds to the phasor difference between two or more electrical quantities.

Q. 94. Which type of relays are used in Merz-Price protection system for alternator ?

Ans. The relays used in Merz-Price protection system of alternator are instantaneous electromagnetic type (attracted-armature type).

Q. 95. How does the inclusion of resistance in neutral grounding circuit of an alternator affect the performance of the differential protection of a 3-phase synchronous generator ?

Ans. With the inclusion of resistance in neutral grounding circuit of an alternator, it will not be possible to protect whole of the stator windings of a star-connected generator against earth faults. The percentage of winding protected depends on the value of neutral grounding resistor and earth-fault relay setting.

Q. 96. Does the Merz-Price system of protection applied to alternators provide any protection for turn-to-turn faults on the same phase ? If not why ?

Ans. Merz-Price system of protection applied to alternators does not provide any protection against turn-to-turn faults on the same phase because the current produced by such a fault flows in a local circuit between the turns involved and does not create the difference between the currents entering and leaving the windings at its two ends where the high voltage CTs are mounted.

Q. 97. Why it is not necessary to provide protection for turn-to-turn fault in turbo-generators ?

Ans. The coils of modern large turbo-generators are usually single turn and, therefore, it is not necessary to provide protection for turn-to-turn faults.

Q. 98. What type of protective device is used for the protection of an alternator against overheating of its stator ?

Ans. Resistance temperature detector.

Q. 99. Why is overcurrent protection not necessary for modern alternators ?

Ans. Overcurrent protection is not considered necessary for modern alternators because these are capable of withstanding a complete short-circuit at their terminals for sufficient time without much overheating and damage.

Q. 100. Why is it not necessary to provide overvoltage protection in turbo-generators ?

Ans. The overvoltage in a generator occurs when the prime mover speed increases due to sudden loss of the load on the generator and the speed control governors in case of turbo-generators are very sensitive to speed variations and, therefore, generated overvoltage of significant duration or magnitude does not generally occur. That is why it is not necessary to provide over-voltage protection in turbo- generators.

Q. 101. What types of protective device are used for the protection of an alternator against overheating of its rotor.

Ans. DC relay and resistance measuring circuit.

Q. 102. Why is it necessary to suppress the field immediately after disconnection of faulty alternator from the system?

Ans. In the event of a fault on a generator winding even though the generator circuit breaker is tripped, the fault continues to be fed as long as the excitation will exist because emf is induced in the generator itself. Hence it is necessary to suppress the field immediately after disconnection of faulty generator from the system.

Q. 103. What is field suppression ?

Ans. The opening of the field circuit breaker and discharge of stored energy in the field winding through a resistor is called the field suppression.

Q. 104. What type of relays are required for backup protection of alternators ?

Ans. High set, definite minimum time, induction type, inverse over-current, earth-fault relays are required for backup protection of alternators ?

Q. 105. What are the types of faults that are likely to occur in operation of a 3-phase induction motor ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The faults which are likely to occur in operation of a 3-phase induction motor are : Stator faults (phase-to-phase, phase-to-ground and inter-turn faults), rotor faults (earth faults and inter-turn faults), prolonged overloading, stalling, unbalanced supply voltages, single phasing, undervoltage, reverse phase.

Q. 106. What are the faults that are likely to occur in a power transformer?

Ans. The faults likely to occur in a power transformer are open-circuit faults (an open-circuit in one phase of a 3-phase transformer), earth faults, phase-to-phase faults, inter-turn faults and overheating.

Q. 107. What are incipient faults ?

Ans. Incipient faults are initially minor faults causing gradual damage. These faults include loose connections in conducting path, sparking, small arcing etc., and grow into major faults.

Q. 108. What is through fault ?

Ans. A through fault in one which is beyond the protected zone of the transformer but fed through it.

Q. 109. What are the various protective schemes available for power transformers ?

Ans. Different protective schemes available for the protection of power transformers are Buchholz protection, percentage differential protection, earth-fault protection, overcurrent protection, combined leakage and overload protection, restricted earth-fault protection, overfluxing protection etc.

Q. 110. On what factors does the choice of a protective gear for transformer depend ?

Ans. The choice of a protective gear for a transformer depends upon several factors such as (*i*) type of transformer (distribution transformer or power transformer), (*ii*) size of the transformer, (*iii*) type of cooling used (*iv*) systems where used *i.e.*, its electrical location in the network and (*v*) the importance of the service for which it is required.

Q. 111. In what respect core-balance leakage protection is inferior to combined leakage and overload protection ?

Ans. The core-balance leakage protection suffers from the drawback that it does not provide protection against phase-to-phase faults.

Q. 112. Does circulating current protection system provide protection against inter-turn fault in case of power transformers ?

Ans. Yes.

Q. 113. Name the two basic requirements that are to be fulfilled by differential relay.

Ans. The two basic requirements to be satisfied by differential relay on the protection of power transformers are that the differential relay should not operate on overload or external faults and it must operate on severe internal faults.

Q. 114. If T is the turn-ratio of power transformer, what will be the turn ratio of CTs on the *lv* side ?

Ans. If T is the turn-ratio of power transformer, then turn-ratio of CTs on the *lv* side will be T times that of CTs on the *hv* side ?

Q. 115. What are the shortcomings of differential protection scheme as applied to power transformer ?

Ans. Simple differential protection, as applied to a power transformer, has the following drawbacks.

(*i*) Unmatched characteristic of CTs (*ii*) Change in ratio due to tap-changing and (*iii*) magnetising inrush current.

Q. 116. What is magnetising inrush current ?

Ans. When the transformer is energized initially there is no induced emf, the condition is similar to switching of an inductive circuit. The resistance being low, a transient rush of current takes place. This transient rush of current is known as magnetising inrush current and it may be equal to 6 to 8 times the rated current.

Q. 117. What is the reason behind providing a second harmonic restraint relay ?

Ans. Second harmonic restraint relay is provided to avoid maloperation of the relays due to magnetising inrush current.

Q. 118. What are the advantages of differential magnetic balance protection system, as applied to power transformers ?

Ans. The main advantages of differential magnetic balance protection system in its application to power transformers are increased stability and sensitivity and its application to transformers provided with load tap-changers.

Q. 119. How is frame leakage protection provided in power transformers?

Ans. The transformer tank is connected to earth through CT to which an instantaneous earth-fault relay is connected.

Q. 120. What is unit type protection ?

Ans. Unit system of protection is one in which the protection responds to faults in the protected zone alone and it does not respond to through faults (faults beyond the protected zone). Non-unit systems do not have exact zone boundary.

Q. 121. Give the examples of unit/and non-unit systems of protection.

Ans. Unit type protection includes pilot-wire differential protection, carrier–current protection based on phase comparison etc. while non-unit type protection includes time-graded overcurrent protection, current-graded overcurrent protection, and distance protection.

Q. 122. What is meant by time-graded protection ?

Ans. Time-graded protection is a scheme of overcurrent protection, in which discrimination is incorporated *i.e.*, the time setting of relays is so graded that in the event of fault, the smallest possible part of the system is disconnected.

Q. 123. What is the purpose of time grading of protection system and where is it employed ?

Ans. The purpose of time grading of protection system is to incorporate time discrimination. It is employed for the protection of radial feeders, parallel feeders and interconnected systems.

Q. 124. What type of relay is suitable for radial feeders ?

Ans. Induction type inverse definite mininum time (IDMT) relays are most suitable for radial feeders.

Q. 125. What is the minimum time interval which can be permitted for the two adjacent circuit breakers to operate in radial feeders ?

Ans. 0.4 second.

Q. 126. Why induction type IDMT relays are most suitable for protection of radial feeders ?

Ans. Induction type IDMT relays are most suitable for protection of radial feeders because their time-current characteristics are similar in shape and in no case they cross each other at any point.

Q. 127. On what fact is the current-graded protection based ?

Ans. Current-graded protection is based on the fact that the short-circuit current along the length of the protected circuit decreases with the increase in distance between the supply end and the fault point.

Q. 128. What type of relay is suitable for current-graded protection ?

Ans. High-speed high-set overcurrent relays.

Q. 129. Can Merz-Price system be employed for protection of ring mains and duplicate feeders ?

Ans. Yes.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 130. Does Merz-Price system provide backup protection or overload protection ?

Ans. No.

Q. 131. Why Merz-Price protection is not suitable beyond 33 kV ?

Ans. Difficulties are experienced in balancing the secondaries of the two CTs and that is why Merz-Price protection system cannot be used beyond 33 kV.

Q. 132. Is the operation of relays affected by capacitive currents in Translay system of protection of feeders?

Ans. No.

Q. 133. Why is use of wire-pilot relaying scheme restricted to protection of short transmission lines ?

Ans. In case of medium and long transmission lines the pilot-wire protection scheme becomes expensive because of cost of pilot-wires.

Q. 134. What are the main elements of current–carrier protection ?

Ans. The main elements of the current-carrier protection scheme are: (*i*) transmitter (*ii*) receiver (*iii*) coupling equipment and (*iv*) line trap.

Q. 135. What purposes are served by line trap and coupling capacitors in carrier channels ?

Ans. Line trap is an LC network inserted between the busbar and connection of coupling capacitor to the line and tuned to resonance at the high frequency and are used to confine the carrier currents to the protected section so as to avoid interference with or from adjacent carrier-current channels and also to avoid loss of the carrier-current signal in adjoining power circuits for any reason whatsoever.

The coupling capacitor is used to connect the high frequency (carrier) equipment to one of the line conductors and simultaneously serves to isolate the carrier equipment from the high-power line voltage.

Q. 136. What is meant by voltage surge ?

Ans. By voltage surge is meant any sudden excessive rise in voltage that may be dangerous to the electrical equipment of an installation.

Q. 137. What are the internal causes of overvoltages ?

Ans. Internal overvoltages arise during sudden changes in the operating conditions of an installation such as a switch-in, switch-out or sudden change in load, the opening of circuits with large inductance or capacitance, the interruption of a short-circuit current, the appearance of an arc fault between one phase and ground, as well as other circuit disturbances.

Q. 138. What is meant by lightning ?

Ans. Lightning is a huge spark, which is due to the electrical discharge taking place between the clouds, within the same cloud and between the clouds and ground.

Q. 139. What is difference between A stroke and B stroke ?

Ans. A stroke is characterised by the comparatively long time to produce discharge, while the B stroke is characterised by its rapidity. A stroke strikes the highest and most sharply pointed object in the neighbourhood while B stroke ignores the tall objects and reaches the ground in a random manner. B stroke is most dangerous.

Q. 140. What is earthing screen ? What type of protection is provided by it ? What is it application ?

Ans. Earthing screen consists of a network of copper conductors, earthed at least on two points, over all the electrical equipment in the substation. An electrostatic shield against external field is presented by such a screen and so protects the system. Earthing screen protects the system from direct lightning strokes, reduces the voltages induced electrostatically or electromagnetically but does not provide any protection against voltage waves which may still reach the terminal equipment.

Substations, interconnectors and powerhouses are protected from direct strokes by earthing screen.

Q. 141. What is an earth wire ?

Ans. An earth wire is a form of lightning protection using a conductor or conductors, well grounded at regular intervals, preferably at each support, and attached from support to support above the transmission line.

Q. 142. Why earth wire is provided in overhead transmission lines ?

Ans. Earth wire is provided above overhead transmission lines for protection from lightning strokes. The ground wire shields the phase or line conductors by attracting itself the lightning strokes which, in its absence would strike the phase conductors. Besides it, the ground wire reduces the voltage electrostatically or electromagnetically induced in the conductors by the discharge of a neighbouring cloud. It also provides additional protective effect by causing attenuation of travelling waves set in lines by acting as a short-circuited secondary of the line conductors.

Q. 143. What is meant by protective angle ? Give its value for reliable protection.

Ans. Protective angle is the angle between the vertical line through the ground wire axis and the line passing from the ground wire axis to the outermost phase conductor. Its value for reliable protection is taken equal to 20-30 degrees.

Q. 144. What is meant by coupling factor ?

Ans. The ratio of the induced voltage in the line conductors to the potential of ground wire is called the coupling factor.

Q. 145. What is meant by a lightning arrester or surge diverter ?

Ans. A surge diverter is a device that is connected between line and earth, i.e., in parallel with the equipment under protection at the substation. It limits the duration and amplitude of the follow current.

Q. 146. What is meant by impulse ratio of any lightning arrester ?

Ans. Impulse ratio of any lightning arrester is the ratio of breakdown voltage of a wave of special duration to the breakdown voltage of a 50 Hz wave.

Q. 147. What is the application of an electrolytic arrester ?

Ans. Electrolytic arrester is very delicate, needs daily supervision, and the film is required to be reformed whenever destroyed. It is used in conjunction with an impulse gap.

Q. 148. What is the main advantage of oxide film arrester ?

Ans. The main advantage of an oxide film arrester is that it does not require daily replacement and it may thus be installed at points in transmission systems where daily attendance is difficult or expensive to provide.

Q. 149. How metal oxide lightning arrester is superior to thyrite arrester ?

Ans. Metal oxide lightning arrester is simple in construction and has superior energy dissipation capacity, better surge protection, more stable protective characteristics and substantial reduction in overvoltage across the equipment as compared to thyrite arrester.

Q. 150. What is meant by "follow current" ?

Ans. Follow current is the current that flows from connected supply source through lightning arrester following the passage of discharge current.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 151. What is meant by surge absorber ?

Ans. The device, which reduces the steepness of the wavefront of a particular surge and thus minimizes the danger due to over-voltage is called the surge absorber.

Q. 152. What is the difference between a lightning conductor and lightning arrester ?

Ans. Lightning conductor is installed at the top of tall structures and is connected to the general mass of earth through a system of connecting conductors and the earth electrodes so that the structure under protection is not subjected to the dangerously high potential of the cloud discharges. While lighting arrester is a device that is connected in parallel with the equipment, under protection from lightning strokes, at the substation.

Q. 153. What is the difference between a lightning arrester and surge absorber ?

Ans. Lightning arrester limits the duration and amplitude of the follow current while a surge absorber reduces the steepness of the wave front of a particular surge.

Q. 154. What are the values of natural impedances for overhead lines and cables ?

Ans. The value of natural impedance for an overhead line is between 400 Ω and 600 Ω while for a cable it is between 40 Ω and 60 Ω.

Q. 155. Why velocity of propagation over all overhead lines is same ?

Ans. Velocity of propagation over all overhead lines is same because product of L and C is same for all overhead lines.

Q. 156. What is meant by crest of a wave ?

Ans. Crest of a wave is the maximum amplitude and is usually expressed in kV or kA.

Q. 157. What is meant by front of a wave ?

Ans. Front of a wave is the portion of the wave before crest and is expressed in time from the beginning of the wave to the crest value in ms or μs.

Q. 158. A transmission line of surge impedance Z_C is terminated through a resistance R. Give the coefficients of refraction and reflection.

Ans. Coefficients of refraction $= \dfrac{2R}{R + Z_C}$ and coefficient of reflection $= \dfrac{R - Z_C}{R + Z_C}$

Q. 159. While connecting station equipment to an overhead line through a cable it is important that length of the cable should not be very small. Why ?

Ans. In connecting station equipment to an overhead line through a cable it is important that the length of cable should not be shorter than the expected length of the wave otherwise successive reflections at the junction may cause piling up of voltage and the voltage at the junction may attain the value of incident voltage.

Q. 160. What is the effect of shunt capacitance at the terminal of a transmission line ?

Ans. The effect of shunt capacitance at the terminal of a transmission line is to cause the voltage at the terminal to rise to full-value gradually instead of abruptly i.e., to cause flattening of the wave front, which reduces the stress on the line-end windings of a transformer connected to the line.

Q. 161. What is the application of Bewley's lattice diagram ?

Ans. With the use of Bewley's lattice diagram one can know at a glance the position and direction of motion of every incident, reflected and transmitted wave on the system at every instant of time.

Q. 162. What is difference between system earthing and equipment earthing ?

Ans. System earthing deals with earthing of the system neutral to ensure system security and protection while equipment earthing deals with earthing of non-current carrying parts of the equipment to ensure safety of personnel and protection against lightning.

Q. 163. What is average resistance of a human body ?

Ans. About 1,000 Ω.

Q. 164. What is the current that is considered safe for human body ?

Ans. About 9 mA.

Q. 165. What is meant by an earth electrode ?

Ans. Any wire, rod, pipe, plate and an array of conductors embedded in ground horizontally or vertically is called the earth electrode.

Q. 166. Give the maximum permissible values of ground resistance for (*a*) large power stations (*b*) small substations.

Ans. (*a*) 0.5 Ω; (b) 2.0 Ω.

Q. 167. What is meant by 'let go current' ?

Ans. The maximum current at which the subject is capable of releasing an electrical conductor by using muscles directly stimulated by the current is called 'let go current'.

Q. 168. On what factor does the resistivity of soil depend ?

Ans. Soil resistivity depends upon moisture content, soil temperature, composition and amount of soluble salts in the soil, magnitude of current flowing through the soil and depth of the layer.

Q. 169. What is meant by earthing mat ?

Ans. A number of rods when joined together through copper conductors constitute an earthing mat. This is also called the earthing grid.

Q. 170. What is the chief argument that favours use of isolated neutral system ?

Ans. The chief argument that goes in favour of isolated neutral system is the possibility of maintaining continuity of supply in case one phase gets grounded until it is convenient to disconnect and repair the faulty line.

Q. 171. What is harmonic suppressor ?

Ans. Harmonic suppressor is an iron-cored reactor and is used in the neutral ground connections of a generator so that third harmonic currents are reduced to safe value.

Q. 172. Why is it necessary to keep the receiving-end voltage constant within specified limits ?

Ans. For satisfactory operation of equipment/machinery supplied by the electrical power network it is necessary to keep the receiving-end voltage constant within specified limits. Too wide variation of voltage may cause erratic operation or even malfunctioning of consumers appliances. This is statuary requirement also.

Q. 173. What are the limits within which consumer's terminal voltage should be maintained ?

Ans. According to IE rules the declared consumer's voltage is 415/240 V (*i.e.*, 415 V between phases and 240 V between phase and neutral). The higher and lower limits are 440/254 during light load hours and 400/230 V during peak load hours.

Q. 174. How is voltage control achieved ?

Ans. Voltage control is achieved by installing voltage control equipment at suitable places such as at (*i*) generating stations (*ii*) transformer stations supplying to feeders and (*iii*) at load end.

Q. 175. Name the different methods of controlling voltages in ac supply systems.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The different methods used to control voltages in ac supply system are (*i*) excitation control at generating stations and by using (*ii*) tap-changing transformers (*iii*) induction regulators (*iii*) booster transformers (*iv*) series compensation (*v*) shunt compensation and (*vi*) synchronous phase modifiers.

Q. 176. Why the excitation control is not possible beyond certain limits ?

Ans. Excitation below a certain level may cause unstability of the system and excitation above a certain limit may cause overheating of the rotor. So excitation control is not possible beyond certain limits.

Q. 177. What is a booster transformer ?

Ans. Booster transformer is one which is often used toward the end of a power line in order to raise the voltage to the desired value.

Q. 178. What special precautions must be taken when using a booster transformer ?

Ans. There must be no fuse on the *hv* side, or primary; since the booster transformer is similar to a current transformer, if the fuse should blow, an extremely high voltage could be built up on the secondary side.

Q. 179. State whether the tap changer in a transformer is provided on *hv* side or *lv* side ?

Ans. On *hv* side.

Q. 180. State any four types of substations according to the service ?

Ans. The substations, according to the service rendered are: Transformer substations, Switching substations, Converting substations and Frequency Changing substations.

Q. 181. State the relative merits of indoor and outdoor substations.

Ans. **Merits of Indoor Substations**. Less requirement of space, less maintenance and control cable length; protection from lightning; flexibility in installation, no dust and dirt.

Merits of Outdoor Substations. No building requirement, short erection time; Easy fault finding due to visibility of equipment; Easy repair work; Easier installation extension; Availability of sufficient space between equipments.

Q. 182. What are the factors governing the selection of site for substations ?

Ans. Factors governing the selection of site for a substation are :

1. Nearness to load centre 2. Availability of suitable and sufficient land 3. Availability of communication facilities 4. Drainage facilities 5. Availability of essential amenities to the staff. 6. Pollution free atmosphere 7. Facility for future extension 8. Distance from airport, military or police rifle training centre.

Q. 183. List out the equipment used in a substation.

Ans. Equipment used in a substation are Transformer(s); Bus-bars; Circuit breakers; CTs; PTs; Insulators; Isolators; Switchgear (fuses, air-break switches etc.), Protective relays; Surge arresters; Cables, Fire-fighting equipment; Batteries; Earthing arrangement, Wave traps, Reactors etc.

Q. 184. What are the functions of panels and fire-fighting equipment in a substation ?

Ans. *Panels* or *cubicles* in a substation are provided to support the various equipment like meters, relays etc. It saves the horizontal space and facilitates the supervisory staff to record readings easily. All the panels/cubicles are properly grounded.

Special type of fire extinguishers are installed in a substation to quench electric fire in case of a fire accident because ordinary fire extinguishers or water cannot be used to quench electric fire as it is dangerous. They are provided in accessible position and every one in the substation must know its operation.

Q. 185. What is flexible bus ?

Ans. Flexible bus consists of flexible ACSR or all aluminium alloy stranded conductors supported by strain insulators from each end.

Q. 186. Name the interlockings provided with isolators.

Ans. The interlocking provided with isolators are :

1. Interlocking between three poles for simultaneous operation.
2. Interlocking with circuit breakers.

Q. 187. In what way is an isolator different from an air-break switch ?

Ans. Isolators are used to connect or disconnect the line only under no-load condition while air-break switches are used for making and breaking of the circuit under loaded condition. Air-break switches are provided with arc control devices.

Q. 188. Why are isolators necessarily provided on the supply side of the circuit breakers ?

Ans. Isolators are necessarily provided on the supply side of the circuit breaker in order to ensure isolation of the circuit breaker from the live parts for the purpose of maintenance.

Q. 189. Give the sequence of operation during opening and closing of a circuit.

Ans. Sequence of operation of circuit breaker, isolator and earthing switch during opening/closing of a circuit are given below.

While Opening: Open circuit breaker, open isolator and then close earthing switch if provided.

While Closing: Open earthing switch, close isolator and then close circuit breaker.

Q. 190. Define stability limit.

Ans. A stability limit is the maximum power flow possible through some particular point in the system or the part of the system to which the stability limit refers is operating with stability.

Q. 191. Define steady state stability. **[Madras Univ. April 1997]**

Ans. Steady state stability may be defined as the capability of an electric power system to maintain synchronism between machines within the system and external tie lines following a small slow disturbance (normal load fluctuations, the actions of automatic voltage regulators and turbine governors).

Q. 192. What is meant by steady state stability limit ?

Ans. The steady state stability limit refers to the maximum power which can be transferred through the system without loss of stability.

Q. 193. Distinguish between steady state stability and transient stability of a power system. **[Bharathiyar Univ. November 1996]**

Ans. Steady state stability refers to the conditions of stability in response to small and gradual changes of load while transient stability refers to the conditions of stability in response to large sudden disturbances. A sudden large disturbance includes application of faults, clearing of faults, sudden load changes, and inadvertent tripping of lines and generators.

Q. 194. Define dynamic stability of a power system. **[Bharathidasan Univ. Nov. 1996]**

Ans. Dynamic stability is the ability of a power system to remain in synchronism after the initial swing (transient stability period) until the system has settled down to the new steady state equilibrium condition.

Q. 195. Define load angle of a generator. **[Madurai Kamaraj Univ. Nov. 1996]**

Ans. Angle between rotor pole axis and stator rotating field axis (both rotating together at synchronous speed) is called the load angle. It is expressed in electrical degrees or electrical radians.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 196. What is meant by power angle curve ?

[Bharathidasan Univ. Nov. 1996]

Ans. Power angle curve is a curve of power transfer P versus power angle δ. It is a sine curve.

Q. 197. What is meant by a swing curve ?

Ans. Swing curve is a graph of power angle δ versus time t.

Q. 198. On what basis do you conclude that a given synchronous machine has lost stability ? [Bharathiyar Univ. April 1997]

Ans. In case the power angle δ reduces after attaining maxima corresponding to $\frac{d\delta}{dt} = 0$ condition indicates stability. On contrary if the power angle exceeds critical angle of load, the system becomes unstable.

Q. 199. Define infinite bus in a power system.

[Bharathiyar Univ. April 1997]

Ans. Infinite bus has constant voltage, constant electrical angle of the voltage, constant frequency, infinite fault level and, therefore, the quantities of infinite bus do not get affected by connecting or disconnecting individual machines or transmission lines.

Q. 200. How can steady state limit be improved ?

Ans. Steady state limit can be improved either by increasing the excitation of the machine/machines or by reducing transfer reactance.

Q. 201. Write swing equation for a single machine system.

[Bharathiyar Univ. April 1997]

Ans. The swing equation for a single machine system can be written as $M\frac{d^2\delta}{dt} = P_S - P_E = P_S - P_{max}\sin\delta$

where M is angular momentum, P_S is shaft power (mechanical power), P_E is electromagnetic power, δ is load angle between E and V and P_{max} is the maximum steady state power.

Q. 202. Define inertia constants M and H. [Bharathidasan Univ. Nov. 1996]

Ans. M is the angular momentum of the machine and is expressed in joule-seconds per radian or in mega-joule-seconds per electrical degree. M, the inertia constant of the machine, depends on the type and size of the machine.

Another constant H having narrow range of values for each class of machine regardless of its capacity is defined as the ratio of the kinetic energy stored at rated speed to the rated power of the machine. H is expressed in MJ/MVA.

Q. 203. Give typical values of inertia constant H for turbo-generators and slow-speed water wheel generators.

[Madras Univ. October 1996]

Ans. The average value of H in MJ/MVA for turbo-generators is between 3 and 9 and for water-wheel generators it is between 2 and 4.

Q. 204. Write down the units of inertia constants M and H and their interrelationships. [Madras Univ. April 1997]

Ans. M is expressed in MJ-seconds/electrical degree or MJ-seconds/electrical radian and H is expressed in MJ/MVA

The interrelationship between M and H is given as

$$M = \frac{GH}{180f} = \frac{GH}{\pi f}$$

Q. 205. What is equal area criterion ? [Bharathiyar Univ. April 1997]

Ans. Equal area criterion is a simple graphical method of predicting the transient stability of two machine systems or a single machine against infinite bus. This criterion does not require solution of swing equation for determination of stability conditions. The stability conditions are determined by equating the areas of segments on the power angle diagram between the P-curve and the new power transfer line for the given condition.

Q. 206. For the swing equation $M\frac{d^2\delta}{dt^2} = P_A$, what will be the value of P_A during steady state operation ? [Madras Univ. October 1996]

Ans. During steady state operation the value of accelerating power P_A will be zero.

Q. 207. If the two machines with inertias M_1 and M_2 are swinging together, what will be the inertia of the equivalent machine ?

[Madras Univ. April 1997]

Ans. Equivalent machine inertia is given as $M_{eq} = \frac{M_1 M_2}{M_1 + M_2}$

Q. 208. What is the purpose served by power flow analysis ?

[Bahrathiyar Univ. April 1997]

Ans. Power flow analysis provides a systematic mathematical approach for determination of various bus voltages, their phase angles, active and reactive power flows through different branches, generators and loads under steady state conditions.

Q. 209. Name the three categories of buses. [Madras Univ. December 1996]

Ans. Depending upon which quantities have been specified, the buses are classified into following three categories;

1. Generation or voltage-controlled or P-V buses,

2. Load or P-Q buses and 3. Slack or swing or reference bus.

Q. 210. What are quantities specified at a generator bus ?

[Bharathidasan Univ. November 1996]

Ans. At a generator bus voltage magnitude and true or active power are specified.

Q. 211. Mention the items specified and not specified at a reference bus.

[Madras Univ. April 1997]

Ans. At a reference bus, the magnitude and phase angle of the voltage are specified. The unknown quantities are active and reactive power flows.

Q. 212. Whe is one of the buses taken as slack bus in load flow studies.

[U.P.S.C. I.E.S. E.E.-II, 2001]

Ans. The need to designate one of the buses as a slack bus is obviously due to the fact that the system power losses are not known initially and, therefore, the net power flow into the system cannot be fixed in advance. At his bus, the magnitude and phase angle of the voltage are specified. The phase angle of the voltage is usually set equal to zero. The active and reactive power at this bus are to be determined through the solution of equations.

Q. 213. How is the swing bus selected in a load flow study ?

[Bharathidasan Univ. November 1996]

OR

What are the guidelines for choosing slack bus ?

[Bharthiyar Univ. Nov. 1996]

Ans. One of the generation bus is selected as slack bus and the generators at this bus supply the difference between the specified real power injected into the system at other buses and the total output of the system plus system power losses.

Q. 214. Define the bus admittance matrix. [Bharthiyar Univ. April 1997]

Ans. General equation for n-bus network based on Kirchhoffs' current law and admittance form is $[I] = [Y_{bus}]^* [V]$ where [I] is the n-bus current matrix, [V] is the n-bus voltage matrix and $[Y_{bus}]$ is called the bus-admittance matrix and above equation is written as

$I = Y_{bus} V$

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

where $\mathbf{Y}_{bus} = \begin{bmatrix} Y_{11} & Y_{12} & Y_{13} & \dots & Y_{1n} \\ Y_{21} & Y_{22} & Y_{23} & \dots & Y_{2n} \\ Y_{31} & Y_{32} & Y_{33} & \dots & Y_{3n} \\ \dots & \dots & \dots & \dots & \dots \\ Y_{n1} & Y_{n2} & Y_{n3} & \dots & Y_{nn} \end{bmatrix}$ and is called the bus admittance matrix.

Q. 215. Define tree, cotree and cut-set

Ans. *Tree* is a subgraph containing all the nodes of the original graph but no closed path. The elements of the tree are known as branches.

Cotree is a complement of a tree. The elements of the original graph not included in the tree, form a subgraph which may not necessarily be connected, is known as cotree.

Cut-set is the minimal set of the elements in the connected graph which when removed, divide the graph in only two parts, *i.e.*, two connected subgraphs.

Q. 216. Give any two operating constraints imposed in load flow studies.

[Madras Univ. April 1997]

Ans. Two operating constraints may be voltage and reactive power.

Q. 217. Write general expression for the complex power injected by the source into the *i*th bus of a power system.

[Madras Univ. April 1997]

Ans. General expression for the complex power (conjugate) injected into *i*th bus is given as

$$\mathbf{S}_i^* = P_i - j Q_i = \mathbf{V}_i^* \sum_{k=1}^{n} \mathbf{Y}_{ik} \mathbf{V}_k \quad i = 1, 2, \dots n$$

Q. 218. Name any two iterative methods used for solution of load flow problems.

Ans. The most commonly used iterative methods for solution of load flow problems are 1. Gauss-Seidel method and Newton-Raphson method.

Q. 219. State Gauss-Seidel load flow formula.

[Madurai Kamaraj Univ. November 1996]

Ans. Gauss-Seidel load flow formula is given as

$$\mathbf{V}_i = \frac{1}{\mathbf{Y}_{ii}} \left[\frac{P_i - j Q_i}{\mathbf{V}_i} - \sum_{\substack{k=1 \\ k \neq i}}^{n} \mathbf{Y}_{ik} \mathbf{V}_k \right] \quad i = 2, 3, \dots, n$$ Bus 1 is a slack bus with specified V.

Q. 220. What is meant by acceleration factor in load flow solution and its best value ?

[Bharthidasan Univ. November 1996]

Ans. Acceleration factor is used in Gauss-Seidel method of load flow solution to increase the rate of convergence. Acceleration factor = 1.6 is considered to be a good value for power flow studies.

Q. 221. Why is Gauss-Seidel method considered superior to Gauss-iterative method ?

Ans. The Gauss-Seidel method uses upgraded iterates as soon as they are available and thus has an advantage over the Gauss-iterative method which takes longer time. Gauss-Seidel method converges much faster than the Gauss-iterative method, *i.e.*, the number of iterations required to obtain the solution is much less in Gauss-Seidel method compared to the Gauss-iterative method.

Q. 222. Which method out of Gauss-Seidel method and Newton-Raphson method is used for large power system ?

Ans. Newton-Raphson method as it needs less number of iterations to reach convergence, takes less computer time, convergence is certain, computer cost is less and it is more accurate and is insensitive to factors like slack bus selection, regulating transformer etc.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answer, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Short-circuit currents are due to
(a) single-phase to earth fault.
(b) phase-to-phase fault.
(c) all the three phases-to earth fault.
(d) all the three phases short-circuited.
(e) any of the above.

2. The most serious consequence of a major uncleared short-circuit fault could be
(a) blowing of fuse. (b) fire.
(c) heavy voltage drop. (d) none of these.

3. Which of the following results in a symmetrical fault ?
(a) Single-phase-to earth. (b) Phase-to-phase.
(c) All the three phases-to earth. (d) Two phases-to earth.

4. Which portion of the transmission system is more prone to faults?
(a) Alternator. (b) Transformer.
(c) Overhead lines. (d) Underground cable.

5. Which portion of the power system is least prone to faults ?
(a) Alternators. (b) Switchgear.
(c) Transformers. (d) Overhead lines.

6. The magnitude of fault current depends upon
(a) total impedance up to fault. (b) voltage at the fault point.
(c) load current being supplied before occurrence of fault.
(d) both (a) and (b).

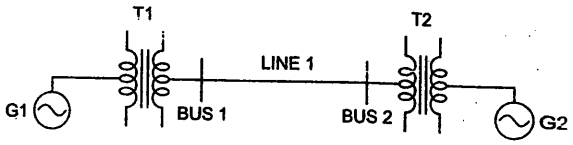
7. The most common type of fault is
(a) single-phase-to ground. (b) phase-to-phase.
(c) two-phase-to ground. (d) three-phase to ground.
[A.M.I.E. Sec B. Summer 1999]

8. The maximum short-circuit current occurs in the case of:
(a) three-phase bolted fault. (b) double-line-to-ground fault.
(c) line-to-line fault. (d) single-line-to-ground fault.
[M.D. Univ. Transmission and Distribution, May 2011]

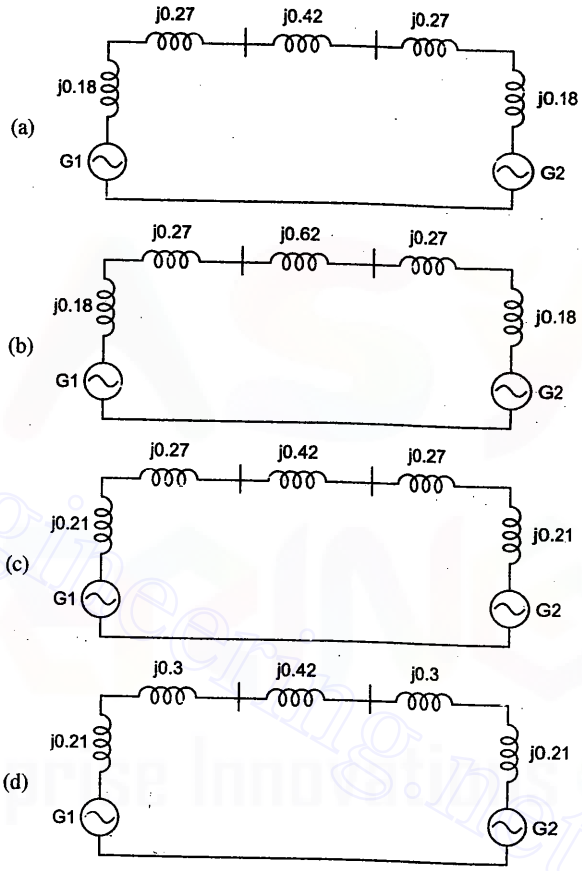
9. For a fault at the terminals of synchronous generator, the fault current is maximum for a
(a) 3-phase fault. (b) 3-phase to ground fault.
(c) line-to-ground fault. (d) line-to-line fault.
[GATE E.E. 1997]

10. The load currents in short-circuit calculation are neglected because
1. short-circuit currents are much larger than load currents.
2. short-circuit currents are greatly out of phase with load currents.
Which of these statement(s) is/are correct ?
(a) neither 1 nor 2 (b) 2 alone
(c) 1 alone (d) 1 and 2
[U.P.S.C. I.E.S. E.E.-II, 2001]

11. For the power system shown in the figure below, the specifications of the components are the following
G1 : 25 kV, 100 MVA, X = 9%
G2 : 25 kV, 100 MVA, X = 9%
T1 : 25 kV/220 kV, 90 MVA, X = 12%
T2 : 25 kV/25 kV, 90 MVA, X = 12%
Line 1: 220 kV, X = 150 ohms



Choose 25 kV as the base voltage at the generator G1, and 200 MVA as the MVA base. The impedance diagram is



[GATE E.E. 2010]

12. The per unit impedance $Z_{(Pu)}$ in a 3-phase system is

(a) $\frac{Z_{(ohms)} \times (MVA)_B}{(KV)_B^2}$ (b) $\frac{Z_{(ohms)} \times (KV)_B^2}{(MVA)_B}$

(c) $\frac{1000 \times (KV)_B}{\sqrt{3} I_B}$ (d) $\frac{1000 \times (KV)_B}{I_B \times 10^6}$

[U.P.S.C. I.E.S. E.E.-II, 2004]

13. Z_{pu}^{old} is the per unit impedance on the power base S_B^{old} and voltage base V_B^{old}. What would be the per unit impedance on the new power base S_B^{new} and voltage base V_B^{new} ?

Answers: **1.** (e), **2.** (b), **3.** (c), **4.** (c), **5.** (a), **6.** (d), **7.** (a), **8.** (a), **9.** (c), **10.** (c), **11.** (b), **12.** (a), **13.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $Z_{pu}^{new} = Z_{pu}^{old} \frac{S_B^{old}}{S_B^{new}} \left(\frac{V_B^{new}}{V_B^{old}} \right)^2$. (b) $Z_{pu}^{new} = Z_{pu}^{old} \frac{S_B^{new}}{S_B^{old}} \left(\frac{V_B^{old}}{V_B^{new}} \right)^2$.

(c) $Z_{pu}^{new} = Z_{pu}^{old} \frac{S_B^{new}}{S_B^{old}} \left(\frac{V_B^{old}}{V_B^{new}} \right)$. (d) $Z_{pu}^{new} = Z_{pu}^{old} \frac{S_B^{old}}{S_B^{new}} \left(\frac{V_B^{new}}{V_B^{old}} \right)$.

[U.P.S.C. I.E.S. E.E.-II, 2004]

14. For a given base voltage and base volt-amp, the per-unit impedance value of an element is X. What will be the per-unit impedance value of this element when the voltage and a volt-amp bases are both doubled ?

(a) 4X (b) 2X (c) X (d) 0.5X

[U.P.S.C. I.E.S. E.E.-II, 2002]

15. A 10 kVA, 400 V/200 V single-phase transformer with 10% impedance, draws a steady short-circuit current of

(a) 50 A (b) 150 A
(c) 250 A (d) 350 A

[U.P.S.C. I.E.S. E.E.-II, 2010]

16. A transformer rated for 500 kVA, 11 kV/0.4 kV has an impedance of 10% and is connected to an infinite bus. The fault level of the transformer is

(a) 500 kVA (b) 5000 kVA
(c) 500 MVA (d) none of these.

[W.B. Univ. of Technology Power System-II, 2009-10]

17. Three individual 3-phase 400 kV power systems, each one of which consists of a generator transformer and a radial line having 3-ϕ symmetrical fault level of 20 GVA for fault at the remote end of lines, are now reinforced by interconnecting the remote end lines by three lines each of reactance $j12\ \Omega$ so that the fault level at each remote end of the radial lines on ignoring resistance becomes

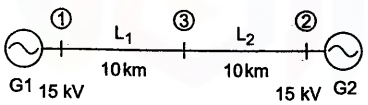
(a) 10 GVA (b) (20/3) GVA
(c) 24 GVA (d) 20 GVA

[U.P.S.C. I.E.S. E.E.-II, 2010]

Linked Answer Questions

Statement for Linked Answer Questions 18-19:

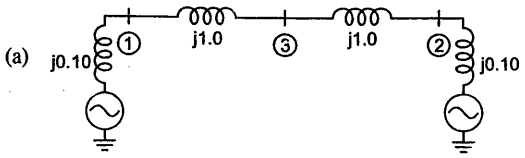
Two generator units G1 and G2 are connected by 15 kV line with a bus at the midpoint as shown below.



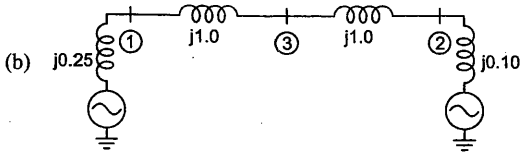
G1 = 250 MVA, 15 kV, positive sequence reactance
X = 25% on its own base
G2 = 100 MVA, 15 kV, positive sequence reactance
X = 10% on its own base
L_1 and L_2 = 10 km, positive sequence X = 0.225 Ω/km

18. For the above system, the positive sequence diagram with the pu values on the 100 MVA common base is

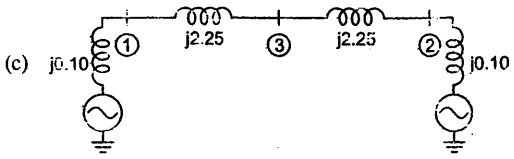
(a)



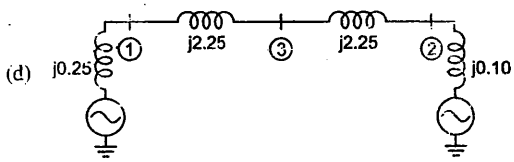
(b)



(c)



(d)



[GATE E.E., 2011]

19. In the above system, the three-phase fault MVA at the bus 3 is

(a) 82.55 MVA (b) 85.11 MVA
(c) 170.91 MVA (d) 181.82 MVA

[GATE E.E., 2011]

20. The per-unit impedance of an alternator corresponding to base values 13.2 kV and 30 MVA is 0.2 p.u. The p.u. value of the impedance for base values of 13.8 kV and 50 MVA in pu will be

(a) 0.131 (b) 0.226 (c) 0.305 (d) 0.364

[U.P.S.C. I.E.S. E.E.-II, 2002]

21. An isolated synchronous generator with transient reactance equal to 0.1 pu on a 100 MVA base is connected to the high voltage bus through a step-up transformer of reactance 0.1 pu on a 100 MVA base. The fault level at the bus is

(a) 1,000 MVA. (b) 500 MVA.
(c) 50 MVA. (d) 10 MVA.

[U.P.S.C. I.E.S. E.E.-II, 2000]

22. Four alternators, each rated at 5 MVA, 11 kV, with 20% reactance are working in parallel. The short-circuit level at bus-bars is

(a) 6.25 MVA. (b) 20 MVA.
(c) 25 MVA. (d) 100 MVA.

[U.P.S.C. I.E.S. E.E.-II, 1999]

23. A generator is connected through a 20 MVA, 13.8/138 kV step-down transformer, to transmission line. At the receiving end of the line a load is supplied through a step-down transformer of 10 MVA, 138/69 kV rating. A 0.72 pu load, evaluated on load side transformer ratings as base values, is supplied from the above system. For system base values of 10 MVA and 69 kV in load circuit, the value of the load (in per unit) in generator circuit will be

(a) 36 (b) 1.44 (c) 0.72 (d) 0.18

[GATE E.E. 2006]

24. A new generator having $E_g = 1.4 \angle 30°$ pu [equivalent to (1.212 + j0.70) pu] and synchronous reactance 'X_s' of 1.0 pu on the system base, is to be connected to a bus having voltage V, in the existing power system. This existing power system can be represented by Thevenin's voltage $E_{th} = 0.9 \angle 0°$ pu in series with Thevenin's impedance $Z_{th} = 0.25 \angle 90°$ pu. The magnitude of the bus voltage V_t of the system in pu will be

(a) 0.990 (b) 0.973 (c) 0.963 (d) 0.900

[GATE E.E. 2004]

25. A 3-phase generator rated at 110 MVA, 11 kV is connected through circuit breakers to a transformer. The generator is having direct axis sub-transient reactance $X''_d = 19\%$, transient reactance $X'_d = 26\%$ and synchronous reactance = 130%. The generator is operating at no load and rated voltage when a three phase short circuit fault occurs between the breakers and the transformer. The magnitude of initial symmetrical rms current in the breakers will be

(a) 4.44 kA (b) 22.20 kA (c) 30.39 kA (d) 38.45 kA

[GATE E.E. 2004]

Answers: **14.** (d), **15.** (c), **16.** (c), **17.** (c), **18.** (a), **19.** (d), **20.** (c), **21.** (b), **22.** (d), **23.** (a), **24.** (b), **25.** (c),

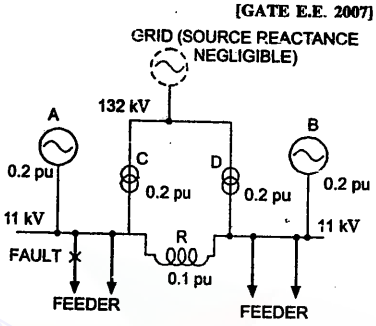
26. A three-phase balanced star-connected voltage source with frequency ω rad/s is connected to a star-connected balanced load which is purely inductive. The instantaneous line currents and phase to neutral voltages are denoted by (i_a, i_b, i_c) and (V_{an}, V_{bn}, V_{cn}) respectively, and their rms values are denoted by V and I.

If $R = [V_{an}, V_{bn}, V_{cn}] \begin{bmatrix} 0 & \frac{1}{\sqrt{3}} & -\frac{1}{\sqrt{3}} \\ -\frac{1}{\sqrt{3}} & 0 & \frac{1}{\sqrt{3}} \\ \frac{1}{\sqrt{3}} & -\frac{1}{\sqrt{3}} & 0 \end{bmatrix} \begin{bmatrix} i_a \\ i_b \\ i_c \end{bmatrix}$, then the magnitude of R is

(a) 3VI (b) VI (c) 0.7VI (d) 0

[GATE E.E. 2007]

27. The diagram shows the layout of a power station having two generators A and B, connected to the 11 kV buses which are also fed through two transformers C and D from a 132 kV grid. The 11 kV buses are interconnected through a reactor R.



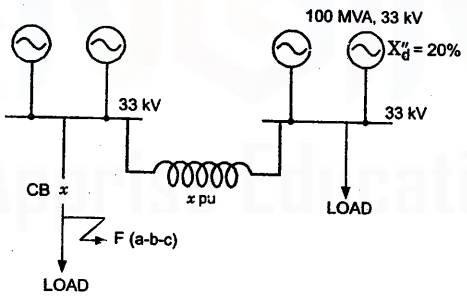
The reactances of A, B, C, D and R are in pu on a common MVA- and kV- base. All the generated voltages in A, B and grid are each 1.0 pu and assumed as in phase at the time of fault.

The steady state symmetrical fault-current for a 3-phase fault on the 11 kV feeders is

(a) 10 pu (b) 15 pu (c) 20 pu (d) 25 pu

[U.P.S.C. I.E.S. E.E.-II, 2001]

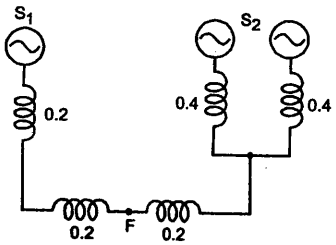
28. Four identical 100 MVA, 33 kV generators are operating in parallel, as shown below, in two bus-bar sections, interconnected through a current limiting reactor of x pu reactance on the generator-base. Each generator has a reactance of 0.2 pu. The value of the reactor x to limit a symmetrical short-circuit (a-b-c) current through the circuit breaker to 1,500 MVA is



(a) 0.05 pu (b) 0.10 pu (c) 0.15 pu (d) 0.20 pu

[U.P.S.C. I.E.S. E.E.-II, 2003]

29. Two power stations S_1 and S_2 are interconnected through a transmission line of per unit (pu) reactance of 0.4. Station S_1 has one generator of pu reactance of 0.2, and station S_2 has two generators of pu reactance 0.4 each.



For a 3-phase symmetrical short circuit at the middle of the transmission line (point F), what is the change in the value of the equivalent fault reactance, with one of the generators of S_2 removed?

(a) 10% (b) 20% (c) 30% (d) 40%

[U.P.S.C. I.E.S. E.E.-II, 2007]

Data for Q. 30, and Q. 31 are given below. Solve the problems and choose the correct answers.

For a power system the admittance and impedance matrices for the fault studies are as follows.

$$Y_{bus} = \begin{bmatrix} -j8.75 & j1.25 & j2.50 \\ j1.25 & -j6.25 & j2.50 \\ j2.50 & -j2.50 & -j5.00 \end{bmatrix}$$

$$Z_{bus} = \begin{bmatrix} j0.16 & j0.08 & j0.12 \\ j0.08 & j0.24 & j0.16 \\ j0.12 & j0.16 & j0.34 \end{bmatrix}$$

The prefault voltages are 1.0 pu at all the buses. The system was unloaded prior to the fault. A solid 3 phase fault takes place at bus 2.

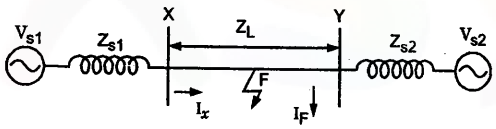
30. The post fault voltages at buses 1 and 3 in per unit respectively are

(a) 0.24, 0.63 (b) 0.31, 0.76
(c) 0.33, 0.67 (d) 0.67, 0.33 [GATE E.E. 2006]

31. The per unit fault fed from generators connected to buses 1 and 2 respectively are

(a) 1.20, 2.51 (b) 1.55, 2.61
(c) 1.66, 2.50 (d) 5.00, 2.50 [GATE E.E. 2006]

Data for Q. 32, Q. 33 and Q. 34 are given below. Solve the problems and choose the correct answers.



Given that: $V_{s1} = V_{s2} = 1 + j0$ pu, +ve sequence impedances are $Z_{s1} = Z_{s2} = 0.001 + j0.01$ pu and $Z_L = 0.006 + j0.06$ pu, 3ϕ. Base MVA = 100, voltage base = 400 kV(L – L).

Nominal system frequency = 50 Hz. The reference voltage for phase 'a' is defined as $V(t) = V_m \cos(\omega t)$. A symmetrical 3-$\phi$ fault occurs at centre of the line, i point 'F' at time t_0 the +ve sequence impedance from source S, to point 'F' equals $(0.004 + j0.04)$ pu. The waveform corresponding to phase 'a' fault current from bus X reveals that decaying dc offset current is –ve and in magnitude at its maximum initial value. Assume that the negative sequence are equal to +ve sequence impedances and the zero sequence (Z) are 3 times +ve sequence (Z).

32. The instant (t_0) of the fault will be

(a) 4.682 ms (b) 9.667 ms
(c) 14.667 ms (d) 19.667 ms [GATE E.E. 2008]

33. The rms value of the ac component of fault current (I_x) will be

(a) 3.59 kA (b) 5.07 kA
(c) 7.18 kA (d) 10.15 kA [GATE E.E. 2008]

34. Instead of the three phase fault, if a single line-to ground fault occurs on phase 'a' at point 'F' with zero fault impedance, then the rms of the ac component of fault current (I_x) for phase 'a' will be

(a) 4.97 pu (b) 7.0 pu (c) 14.93 pu (d) 29.85 pu

[GATE E.E. 2008]

35. If a sudden short circuit occurs on a power system (considered as R-L series circuit), the current waveform consists of

1. a decaying ac current. 2. a decaying dc current.

Answers: 26. (a), **27.** (b), **28.** (b), **29.** (b), **30.** (d), **31.** (c), **32.** (a), **33.** (c), **34.** (a), **35.** (a),

Let the alternator reactance be X and the power system resistance R. Which one of the following is correct ?
(a) The decay in (1) is caused by the increase in X but in (2) is caused by R.
(b) The decay in (1) is caused by R but in (2) is caused by increase in X.
(c) The decay in both (1) and (2) is caused by R.
(d) The decay in both (1) and (2) is caused by the increase in X.
[U.P.S.C. I.E.S. E.E.-II, 2004]

36. Series reactors are used to
(a) improve the transmission efficiency.
(b) improve the power factor of the power system.
(c) improve the voltage regulation.
(d) bring down the fault level within the capacity of the switchgear.

37. Current limiting reactors may be
(a) air-cored air-cooled.
(b) oil immersed magnetically shielded.
(c) oil immersed non-magnetically shielded.
(d) any of the above.

38. The symmetrical components are used in the fault analysis because
(a) the number of equations becomes smaller.
(b) the sequence networks do not have mutual couplings.
(c) the results are required in terms of symmetrical components.
[U.P.S.C. I.E.S. E.E.-II, 2000]

39. In a star-connected system without neutral grounding, zero-sequence currents are
(a) zero. (b) phasor sum of phase currents.
(c) same as rms value of phase currents.
(d) same as peak value of phase currents.

40. A balanced 3-phase system consists of
(a) zero-sequence currents only.
(b) positive-sequence currents only.
(c) negative- and zero-sequence currents.
(d) zero, negative and positive sequence currents.

41. The positive sequence current of a transmission line is:
(a) always zero.
(b) 1/3 of negative sequence current.
(c) equal to negative sequence current.
(d) 3 times negative sequence current.
[M.D. Univ. Transmission Distribution May 2011]

42. In case of an unbalanced star-connected load supplied from an unbalanced 3-phase, 3-wire system, load currents will consist of
(a) positive-sequence components.
(b) negative-sequence components.
(c) zero-sequence components. (d) only (a) and (b).

43. For an unbalanced fault, with paths for zero-sequence currents, at the point of fault
(a) the negative- and zero-sequence voltages are minimum.
(b) the negative- and zero-sequence voltages are maximum.
(c) the negative-sequence voltage is minimum and zero-sequence voltage is maximum.
(d) the negative-sequence voltage is maximum and zero-sequence voltage is minimum. [GATE E.E. 1996]

44. When a line-to-ground fault occurs, the current in the faulted phase is 100 A. The zero-sequence current in this case will be:
(a) zero (b) 33.3 A
(c) 66.6 A (d) 100 A
[M.D. Univ. Transmission and Distribution May 2011]

45. Zero-sequence fault current is absent when fault is
(a) single-line-to ground fault.
(b) line-to-line ground fault.
(c) double-line-to ground fault.
(d) line-to-line. [W.B. Univ. of Technology Power System-II, 2010]

46. The current of a single-phase load drawn from a 3-phase system has:
(a) Zero-sequence component of current as zero.
(b) Negative-sequence component of current more than positive sequence component.
(c) Positive-, negative- and zero-sequence components equal.
(d) Negative-sequence component of current less than positive-sequence component. [U.P.S.C. I.E.S. E.E.-II, 2011]

47. Zero-sequence currents can flow from a line to transformer bank if the windings are in
(a) grounded star/delta. (b) delta/star.
(c) star/grounded star. (d) delta/delta.
[U.P.S.C. I.E.S. E.E.-II, 1997]

48. If the positive-, negative- and zero-sequence reactances of an element of a power system are 0.3, 0.3 and 0.8 pu respectively, then the element would be a
(a) synchronous generator. (b) synchronous motor.
(c) static load. (d) transmission line.
[U.P.S.C. I.E.S. E.E.-II, 2000]

49. Negative-sequence reactance of a transformer is
(a) equal to the positive-sequence reactance.
(b) larger than the positive-sequence reactance.
(c) smaller than the positive-sequence reactance.
[A.M.I.E. Sec B. Summer 1998]

50. If all the sequence voltages at the fault point in a power system are equal, then the fault is a
(a) three-phase fault (b) line-to ground fault
(c) line-to-line fault (d) double-line-to ground fault
[U.P.S.C. I.E.S. E.E.-II, 2001]

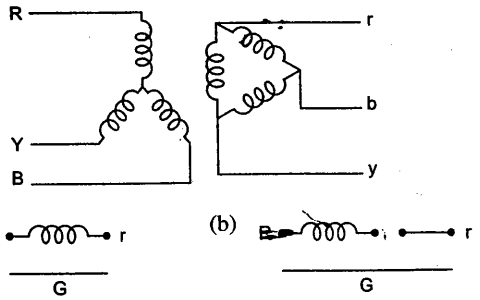
51. The zero-sequence current of a generator for line-to ground fault is $j2.4$ pu. Then the current through the neutral during the fault is
(a) $j2.4$ pu (b) $j0.8$ pu (c) $j7.2$ pu (d) $j0.24$ pu
[U.P.S.C. I.E.S. E.E.-II, 2003]

52. The line currents of a 3-phase power supply are:

$$I_R = 3 + j5A$$
$$I_Y = 2 + j2A$$
$$I_B = -2 - j1A$$

The zero-sequence current will be:
(a) $1 + j2$ A (b) $5 + j7$ A
(c) $1 + j4$ A (d) $-2 - j1$ A
[U.P.S.C. I.E.S. E.E.-II, 2011]

53. The zero-sequence circuit of the three-phase transformer shown in the figure is



Answers: **36.** (d), **37.** (d), **38.** (b), **39.** (a), **40.** (b), **41.** (c), **42.** (d), **43.** (b), **44.** (b), **45.** (d), **46.** (c), **47.** (a), **48.** (d), **49.** (a), **50.** (d), **51.** (c), **52.** (a), **53.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

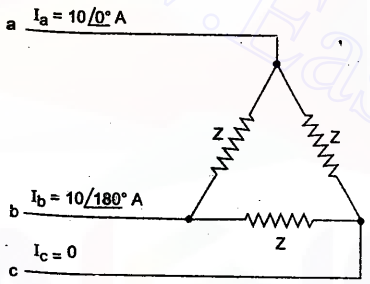
(c) 
(d) 
[GATE E.E. 2010]

54. One current transformer (CT) is mounted over a 3-phase 3-core cable with its sheath and armour removed from the portion covered by the CT. An ammeter placed in the CT secondary would measure
(a) the positive-sequence current.
(b) the negative-sequence current.
(c) the zero-sequence current.
(d) three times the zero-sequence current. [U.P.S.C. I.E.S. E.E.-II, 1998]

55. Consider the following statements regarding the fault analysis :
1. The neutral grounding impedance Z_n appears as $3Z_n$ in zero-sequence equivalent circuit.
2. For faults on transmission lines, 3-phase fault is the least severe amongst other faults.
3. The positive- and negative-sequence networks are not affected by method of neutral grounding.

Which of the statements given above are correct ?
(a) 2 and 3 (b) 1 and 2 (c) 1 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-II, 2004]

56. A 3-phase transmission line supplies Δ-connected load Z. The conductor '*c*' of the line develops an open circuit fault as shown in figure. The currents in the lines are as shown on the diagram. The +ve sequence current component in line 'a' will be



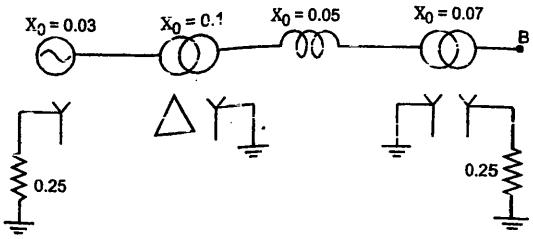
(a) $5.78\angle -30°$ (b) $5.78\angle 90°$
(c) $6.33\angle 90°$ (d) $10.00\angle -30°$
[GATE E.E. 2004]

57. A star-connected 3-phase 11 kV, 25 MVA alternator with its neutral grounded through a 0.033 pu reactance (based on the alternator rating) has positive-, negative- and zero-sequence reactances of 0.2 pu, 0.1 pu and 0.1 pu respectively. A single line to ground fault on one of its terminals would result in a fault MVA of
(a) 150 MVA (b) 125 MVA
(c) 100 MVA (d) 50 MVA
[U.P.S.C. I.E.S. E.E.-II, 1999]

58. The severity of line-to-ground and three-phase faults at the terminals of an unloaded synchronous generator is to be same. If the terminal voltage is 1.0 pu and $\mathbf{Z}_1 = \mathbf{Z}_2 = j\,0.1$ pu, $\mathbf{Z}_0 = j\,0.05$ pu for the alternator, then the required inductive reactance for neutral grounding is
(a) 0.0166 pu (b) 0.05 pu
(c) 0.1 pu (d) 0.15 pu [GATE E.E. 2000]

59. The positive-sequence current for a L-L fault of a 2 kV system is 1,400 A, and corresponding current for a L-L-G fault is 2,220 A. The zero-sequence impedance of the system is
(a) 62.75 Ω (b) 4.5275 Ω (c) 5.275 Ω (d) 0.5275 Ω
[U.P.S.C. I.E.S. E.E.-II, 1999]

60. A generator is connected to a transformer which feeds another transformer through a short feeder shown in the figure. The zero sequence impedance values are expressed in pu on a common base and are indicated in the figure. The Thevenin equivalent zero sequence impedance at point B is



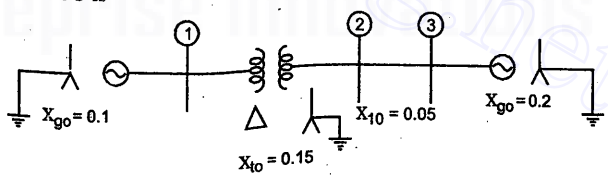
(a) $0.8 + j0.6$ (b) $0.75 + j0.22$
(c) $0.75 + j0.25$ (d) $1.5 + j0.25$ [GATE E.E. 2002]

61. The parameters of a transposed overhead transmission line are given as :
Self reactance $X_s = 0.4$ Ω/km and Mutual reactance $X_m = 0.1$ Ω/km.
The positive sequence reactance X_1 and zero sequence reactance X_0, respectively, in Ω/km are
(a) 0.3, 0.2 (b) 0.5, 0.2
(c) 0.5, 0.6 (d) 0.3, 0.6 [GATE E.E. 2005]

62. An alternator (star connected) is connected to Delta-Star transformer with star neutral earthed. On the star side of the transformer a single line-to-ground fault occurs. This is equivalent to :
(a) A line-to-ground fault on the generator side of the transformer.
(b) A line-to-line fault on the generator side of the transformer.
(c) A 3-phase fault on the generator side of the transformer.
(d) A single-line-to-ground fault on the generator side of the transformer. [U.P.S.C. I.E.S. E.E.-II, 2003]

63. A 500 MVA, 50 Hz, 3-phase turbo-generator produces power at 22 kV. Generator is Y-connected and its neutral is solidly grounded. Its sequence reactances are $X_1 = X_2 = 0.15$ and $X_0 = 0.05$ pu. It is operating at rated voltage and disconnected from the rest of the system (no load). The magnitude of the sub-transient line current for single-line-to ground fault at the generator terminal in pu will be
(a) 2.851 (b) 3.333 (c) 6.667 (d) 8.553
[GATE E.E. 2004]

64. For the network shown in figure the zero-sequence reactances in pu are indicated. The zero-sequence driving point reactance of the node 3 is



(a) 0.12 (b) 0.30 (c) 0.10 (d) 0.20
[GATE E.E. 1998]

65. A fault occurring at the terminals of an unloaded synchronous generator operating at its rate voltage has resulted in the following values of currents and voltages
$I_{a0} = j2.37$ pu, $I_{a1} = -j3.05$ pu, $I_{a2} = j0.68$ pu,
$V_{a0} = V_{a1} = V_{a2} = 0.237$ pu
Which one of the following faults has occurred ?
(a) L-L fault. (b) L-G fault.
(c) L-L-G fault. (d) L-L-L fault.
[U.P.S.C. I.E.S. E.E.-II, 2005]

Answers: **54.** (d), **55.** (c), **56.** (a), **57.** (a), **58.** (a), **59.** (d), **60.** (b), **61.** (d), **62.** (b), **63.** (d), **64.** (c), **65.** (c),

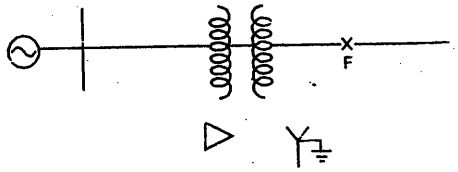
66. For the system shown in the diagram given below, what is a line-to-ground fault on the line side of the transformer equivalent to ?



(a) A line-to-ground fault on the generator side of the transformer.
(b) A line-to-line fault on the generator side of the transformer.
(c) A double-line-to-ground fault on the generator side of the transformer.
(d) A 3-phase fault on the generator side of the transformer.
[U.P.S.C. I.E.S. E.E.-II, 2006]

Data for Q. 67 and Q. 68 are given below. Solve the problems and choose the correct answers.

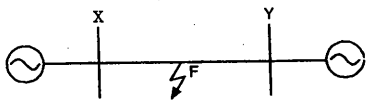
At a 220 kV substation of a power system, it is given that the three-phase fault level is 4,000 MVA and single-line-to ground fault level is 5,000 MVA. Neglecting the resistance and the shunt susceptances of the system.

67. The positive sequence driving point reactance at the bus is
(a) 2.5 Ω (b) 4.033 Ω (c) 5.5 Ω (d) 12.1 Ω
[GATE E.E. 2005]

68. The zero sequence driving point reactance at the bus is
(a) 2.2 Ω (b) 4.84 Ω (c) 18.18 Ω (d) 22.72 Ω
[GATE E.E. 2005]

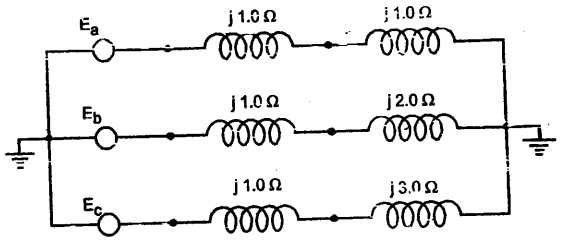
69. A 20 MVA, 6.6 kV, 3-phase alternator is connected to a 3-phase transmission line. The per unit positive-sequence, negative-sequence and zero-sequence impedances of the alternator are *j*0.1, *j*0.1 and *j*0.04 respectively. The neutral of the alternator is connected to ground through an inductive reactor of *j*0.05 pu. The per unit positive-, negative- and zero-sequence impedances of the transmission line are *j*0.1, j0.1 and j0.3, respectively. All per unit values are based on the machine ratings. A solid ground fault occurs at one phase of the far end of the transmission line. The voltage of the alternator neutral with respect to ground during the fault is
(a) 513.8 V (b) 889.9 V (c) 1,112.0 V (d) 642.2 V
[GATE E.E. 2003]

70. A two-machine power system is shown. Transmission line XY has positive sequence impedance of $Z_1\Omega$ and zero sequence impedance of $Z_0\Omega$.
An '*a*' phase to ground fault with zero fault impedance occurs at the centre of the transmission line. Bus voltage at X and line current from X to F for the phase '*a*', are given by V_a volts and I_a amperes, respectively. Then, the impedance measured by the ground distance relay located at the terminal X of line XY will be given by



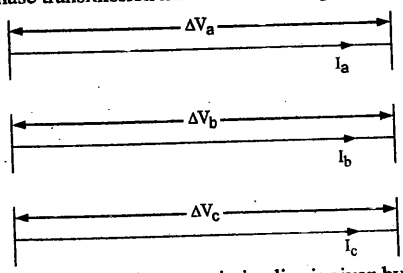
(a) $Z_1/2\ \Omega$ (b) $Z_0/2\ \Omega$
(c) $(Z_0 + Z_1)/2\ \Omega$ (d) $V_d/I_a\ \Omega$ **[GATE E.E. 2008]**

71. A three-phase alternator generating unbalanced voltages is connected to an unbalanced load through a 3-phase transmission line as shown in figure. The neutral of the alternator and the star point of the load are solidly grounded. The phase voltages of the alternator are $E_a = 10\angle 0°$ V, $E_b = 10\angle -90°$ V, $E_c = 10\angle 120°$ V. The positive sequence component of the load current is



(a) $1.310\angle -107°$ A (b) $0.332\angle -120°$ A
(c) $0.996\angle -120°$ A (d) $3.510\angle -81°$ A **[GATE E.E. 2003]**

72. A 3-phase transmission line is shown in figure.



Voltage drop across the transmission line is given by the following equation :

$$\begin{bmatrix}\Delta V_a\\ \Delta V_b\\ \Delta V_c\end{bmatrix} = \begin{bmatrix}Z_s & Z_m & Z_m\\ Z_m & Z_s & Z_m\\ Z_m & Z_m & Z_s\end{bmatrix}\begin{bmatrix}I_a\\ I_b\\ I_c\end{bmatrix}$$

Shunt capacitance of the line can be neglected. If the line has positive sequence impedance of 15 Ω and zero sequence impedance of 48 Ω, then the values of Z_s and Z_m will be
(a) $Z_s = 31.5\ \Omega$; $Z_m = 16.5\ \Omega$
(b) $Z_s = 26\ \Omega$; $Z_m = 11\ \Omega$ (c) $Z_s = 16.5\ \Omega$; $Z_m = 31.5\ \Omega$
(d) $Z_s = 11\ \Omega$; $Z_m = 26\ \Omega$ **[GATE E.E. 2008]**

73. Suppose we define a sequence transformation between "*a-b-c*" and "*p-n-o*" variables as follows :

$$\begin{bmatrix}f_a\\ f_b\\ f_c\end{bmatrix} = K\begin{bmatrix}1 & 1 & 1\\ \alpha^2 & \alpha & 1\\ \alpha & \alpha^2 & 1\end{bmatrix}\begin{bmatrix}f_p\\ f_n\\ f_0\end{bmatrix}$$ where $\alpha = e^{j\frac{2\pi}{3}}$ and k is a constant

Now, if it is given that : $\begin{bmatrix}V_p\\ V_n\\ V_0\end{bmatrix} = \begin{bmatrix}0.5 & 0 & 0\\ 0 & 0.5 & 0\\ 0 & 0 & 2.0\end{bmatrix}\begin{bmatrix}i_p\\ i_n\\ i_0\end{bmatrix}$

and $\begin{bmatrix}V_a\\ V_b\\ V_c\end{bmatrix} = Z\begin{bmatrix}i_a\\ i_b\\ i_c\end{bmatrix}$ then,

(a) $Z = \begin{bmatrix}1.0 & 0.5 & 0.75\\ 0.75 & 1.0 & 0.5\\ 0.5 & 0.75 & 1.0\end{bmatrix}$ (b) $Z = \begin{bmatrix}1.0 & 0.5 & 0.5\\ 0.5 & 1.0 & 0.5\\ 0.5 & 0.5 & 1.0\end{bmatrix}$

(c) $Z = 3k^2\begin{bmatrix}1.0 & 0.75 & 0.5\\ 0.5 & 1.0 & 0.75\\ 0.75 & 0.5 & 1.0\end{bmatrix}$ (d) $Z = \frac{K^2}{3}\begin{bmatrix}1.0 & -0.5 & -0.5\\ -0.5 & 1.0 & -0.5\\ -0.5 & -0.5 & 1.0\end{bmatrix}$
[GATE E.E. 2007]

74. The given circuit shows a 3-phase system having a balanced self-inductive reactance of X_L per phase and a mutual reactance of X_m between pairs of phases. The line currents are I_a, I_b and I_c, and they may be unbalanced The series voltage-drop relations would be

Answers: **66.** (b), **67.** (d), **68.** (b), **69.** (d), **70.** (d), **71.** (d), **72.** (b), **73.** (b), **74.** (a),

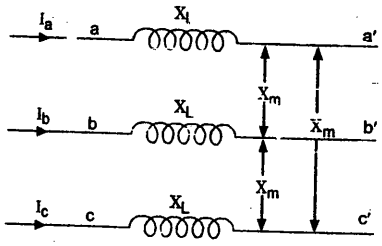
$$V_{aa'} = I_a X_L + I_b X_m + I_c X_m$$
$$V_{bb'} = I_a X_m + I_b X_L + I_c X_m$$
$$V_{cc'} = I_a X_m + I_b X_m + I_c X_L$$



The positive, negative and zero-sequence reactances X_1, X_2, and X_0, respectively, would be
(a) $(X_L - X_m)$, $(X_L - X_m)$ and $(X_L - 2X_m)$.
(b) $(X_L + X_m)$, $(X_L - 2X_m)$ and $(X_L + 2X_m)$.
(c) $(X_L - 2X_m)$, $(X_L + X_m)$ and $(X_L - X_m)$.
(d) $(X_L + 2X_m)$, $(X_L + 2X_m)$ and $(X_L + X_m)$.
[U.P.S.C. I.E.S. E.E.-II, 2003]

75. Fuses have got advantages of
(a) cheapest type of protection.
(b) inverse time-current characteristic.
(c) no maintenance.
(d) current limiting effect under short-circuit conditions.
(e) all of the above.

76. The primary function of a fuse is to
(a) open the circuit. (b) protect the appliance.
(c) protect the line.
(d) prevent excessive currents from flow through the circuit.

77. The material used in liquid fuses is
(a) SF_6 (b) distilled water.
(c) carbon tetra chloride. (d) transformer oil.

78. In comparison to rewirable fuses HRC fuses have the advantage(s) of
(a) high speed operation. (b) high rupturing capacity.
(c) no ageing effect. (d) all of the above.

79. In HRC fuse the time between cut-off and final current zero is called the
(a) pre-arcing time. (b) arcing time.
(c) total operating time. (d) none of these.

80. If a combination of HRC fuse and a circuit breaker is employed, the circuit breaker operates for
(a) short-circuit current. (b) low overload currents.
(c) under all abnormal currents.
(d) the combination is newer employed in practice.

81. The least expensive protection for overcurrent in low-voltage system is
(a) rewirable fuse. (b) isolator.
(c) circuit breaker. (d) air-break switch.

82. A circuit breaker normally operates
(a) when the power is to be supplied.
(b) when the line is to be tested.
(c) when the switch is to be put on.
(d) whenever fault occurs in the line.

83. When a fault occurs in a high voltage transmission line, first the
(a) circuit breaker operates then the relay.
(b) relay operates then the circuit breaker.
(c) relay operates, then successively the isolator and the circuit breaker.
(d) isolator operates, then successively the relay and the circuit breaker. [A.M.I.E. Sec B. Winter 1999]

84. The initiation of electric arc at the instant of contact separation is caused by
(a) thermionic emission of electrons.
(b) field emission of electrons.
(c) (a) and (b) both. (d) none of the above.
[A.M.I.E. Sec B. Summer 1996]

85. Arcing voltage will be the least in case of
(a) carbon. (b) copper. (c) silver. (d) tungsten.

86. The heat produced at the contact point owing to flow of electric current is least affected by
(a) temperature of the surrounding medium.
(b) contact resistance.
(c) magnitude of electric current flowing.
(d) duration of flow of current.

87. Which of the following should have low value for the contacts and their material ?
(a) Thermal capacity. (b) Contact resistance.
(c) Thermal conductivity. (d) None of these.

88. In a CB contact wipe is necessary
(a) to decrease the speed of opening of the CB.
(b) to increase the speed of opening and reduce the arcing of contacts.
(c) to increase the dielectric strength across the CB contacts.
(d) none of the above. [A.M.I.E. Sec B. Winter 1999]

89. Interrupting medium in a contactor may be
(a) air at atmospheric pressure.
(b) SF_6 gas. (c) oil.
(d) compressed air. (e) any of these.

90. The fluids used in circuit breakers should be of
(a) high dielectric strength and thermal stability.
(b) noninflammability. (c) arc extinguishing ability.
(d) all of the above.

91. Sparking between contacts can be reduced by inserting
(a) a capacitor in parallel with the contacts.
(b) a capacitor in series with the contacts.
(c) a resistor in the line. (d) a reactor in the line.

92. For magnetic blow out of arc the magnetic field is produced
(a) in the load circuit.
(b) at right angles to the axis of the arc.
(c) in line with the axis of the arc.
(d) any of the above.

93. In circuit breakers the contact space is ionized by
(a) field emission from the contact surface.
(b) thermal emission from the contact surface.
(c) thermal ionization of gas.
(d) any of the above.

94. In a circuit breaker, ionization is facilitated by
(a) increase in field strength. (b) increase of mean free length.
(c) high temperature of surrounding medium.
(d) all of the above.

95. The stability of arc in vacuum depends on
(a) The contact material only.
(b) The contact material and its vapour pressure.
(c) The circuit parameters only.
(d) The combination of (b) and (c). [U.P.S.C. I.E.S. E.E.-II, 2005]

96. The interrupting time of a circuit breaker is the period between the instant of

Answers: **75.** (e), **76.** (d), **77.** (c), **78.** (d), **79.** (b), **80.** (b), **81.** (a), **82.** (d), **83.** (b), **84.** (c), **85.** (c), **86.** (a), **87.** (b), **88.** (c), **89.** (e), **90.** (d), **91.** (a), **92.** (b), **93.** (b), **94.** (d), **95.** (d), **96.** (b),

Downloaded From : www.EasyEngineering.net

(a) initiation of short circuit and the arc extinction on an opening operation.
(b) energizing of the trip circuit and the arc extinction on an opening operation.
(c) initiation of short circuit and the parting of primary arc contacts.
(d) energizing of the trip circuit and the parting of primary arc contacts. [GATE E.E. 2003]

97. For a high speed circuit breaker the total clearing time is around
(a) few minutes. (b) few seconds.
(c) 1 to 2 cycles. (d) 5 to 20 cycles.

98. The resistance of an electric arc can be increased by
(a) increasing the concentration of ionized particles.
(b) reducing the arc length. (c) splitting the arc.
(d) increasing the arc x-section.

99. The arc voltage in a circuit breaker is
(a) in the phase with the arc current.
(b) lagging the arc current by 90°.
(c) leading the arc current by 90°.
(d) lagging the arc current by 180°. [A.M.I.E. Sec B. Summer 1999]

100. In a circuit breaker, the active recovery voltage depends upon
(a) circuit conditions. (b) power factor.
(c) armature reaction. (d) all of these.

101. In a circuit breaker the current that exists at the instant of contact separation is called the _____ current.
(a) restriking (b) breaking (c) arc (d) recovery

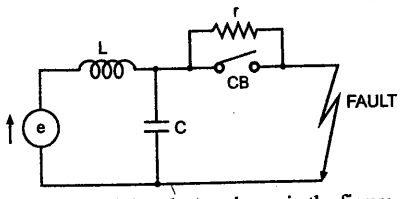
102. The rate of rise of restriking voltage (RRRV) depends upon
(a) system voltage. (b) circuit pf only.
(c) switching condition only. (d) both (b) and (c).

103. The RRRV depends upon the
(a) type of the circuit breaker.
(b) capacitance of the system only.
(c) inductance of the system only.
(d) inductance and capacitance of the system.

104. It is difficult to interrupt a capacitive circuit because
(a) the current has a leading power factor.
(b) the restriking voltage can be high.
(c) current magnitude is very small.
(d) stored energy in the capacitor is very high. [A.M.I.E. Sec B. Summer 1993]

105. A 50 Hz, 3-phase synchronous generator has inductance per phase of 15 mH. The capacitance of generator and circuit breaker is 0.002 μF. What is its natural frequency of oscillation ?
(a) 29 kHz (b) 2.9 kHz (c) 290 kHz (d) 29 MHz [U.P.S.C. I.E.S. E.E.-II, 2008]

106. In connection with the arc extinction in the circuit breaker, resistance switching is employed wherein a resistance is placed in parallel with the poles of the circuit breaker as shown in the figure. This process introduces damping in the L-C circuit. For critical damping, the value of 'r' should be equal to



(a) $\sqrt{C/L}$ (b) $0.5\sqrt{C/L}$
(c) $0.5\sqrt{L/C}$ (d) $\frac{1}{2\pi}\sqrt{\frac{L}{C}}$ [U.P.S.C. I.E.S. E.E.-II, 1998]

107. If the inductance and capacitance of a power system are respectively 1 H and 0.01 μF and the instantaneous value of interrupted current is 10 A, then the voltage across the breaker contact will be
(a) 50 kV (b) 57 kV (c) 60 kV (d) 100 kV [U.P.S.C. I.E.S. E.E.-II, 2000]

108. A 50 Hz, 17.32 kV generator is connected to a power system. The system reactance and capacitance per phase are : 10 mH and 0.02 μF, respectively. What is the maximum voltage across the contacts of the circuit breaker at an instant when it passes through zero ?
(a) 28.28 kV (b) 29.28 kV
(c) 30.28 kV (d) 31.28 kV [U.P.S.C. I.E.S. E.E.-II, 2005]

109. In circuit breakers, oil, as quenching medium, has the advantage(s) of
(a) good cooling properties. (b) absorption of arc energy.
(c) high dielectric strength. (d) acting as an insulator.
(e) all of the above.

110. In circuit breakers, oil, as quenching medium, has the disadvantage(s) of
(a) need of periodical reconditioning or replacement.
(b) risk of formation of explosive mixture with air.
(c) possibility of causing fire hazards.
(d) all of the above.

111. Main purpose of oil in OCB is to
(a) provide insulation. (b) provide cooling of contacts.
(c) quenching arc. (d) none of above. [A.M.I.E. Sec B. Summer 1994]

112. Arc interruption in an oil circuit breaker takes place when
(a) contacts apart. (b) voltage goes through zero.
(c) current goes through zero. [A.M.I.E. Sec B. Winter 1999]

113. The chances of arc interruption in subsequent current zeros
(a) increase in case of ABCB but decrease in OCB.
(b) decrease in case of ABCB but increase in OCB.
(c) decrease in both cases.
(d) increase in both cases. [U.P.S.C. I.E.S. E.E.-II, 2008]

114. In a minimum oil circuit breaker the oil is used
(a) to act as circuit breaking medium only.
(b) for circuit breaking and providing insulation.
(c) for providing insulation only.
(d) for none of the above purposes. [A.M.I.E. Sec B. Summer 1993]

115. The air-blast circuit breakers for 400 kV system are designed to operate in
(a) 0.1 s (b) 0.5 s (c) 50 ms (d) 100 μs [A.M.I.E. Sec B. Summer 1999]

116. The minimum oil circuit breaker has less volume of oil because
(a) the oil between the breaker contacts has greater strength.
(b) there is insulation between the breaker contacts.
(c) solid insulation is provided for insulating the contacts from the earth.
(d) none of the above.

117. Air used in air blast circuit breaker must
(a) be ionized. (b) be free from moisture.
(c) have least CO_2. (d) have oil mist.

118. While using air-blast circuit breaker, current chopping is a phenomenon often observed when
(a) a long overhead line is switched off.
(b) a bank of capacitors is switched off.
(c) a transformer on no load is switched off.
(d) a heavy load is switched off. [U.P.S.C. I.E.S. E.E.-II, 1994]

Answers: **97.** (c), **98.** (c), **99.** (a), **100.** (d), **101.** (b), **102.** (d), **103.** (d), **104.** (b), **105.** (a), **106.** (c), **107.** (d), **108.** (a), **109.** (e), **110.** (d), **111.** (c), **112.** (c), **113.** (b), **114.** (a), **115.** (c), **116.** (c), **117.** (b), **118.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

119. In air-blast circuit breaker resistance switching is used to
(a) reduce the magnitude of fault current.
(b) control the CB operating time.
(c) damp out the fast transient.
(d) change the fault current power factor.
[A.M.I.E. Sec B. Summer 1993]

120. SF_6 gas has excellent heat transfer properties because of its
(a) low gaseous viscosity. (b) high dielectric strength.
(c) higher molecular weight. (d) both (a) and (b).
(e) both (a) and (c).

121. SF_6 circuit breakers have the advantages of
(a) very much reduced electrical clearance, reduced moisture problem and minimum current chopping problem.
(b) noiseless operation, less arcing time resulting in less contact erosion.
(c) no reduction in dielectric strength of SF_6.
(d) performance independent of ambient conditions.
(e) all of the above.

122. SF_6 circuit breakers have the drawback(s) of
(a) sealing problem of gas.
(b) ingress of moisture in the gas system–dangerous.
(c) deterioration of SF_6 with time.
(d) both (a) and (b).

123. Which of the following statements is not correct?
(a) SF_6 is non-toxic and noninflammable gas.
(b) SF_6 has very high dielectric strength roughly 24 times of that of air.
(c) SF_6 is yellow in colour.
(d) SF_6 is about 100 times more effective than air in arc extinction.
(e) SF_6 has density 5 times that of air at 20°C.

124. The single most important property that makes SF_6 a very efficient medium for circuit breaking is
(a) it is non-toxic and noninflammable.
(b) it has high dielcctric constant.
(c) it has high breakdown strength.
(d) it is highly electronegative in character.
[A.M.I.E. Sec B. Summer 1993]

125. During arc extinction SF_6 gas gets
(a) decomposed into SF_4 and SF_2.
(b) decomposed into S and F ions.
(c) reduced to SF_2. (d) oxidised.

126. SF_6 gas is transported in
(a) air cylinders. (b) gas cylinders.
(c) liquid form in cylinders. (d) solid form.

127. The current chopping tendency is mimimised by using SF_6 gas at relatively
(a) low pressure and high viscosity.
(b) low pressure and low viscosity.
(c) high pressure and low viscosity.
(d) high pressure and high viscosity.

128. To limit current chopping in vacuum circuit breakers, the contact material employed should have the properties of
(a) low conductivity and high vapour pressure.
(b) low conductivity and low vapour pressure.
(c) high conductivity and high vapour pressure.
(d) high conductivity and low vapour pressure.

129. A thermal protection switch provides protection against
(a) overload. (b) temperature.
(c) short circuit. (d) overvoltage.

130. For remote operation, the circuit breaker must be equipped with
(a) inverse time trip. (b) shunt trip.
(c) time delay trip. (d) all of these.

131. Which of the following circuit breakers is generally used in railway electrification ?
(a) Air-blast circuit breaker. (b) Minimum oil circuit breaker.
(c) Bulk oil circuit breaker. (d) SF_6 circuit breaker.
[U.P.S.C. I.E.S. E.E.-II, 2006]

132. What is the preferred type of CB to be installed in extra high voltage ac system ?
(a) Bulk oil type CB (b) Air-blast CB
(c) Vacuum CB
(d) Sulphur hexafluoride (SF_6) CB [U.P.S.C. I.E.S. E.E.-II, 2007]

133. Keeping in view the cost and overall effectiveness, the following circuit breaker is best suited for capacitor bank switching
(a) vacuum. (b) air-blast.
(c) SF_6 (d) oil. [GATE E.E. 2006]

134. Which of the following circuit breakers has the lowest operating voltage ?
(a) SF_6 gas. (b) Air-break.
(c) Air-blast. (d) Minimum oil.

135. Which of the following circuit breakers produce the least arc energy?
(a) Plain oil. (b) Minimum oil.
(c) Air-blast. (d) Air break.

136. Which of the following circuit breakers has high reliability and negligible maintenance?
(a) Air-blast. (b) SF_6 (c) Oil. (d) Vacuum.

137. Which of the following circuit breakers take minimum time in installation?
(a) Air-blast. (b) Minimum oil.
(c) Bulk oil. (d) SF_6

138. Where voltages are high and current to be interrupted is low, the circuit breaker preferred is ... one.
(a) air-break (b) vacuum (c) oil (d) air-blast

139. For rural electrification in a country like India with complex network, the circuit breaker preferred is ... one.
(a) air-break (b) oil (c) vacuum (d) minimum oil

140. The most suitable circuit breaker for short line fault without switching resistor is ... one.
(a) minimum oil (b) air-blast
(c) SF_6 (d) air-break

141. The rating of a circuit breaker is usually determined on the basis of ... fault.
(a) symmetrical (b) line to line
(c) single line to ground (d) double line to ground

142. The transient phenomenon lasts in a power system for a period ranging from
(a) few ms to 1 s. (b) 1 s to 2 s.
(c) 2 s to 3 s. (d) greater than 3 s.
[W.B. Univ. of Technology Power System-III, 2009-10]

143. Circuit breakers usually operate under
(a) steady short-circuit current.
(b) sub-transient state of short-circuit current.
(c) transient state of short-circuit current.
(d) none of these. [W.B. Univ. Technology Power Systems-II, 2010]

144. The restriking voltage is measured in
(a) RMS value. (b) Peak value.
(c) Instantaneous value. (d) Average value.
[U.P.S.C. I.E.S. E.E.-II, 2010]

Answers: **119.** (c), **120.** (e), **121.** (e), **122.** (d), **123.** (c), **124.** (d), **125.** (a), **126.** (c), **127.** (b), **128.** (a), **129.** (a), **130.** (b), **131.** (a), **132.** (d), **133.** (a), **134.** (b), **135.** (c), **136.** (b), **137.** (d), **138.** (b), **139.** (c), **140.** (c), **141.** (a), **142.** (a), **143.** (b), **144.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

145. The making and breaking currents of 3-phase ac circuit breakers in power system are respectively in what form?
(a) rms value, rms value.
(b) instantaneous value, rms value.
(c) rms value.
(d) instantaneous value, instantaneous value.
[U.P.S.C. I.E.S. E.E.-II, 2010]

146. The breaking capacity of a 3-phase circuit breaker is given as
(a) service line voltage in volts × rated symmetrical current in amperes $\times 10^{-6}$ MVA.
(b) $\sqrt{3}$ service line voltage in volts × rated symmetrical current in amperes $\times 10^{-6}$ MVA.
(c) 1.1 × service line voltage in volts × rated symmetrical current in amperes $\times 10^{-6}$ MVA.
(d) $\sqrt{2}$ service line voltage in volts x rated symmetrical current in amperes × 10^{-6} MVA.

147. Rated breaking capacity (MVA) of a circuit breaker is equal to
(a) the product of rated breaking current (kA) and rated voltage (kV).
(b) the product of rated symmetrical breaking current (kA) and rated voltage (kV).
(c) the product of breaking current (kA) and fault voltage (kV).
(d) twice the value of rated current (kA) and rated voltage (kV).

148. The making to breaking current ratio for an EHV circuit breaker is
(a) more than 1. (b) equal to 1.
(c) less than 1. (d) a negative number.
[A.M.I.E. Sec B. Winter 1995]

149. The making capacity of a circuit breaker is
(a) Less than the asymmetrical breaking capacity of the breaker.
(b) Greater than the asymmetrical breaking capacity of the breaker.
(c) Equal to the symmetrical breaking capacity of the breaker.
(d) Equal to the asymmetrical breaking capacity.
[U.P.S.C. I.E.S. E.E.-II, 2007]

150. A three-phase, 33 kV oil circuit breaker is rated 1200 A, 2,000 MVA, 3 s. The symmetrical breaking current is
(a) 1,200 A (b) 3,600 A (c) 35 kA (d) 104.8 kA
[GATE E.E., 2010]

151. A three-phase breaker is rated 2,000 MVA, 33 kV. Its making current will be
(a) 35 kA (b) 49 kA (c) 70 kA (d) 89 kA
[U.P.S.C. I.E.S. E.E.-II, 2000; W.B. Univ. of Technology Power System-II, 2009-10]

152. In a 220 kV system, the inductance and capacitance up to the circuit breaker location are 25 mH and 0.025 μF respectively. The value of resistor required to be connected across the breaker contacts which will give no transient oscillations, is
(a) 25 Ω. (b) 250 Ω. (c) 500 Ω. (d) 1000 Ω.
[U.P.S.C. I.E.S. E.E.-II, 2001]

153. Which of the following sequences of operations represents the rated operating duty cycle of a circuit breaker?
(O-open; C-close; t = 3s; T = 3 minutes)
(a) O-t-CO-T-CO. (b) O-CO-t-CO-T-C.
(c) O-C-t-OC-T. (d) O-CO-T-CO-T-C.
[U.P.S.C. I.E.S. E.E.-II, 1999]

154. Which of the following statements is not correct?
(a) Arc chutes are used in air break circuit breakers.
(b) Air-blast circuit breakers are employed for high voltage traction system.
(c) Resistance switching is employed for overcoming current chopping.
(d) Linear resistors are used in resistance switching.

155. Capacitor switching in 33 kV power system is better done with ... circuit breakers.
(a) air-blast (b) minimum oil
(c) vacuum
[A.M.I.E. Sec B Winter 1996]

156. The probable cause(s) for fall in insulation resistance between phase terminal and earthed frame could be
(a) dirty insulation surface.
(b) ingress of moisture.
(c) sticking of carbon or copper particles to the internal surface.
(d) all of the above.

157. The probable cause(s) for failure of a circuit breaker on electrical compound could be
(a) trip circuit open. (b) trip latch defective.
(c) spring defective. (d) any of the above.

158. Routine tests are conducted on
(a) bulk oil circuit breakers. (b) minimum oil circuit breakers.
(c) air-blast circuit breakers. (d) all of the above.

159. An isolator is installed
(a) to isolate one portion of the circuit from another.
(b) usually on both sides of a circuit breaker.
(c) as a substitute for a circuit breaker.
(d) both (a) and (b).

160. Current rating is not necessary in case of
(a) isolators. (b) circuit breakers.
(c) load break switches.
(d) circuit breakers and load break switches.
[A.M.I.E. Sec B. Power Systems Winter 1999]

161. An isolator is meant for
(a) breaking abnormal current.
(b) making under fault condition.
(c) breaking the circuit under no-load condition.
(d) none of the above.
[A.M.I.E. Sec B. Advanced Power Systems Summer 1998]

162. Isolators used in transmission lines are capable of breaking:
(a) fault current. (b) no current.
(c) charging current. (d) load current.
[M.D. Univ. Transmission and Distribution May, 2011]

163. The oil switches may be
(a) remote or manually controlled.
(b) used for capacitor switching, street lighting control and automatic disconnect on power failure.
(c) used for high voltage and large current circuits.
(d) all of the above.

164. Which of the following sequence of operation is correct for operation of circuit breaker, isolator and earthing switch while opening a circuit ?
(a) Open circuit breaker–open isolator–close earthing switch.
(b) Open isolator–open circuit breaker–close earthing switch.
(c) Open earthing switch–open isolator–then open circuit breaker.
(d) Open circuit breaker–close earthing switch–open isolator.

165. Which of the following sequence of operation is correct for operation of circuit breaker, isolator and earthing switch while closing a circuit?
(a) Ensure circuit breaker is open-close isolator–open earthing switch–close circuit breaker.
(b) Ensure circuit breaker is open–open earthing switch-close isolator–close circuit breaker.
(c) Close circuit breaker–open earthing switch–close isolator.
(d) Open earthing switch–close circuit breaker–close isolator.

Answers: **145.** (d), **146.** (b), **147.** (b), **148.** (a), **149.** (b), **150.** (c), **151.** (d), **152.** (c), **153.** (a), **154.** (d), **155.** (c), **156.** (d), **157.** (d), **158.** (d), **159.** (d), **160.** (a), **161.** (c), **162.** (c), **163.** (d), **164.** (a), **165.** (b),

166. Purpose of backup protection is
(a) to increase the speed. (b) to increase a reach.
(c) to leave no blind spot.
(d) to guard against failure of primary. [A.M.I.E. Sec B. Winter 1998]

167. Protective relays are the devices that detect abnormal conditions in electrical circuits by measuring
(a) voltage. (b) current.
(c) constantly the electrical quantities which differ during normal and abnormal conditions.
(d) none of the above.

168. The actuating quantity for the relays may be
(a) magnitude. (b) frequency.
(c) phase angle. (d) any of these.

169. Protective relays can be designed to respond to
(a) light intensity. (b) temperature.
(c) resistance, reactance or impedance.
(d) voltage or current. (e) all of the above.

170. The protective relay is provided to
(a) provide additional safety to the circuit breaker in its operation.
(b) close the contacts when the actuating quantity attains a certain predetermined value.
(c) limit the arcing current during the circuit breaker operation.
(d) earth any stray voltage.

171. The operating speed of a relay depends upon the
(a) rate of flux built up. (b) armature core air-gap.
(c) spring tension. (d) all of these.

172. Plug setting of an electromagnetic relay can be altered by varying
(a) number of ampere turns. (b) air gap of magnetic path.
(c) adjustable back stop. (d) none of these.
[W.B. Univ. of Technology Power System-II, 2009-10]

173. The torque produced in shaded pole structure induction type relay is
(a) proportional to the square of the current.
(b) proportional to the current.
(c) inversely proportional to the current.
(d) inversely proportional to the square of the current.
[A.M.I.E. Sec. B Summer 1999]

174. Given ϕ_{1m}, ϕ_{2m} = the fluxes produced by the two portions of the shaded pole,
θ = the angle between ϕ_{1m} and ϕ_{2m},
R = resistance of the disc, the torque developed in an induction relay would be proportional to which of the following
1. ϕ_{1m} and ϕ_{2m} 2. 1/R
3. R 4. sin θ
Select the correct answer using the codes given below
Codes:
(a) 1, 2 and 4 (b) 1, 3 and 4
(c) 1 and 2 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 1993]

175. The most efficient torque-producing actuating structure for induction-type relays is
(a) shaded pole structure. (b) watt-hour meter structure.
(c) induction-cup structure.
(d) single induction loop structure. [U.P.S.C. I.E.S. E.E.-II, 1994]

176. A bimetal strip, in a thermal relay, consists of two metal strips of different
(a) specific heat. (b) thermal conductivity.
(c) coefficients of expansion. (d) all of the above.

177. Thermal relays are used for protection of motors against over-current owing to
(a) short circuits. (b) heavy loads.
(c) earth fault. (d) all of these.

178. Buchholz relay is
(a) located in the conservator tank.
(b) located in the transformer tank itself.
(c) connected in the pipe connecting main tank of transformer and conservator.
(d) installed in the circuit breaker.

179. Buchholz relays are used on
(a) air cooled transformers. (b) instrument transformers.
(c) distribution transformers.
(d) oil immersed power transformers of ratings above 500 kVA.

180. The Buchholz relay protects a transformer from
(a) types of internal faults. (b) a turn to turn fault.
(c) winding to winding fault. (d) none of these.
[W.B. Univ. of Technology Power System-II, 2009-10]

181. Which of the following relays is/are overload relays?
(a) Thermal. (b) Electromagnetic.
(c) Induction. (d) Solid state.
(e) All of the above.

182. In an overcurrent protection the setting of the earth fault relay is
(a) more than the phase fault relay.
(b) equal to the phase fault relay.
(c) less than the phase fault relay.
(d) the two settings are unrelated to each other.

183. Inverse time-current relays are used for the protection of
(a) feeders. (b) transformers.
(c) alternators. (d) both (a) and (b).

184. IDMT relays are used to protect the power transformers against
(a) external short circuits. (b) overloads.
(c) internal short circuits. (d) both (a) and (b).

185. Consider the following statements with reference to protective relays :
1. The minimum relay coil current at which the relay operates is called pick-up value.
2. The pick-up value of a relay is 7.5 A and fault current is 30 A. Therefore, its plug setting multiplier is 5.
3. An earth fault current is generally lesser than the short-circuit current.
4. Induction relays are used with both ac and dc quantities.
Which of these statements are correct ?
(a) 1 and 2. (b) 2 and 3.
(c) 1 and 3. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2003]

186. A fault current of 2,000 A is passing on the primary side of a 400/5 C.T. On the secondary side of the C.T., an inverse-time over current relay is connected whose plug setting is set at 50%. The plug setting multiplier will be :
(a) 25 (b) 50 (c) 10 (d) 30
[U.P.S.C. I.E.S. E.E.-II, 2003]

187. In an inverse definite minimum time, electromagnetic type over-current relay, the minimum time feature is achieved because of
(a) saturation of the magnetic circuit.
(b) proper mechanical design.
(c) appropriate time-delay element.
(d) electromagnetic damping. [GATE E.E. 2000]

Answers: **166.** (d), **167.** (c), **168.** (d), **169.** (e), **170.** (b), **171.** (d), **172.** (a), **173.** (a), **174.** (a), **175.** (c), **176.** (c), **177.** (b), **178.** (c), **179.** (d), **180.** (a), **181.** (e), **182.** (c), **183.** (d), **184.** (d), **185.** (c), **186.** (c), **187.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

188. Earth fault relays are
(a) directional relays. (b) non-directional relays.
(c) short operate time relays. (d) none of these.

189. The domains of power system where directional overcurrent relay is indispensable are
(a) in case of parallel feeder protection.
(b) in case of ring main feeder protection.
(c) both (a) and (b). (d) none of the above.
[A.M.I.E. Sec. B Summer 1998]

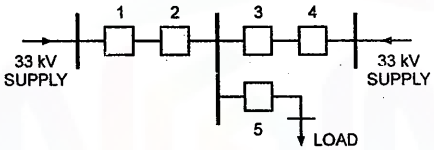
190. Directional overcurrent relays have two exciting coils connected across
(a) CT secondaries of two different phases.
(b) VT secondaries of two different phases.
(c) CT and VT secondaries of the same phase.
(d) CT and VT secondaries of two different phases.
[A.M.I.E. Sec. B Winter 1995]

191. Directional element connections of directional overcurrent relays are popularly described in terms of the angle by which unity power factor balanced load current flowing in tripping direction leads the voltage applied to relay potential coil. A protection scheme having the following potential coil and current coil connection is termed.

Relay	Potential Coil Voltage	Current Coil Current
A	V_{ac}	I_a
B	V_{ba}	I_b
C	V_{cb}	I_c

(a) 0^o connection. (b) 30^o connection.
(c) 60^o connection. (d) 90^o connection.
[U.P.S.C. I.E.S. E.E.-II, 1993]

192. The distribution system shown in the figure is to be protected by overcurrent system of protection. For proper fault discrimination, directional overcurrent relays will be required at locations



(a) 1 and 4. (b) 2 and 3.
(c) 1, 4 and 5. (d) 2, 3 and 5.
[Gate E.E. 1993; U.P.S.C. I.E.S. E.E.-II, 1959]

193. Consider the following statements. Distance relays used for protection of transmission lines might operate undesirably due to
1. magnetizing-current inrush.
2. power swings.
3. series compensating capacitors.
4. switching overvoltages.
Of these statements
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 1, 2 and 4 are correct. (d) 1, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1993]

194. In distance protection, the relay measures
(a) negative sequence impedance of the line from relay up to the fault point.
(b) positive sequence impedance of the line from relay up to the fault point.
(c) self impedance of the line from relay up to the fault point.
(d) zero sequence impedance of the line from relay up to the fault point.
[A.M.I.E. Sec B. Winter 1996]

195. If the fault occurs near the relay, the V/I ratio will be
(a) lower than that of if the fault occurs away from the relay.
(b) constant for all distances.
(c) higher than that of it the fault occurs away from the relay.
(d) none of the above.
[A.M.I.E. Sec B. Summer 1998]

196. Impedance relay may use
(a) balance beam structure. (b) induction-cup structure.
(c) shaded pole structure. (d) either (a) or (b).

197. Impedance relay can be used for
(a) phase faults only. (b) earth faults only.
(c) both earth and phase faults.
(d) none of above.

198. An impedance relay is a
(a) voltage restrained overcurrent relay.
(b) voltage restrained directional relay.
(c) directional restrained overcurrent relay.
(d) directional restrained overvoltage relay.

199. Threshold characteristics of a plain impedance relay in a complex Z plane is a
(a) circle passing through origin.
(b) circle with the centre at the origin.
(c) straight line passing through origin.
(d) straight line offset from the origin. [A.M.I.E. Sec B. Summer 1994]

200. On transient fault OC and impedance relay.
(a) under reaches. (b) over reaches.
(c) reach unaffected. (d) none of these.
[A.M.I.E. Sec B. Winter 1998]

201. The structure used in reactance relays is
(a) induction cup. (b) double induction loop.
(c) single induction loop. (d) either (a) or (b).

202. A reactance relay is
(a) voltage restrained overcurrent relay.
(b) voltage restrained directional relay.
(c) directional restrained overcurrent relay.
(d) directional restrained overvoltage relay.

203. The operating characteristics of a reactance relay in the complex impedance plane is a
(a) circle with its origin at the centre of the R–X plane.
(b) circle passing through the origin.
(c) straight line passing through the origin.
(d) straight line parallel to the X-axis. [A.M.I.E. Sec B. Summer 1993]

204. Reactance relay is normally used for protection against
(a) earth fault only. (b) phase fault only.
(c) both earth and phase faults. (d) none of the above.

205. Admittance relay is
(a) non-directional relay. (b) directional relay.
(c) differential relay. (d) none of these.

206. A mho relay is a
(a) voltage restrained directional relay.
(b) voltage restrained overcurrent relay.
(c) directional restrained overcurrent relay.
(d) directional restrained overvoltage relay.

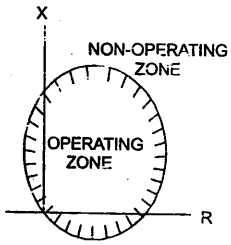
207. A Mho relay is a
(a) voltage restrained directional relay.
(b) voltage controlled overcurrent relay.
(c) directional restrained overcurrent relay.
(d) directional restrained overvoltage relay.
[W.B. Univ. of Technology Power System-II, 2009-10]

Answers: **188.** (a), **189.** (c), **190.** (c), **191.** (b), **192.** (b), **193.** (b), **194.** (b), **195.** (a), **196.** (d), **197.** (a), **198.** (a), **199.** (b), **200.** (a), **201.** (d), **202.** (c), **203.** (d), **204.** (a), **205.** (b), **206.** (a), **207.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

208. The operating characteristic of a distance relay in the R-X plane is shown in the figure. It represents operating characteristic of a



(a) reactance relay.
(b) directional impedance relay.
(c) impedance relay.
(d) mho relay.
[U.P.S.C. I.E.S. E.E.-II, 2001]

209. For ground fault use preffer:
(a) plain impedance relay. (b) directional relay.
(c) reactance relay. (d) over current relay.
[A.M.I.E. Sec B. Summer 1994; M.D. Univ. Transmission and Distribution May, 2011]

210. A distance relay is said to be inherently directional if its characteristics on R-X diagram
(a) is a straight line off-set from the origin.
(b) is a circle that passes through the origin.
(c) is a circle that encloses the origin.
(d) always a separate directional relay is required.
[W.B. Univ. of Technology Power System-II, 2009-10]

211. For the protection of lines against faults involving variable fault resistance, the preferred relaying scheme is a
(a) plain impedance relay. (b) directional overcurrent relay.
(c) mho relay. (d) reactance relay.
[A.M.I.E. Sec B. Summer 1993]

212. The relay used for phase fault protection of short transmission lines is
(a) reactance relay. (b) impedance relay.
(c) mho relay. (d) IDMT relay.
[A.M.I.E. Sec B. Summer 1999]

213. Mho relay is usually employed for the protection of
(a) short lines only. (b) medium lines only.
(c) long lines only. (d) any line.
[U.P.S.C. I.E.S. E.E.-II, 2008]

214. Where severe synchronising swing occur, the relay employed is
(a) impedance relay. (b) mho relay.
(c) reactance relay. (d) induction relay.

215. Which of the following relays has inherent directional characteristic?
(a) Mho. (b) Reactance.
(c) Impedance. (d) None of the above.

216. For the protection of a very long extra high voltage line, the protective relay used is
(a) overcurrent with extremely inverse characteristics.
(b) percentage differential relay.
(c) reactance type distance relay.
(d) mho type distance relay. [A.M.I.E. Sec B. Summer 1993]

217. A differential relay responds to
(a) algebraic difference of two or more similar electrical quantities.
(b) phasor difference of two or more similar electrical quantities.
(c) algebraic difference between two currents.
(d) algebraic difference between two voltages.

218. Differential relays are used for protection of equipment against
(a) internal faults. (b) overcurrent.
(c) reverse current. (d) reverse power.

219. Undervoltage relays are mainly used for
(a) motor protection. (b) transformer protection.
(c) transmission line protection.
(d) All of these. [U.P.S.C. I.E.S. E.E.-II, 2010]

220. In a biased differential relay the bias is defined as a ratio of
(a) number of turns of restraining and operating coil.
(b) operating coil current and restraining coil current.
(c) fault current and operating coil current.
(d) fault current and restraining coil current. [GATE E.E. 2006]

221. Differential relays are used for protection of
(a) feeders. (b) alternators.
(c) transformers. (d) all of these.

222. Both voltage and current signals are required for
(a) a plain overcurrent relay.
(b) a differential relay. (c) a directional relay.
(d) a biased differential relay. [A.M.I.E. Sec B. Summer 1994]

223. A 75 MVA, 10 kV synchronous generator has $X_d = 0.4$ pu. The X_d value (in pu) to a base of 100 MVA, 11 kV is
(a) 0.578. (b) 0.279.
(c) 0.412. (d) 0.44. [GATE E.E. 2001]

224. The relay used for feeder protection is
(a) undervoltage relay. (b) Translay relay.
(c) thermal relay. (d) Buchholz relay.

225. In the case of transmission line protection, overcurrent relay is used
(a) only up to 110 kV. (b) only up to 220 kV.
(c) only up to 50 kV. (d) only up to 1,100 kV.
[A.M.I.E. Sec B. Summer 1994]

226. Phase relays are used to provide protection against
(a) single line to ground fault. (b) three phase fault only.
(c) phase faults involving two or more phases.
(d) double phase to ground fault only. [A.M.I.E. Sec B. Summer 1994]

227. In a 3-phase circuit, residual current means the flow of ... current.
(a) negative-sequence (b) zero sequence
(c) dc transient [A.M.I.E. Sec B. Winter 1999]

228. The plug setting of a negative sequence relay is 0.2 A. The current transformer ratio is 5 : 1. The minimum value of line to line fault current for the operation of the relay is
(a) 1 A (b) $\frac{1}{1.732}$ A
(c) 1.732 A (d) $\frac{0.2}{1.732}$ A [GATE E.E. 2000]

229. Zero-sequence current is used for relaying purposes only in the case of
(a) phase overcurrent relay. (b) phase impedance relay.
(c) ground overcurrent relay. (d) ground impedance relay.
[A.M.I.E. Sec B. Summer 1994]

230. Over conventional electromechanical relays, the transistor relays have the advantages of
(a) low power consumption, less maintenance and greater sensitivity.
(b) quick operation and high reset to pick-up ratio.
(c) wide range of characteristics approaching more or less to ideal requirements.
(d) all of the above.

231. Over conventional electromechanical relays, the transistor relays have the limitations of
(a) characteristics varying with temperature and ageing.
(b) low short-time overload capacity.
(c) reliability dependent upon the large number of small components and their electrical connections.
(d) all of the above.

Answers: **208.** (d), **209.** (c), **210.** (b), **211.** (d), **212.** (a), **213.** (c), **214.** (b), **215.** (a), **216.** (d), **217.** (b), **218.** (a), **219.** (d), **220.** (a), **221.** (d), **222.** (c), **223.** (d), **224.** (b), **225.** (c), **226.** (c), **227.** (b), **228.** (a), **229.** (c), **230.** (d), **231.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

232. In a static overcurrent relay, inverse time characteristics are obtained by
(a) a transistor amplifier. (b) an integrating circuit.
(c) a transistor switch. (d) a differentiating circuit.
[A.M.I.E. Sec B. Summer 1993]

233. Two-input phase comparator in a static relay is made up of a
(a) transformer amplifier. (b) transistor logic circuit.
(c) rectifier bridge. (d) thyristor bridge.
[A.M.I.E. Sec B. Summer 1993]

234. The phase comparators in case of static relays and electro-mechanical relays normally are
(a) cosine and sine comparators respectively.
(b) sine and cosine comparators respectively.
(c) both are sine comparators. (d) both are cosine comparators.

235. Merz-Price protection is employed for protection of
(a) alternators. (b) transformers.
(c) transmission lines. (d) both (a) and (b).
[A.M.I.E. Sec B. Summer 1999]

236. Negative-sequence voltages in the stator induces.
(a) high frequency currents in the rotor.
(b) high frequency voltage in the rotor.
(c) low frequency currents in the rotor.
(d) high frequency currents in the stator.

237. The short-circuit current of an alternator, in case of line to line fault, depends on its
(a) short-circuit resistance. (b) transient reactance.
(c) synchronous reactance. (d) none of the above.

238. We do not require any protection against prime mover failure in case of
(a) turbo-generator sets. (b) hydrogenerator sets.
(c) diesel-engine driven alternators.
(d) back pressure turbo-generators.

239. A large ac generator supplying power to an infinite bus, has a sudden short circuit occurring at its terminals. Assuming the prime mover input and the voltage behind the transient reactance to remain constant immediately after the fault, the acceleration of the generator rotor is
(a) inversly proportional to the moment of inertia of the machine.
(b) inversly proportional to the square of voltage.
(c) directly proportional to the square of the short-circuit current.
(d) directly proportional to the short-circuit power.
[U.P.S.C. I.E.S. E.E.-I, 1994]

240. For the protection of stator winding of an alternator against internal fault involving ground, the relay used is a
(a) biased differential relay. (b) directional overcurrent relay.
(c) plain impedance relay. (d) Buchholz relay.
[A.M.I.E. Sec B. Summer 1993]

241. The bias factor S in unit protection synchronous generators
(a) lies between 0.05 and 0.1 pu.
(b) is less than 0.05 pu. (c) lies between 0.1 to 0.25 pu.
(d) is greater than 0.025 pu. [A.M.I.E. Sec B. Summer 1994]

242. Field failure in an alternator occurs due to
(a) failure of exciter. (b) faulty field circuit breaker.
(c) inrush of large currents. (d) both (a) and (b).

243. A soon as a fault develops in a generator stator, it is essential to suppress field excitation, otherwise
(a) terminal voltage will drop.
(b) it may lead to loss of synchronism.
(c) it will continue to supply power to the stator winding fault.
(d) all of the above.

244. If there is an open circuit in the field circuit of a generator
(a) the generator will continue to operate as an induction generator supplying load at a very low leading power factor.
(b) the supply voltage will drop, and the system stability will be affected.
(c) the circulating current at slip frequency may overheat the generator.
(d) all of the above.

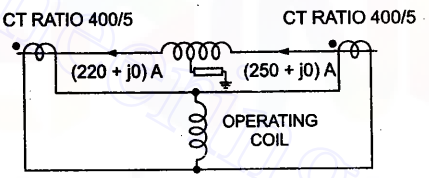
245. The earth fault in stator causes
(a) arcing to core.
(b) severe heating in conductors and thereby damaging the insulation.
(c) open-circuit in the stator. (d) both (a) and (b).

246. Failure of insulation on stator winding of generator results in
(a) short circuit between turns.
(b) short circuit between one or more phases and earth.
(c) short circuit between phases.
(d) all of the above.

247. The magnitude of earth-fault current for a given fault position within a winding depends upon
(a) the winding connections.
(b) the method of neutral grounding.
(c) unmatched characteristics of CTs.
(d) both (a) and (b).

248. The neutral of 10 MVA, 11 kV alternator is earthed through a resistance of 5 ohms. The earth fault relay is set to operate at 0.75 A. The CT's have a ratio of 1,000/5. What percentage of the alternator winding is protected ?
(a) 85% (b) 88.2% (c) 15% (d) 11.8%
[GATE E.E. 1998]

249. Consider a stator winding of an alternator with an internal high-resistance ground fault. The currents under the fault condition are as shown in the figure. The winding is protected using a differential current scheme with current transformers of ratio $\frac{400}{5}$ A as shown. The current through the operating coil is



(a) 0.1875 A (b) 0.2 A
(c) 0.375 A (d) 60 kA [GATE E.E., 2010]

250. For the protection of a large squirrel-cage induction motor against single phase normally
(a) an overcurrent relay is used.
(b) a differential relay is used.
(c) a directional relay is used.
(d) negative sequence current sensitive relay is used.
[A.M.I.E. Sec B. Summer 1993]

251. The main function of undervoltage protective device generally employed with a motor starter is to
(a) open the supply circuit on failure of power supply.
(b) control the motor voltage.
(c) prevent the opening of supply circuit.
(d) none of the above.

Answers: **232.** (b), **233.** (c), **234.** (a), **235.** (d), **236.** (a), **237.** (c), **238.** (a), **239.** (a), **240.** (a), **241.** (a), **242.** (d), **243.** (c), **244.** (d), **245.** (d), **246.** (d), **247.** (d), **248.** (b), **249.** (c), **250.** (d), **251.** (a),

252. While adding extra stop buttons to an existing control system they must be in
(a) parallel to the load. (b) series with the contactor coil.
(c) series with the motor. (d) parallel to the start button.

253. The types of faults that occur in electric motors are
(a) stator. (b) rotor.
(c) overload. (d) undervoltage.
(e) unbalanced supply voltages and reverse or open phase starting.
(f) all of the above.

254. Negative-sequence currents flow in the stator windings of an ac motor due to
(a) unbalance in the supply voltage.
(b) unbalanced load. (c) phase reversal.
(d) either (a) or (b).

255. A negative sequence relay is commonly used to protect
(a) an alternator. (b) a transformer.
(c) a transmission line. (d) a bus bar. [GATE E.E. 2011]

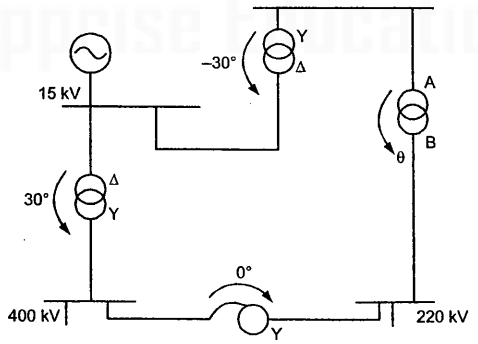
256. Earth fault protection for an electric motor is provided by means of
(a) instantaneous overcurrent relay.
(b) instantaneous relay having a setting of aproximately 30% of motor rated current in the residual circuits of two CTs.
(c) ground wire. (d) both (b) and (c).

257. Any winding of a power transformer develops short-circuit owing to
(a) loose connection. (b) insulation failure.
(c) impulse voltage. (d) mechanical vibrations.

258. Which one of the following relays has the capability of anticipating the possible major fault in a transformer ?
(a) Overcurrent relay (b) Differential relay
(c) Buchholz relay (d) Overfluxing relay
[U.P.S.C. I.E.S. E.E.-II, 2001]

259. Which relay is used to detect and protect internal faults of a transformer ?
(a) Buchholz (b) Directional relay
(c) Thermal relay (d) Distance relay
[U.P.S.C. I.E.S. E.E.-II, 2007]

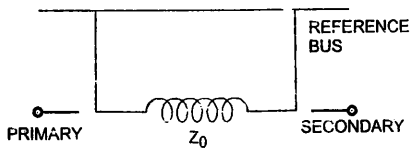
260. Consider the transformer connections in a part of a power system shown in the figure. The nature of transformer connections and phase shifts are indicated for all but one transformer.
Which of the following connections, and the corresponding phase shift θ, should be used for the transformer between A and B?



AUTO-TRANSFORMER

(a) Star-Star (θ = 0°) (b) Star-Delta (θ = −30°)
(c) Delta-Star (θ = 30°) (d) Star-Zigzag (θ = 30°)
[GATE E.E. 2007]

261. A three-phase transformer having zero-sequence impedance of Z_0 has the zero-sequence network as shown in the figure. The connections of its windings are



(a) star-star (b) delta-delta
(c) star-delta
(d) delta-star with neutral grounded [U.P.S.C. I.E.S. E.E.-II, 2001]

262. To protect the power transformer (Y – Y with neutral grounded) against fault, what type of connection do the CTs have ?
(a) Δ – Y connection (b) Δ – Δ connection
(c) Y – Y connection (d) Y – Δ connection
[U.P.S.C. I.E.S. E.E.-II, 2006]

263. In Merz-Price percentage differential protection of a Δ-Y transformer, the CT secondaries connection in the primary and secondary winding of the transformer would be in the form of
(a) Δ-Y. (b) Y-Δ. (c) Δ-Δ. (d) Y-Y.
[U.P.S.C. I.E.S. E.E.-II, 2000]

264. A 10 kVA, 400 V/200 V single phase transformer with 10% impedance draws a steady short-circuit line current of
(a) 50 A. (b) 150 A. (c) 250 A. (d) 350 A.
[GATE E.E. 1999]

265. A 3-phase 11/66 kV delta/star transformer, protected by Merz-Price scheme has CT ratio of 400/5 on *lt* side. Ratio of CT on *ht* side will be equal to
(a) 1 : 23 (b) 23 : 1 (c) 23 : $\sqrt{3}$ (d) $\sqrt{3}$: 23
[U.P.S.C. I.E.S. E.E.-II, 1999]

266. To prevent mal operation of differentially connected relay while energising a transformer, the relay restraining coil is biased with
(a) second harmonic current. (b) third harmonic current.
(c) fifth harmonic current. (d) seventh harmonic current.
[U.P.S.C. I.E.S. E.E.-II, 1995]

267. The inrush current of a transformer at no load is maximum if the supply voltage is switched on
(a) at peak voltage value. (b) at zero voltage value.
(c) at half voltage value. (d) at 0.866 time voltage value.

268. Magnetising inrush phenomena occur in
(a) large transformer primary only, when the transformer is switched on.
(b) large transformer primary when a 3-phase fault occurs in the secondary.
(c) large transformer secondary only when the transformer is switched on in the primary.
(d) none of the above. [A.M.I.E. Sec B. Winter 1996]

269. In case of power transformer :
(a) positive-, negative- and zero-sequence impedances are all equal.
(b) positive- and zero-sequence impedances are equal but less than negative-sequence impedance.
(c) positive- sequence impedance is greater than both negative- and zero-sequence impedances.
(d) positive- sequence impedance is less than negative-sequence impedance but equal to zero-sequence impedance.
[A.M.I.E. Sec B. Advanced Power Systems Summer 1998]

Answers: **252.** (b), **253.** (f), **254.** (d), **255.** (a), **256.** (d), **257.** (b), **258.** (c), **259.** (a), **260.** (a), **261.** (b), **262.** (b), **263.** (b), **264.** (c), **265.** (b), **266.** (a), **267.** (b), **268.** (a), **269.** (a),

270. For the protection of transformers, harmonic restraint is used to guard against
(a) magnetising inrush current.
(b) unbalanced operation. (c) lightning.
(d) switching overvoltage. [GATE E.E. 2001]

271. The connections of CTs are opposite to that of transformer windings so that current in the pilot wires of two are/have
(a) same phase. (b) opposite in phase.
(c) a phase difference of 60°. (d) a phase difference of 90°.

272. For preventing the maloperation of Merz-Price protection scheme on inrush of magnetizing current
(a) the relay restraining coil is biased with second harmonic current.
(b) time lag is provided in the relay.
(c) relay sensitivity is reduced by employing a shunt.
(d) all of the above.

273. Problems associated with differential protection is/are
(a) magnetizing inrush current.
(b) mismatching characteristics of CTs.
(c) charge of ratio as a result of tapping.
(d) all of the above.

274. Which of the following sections can be employed for bus-bars?
(a) Bars. (b) Rods.
(c) Tubes. (d) Any of the above.

275. The material used for bus-bars should have
(a) low resistivity. (b) low cost.
(c) high softening temperature.
(d) all of the above.

276. A bus-bar is rated by
(a) current only. (b) voltage only.
(c) current, voltage and frequency.
(d) current, voltage, frequency and short-circuit current.

277. Single bus-bar arrangement
(a) is cheapest in initial as well as maintenance cost.
(b) provides simple operation and relaying system.
(c) has the drawback that there will be complete shutdown when fault occurs on the bus itself.
(d) all of the above.

278. Double bus-bar arrangement makes use of two identical bus-bars and has the advantage(s) that
(a) it does not require any bus coupler and permits switchover from one bus to another whenever desired.
(b) it provides maximum flexibility and reliability.
(c) either bus-bar may be taken up for maintenance.
(d) the infeed and load circuits may be divided into two separate groups.
(e) all of the above.

279. A bus coupler circuit breaker is utilised in a substation for
(a) joining the transmission line with station bus-bar.
(b) joining main and transfer bus in a substation.
(c) joining the generator with transfer.
(d) joining the neutral of the generator with earth.
[A.M.I.E. Sec B. Summer 1993]

280. Zero-sequence impedance of the transmission line is
(a) equal to the positive-sequence impedance of the line.
(b) about 2.5-3 times the positive-sequence impedance of the line.
(c) less than positive-sequence impedance of the line.
(d) none of the above. [A.M.I.E. Sec B. Winter 1996]

281. Which is the pilotless protection method for feeder line?
(a) Differential protection. (b) Carrier current protection.
(c) Time graded protection. (d) None of these.

282. The most commonly used method for the protection of 3-phase feeder is
(a) time graded protection. (b) differential protection.
(c) reverse power protection.

283. A transmission line is protected by:
(a) distance protection.
(b) current graded overcurrent protection.
(c) time graded overcurrent protection.
(d) inrush protection.
[M.D. Univ. Transmission and Distribution May 2011]

284. In the case of transmission line protection, overcurrent used is:
(a) only up to 110 kV. (b) only upto 220 kV.
(c) only upto 50 kV. (d) only upto 1,100 kV.
[M.D. Univ. Transmission and Distribution May 2011]

285. Which is the main relay for protecting up to 90% of the transmission line-length in the forward direction ?
(a) Directional overcurrent relay. (b) Mho relay.
(c) Carrier-current protective relay. (d) Impedance relay.
[U.P.S.C. I.E.S. E.E.-II, 2006]

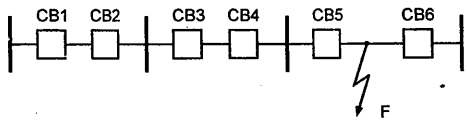
286. For complete protection of a 3-phase transmission line we require
(a) three-phase and three earth fault relays.
(b) three-phase and two earth fault relays.
(c) two-phase and two earth fault relays.
(d) two-phase and one earth fault relay.

287. For complete protection of a 3-phase line
(a) three-phase and three-earth fault relays are required.
(b) three-phase and two-earth fault relays are required.
(c) two-phase and two-earth fault relays are required.
(d) two-phase and one-earth fault relays are required.
[W.B. Univ. of Technology Power System-II, 2009-10]

288. How many relays are used to detect interphase fault of a three-line system ?
(a) One (b) Two (c) Three (d) Six
[U.P.S.C. I.E.S. E.E.-II, 2006]

289. The transmission line distance protection relay having the property of being inherently directional is
(a) impedance relay (b) MHO relay
(c) OHM relay (d) reactance relay [GATE E.E. 2004]

290. The sections of a feeder are provided with circuit breakers CB_1, CB_2, CB_3, CB_4, CB_5 and CB_6. For a fault at F as indicated in figure



(a) CB_5 must be set to trip after CB_1 trips.
(b) CB_5 must be set to trip after CB_3 and CB_4 trip.
(c) CB_5 must be set to trip after CB_2 trips.
(d) CB_5 must be set to trip before CB_1, CB_2, CB_3 and CB_4 trip.
[GATE E.E. 1999]

291. Time graded protection of a radial feeder can be achieved by using
(a) definite time relays. (b) inverse time relays.

Answers: **270.** (a), **271.** (a), **272.** (a), **273.** (d), **274.** (d), **275.** (d), **276.** (d), **277.** (d), **278.** (e), **279.** (b), **280.** (b), **281.** (b), **282.** (b), **283.** (a), (b), (c), **284.** (c), **285.** (b), **286.** (d), **287.** (d), **288.** (c), **289.** (b), **290.** (d), **291.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) both definite and inverse time relays.
(d) none of the above. [A.M.I.E. Sec B. Summer 1999]

292. For protection of parallel feeders fed from one end, the relays required are
(a) Non-directional relays at the source end and directional relays at the load end.
(b) Non-directional relays at both ends.
(c) Directional relays at source end and non-directional relays at load end.
(d) Directional relays at both ends. [U.P.S.C. I.E.S. E.E.-II, 2005]

293. Pilot-wire protection scheme is most economical and provides high speed relaying for
(a) short length of lines up to 15 km.
(b) medium length of lines up to 60 km.
(c) long length of lines up to 200 km.
(d) all of the above.

294. Adjustable resistors are connected in the pilot wires in order to
(a) change the phase of the current flowing through the relay.
(b) get equipotential points on pilot wires.
(c) reduce current flowing through the relay.
(d) none of the above.

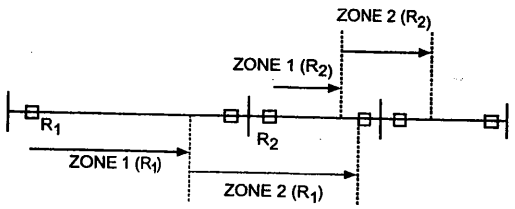
295. Signal mixing transformers are used for
(a) induction disc type overcurrent relay.
(b) direction sensitive distance relay.
(c) pilot-wire feeder protection.
(d) plain differential relay. [A.M.I.E. Sec B. Summer 1993]

296. In a balanced voltage pilot-wire protection scheme if the pilot-circuit gets opened, the relay will
(a) fail to trip on internal faults. (b) trip on full load.
(c) trip instantaneously on external faults.

297. In a balanced voltage pilot-wire protection scheme, if the pilot-circuit gets short-circuited, the relay will
(a) fail to trip on internal faults.
(b) fail to trip on external faults.
(c) trip on full-load. (d) trip instantaneously.

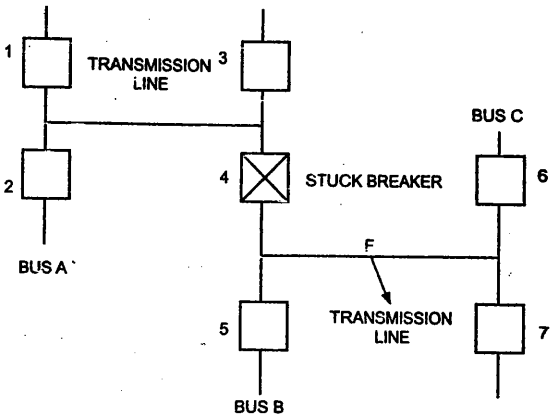
298. Voltage phasors at the two terminals of a transmission line of length 70 km have a magnitude of 1.0 per unit but are 180 degrees out of phase. Assuming that the maximum load current in the line is 1/5th of minimum 3-phase fault current. Which one of the following transmission line protection schemes will NOT pick up for this condition ?
(a) Distance protection using mho relays with zone-1 set to 80% of the line impedance.
(b) Directional overcurrent protection set to pick up at 1.25 times the maximum load current.
(c) Pilot relaying system with directional comparison scheme.
(d) Pilot relaying system with segregated phase comparison scheme. [GATE E.E. 2008]

299. Consider the problem of relay coordination for the distance relays R_1 and R_2 on adjacent lines of a transmission system. The Zone 1 and Zone 2 settings for both the relays are indicated on the diagram. Which of the following indicates the correct time setting for the Zone 2 of relays R_1 and R_2.



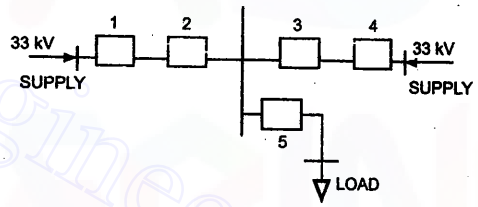
(a) $TZ2_{R1} = 0.6s$, $TZ2_{R2} = 0.3s$.
(b) $TZ2_{R1} = 0.3s$, $TZ2_{R2} = 0.6s$.
(c) $TZ2_{R1} = 0.3s$, $TZ2_{R2} = 0.3s$.
(d) $TZ2_{R1} = 0.1s$, $TZ2_{R2} = 0.3s$. [GATE E.E. 2002]

300. Consider the protection system shown in the figure. The circuit breakers numbered from 1 to 7 are of identical type. A single line to ground fault with zero fault impedance occurs at the midpoint of the line (at point F), but circuit breaker 4 fails to operate ("Stuck breaker"). If the relays are coordinated correctly, a valid sequence of circuit breaker operation is



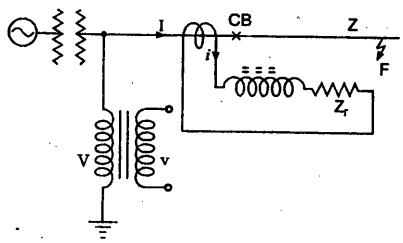
(a) 1, 2, 6, 7, 3, 5 (b) 1, 2, 5, 5, 7, 3
(c) 5, 6, 7, 3, 1, 2 (d) 5, 1, 2, 3, 6, 7 [GATE E.E. 2008]

301. The distribution system shown in figure is to be protected by overcurrent system of protection.
At which locations are directional overcurrent relays required for proper fault discrimination ?



(a) 1 and 4 (b) 2 and 3
(c) 1, 4 and 5 (d) 2, 3 and 5
[U.P.S.C. I.E.S. E.E.-II, 2005]

302. The figure given below shows a schematic arrangement of a Distance Relay provided with a 'Replica Impedance' Z_r. The CT ratio = $\frac{I}{i}$ and VT ratio = $\frac{V}{v}$.
When a fault occurs on the line being protected, when would the relay operate ?



(a) $Z_r > Z$ (b) $Z_r < Z$
(c) $Z_r > Z \cdot \frac{I}{i}$ (d) $Z_r > Z \cdot \frac{V}{v}$
[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **292.** (a), **293.** (a), **294.** (b), **295.** (c), **296.** (a), **297.** (c), **298.** (a), **299.** (a), **300.** (c), **301.** (b), **302.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

303. The frequency of carrier in the carrier current pilot scheme is in the range of
(a) 1 kHz to 10 kHz. (b) 10 kHz to 25 kHz.
(c) 25 kHz to 50 kHz. (d) 50 kHz to 500 kHz.
[A.M.I.E. Sec B. Summer 1994]

304. The frequency of carrier transmitted by microwave pilot is in the range of
(a) 1,000 kHz to 1,500 kHz (b) 2,000 kHz to 5,000 kHz
(c) 900 MHz to 6,000 MHz (d) 10,000 MHz to 15,000 MHz
[A.M.I.E. Sec B. Summer 1994]

305. In carrier current protection the purpose of the wavetrap is for
(a) trapping power frequency waves.
(b) trapping high frequency waves entering into generators/ transformer unit.
(c) both (a) and (b).
(d) none of the above. [A.M.I.E. Sec B. Summer 1998]

306. A line trap in carrier current relaying tuned to carrier frequency presents
(a) high impedance to carrier frequency but low impedance to power frequency.
(b) low impedance to both carrier and power frequency.
(c) high impedance to both carrier and power frequency.
(d) low impedance to carrier frequency but high impedance to power frequency. [U.P.S.C. I.E.S. E.E.-II, 1998]

307. A line trap in a long transmission line is used to
(a) improve the power factor.
(b) dampen the overvoltage oscillations.
(c) confine the carrier signals in the line.
(d) protect the line against direct lightning stroke.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

308. Line trap and coupling capacitors are used for carrier current protection in which
(a) line trap has high impedance to 50 Hz signal but low impedance to carrier current signal whereas a coupling capacitor has low impedance to 50 Hz signal but high impedance to carrier signal.
(b) line trap has low impedance to 50 Hz signal but high impedance to carrier current signal, where as a coupling capacitor has high impedance to 50 Hz signal but low impedance to carrier signal.
(c) both the line trap and coupling capacitor have low impedance to 50 Hz signal but high impedance to carrier current signal.
(d) both the line trap and coupling capacitor have high impedance to 50 Hz signal but low impedance to carrier current signal.
[U.P.S.C. I.E.S. E.E.-II, 1999]

309. In a 3-step distance protection, the reach of the three zones of the relay at the beginning of the first line typically extends into
(a) 100% of the first line, 50% of the second line and 20% of the third line.
(b) 80% of the first line, 50% of the second line and 20% of the third line.
(c) 80% of the first line, 50% of the second line and 10% of the third line.
(d) 50% of the first line, 50% of second line and 20% of the third line. [GATE E.E. 2000]

310. Distance protection scheme is preferred over graded time-lag over-current protection in HV and EHV lines because
(a) it is faster in operation. (b) it is simple.
(c) it is cheaper in cost. (d) all of the above.

311. Three step time-distance characteristic of distance relay can be had by
(a) changing taps on voltage transformer.
(b) separate measuring elements for zones 2 and 3.
(c) switching resistance in relay restraint circuit at pre-set time intervals by means of timer element.
(d) any of the above.

312. Lightning is a huge spark caused by electrical discharge taking place between
(a) clouds. (b) within the same cloud.
(c) cloud and earth. (d) any of the above.

313. Switching overvoltages are more hazardous than lightning surges in case of
(a) low voltage system. (b) 33 kV system.
(c) EHV and UHV systems. (d) all of these.

314. The overvoltage surges in power systems may be caused by
(a) lightning. (b) resonance.
(c) switching. (d) all of these.

315. Requirements of protection power station buildings against direct strokes are
(a) interception. (b) conduction.
(c) dissipation. (d) reflection and convection.
(e) (a), (b) and (c).

316. The protection against direct lightning strokes and high voltage steep waves is provided by
(a) ground wires. (b) lightning arresters.
(c) lightning arresters and ground wires.
(d) earthing of neutral.

317. Which of the following factors should be considered in the design of a transmission line against lightning with ground wire?
(a) Mechanical strength of ground wire.
(b) Clearance between line conductor and ground wire.
(c) Clearance between line conductor and earth.
(d) All of the above.

318. For protection of rotating machines against lightning surges _____ is used
(a) lightning arrester. (b) capacitor.
(c) combination of lightning arrester and capacitor.
(d) lightning conductor and arrester.

319. Consider the following statements. To provide reliable protection for a distribution transformer against overvoltages using lightning arresters, it is essential that the
1. lead resistance is high.
2. distance between the transformer and the arrester is small.
3. transformer and the arrester have a common interconnecting ground.
4. sparkover voltage of the arrester is greater than the residual voltage.

Of these statements.
(a) 1, 3 and 4 are correct. (b) 2 and 3 are correct.
(c) 2, 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1997]

320. Impulse ratios of insulators and lightning arresters should be
(a) both low. (b) high and low respectively.
(c) low and high respectively. (d) both high.
[U.P.S.C. I.E.S. E.E.-II, 1996]

321. Lighting arresters are used in power systems to protect electrical equipments against

---

Answers: **303.** (d), **304.** (c), **305.** (b), **306.** (a), **307.** (c), **308.** (b), **309.** (b), **310.** (a), **311.** (d), **312.** (d), **313.** (c), **314.** (d), **315.** (e), **316.** (c), **317.** (d), **318.** (c), **319.** (b), **320.** (b), **321.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) direct strokes of lightning.
(b) overvoltages due to indirect lightning stroke.
(c) power frequency overvoltages.
(d) overcurrents due to lightning. [U.P.S.C. I.E.S. E.E.-II, 1995]

322. Which of the following is the protective device against lightning overvoltages?
(a) Rod gaps. (b) Surge absorbers.
(c) Horn gaps. (d) All of the above.
[A.M.I.E. Sec B. Power Systems Winter 1999]

323. Overhead ground wires are used to protect a transmission line against
(a) line-to-ground faults. (b) arcing earths.
(c) voltage surges due to direct lightning stroke.
(d) high voltage oscillations due to switching.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

324. An overhead transmission line is provided with earth wire for protection against
(a) switching surge. (b) lightning surge.
(c) power frequency overvoltage.
(d) none of these. [W.B. Univ. of Technology Power System-III, 2009-10]

325. In a thyrite lightning arrester the resistance
(a) varies linearly with the applied voltage.
(b) increases with the applied voltage.
(c) decreases linearly with the applied voltage.
(d) is high at low current and low at high current.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

326. An ideal surge diverter should have the characteristics
(a) its power frequency breakdown or sparkover must be above normal or abnormal fundamental frequency.
(b) when the value of voltage transient peak exceeds the spark-over value of the surge diverter, a conducting path to earth must be provided.
(c) after occurrence of breakdown, it must carry the resulting discharge current without any damage to it.
(d) after breakdown the power frequency current must be interrupted as soon as the transient voltage has dropped below the breakdown value.
(e) all of the above.

327. Consider the following statements:
1. Present-day surge diverters use nonlinear resistance elements.
2. A travelling wave is usually represented as a step wave in the analysis.
3. A travelling wave suffers reflection when it reaches a discontinuity.
4. The function $(f(vx \pm t))$ represents a travelling wave.
Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 2 only.
(c) 1, 2 and 3. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2009]

328. A lightning arrester provides
(a) low impedance path. (b) high impedance path.
(c) low resistance path.
(d) high resistance path between line and earth during operation.

329. Surge absorbers are used for protection against
(a) high voltage low frequency oscillations.
(b) high voltage high frequency oscillations.
(c) low voltage high frequency oscillations.
(d) low voltage low frequency oscillations.

330. Surge modifiers are employed for
(a) reducing the steepness of wavefront.
(b) reducing the current of wavefront.
(c) reducing the voltage of wavefront.
(d) modify the shape of the wavefront.

331. Which of the following are the important limitations of rod gap surge arresters ?
1. They are not capable of sealing off power frequency follow up current.
2. After a discharge, the rods are destroyed completely.
3. Performance is affected by climatic conditions.
Use the following codes for selecting the correct answer.
Codes :
(a) 1, 2 and 3 (b) 1 and 2 (c) 2 and 3 (d) 1 and 3
[U.P.S.C. I.E.S. E.E.-II, 1993]

332. A thyrite type lightning arrester
(a) blocks the surge voltage appearing in a line.
(b) absorbs the surge voltage appearing in a line.
(c) offers a low resistance path to the surge appearing in a line.
(d) returns the surge back to the source.
[U.P.S.C. I.E.S. E.E.-II, 1993]

333. A lightning arrester connected between the line and earth in a power system
(a) protects the terminal equipment against travelling surges.
(b) protects the terminal equipment against direct lightning stroke.
(c) suppresses high frequency oscillations in the line.
(d) reflects back the travelling waves approaching it.
[U.P.S.C. I.E.S. E.E.-II, 1994]

334. Which of the following is a non-linear diverter?
(a) Expulsion type arrester. (b) Valve type arrester.
(c) Electrolytic type arrester. (d) Rod gap arrester.

335. A valve type lightning arrestor in a substation should be placed
(a) close to the circuit breaker.
(b) close to the transformer.
(c) away from the transformer.
(d) none of these. [W.B. Univ. Technology Power System-III, 2009-10]

336. Surge absorber _____ the energy of travelling waves
(a) absorbs (b) reflects
(c) diverts (d) partly absorbs and partly diverts

337. Coupling factor of a ground wire can be increased by
(a) reducing the footing impedance.
(b) increasing the ground wire size.
(c) using cantilever rods on the crossing alongwith the areas of ground wire.
(d) all of the above.

338. In the presence of corona, electrostatic coupling _____ and electro-magnetic coupling _____
(a) decrease, increases. (b) increases, decreases.
(c) increases, remains the same.
(d) remains the same, decreases.

339. When a transmission line is energized, _____ propagate on it
(a) voltage wave only (b) current wave only
(c) both voltage and current waves
(d) none of the above.

340. When a wave propagate on a transmission line, it suffers reflection several times at
(a) load end. (b) sending end.
(c) sending end and other end. (d) tapping point.

Answers: **322.** (d), **323.** (c), **324.** (b), **325.** (d), **326.** (e), **327.** (c), **328.** (a), **329.** (c), **330.** (a), **331.** (d), **332.** (c), **333.** (a), **334.** (b), **335.** (b), **336.** (d), **337.** (d), **338.** (c), **339.** (c), **340.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

341. Travelling voltage wave and current wave have the same waveforms and travel together along the transmission line at a velocity
(a) of sound. (b) of light.
(c) slightly lesser than that of light.
(d) slightly lesser than that of sound.

342. The relation between travelling voltage wave and current wave is given as
(a) $ei = \sqrt{\frac{L}{C}}$ (b) $\frac{e}{i} = \sqrt{\frac{L}{C}}$
(c) $ei = \sqrt{LC}$ (d) $e/i = \sqrt{LC}$

343. For a transmission line the standing wave ratio is the ratio of
(a) peak voltage to rms voltage.
(b) maximum current to minimum current.
(c) maximum voltage to minimum voltage.
(d) maximum impedance to minimum impedance.

344. The steepness of the wavefront can be reduced by connecting
(a) an inductor in series with the line.
(b) a capacitor between line and earth.
(c) either (a) or (b).
(d) an inductor between line and earth or a capacitor in series with the line.

345. If a travelling wave travelling along a loss-free overhead line does not result in any reflection after it has reached the far end, then the far end of the line is
(a) open circuited. (b) short circuited.
(c) terminated into a resistance equal to surge impedance of the line.
(d) terminated into a capacitor. [U.P.S.C. I.E.S. E.E.-II, 2001]

346. A rectangular voltage wave is impressed on a loss-free overhead line, with the far end of the line being short-circuited. On reaching the end of this line
(a) The current wave is reflected back with positive sign, but the voltage wave with negative sign.
(b) The current wave is reflected back with negative sign, but the voltage wave with positive sign.
(c) Both the current and the voltage waves are reflected with positive sign.
(d) Both the current and the voltage waves are reflected with negative sign. [U.P.S.C. I.E.S. E.E.-II, 2003]

347. Consider the following statements for transmission lines :
1. When a transmission line is terminated by its characteristic impedance the line will not have any reflected wave.
2. For a finite line terminated by its characteristic impedance the velocity and current at all points on the line are exactly same.
3. For a lossless half wave transmission line the input impedance is not equal to load impedance.

Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2008]

348. For a loss-free long transmission line, the conventional line equations become,

$V_s = (\cos \beta l)V_R + (j \sin \beta l)I_R$ and $I_S = \left(\frac{j \sin \beta l}{Z_C}\right) V_R + (\cos \beta l)\, I_R$

Which one of the following statements is correct ?
If the line is terminated at the receiving end by its natural load impedance Z_c, then
(a) the voltage is constant in magnitude at all points along the line and, V_s and V_R always remain in phase.
(b) the voltage is constant in magnitude at all points along the line but V_s advances in phase relative to V_R by an angle β radians per km.
(c) the magnitude of the voltage along the line changes in proportion to the line-length and the V_s and V_R always remain in phase.
(d) the magnitude of the voltage along the line changes in proportion to the line-length, V_s advances in phase relative to V_R by β radians per km. [U.P.S.C. I.E.S. E.E.-I, 2006]

349. A cable has the following characteristics, L = 0.201 μH/m and C = 196.2 pF/m. The velocity of wave propagation through the cable is
(a) 32 m/s (b) 159.24 m/μs
(c) 0.0312 m/s (d) 159.24 m/s [GATE E.E. 1998]

350. An extra high voltage transmission line of length 300 km can be approximated by a lossless line having propagation constant β = 0.00127 radians per km. Then the percentage ratio of line length to wavelength will be given by
(a) 24.24% (b) 12.12% (c) 19.05% (d) 6.06%
[GATE E.E. 2008]

351. The reflection coefficient for the voltage wave in overhead lines is given as
(a) $\frac{R_0}{R_0 - R_L}$ (b) $\frac{R_L}{R_0 - R_L}$
(c) $\frac{R_L - R_0}{R_L + R_0}$ (d) $\frac{R_L + R_0}{R_0 - R_L}$

352. If a line of surge impedance Z_o is terminated in an impedance Z then the reflection for current and voltage surges at the termination are given respectively by
(a) $\frac{Z_o - Z}{Z_o + Z}, \frac{2Z}{Z_o + Z}$ (b) $\frac{Z_o - Z}{Z_o + Z}, \frac{Z - Z_o}{Z_o + Z}$
(c) $\frac{2Z_o}{Z_o + Z}, \frac{2Z}{Z_o + Z}$ (d) $\frac{2Z_o}{Z_o + Z}, \frac{Z - Z_o}{Z_o + Z}$
[U.P.S.C. I.E.S. E.E.-II, 2010]

353. If the load impedance is 100 ohm and input impedance is 25 ohm, then the characteristic impedance of the transmission line is
(a) 70 ohm. (b) 60 ohm.
(c) 50 ohm. (d) 40 ohm.
[U.P.S.C. I.E.S. E.E.-I, 2010]

354. A transmission line of characteristic impedance of 50 ohm is terminated by a load impedance of $(15 - j20)$ ohm. What is the normalized load impedance?
(a) $0.6 - j0.8$ (b) $0.3 - j0.6$
(c) $0.3 - j0.4$ (d) $0.3 + j0.4$
[U.P.S.C. I.E.S. E.E.-I, 2009]

355. A loss-less transmission line with characteristic impedance of 600 ohms is terminated in a purely resistive load of 900 ohms. The reflection coefficient is
(a) 0.2 (b) 0.5 (c) 0.667 (d) 1.5
[U.P.S.C. I.E.S. E.E.-I, 2003]

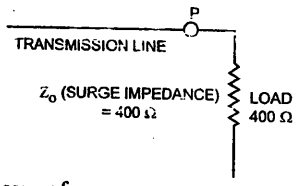
356. For a line of characteristic impedance Z_0 terminated in a load of Z_R such that $Z_R = Z_0/3$, what is the reflection coefficient T_L ?
(a) 1/3 (b) 2/3 (c) −1/3 (d) −1/2
[U.P.S.C. I.E.S. E.E.-I, 2006]

Answers: **341.** (c), **342.** (b), **343.** (c), **344.** (c), **345.** (c), **346.** (a), **347.** (a), **348.** (b), **349.** (b), **350.** (d), **351.** (c), **352.** (b), **353.** (c), **354.** (c), **355.** (a), **356.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

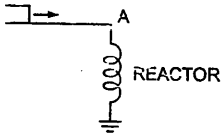
357. The reflection coefficient for the transmission line shown in figure at point P is



(a) +1 (b) 0.5
(c) 0 (d) –1

[U.P.S.C. I.E.S. E.E.-II, 2002]

358. Consider a step voltage wave of magnitude 1 pu travelling along a lossless transmission line that terminates in a reactor. The voltage magnitude across the reactor at the instant the travelling wave reaches the reactor is



(a) –1 pu (b) 1 pu (c) 2 pu (d) 3 pu

[GATE E.E., 2010]

359. The reflection coefficient of a short-circuited line is

(a) –1 (b) +1 (c) 0.5 (d) zero

[U.P.S.C. I.E.S. E.E.-II, 1997]

360. The propagation constant of a transmission line is

$$0.15 \times 10^{-3} j\, 1.5 \times 10^{-3}$$

The wavelength of the travelling wave is

(a) $\frac{1.5\times10^{-3}}{2\pi}$ (b) $\frac{2\pi}{1.5\times10^{-3}}$

(c) $\frac{1.5\times10^{-3}}{5\pi}$ (d) $\frac{\pi}{1.5\times10^{-3}}$

[U.P.S.C. I.E.S. E.E.-II, 1997]

361. The reflection coefficient at the load end of a short-circuited line is

(a) zero. (b) $1 \angle 0°$ (c) $1 \angle 90°$ (d) $1 \angle 180°$

[U.P.S.C. I.E.S. E.E.-I, 1999]

362. A surge voltage of 1,000 kV is applied to an overhead line with its receiving end open. If the surge impedance of the line is 500 Ω, then the total surge power in the line is

(a) 2,000 MW (b) 500 MW
(c) 2 MW (d) 0.5 MW

[U.P.S.C. I.E.S. E.E.-II, 1996]

363. A surge of 260 kV travelling in a line of natural impedance of 500 Ω arrives at the junction with two lines of natural impedances of 250 Ω and 50 Ω respectively. The voltage transmitted in the branch lines is

(a) 400 kV (b) 260 kV (c) 80 kV (d) 40 kV

[U.P.S.C. I.E.S. E.E.-II, 1999]

364. An overhead line with surge impedance of 400 Ω is terminated through a resistance R. A surge travelling over the line will not suffer any reflection at the junction, if the value of R is

(a) 100 Ω (b) 200 Ω (c) 400 Ω (d) 800 Ω

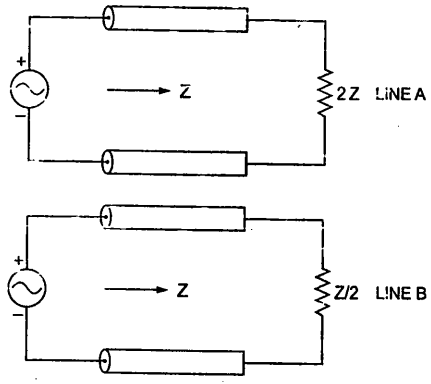
[U.P.S.C. I.E.S. E.E.-II, 2000]

365. An overhead line with a surge impedance of 400 Ω is connected to a transformer by a short length of cable of surge impedance of 100 Ω. If a rectangular surge wave of 40 kV travels along the line towards the cable, then the voltage of the wave travelling from the junction of the overhead line through the cable towards the transformer would be

(a) 16 kV (b) 24 kV (c) 32 kV (d) 36 kV

[U.P.S.C. I.E.S. E.E.-II, 2000]

366. Two loss-less resistive transmission lines each of characteristic impedance Z are connected as shown in the circuits below. If the maximum voltage on the two lines is the same and the power transmitted by line A is W_1, then what is the power transmitted by the line B?



(a) $4\,W_1$ (b) $3\,W_1$ (c) $2\,W_1$ (d) $1\,W_1$

[U.P.S.C. I.E.S. E.E.-I, 2009]

367. A travelling wave due to lightning with an incident voltage V travels through the overhead line of surge impedance of 400 Ω enters a cable of surge impedance of 40 Ω. What is the voltage entering the cable at the junction ?

(a) V/11 (b) 4 V/11 (c) 2 V/11 (d) V

[U.P.S.C. I.E.S. E.E.-I, 2006]

368. A surge voltage rising at 100 kV/μs travels along a lossless open-circuited transmission line. It takes 10 μs to reach the open end. The reflected wave from the open end, will be rising at

(a) 1,000 kV/μs. (b) 200 kV/μs.
(c) 1,000 kV/μs. (d) 2,000 kV/μs.

[U.P.S.C. I.E.S. E.E.-I, 2002]

369. An overhead line having a surge impedance of 400 Ω is connected in series with an underground cable having a surge impedance of 100 Ω. If a surge of 50 kV travels from the line end towards the line-cable junctions, the value of the transmitted voltage wave at the junction is

(a) 30 kV (b) 20 kV (c) 80 kV (d) –30 kV

[GATE E.E. 1999]

370. A lightning stroke discharges impulse current of 10 kA (peak) on a 400 kV transmission line having surge impedance of 250 Ω. The magnitude of transient overvoltage travelling waves in either direction assuming equal distribution from the point of lightning strike will be

(a) 1,250 kV (b) 1,650 kV (c) 2,500 kV (d) 2,900 kV

[GATE E.E. 2004]

371. A surge of 100 kV travels along an overhead line towards its junction with a cable. The surge impedances for the overhead line and cable are 400 ohms and 50 ohms respectively. The magnitude of the surge transmitted through the cable is

(a) 11.11 kV (b) 22.22 kV (c) 12.50 kV (d) 88.89 kV

[U.P.S.C. I.E.S. E.E.-II, 2002]

372. A short length of cable between the dead end tower and the power transformer

(a) reduces the steepness of the wave under certain conditions only.
(b) always reduces the steepness of the incident wave.
(c) steepness of the incident wave remains unaffected.

373. The insulation strength of an EHV transmission line is mainly governed by

(a) load power factor. (b) switching overvoltages.
(c) harmonics. (d) corona. [GATE E.E. 2005]

Answers: **357.** (c), **358.** (b), **359.** (a), **360.** (b), **361.** (d), **362.** (a), **363.** (d), **364.** (c), **365.** (a), **366.** (a), **367.** (c), **368.** (c), **369.** (b), **370.** (a), **371.** (b), **372.** (b), **373.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

374. The insulation coordination for UHV lines (above 500 kV) is done based on
(a) lightning surges.
(b) lightning surges and switching surges.
(c) switching surges. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-II, 1999]

375. In comparison to line insulation, the insulation level of the station equipment is
(a) less. (b) more. (c) equal.
(d) not related directly with each other.

376. When a wave reaches an open circuit the _____ at the termination is/are double the incident value(s)
(a) voltage (b) current
(c) both the voltage and current

377. When a wave reaches a short-circuit the _____ at the termination is/are zero
(a) voltage (b) current
(c) both the voltage and current

378. A backward wave means a
(a) negative voltage wave. (b) negative current wave.
(c) a wave travelling in the negative direction.

379. The size of the earth wire is determined on the basis of
(a) voltage of the service line.
(b) current carrying capacity of the service line.
(c) atmospheric conditions. (d) none of the above.

380. Neutral earthing is provided for
(a) the safety of personnel from electric shock.
(b) the safety of equipment and personnel against lightning and voltage surges.
(c) reducing the voltage stress on lines and equipment with respect to earth under various operating and fault conditions.
(d) controlling the earth fault currents for protective relaying.
(e) both (c) and (d).

381. Isolated neutral system has the disadvantage(s) of
(a) voltage oscillations. (b) difficult earth fault relaying.
(c) persistent arcing ground. (d) all of the above.

382. Isolated neutral transmission system is not recommended as the
(a) system insulation is overstressed due to overvoltages.
(b) insulation overstress may lead to its failure resulting in phase-to-phase faults.
(c) system is not adequately protected against earth fault.
(d) all of the above.

383. Neutral earthing has the advantage(s) of
(a) elimination of arcing grounds.
(b) low maintenance and operating costs over isolated neutral systems.
(c) simplified design of earth fault protection.
(d) discharging of overvoltages due to lightning to earth.
(e) all of the above.

384. The advantage of neutral earthing is
(a) safety of personnel. (b) reduction of earth fault current.
(c) elimination of arcing ground.
(d) none of the above. [A.M.I.E. Sec B. Winter 1993]

385. Resistance earthing is employed for voltages between
(a) 3.3 and 11 kV. (b) 11 and 33 kV.
(c) 33 and 66 kV. (d) 66 kV and 132 kV.

386. Earthing of transformer neutral through reactance will improve its
(a) transient stability. (b) steady state stability.
(c) both of the above. (d) none of these.

387. Which of the following neutral systems will require the lightning arrester of least voltage rating ?
(a) Insulated. (b) Solidly earthed.
(c) Resistance earthed. (d) Reactance earthed.

388. Petersan coil is used for
(a) grounding of system neutral.
(b) to reduce fault current.
(c) connecting two interconnected systems.
(d) for shunt compensation of transmission lines.
[A.M.I.E. Sec B. Power Plant Engineering Summer 1999]

389. A 3-phase, 50 Hz transmission line has the following constants (line-to-neutral) Resistance = 10 Ω, Inductive reactance = 20 Ω; Capacitive susceptance = 4×10^{-4} ℧. The inductance of the arc suppressor coil to be used in the system is
(a) 0.06368 H (b) 0.127 H
(c) 1.1274 H (d) 2.654 H
[U.P.S.C. I.E.S. E.E.-II, 1994]

390. Which one of the following grounding methods is used to reduce the tower footing resistance where earth resistance is low?
(a) Single driven rod. (b) Multiple rods.
(c) Counter poises. (d) Plates.
[U.P.S.C. I.E.S. E.E.-II, 1993]

391. Tower footing resistance of a transmission tower should be
(a) as high as possible. (b) as low as possible.
(c) moderately high. (d) moderately low.
[W.B. Univ. of Technology Power System-I, 2009-10]

392. The method of neutral grounding affects the
(a) positive-sequence network. (b) negative-sequence network.
(c) zero-sequence network.
(d) both positive- and zero-sequence networks.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1998]

393. The earth transformer is used to
(a) avoid the harmonics in the transformers.
(b) provide artificial neutral earthing where neutral point is not accessible.
(c) improve stability of the system.
(d) measure the voltage.
[A.M.I.E. Sec B. Advanced Power Systems Summer 1999]

394. The positive-, negative- and zero-sequence impedances of a solidly grounded system under steady-state condition always follow the relations
(a) $Z_0 < Z_1 < Z_2$ (b) $Z_1 > Z_2 > Z_0$
(c) $Z_1 < Z_2 < Z_3$ (d) $Z_0 > Z_1 > Z_2$

395. In an isolated neutral system, when a single line to ground fault occurs
(a) persistent arcing grounds will be developed.
(b) voltage in the healthy phases rise to full line value causing insulation breakdown.
(c) the capacitive current in the faulty phase rises to 3 times its normal value.
(d) all of the above.

396. The voltage of a transmission line can be controlled by
(a) excitation control. (b) using induction regulator.
(c) reactive VAR injection methods.
(d) any of the above.

397. The voltage of a particular bus is regulated by controlling the
(a) active power of the bus. (b) reactive power of the bus.
(c) phase angle.
(d) phase angle and reactive power. [U.P.S.C. I.E.S. E.E.-I, 2001]

Answers: **374.** (c), **375.** (d), **376.** (a), **377.** (a), **378.** (c), **379.** (b), **380.** (e), **381.** (d), **382.** (d), **383.** (e), **384.** (c), **385.** (a), **386.** (a), **387.** (b), **388.** (a), **389.** (d), **390.** (a), **391.** (b), **392.** (c), **393.** (b), **394.** (b), **395.** (d), **396.** (c), **397.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

398. In ac distribution system the voltage can be controlled by using
(a) tap changing transformer. (b) booster transformer
(c) induction regulator. (d) any of the above.

399. Tap changing transformers are employed for
(a) stepping down the voltage. (b) stepping up the voltage.
(c) supplying low voltage current to instruments.
(d) both stepping up and stepping down the voltage.

400. The best location for use of a booster transformer in a transmission line is
(a) at the sending end. (b) at the receiving end.
(c) at the intermediate point. (d) anywhere in the line.

401. For voltage control in ac distribution system the induction regulators have the advantage(s) of
(a) reliability of operation.
(b) operation independent of load and power factor variations.
(c) stepless voltage variations without arcing or short-circuiting of turns as in the case of transformers.
(d) all of the above.

402. A line voltage regulator is to be used in a single phase 200 V, 5 kVA system to keep the voltage constant for voltage variations within ± 10%.
The rating (in kVA) of the voltage regulator is
(a) 0.05 (b) 0.5 (c) 5 (d) 50
[U.P.S.C. I.E.S. E.E.-II, 1993]

403. Series capacitor is used in a transmission line to
(a) compensate the voltage drop.
(b) reduce line losses. (c) limit short-circuit current.
(d) improve load power factor. [A.M.I.E. Sec B. Winter 1993]

404. Shunt compensation in an EHV line is used to improve
(a) stability and fault level. (b) fault level and voltage profile.
(c) voltage profile and stability.
(d) stability, fault level and voltage profile.
[U.P.S.C. I.E.S. E.E.-II, 2000]

405. _____ are used to provide compensation at the receiving end of a transmission line so as to improve its voltage profile.
(a) Condensers. (b) Resistors.
(c) Reactors.
(d) Condensers, resistors or reactors.

406. The combined effect of series and shunt compensation on transmission lines in terms of degree of series compensation (K_{se}), degree of shunt compensation (K_{sh}), and surge impedance of uncompensated line (Z_0) is given by which one of the following equations ?
(a) $Z'_0 = Z_0\sqrt{1-K_{se}}\cdot\sqrt{1-K_{sh}}$
(b) $Z'_0 = \left[\sqrt{1-K_{se}}\cdot\sqrt{1-K_{sh}}\right]/Z_0$
(c) $Z'_0 = Z_0\sqrt{(1-K_{se})/(1-K_{sh})}$
(d) $Z'_0 = Z_0\sqrt{(1-K_{sh})/(1-K_{se})}$ [U.P.S.C. I.E.S. E.E.-II, 2004]

407. Consider the following statements :
Addition of lumped capacitances in parallel to a loss-free transmission line increases
1. characteristic impedance. 2. propagation constant.
3. system stability. 4. charging current.
Which of these statements are correct ?
(a) 1 and 3 (b) 2 and 4 (c) 2, 3 and 4 (d) 1, 2 and 4
[U.P.S.C. I.E.S. E.E.-I, 2002]

408. What will happen if a short-circuit fault occurs in a switched capacitor controlled reactor?
(a) Oscillation. (b) Capacitor discharge.
(c) Over voltage. (d) Noise.
[U.P.S.C. I.E.S. E.E.-II, 2010]

409. An AC capacitor is to be switched in parallel with AC line using back to back connected thyristor. What is the firing angle of thyristor for first switching?
(a) 0° (b) 180° (c) 90° (d) 45°
[U.P.S.C. I.E.S. E.E.-II, 2009]

410. In between the generating station (power house) and consumers a number of transformation and switching stations exist, these are called the
(a) switchgears. (b) substations.
(c) intermediate substations. (d) transformation stations.

411. Which of the following is provided with arcing horns?
(a) Isolator. (b) Air-break switch.
(c) Oil switch. (d) None of the above.

412. Pole mounted substations are used in
(a) primary transmission system.
(b) secondary transmission system.
(c) primary distribution system.
(d) secondary distribution system.
[W.B. Univ. of Technology Power System-I, 2009-10]

413. With large reactance interconnector between two power stations
(a) the power stations may fall out of step due to large angular displacement between the power stations.
(b) power will be transferred with minimum power losses.
(c) power will be transferred with voltage fluctuations and noise.
(d) none of the above.

414. AC network analyser is employed for solving the problems of
(a) load flow. (b) load flow and stability.
(c) load flow and short circuit.
(d) load flow, stability and short circuit.

415. Consider the following statements :
Stability studies constitute
1. the major analytical approach to the study of power system electromechanical dynamic behaviour.
2. the involvement of one or just a few machines undergoing slow or gradual changes in operating conditions.
3. the determination of the locus of essentially steady-state operating points of the system.
4. the determination of whether or not the rotors of the machines being perturbed, return to the constant speed operation.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2004]

416. Power system stability is defined as
(a) that attribute of the system or part of the system which enables it to develop restoring forces between the elements there of equal or greater than disturbing forces so as to restore a state of equilibrium between the elements.
(b) the maximum power flow possible through some particular point in the system when the entire or part of the system is disturbed.
(c) both (a) and (b). (d) neither (a) nor (b).

417. Stability limit of a power system is defined as
(a) that attribute of the system or part of the system which enables it to develop restoring forces between the elements there of equal or greater than disturbing forces so as to restore a state of equilibrium between the elements.

Answers: **398.** (d), **399.** (d), **400.** (c), **401.** (d), **402.** (b), **403.** (a), **404.** (b), **405.** (a), **406.** (c), **407.** (b), **408.** (a), **409.** (c), **410.** (b), **411.** (b), **412.** (d), **413.** (a), **414.** (d), **415.** (c), **416.** (a), **417.** (b),

(b) the maximum power flow possible through some particular point in the system when the entire or part of the system is disturbed.
(c) both (a) and (b). (d) neither (a) nor (b).

418. Steady-state stability of a power system is the ability of the power system to
(a) maintain voltage at the rated voltage level.
(b) maintain frequency exactly at 50 Hz.
(c) maintain a spinning reserve margin at all times.
(d) maintain synchronism between machines and on external tie lines. [GATE E.E. 1999]

419. Transient disturbances are caused by
(a) sudden load changes. (b) switching operations.
(c) inadvertent tripping of lines and generators.
(d) faults in the power system.
(e) all of the above.

420. Transient stability of a 3-phase power systems having more than one synchronous generator is not affected by which one of the following specifications?
(a) Initial operating conditions of generators.
(b) Quantum of large power disturbance.
(c) Fast fault clearance and reclosure.
(d) Small changes in system frequency. [U.P.S.C. I.E.S. E.E.-II, 2009]

421. The power transmission capacity of a transmission line is
(a) proportional to transmission voltage.
(b) proportional to the square of transmission voltage.
(c) inversely proportional to transmission voltage.
(d) inversely proportional to the square of transmission voltage.

422. The load carrying capability of a long ac transmission line is
(a) always limited by the conductor size.
(b) limited by statbility considerations.
(c) reduced at low ambient temperatures.
(d) decreased by the use of bundled conductors of single conductors. [GATE E.E. 1999]

423. Maximum power will be transferred from the sending end to the receiving end by a transmission line when
(a) the line reactance is $\sqrt{3}$ times its resistance, *i.e.*, $X = \sqrt{3}\,R$.
(b) the torque angle $\delta = 90^\circ$.
(c) both (a) and (b). (d) neither (a) nor (b).

424. A 100 km transmission line is designed for a nominal voltage of 132 kV and consists of one conductor per phase. The line reactance is 0.726 Ω/km. The static transmission capacity of the line, in Mega watts, would be
(a) 132 (b) 240 (c) 416 (d) 720
[U.P.S.C. I.E.S. E.E.-II, 1993]

425. An 800 kV transmission line is having per phase line inductance of 1.1 mH/km and per phase line capacitance of 11.68 nF/km. Ignoring the length of the line, its ideal power transfer capability in MW is
(a) 1,204 MW (b) 1,504 MW
(c) 2,085 MW (d) 2,606 MW [GATE E.E. 2004]

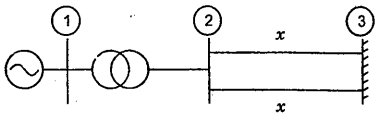
426. An 800 kV transmission line has a maximum power transfer capacity of P. If it is operated at 400 kV with the series reactance unchanged, then maximum power transfer capacity is approximately
(a) P (b) 2P (c) P/2 (d) P/4
[GATE E.E. 2005]

427. If a 500 MVA, 11 kV three-phase generator at 50 Hz feeds, through a transfer impedance of $(0.0 + j0.605)\ \Omega$ per phase, an infinite bus also at 11 kV, then the maximum steady-state power transfer on the base of 500 MVA and 11 kV is
(a) 1.0 pu (b) 0.8 pu (c) 0.5 pu (d) 0.4 pu
[U.P.S.C. I.E.S. E.E.-II, 2001]

428. An alternator having an induced emf of 1.6 pu is connected to an infinite bus of 1.0 pu. If the bus bar has reactance of 0.6 pu and alternator has reactance of 0.2 pu, what is the maximum power that can be transferred ?
(a) 2 pu (b) 2.67 pu (c) 5 pu (d) 6 pu
[U.P.S.C. I.E.S. E.E.-II, 2007]

429. A transmission line has a total series reactance of 0.2 pu. Reactive power compensation is applied at the midpoint of the line and it is controlled such that the midpoint voltage of the transmission line is always maintained at 0.98 pu. If voltage at both ends of the line are maintained at 1.0 pu, then the steady state power transfer limit of the transmission line is
(a) 9.8 pu (b) 4.9 pu (c) 19.6 pu (d) 5 pu
[GATE E.E. 2002]

430. A generator with constant 1.0 pu terminal voltage supplies power through a step-up transformer of 0.12 pu reactance and a double-circuit line to an infinite bus bar as shown in the figure. The infinite bus voltage is maintained at 1.0 pu. Neglecting the resistances and susceptances of the system, the steady state stability power limit of the system is 6.25 pu. If one of the double-circuit is tripped, then resulting steady state stability power limit in pu will be



(a) 12.5 pu (b) 3.125 pu (c) 10.0 pu (d) 5.0 pu
[GATE E.E. 2005]

431. The stability of the power system is not affected by
(a) generator reactance. (b) line reactance.
(c) line losses. (d) excitation of generators.
(e) output torque.

432. The power systems are operated with power angle around
(a) 10° (b) 30° (c) 70° (d) 80°
[U.P.S.C. I.E.S. E.E.-II, 2005]

433. The steady state stability limits for round rotor and salient pole 3-phase synchronous generator are attained at the values of power angle δ
(a) $= \pi/2$, and $= \pi/2$, respectively.
(b) $< \pi/2$, and $< \pi/2$, respectively.
(c) $< \pi/2$, and $= \pi/2$, respectively.
(d) $= \pi/2$, and $< \pi/2$, respectively. [U.P.S.C. I.E.S. E.E.-II, 2006]

434. A round rotor generator with internal voltage $E_1 = 2.0$ pu and $X = 1.1$ pu is connected to a round rotor synchronous motor with internal voltage $E_2 = 1.3$ pu and $X = 1.2$ pu. The reactance of the line connecting the generator to the motor is 0.5 pu. When the generator supplies 0.5 pu power, the rotor angle difference between the machines will be
(a) 57.42° (b) 1° (c) 32.58° (d) 122.58°
[GATE E.E. 2003]

435. Which one of the following statements is true?
(a) steady-state stability limit is greater than transient stability limit.
(b) steady-state stability limit is equal to transient stability limit.
(c) steady-state stability limit is less than the transient stability limit.

Answers: **418.** (d), **419.** (e), **420.** (d), **421.** (b), **422.** (b), **423.** (c), **424.** (b), **425.** (c), **426.** (d), **427.** (d), **428.** (a), **429.** (c), **430.** (d), **431.** (c), **432.** (b), **433.** (d), **434.** (c), **435.** (a),

(d) no generalisation can be made regarding the equality or otherwise of the steady, state stability limit and transient stability limit. [U.P.S.C. I.E.S. E.E.-II, 1995]

436. Steady-state stability of a power system is improved by
(a) reducing fault clearing time.
(b) using double circuit line instead of single circuit line.
(c) single pole switching.
(d) decreasing generator inertia. [U.P.S.C. I.E.S. E.E.-II. 1998]

437. The methods employed in improving the system stability are
(a) increasing the system voltage only.
(b) reducing the transfer reactance only.
(c) using high-speed auto-reclosing circuit breaker only.
(d) using all (a), (b), (c) together.
[A.M.I.E. Sec B. Advanced Power Systems Summer 1998]

438. Series capacitors are used to
(a) compensate for line inductive reactance and improve the stability of the power system.
(b) improve the voltage.
(c) reduce fault level.
(d) improve the power factor.

439. When a number of generators of MVA capacities $S_1, S_2, S_3 \ldots S_n$ and inertia constants $H_1, H_2, H_3 \ldots H_n$ respectively are connected to the same bus-bar in a station, the inertia constant of the equivalent machine on a base of S_b is given by

(a) $\sum_{i=1}^{n} H_i S_i$ (b) $\sum_{i=1}^{n} \frac{S_b}{S_i} H_i$

(c) $\sum_{i=1}^{n} \frac{S_i}{S_b} H_i$ (d) $\sum_{i=1}^{n} \frac{S_b}{S_i} \cdot \frac{1}{H_i}$

[U.P.S.C. I.E.S. E.E.-II, 1998]

440. If a generator of 250 MVA rating has an inertia constant of 6 MJ/MVA, its inertia constant on a 100 MVA base is
(a) 15 MJ/MVA (b) 10.5 MJ/MVA
(c) 6 MJ/MVA (d) 2.4 MJ/MVA
[U.P.S.C. I.E.S. E.E.-II, 2000]

441. If the inertia constant H = 8 MJ/MVA for a 50 MVA generator, the stored energy is:
(a) 50 MJ (b) 8 MJ (c) 400 MJ (d) 6.25 MJ
[U.P.S.C. I.E.S. E.E.-II, 2011]

442. For 800 MJ stored energy in the rotor at synchronous speed, what is the inertia constant H for a 50 Hz, four pole turbo-generator rated 100 MVA, 11 kV?
(a) 2.0 MJ/MVA (b) 4.0 MJ/MVA
(c) 6.0 MJ/MVA (d) 8.0 MJ/MVA
[U.P.S.C. I.E.S. E.E.-II, 2005]

443. The pu parameters for a 500 MVA machine on its own base are: inertia, M = 20 pu; reactance, X = 2 pu.
The pu values of inertia and reactance on 100 MVA common base, respectively, are
(a) 4, 0.4 (b) 100, 10 (c) 4, 10 (d) 100, 0.4
[GATE E.E. 2005]

444. A 500 MW, 21 kV, 50 Hz, 3-phase, 2-pole synchronous generator having a rated pf = 0.9, has a moment of inertia of 27.5×10^3 kg-m^2. The inertia constant (H) will be
(a) 2.44 MJ/MVA (b) 2.71 MJ/MVA
(c) 4.88 MJ/MVA (d) 5.42 MJ/MVA [GATE E.E. 2009]

445. Two 50 Hz generating units operate in parallel within the same power plant and have the following ratings :
Unit 1 : 500 MVA, 0.85 power factor, 20 kV, 3000 rpm, H_1 = 5 MJ/MVA
Unit 2 : 200 MVA, 0.9 power factor, 20 kV, 1500 rpm, H_2 = 5 MJ/MVA
The equivalent inertia constant H in MJ/MVA on 100 MVA base is
(a) 2.5 (b) 5.0 (c) 10.0 (d) 35.0
[U.P.S.C. I.E.S. E.E.-II, 2001]

446. A power station consists of two synchronous generators *A* and *B* of ratings 250 MVA and 500 MVA with intertia 1.6 and 1.0 pu respectively on their own base MVA ratings. The equivalent pu inertia constant for the system on 100 MVA common base is
(a) 2.6 (b) 6.15 (c) 1.625 (d) 9
[GATE E.E. 1998]

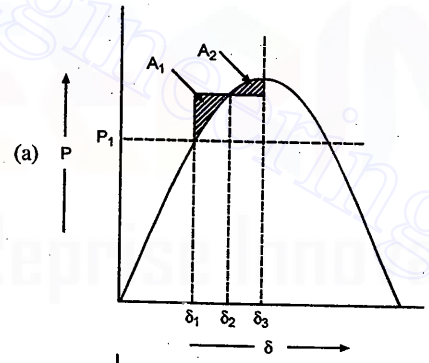
447. The inertia constant of a 100 MVA 50 Hz, 4-pole generator is 10 MJ/MVA. If the mechanical input to the machine is suddenly raised from 50 MW to 75 MW, the rotor acceleration will be equal to
(a) 225 electrical degrees/s^2. (b) 22.5 electrical degrees/s^2.
(c) 125 electrical degrees/s^2. (d) 12.5 electrical degrees/s^2.
[U.P.S.C. I.E.S. E.E.-II, 1999]

448. In a multimachine interconnected system, subsequent to a 3-phase fault, the transient stability is examined by
(a) equal-area criterion.
(b) solution of swing equation.
(c) either by equal-area criterion or by solution of swing equation
(d) combination of equal-area criterion and solution of swing equation. [U.P.S.C. I.E.S. E.E.-II, 2002]

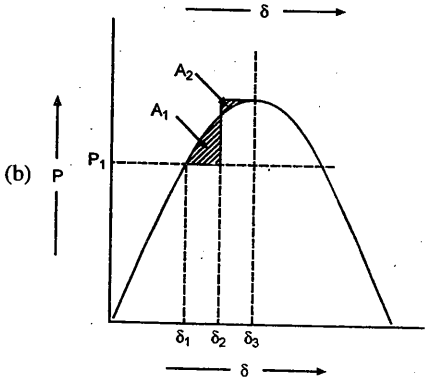
449. The equal area criterion of stability is used for
(a) no load on the bus-bar. (b) one machine and infinite bus-bar.
(c) more than one machine and infinite bus-bar.
(d) none of the above.

450. Principle of equal area criterion is to be applied to determine, for a given initial load P_1, the maximum amount of sudden increase in load ΔP, to maintain transient stability of a cylindrical rotor synchronous motor operating from an infinite bus. Applying this criterion (in each case the area A_1 = area A_2), which one of the following diagrams is correct ?

(a)



(b)



Answers: **436.** (b), **437.** (d), **438.** (a), **439.** (c), **440.** (a), **441.** (c), **442.** (d), **443.** (d), **444.** (a), **445.** (d), **446.** (d), **447.** (a), **448.** (b), **449.** (b), **450.** (a),

[U.P.S.C. I.E.S. E.E.-II, 1993]

451. The 'equal area criterion' for the determination of transient stability of a synchronous machine connected to an infinite bus
(a) ignores line as well as synchronous machine resistances and shunt capacitances.
(b) assumes accelerating power acting on the rotor as constant.
(c) ignores the effect of voltage regulator and governor but considers the inherent damping present in the machine.
(d) takes into consideration the possibility of machine losing synchronism after it has survived during the first swing.
[U.P.S.C. I.E.S. E.E.-II, 1996]

452. The 'Equal area criterion' for the determination of transient stability of the synchronous machine connected to an infinite bus:
(a) Ignores line as well as synchronous machine resistances and shunt capacitances.
(b) Assumes accelerating power acting on the rotor as constant.
(c) Ignores the effect of voltage regulator and governor but considers the inherent damping present in the machine.
(d) Takes into consideration the possibility of machine loosing synchronism after it has survived during the first swing.
[U.P.S.C. I.E.S. E.E.-II, 2011]

453. For what value of damping parameter, the transient stability is assured by equal area criterion?
(a) Independent of systems damping.
(b) If only damping is exactly zero.
(c) For all values of damping parameters.
(d) If only damping is positive and finite.
[U.P.S.C. I.E.S. E.E.-II, 2010]

454. Equal area criterion gives the information regarding
(a) stability region. (b) absolute stability.
(c) relative stability. (d) swing curves.
[U.P.S.C. I.E.S. E.E.-II, 1998]

455. The critical clearing time of a fault is power system is related to
(a) reactive power limit. (b) short-circuit limit.
(c) steady-state stability limit. (d) transient stability limit.
[U.P.S.C. I.E.S. E.E.-II, 1998]

456. With fault clearing time, the transient stability limit of a power system
(a) increases. (b) decreases.
(c) first increases and then decreases.
(d) first decreases and then increases.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

457. For which one of the following types of motors, is the equal-area criterion for stability applicable ?
(a) Three-phase synchronous motor.
(b) Three-phase induction motor.
(c) DC series motor. (d) DC compound motor.
[U.P.S.C. I.E.S. E.E.-II, 2006]

458. Figure 2 given below is the "equal area" criterion diagram for the determination of transient stability limit of the power system shown in Fig. 1 for a fault on the transmission line.
What is the type of fault, and the time of its clearing, from figure 2?

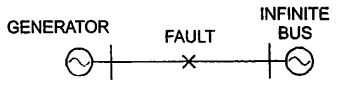

Fig. 1

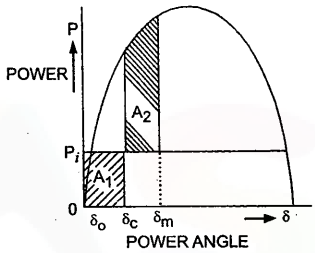

Fig. 2

(a) Three-phase fault with instantaneous clearing.
(b) Three-phase fault with subsequent clearing.
(c) Single-line-to ground fault with instantaneous clearing.
(d) Single-line-to ground fault with subsequent clearing.
[U.P.S.C. I.E.S. E.E.-II, 2007]

459. The inertia constants of two groups of machines which do not swing together are M_1 and M_2 such that $M_1 > M_2$. It is proposed to add some inertia to one of the two groups of machines for improving the transient stability of the system. It should be added to
(a) M_1 (b) M_2
(c) either to M_1 or to M_2. (d) neither of the above.

460. The transient stability limit of a power system can be appreciably increased by introducing
(a) series inductance. (b) shunt inductance.
(c) series capacitance. (d) shunt capacitance.
[U.P.S.C. I.E.S. E.E.-II, 1994]

461. A shunt reactor of 100 MVAr is operated at 98% of its rated voltage and at 96% of its rated frequency. The reactive power absorbed by the reactor is;
(a) 98 MVAr (b) 10.402 MVAr
(c) 96.04 MVAr (d) 100.04 MVAr [GATE E.E. 1998]

462. A 3-phase 11 kV generator feeds power to a constant power unity power factor load of 100 MW through a 3-phase transmission line. The line-to-line voltage at the terminals of the machine is maintained constant at 11 kV. The per unit positive sequence impedance of the line based on 100 MVA and 11 kV is $j0.2$. The line to line voltage at the load terminals is measured to be less than 11 kV. The total reactive power to be injected at the terminals of

Answers: **451.** (b), **452.** (a), **453.** (b), **454.** (b), **455.** (d), **456.** (b), **457.** (a), **458.** (b), **459.** (b), **460.** (c), **461.** (d), **462.** (d),

the load to increase the line-to-line voltage at the load terminals to 11 kV is

(a) 100 MVAR (b) 10.1 MVAR
(c) –100 MVAR (d) –10.1 MVAR [GATE E.E. 2003]

463. A 50 Hz, 4-pole, 500 MVA, 22 kV turbo-generator is delivering rated magavolt-amreres at 0.8 power factor. Suddenly a fault occurs reducing its electric power output by 40%. Neglect losses and assume constant power input to the shaft. The accelerating torque in the generator in MNm at the time of the fault will be

(a) 1.528 (b) 1.018 (c) 0.848 (d) 0.509

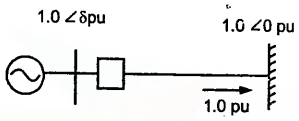
[GATE E.E. 2004]

464. A generator delivers power of 1.0 pu to an infinite bus through a purely reactive network. The maximum power that could be delivered by the generator is 2.0 pu. A three-phase fault occurs at the terminals of the generator which reduces the generator output to zero. The fault is cleared after t_c second. The original network is then restored. The maximum swing of the rotor angle is found to be $\delta_{max} = 110$ electrical degrees. Then the rotor angle in electrical degrees at $t = t_c$ is

(a) 55 (b) 70 (c) 69.14 (d) 72.4

[GATE E.E. 2003]

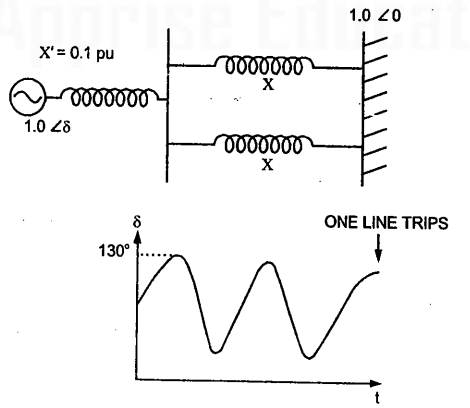
465. A lossless single machine infinite bus power system is shown below :



The synchronous generator transfers 1.0 per unit of power to the infinite bus. The critical clearing time of circuit breaker is 0.28 s. If another identical synchronous generator is connected in parallel to the existing generator and each generator is scheduled to supply 0.5 per unit power, then the critical clearing time of the circuit breaker will

(a) reduce to 0.14 s.
(b) reduce but will be more than 0.14 s.
(c) remain constant at 0.218 s.
(d) increase beyond 0.28 s. [GATE E.E. 2008]

466. Consider a synchronous generator connected to an infinite bus by two identical parallel transmission lines. The transient reactance X′ of the generator is 0.1 pu and the mechanical power input to it is constant at 1.0 pu. Due to some previous disturbance, the rotor angle (δ) is undergoing an undamped oscillation, with the maximum value of $\delta(t)$ equal to 130°. One of the parallel lines trip due to relay maloperation at an instant when $\delta(t) = 130°$ as shown in the figure. The maximum value of the per unit line reactance, X such that the system does not lose synchronism subsequent to this tripping is



(a) 0.87 (b) 0.74 (c) 0.67 (d) 0.54

[GATE E.E. 2007]

Data for Q. 467 and Q. 468 are given below. Solve the problems and choose the correct answers.

A generator feeds power to an infinite bus through a double circuit transmission line. A3 phase fault occurs at the middle point of one of the lines. The infinite bus voltage is 1 pu, the transient internal voltage of the generator is 1.1 pu and the equivalent transfer admittance during fault is 0.8 pu. The 100 MVA generator has an inertia constant of 5 MJ/MVA and it was delivering 1.0 pu power prior of the fault with rotor power angle of 30°. The system frequency is 50 Hz.

467. The initial accelerating power (in pu) will be

(a) 1.0 (b) 0.6 (c) 0.56 (d) 0.4

[GATE E.E. 2006]

468. If the initial accelerating power is X pu, the initial acceleration in elect deg/sec, and the inertia constant in MJ-sec/elect deg respectively will be

(a) 31.4X, 18 (b) 1800X, 0.056
(c) X/1800, 0.056 (d) X/31.4, 18 [GATE E.E. 2006]

469. Consider the following statements:
The transient stability of the power system under unbalanced fault condition can be effectively improved by
1. excitation control.
2. phase shifting transformer.
3. single-pole switching of circuit breakers.
4. increasing the turbine input.

Of these statements

(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 3 and 4 are correct. (d) 1 and 3 are correct.

[U.P.S.C. I.E.S. E.E.-II, 1998]

470. The use of high speed circuit breakers

(a) improves transient stability.
(b) decreases transient stability.
(c) has no effect on system stability. [U.P.S.C. I.E.S. E.E.-II, 2000]

471. The use of fast acting relays and circuit breakers for clearing a sudden short-circuit on a transmission line between a generator and the receiving end bus improves the transient stability of the machine because the

(a) short-circuit current becomes zero.
(b) post-fault transfer impedance attains a value higher than that during the fault.
(c) ordinate of the post-fault power-angle characteristic is higher than that of during fault characteristic.
(d) voltage behind the transient reactance increases to a high value. [U.P.S.C. I.E.S. E.E.-II, 1998]

472. A loss-less finite generator is connected directly to an infinite bus at rated voltage. Conside the following operating conditions.

A: Generator exciation is maintained constant at a value which gives rated voltage at its terminals at rated current.
B: Generator excitation is regulated to maintain rated voltage at its terminals at all loads.

The maximum steady-state power in a *A* and *B* will be

	A	*B*
(a)	finite	infinite.
(b)	infinte	finite.
(c)	finite	finite.
(d)	infinite	infinite. [U.P.S.C. I.E.S. E.E.-II, 1993]

473. A 50 Hz synchronous generator is initially connected to a long lossless transmission line which is open-circuited at the receiving end. With the field voltage held constant, the generator is disconnected from the transmission line. Which of the following may be said about the steady state terminal voltage and field current of the generator?

Answers: **463.** (b), **464.** (c), **465.** (b), **466.** (c), **467.** (c), **468.** (b), **469.** (d), **470.** (a), **471.** (c), **472.** (c), **473.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) The magnitude of terminal voltage decreases, and the field current does not change.
(b) The magnitude of terminal voltage increases, and the field current does not change.
(c) The magnitude of terminal voltage increases, and the field current increases.
(d) The magnitude of terminal voltage does not change, and the field current decreases. [GATE E.E. 2010]

474. Which of the following statements is incorrect?
(a) The inertia constant of an alternator is the ratio of the stored energy in MJ to its machine rating in MVA.
(b) The angular momentum M of a machine is $\frac{GH}{180f}$ MJs per electrical degree.
(c) For moment of inertia J in kg.m^2, the swing equation is $J\frac{d^2\delta}{dt^2} = P_S - P_E$.
(d) In a two machine system, it is advisable to have resistance grounding at the sending end and the reactance grounding at the receiving end.
(e) For the transient stability of the power system the necessary condition is $\frac{d\delta}{dt} = 0$ and $\frac{dP}{dt} > 0$.

475. Load flow study is carried out for
(a) load-frequency control. (b) planning of power system.
(c) fault calculations.
(d) study of stability of the system.

476. Load flow studies must be made on a power system before
(a) making short-circuit studies but not for transient stability studies on the power system.
(b) making transient stability studies but not for short-circuit studies on the power system.
(c) making both short-circuit and transient stability studies on the power system.
(d) for neither making short-circuit studies nor transient stability studies on the power system. [U.P.S.C. I.E.S. E.E.-II, 2010]

477. Load flow studies involve solving simultaneous
(a) linear algebraic equations. (b) non-linear algebraic equations.
(c) linear differential equations.
(d) nonlinear differential equations. [U.P.S.C. I.E.S. E.E.-II, 2000]

478. In a power system, each bus or node is associated with four quantities, namely
1. real power. 2. reactive power.
3. bus-voltage magnitude. 4. phase angle of the bus voltage.
For load-flow solution, among these four, the number of quantities to be specified is
(a) any one. (b) any two.
(c) any three. (d) all the four.
[U.P.S.C. I.E.S. E.E.-II, 1998]

479. Consider the following quantities :
1. Real power 2. Reactive power
3. Power factor 4. Input current
5. Bus voltage magnitude 6. Bus voltage phase-angle
For the purpose of the load flow studies of a power system, each bus or node is associated with which one of the combinations of the above four quantities ?
(a) 1, 3, 4 and 5 (b) 1, 2, 3 and 4
(c) 2, 3, 5 and 6 (d) 1, 2, 5 and 6
[U.P.S.C. I.E.S. E.E.-II, 2004]

480. In load flow studies of a power system, a voltage control bus is specified by :
(a) Real power and reactive power.
(b) Reactive power and voltage magnitude.
(c) Voltage and voltage phase angle.
(d) Real power and voltage magnitude. [U.P.S.C. I.E.S. E.E.-II, 2006]

481. For a load-flow solution the quantities normally specified at a voltage controlled bus are
(a) P and Q (b) P and $|V|$
(c) Q and $|V|$ (d) P and δ.
[W.B. Univ. of Technology Power System-II, 2009-10]

482. Load bus is specified by
(a) P and V. (b) P and δ. (c) P and $|V|$. (d) P and Q.

483. At slacks bus, which one of the following combinations of variables is specified ?
(a) $|V|, \delta$ (b) P, Q (c) P, $|V|$ (d) Q, $|V|$
(The symbols have their usual meaning) [U.P.S.C. I.E.S. E.E.-II, 2004]

484. In a power system, the maximum number of buses are
(a) generator buses. (b) load buses.
(c) slack buses. (d) P-V buses.

485. Buses for load flow studies are classified as
1. Load bus 2. PV bus 3. Slacks bus
Which one of the following is the correct combination of the pair of quantities specified having their usual meaning for different buses ?

	Load bus	*PV bus*	*Slack bus*
(a)	P, $\|V\|$	P, Q	P, δ.
(b)	P, Q	P, $\|V\|$	$\|V\|, \delta$.
(c)	$\|V\|$, Q	P, δ	P, Q.
(d)	P, δ	Q, $\|V\|$	Q, δ.

[U.P.S.C. I.E.S. E.E.-II, 2005]

486. If a voltage controlled bus is treated as a load bus, then which one of the following limits would be violated ?
(a) Voltage. (b) Active power.
(c) Reactive power. (d) Phase angle.
[U.P.S.C. I.E.S. E.E.-II, 1998]

487. In load-flow analysis, the load connected at a bus is represented as
(a) constant current drawn from the bus.
(b) constant impedance connected at the bus.
(c) voltage and frequency dependent source at the bus.
(d) constant real and reactive power drawn from the bus.
[GATE E.E. 1993]

488. The voltage of a particular bus can be controlled by controlling the
(a) active power of the bus. (b) reactive power of the bus.
(c) phase angle. (d) both (a) and (b).
(e) (b) and (c).

489. The voltage of a particular bus can be controlled by controlling
(a) phase angle. (b) reactive power of the bus.
(c) active power of the bus.
(d) phase angle and reactive power.
[W.B. Univ. of Technology Power System-II, 2009-10]

490. A power system consists of two areas connected via a tie line. While entering the data for load flow the tie line parameters and its connectivity data were inadvertently left out. If the load flow program is run with this incomplete data, then the load flow calculations will converge only if
(a) One slack bus is specified in the first area.
(b) One slack bus is specified in the second area.
(c) One slack bus is specified in either of the two areas.
(d) Two slack buses, one in each area, are specified.
[U.P.S.C. I.E.S. E.E.-II, 2003]

Answers: **474.** (c), **475.** (b), **476.** (c), **477.** (b), **478.** (b), **479.** (d), **480.** (d), **481.** (b), **482.** (d), **483.** (a), **484.** (b), **485.** (b), **486.** (a), **487.** (d), **488.** (b), **489.** (b), **490.** (d),

491. A power system consists of 2 areas (Area 1 and Area 2) connected by a single tie-line as shown in the figure. It is required to carry out a load flow study on this system. While entering the network data, the tie-line data (connectivity and parameters) is inadvertently left out. If the load flow program is run with this incomplete data

(a) The loadflow will converge only if the slack bus is specified in Area 1.
(b) The loadflow will converge only if the slack bus is specified in Area 2.
(c) The loadflow will converge if the slack bus is specified in either Area 1 or Area 2.
(d) The loadflow will not converge if only one slack bus is specified.

Tie Line
Area 1 Area 2

[GATE E.E. 2002]

492. The principal information obtained from load flow studies in a power system are

1. magnitude and phase angle of the voltage at each bus.
2. reactive and real power flows in each of the lines.
3. total power loss in the network.
4. transient stability limit of the system.

Select the correct answer from the codes given below :
(a) 1 and 2 (b) 3 and 4
(c) 1, 2 and 3 (d) 2 and 4

[U.P.S.C. I.E.S. E.E.-II, 2001]

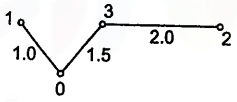
493. Y_{BUS} as used in load flow study, and Z_{BUS} as used for short circuit study are :
(a) the same. (b) inverse of each other.
(c) are not related to each other. [U.P.S.C. I.E.S. E.E.-II, 2003]

494. Which one of the following statements is correct ?
The elements of each row of Y_{BUS} matrix for load flow studies in power system add up to zero,
(a) always.
(b) if the shunt admittances at the buses are ignored.
(c) if mutual couplings between transmission lines are absent.
(d) if both (b) and (c) are satisfied. [U.P.S.C. I.E.S. E.E.-II, 2006]

495. The Y_{BUS} matrix of a 100-bus interconnected system is 90% sparse. Hence the number of transmission lines in the system must be
(a) 450 (b) 500 (c) 900 (d) 1,000

[U.P.S.C. I.E.S. E.E.-II, 2002]

496. For a graph of power system network shown in figure, where bus numbers and impedances are marked, assuming equal R/X of impedances, find the bus impedance matrix element Z_{22}.



(a) 2.0 (b) 3.5 (c) 0.5 (d) 4.5

[U.P.S.C. I.E.S. E.E.-II, 2010]

497. In matrix form, the equation of a 4 terminal network representing a transmission line is

$$\begin{bmatrix} V_s \\ I_s \end{bmatrix} = \begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} V_g \\ I_R \end{bmatrix}$$

The two networks considered are

(A) 
(B) 
The possible transfer matrix for the networks (*A*) and (*B*) could be

(i) $\begin{bmatrix} 1 & YZ \\ 0 & Z \end{bmatrix}$ (ii) $\begin{bmatrix} Y & 0 \\ YZ & 1 \end{bmatrix}$

(iii) $\begin{vmatrix} 1 & Z \\ Y & (1+YZ) \end{vmatrix}$ (iv) $\begin{bmatrix} 1+YZ & Z \\ Y & 1 \end{bmatrix}$

The correct combinations for the two networks (*A*) and (*B*), could be
(a) (i) and (ii). (b) (i) and (iii).
(c) (ii) and (iv). (d) (iii) and (iv).

[U.P.S.C. I.E.S. E.E.-II, 1997]

498. The bus admittance matrix of a power systems is given as

$$\begin{array}{c} \\ 1 \\ 2 \\ 3 \end{array} \begin{array}{c} \begin{array}{ccc} 1 & 2 & 3 \end{array} \\ \begin{bmatrix} -j50 & +j10 & +j5 \\ +j10 & -j30 & +j10 \\ +j5 & +j10 & -j25 \end{bmatrix} \end{array}$$

The impedance of line between bus 2 and 3 will be equal to
(a) $+j0.1$ (b) $-j0.1$ (c) $+j0.2$ (d) $-j0.2$

[U.P.S.C. I.E.S. E.E.-II, 2003]

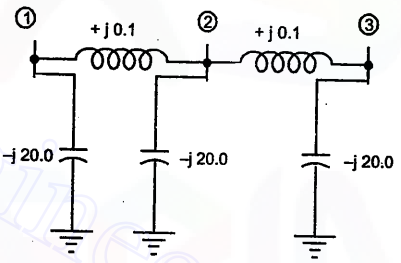
499. For the Y-bus matrix of a 4-bus system given in per, unit, buses having shunt elements are

$$Y_{BUS} = j\begin{bmatrix} -5 & 2 & 2.5 & 0 \\ 2 & -10 & 2.5 & 4 \\ 2.5 & 2.5 & -9 & 4 \\ 0 & 4 & 4 & -8 \end{bmatrix}$$

(a) 3 and 4 (b) 2 and 3 (c) 1 and 2 (d) 1, 2 and 4

[GATE E.E. 2009]

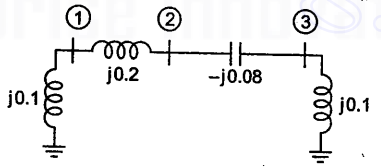
500. The network shown in the given figure has impedances in pu is indicated. The diagonal element Y_{22} of the bus admittance matrix Y_{BUS} of the network is



(a) $-j19.8$ (b) $+j20.0$ (c) $+j0.2$ (d) $-j19.95$

[GATE E.E. 2005]

501. A three-bus network is shown in the figure below indicating the pu impedance of each element.



The Bus admittance matrix, Y-Bus, of the network is

(a) $j\begin{bmatrix} 0.3 & -0.2 & 0 \\ -0.2 & 0.12 & 0.08 \\ 0 & 0.08 & 0.02 \end{bmatrix}$ (b) $j\begin{bmatrix} -15 & 5 & 0 \\ 5 & 7.5 & -12.5 \\ 0 & -12.5 & 2.5 \end{bmatrix}$

(c) $j\begin{bmatrix} 0.1 & 0.2 & 0 \\ 0.2 & 0.12 & -0.08 \\ 0 & -0.08 & 0.10 \end{bmatrix}$ (d) $j\begin{bmatrix} -10 & 5 & 0 \\ 5 & 7.5 & 12.5 \\ 0 & 12.5 & -10 \end{bmatrix}$

[GATE E.E., 2011]

Answers: **491.** (d), **492.** (a), **493.** (c), **494.** (d), **495.** (c), **496.** (a), **497.** (d), **498.** (a), **499.** (c), **500.** (d), **501.** (b),

Downloaded From : www.EasyEngineering.net

502. The bus impedance matrix of a 4-bus power system is given by

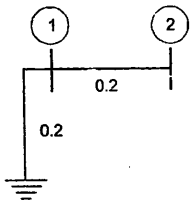
$$Z_{bus} = \begin{bmatrix} j0.3435 & j0.2860 & j0.2723 & j0.2277 \\ j0.2860 & j0.3408 & j0.2586 & j0.2414 \\ j0.2723 & j0.2586 & j0.2791 & j0.2209 \\ j0.2277 & j0.2414 & j0.2209 & j0.2791 \end{bmatrix}$$

A branch having an impedance of $j0.2\ \Omega$ is connected between bus 2 and the reference. Then the values of $Z_{22,\,new}$ and $Z_{23,\,new}$ of the bus impedance matrix of the modified network are respectively

(a) $j0.5408\ \Omega$ and $j0.4586\ \Omega$ (b) $j0.1260\ \Omega$ and $j0.0956\ \Omega$
(c) $j0.5408\ \Omega$ and $j0.0956\ \Omega$ (d) $j0.1260\ \Omega$ and $j0.1630\ \Omega$

[GATE E.E. 2003]

503. In the network as shown in figure, the marked parameters are pu impedances. The bus-admittance matrix of the network is

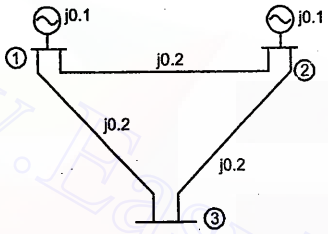


(a) $\begin{bmatrix} 10 & -5 \\ -5 & 5 \end{bmatrix}$ (b) $\begin{bmatrix} 5 & -5 \\ -5 & 10 \end{bmatrix}$

(c) $\begin{bmatrix} -10 & 5 \\ 5 & -5 \end{bmatrix}$ (d) $\begin{bmatrix} -5 & 5 \\ 5 & -10 \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-II, 2003]

504. A sample power system network is shown in the figure. The reactances marked are in pu. What is the pu value of Y_{22} of the Bus Admittance Matrix (Y_{Bus})?



(a) $j10.0$ (b) $j0.5$
(c) $-j0.1$ (d) $-j20.0$

[U.P.S.C. I.E.S. E.E.-II, 2005]

505. Gauss-Seidel interative method can be used for solving a set of
(a) linear differential equations only.
(b) linear algebraic equations only.
(c) both linear and nonlinear algebraic equations.
(d) both linear and nonlinear differential equations.

[GATE E.E. 1997]

506. What is the form of the Y_{bus} matrix for carrying out load flow studies by Gauss-Seidal method of a power system having mesh connection of nodes?
(a) Symmetric but not diagonal matrix.
(b) Diagonal matrix.
(c) Antisymmetric matrix.
(d) Sparse asymmetric matrix. [U.P.S.C. I.E.S. E.E.-II, 2009]

507. The Gauss Siedel load flow method has following disadvantages. Tick the incorrect statement.
(a) Unreliable convergence (b) Slow convergence.
(c) Choice of slack bus affects convergence.
(d) A good initial guess for voltages is essential for convergence.

[GATE E.E. 2006]

508. Compared to Gauss-Seidel method, Newton-Raphson method takes
(a) less number of iterations and more time per iteration.
(b) less number of iterations and less time per iteration.
(c) more number of iterations and more time per iteration.
(d) more number of iterations and less time per iteration.

[U.P.S.C. I.E.S. E.E.-II, 1999]

509. Consider the following statements in respect of load flow studies in power systems
1. Bus admittance matrix is a sparse matrix
2. Gauss-Seidel method is preferred over Newton-Raphson method for load flow studies.
3. One of the buses is taken as slack bus in load flow studies.

Which of the statements given above are correct?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 1 and 3. (d) 2 and 3.

[U.P.S.C. I.E.S. E.E.-II, 2005]

510. In the solution of load-flow equation, Newton-Raphson (NR) method is superior to the Gauss-Seidel (GS) method, because
(a) the time taken to perform one iteration in the NR method is less when compared to the time taken in the GS method.
(b) number of iteration required in the NR method is more when compared to that in the GS method.
(c) number of iterations required is not independent of the size of the system in the NR method.
(d) convergence characteristics of the NR method are not affected by the selection of slack bus. [U.P.S.C. I.E.S. E.E.-II, 1997]

511. Let $x^2 - 117 = 0$. The iterative steps for the solution using Newton-Raphson's method is given by

(a) $x_{k+1} = \frac{1}{2}\left(x_k + \frac{117}{x_k}\right)$ (b) $x_{k+1} = x_k - \frac{117}{x_k}$

(c) $x_{k+1} = x_k - \frac{x_k}{117}$ (d) $x_{k+1} = x_k - \frac{1}{2}\left(x_k + \frac{117}{x_k}\right)$

[GATE E.E., 2009]

512. Regulating transformers are used in power systems for control of
(a) voltage. (b) power factor.
(c) power flow. (d) all of the above.

513. In a load-flow study a PV bus is treated as a PQ bus when
(a) voltage limit is violated. (b) active power limit is violated.
(c) phase angie is high.
(d) reactive power limit is violated. [U.P.S.C. I.E.S. E.E.-II, 2000]

514. For a 15-bus power system with 3 voltage controlled buses, the size of Jacobian matrix is
(a) 11×11 (b) 12×12 (c) 24×24 (d) 25×25

[U.P.S.C. I.E.S. E.E.-II, 1996]

515. A 12-bus power system has 3 voltage controlled buses. The dimensions of the Jacobian matrix will be
(a) 21×21 (b) 21×19 (c) 19×19 (d) 19×21

[U.P.S.C. I.E.S. E.E.-II, 2000]

516. A power system consists of 300 buses out of which 20 buses are generator bus, 25 buses are ones with reactive power support and 15 buses are the ones with fixed shunt capacitors. All the other buses are load buses. It is proposed to perform a load flow analysis in the system using Newton-Raphson method. The size of the Newton Raphson Jacobian matrix is
(a) 553×553 (b) 540×540
(c) 555×555 (d) 554×554 [GATE E.E. 2003]

517. If the reference bus is changed in two load flow buses with same system data and power obtained for reference bus taken as specified P and Q in the latter run
(a) the system losses will be unchanged but complex bus voltages will change.
(b) the system losses will change but complex bus voltages remain unchanged.
(c) the system losses as well as complex bus voltages will change.
(d) the system losses as well as complex bus voltages will be unchanged. [GATE E.E. 1996]

Answers: **502.** (b), **503.** (a), **504.** (d), **505.** (b), **506.** (a), **507.** (a), **508.** (a), **509.** (c), **510.** (d), **511.** (a), **512.** (c), **513.** (d), **514.** (d), **515.** (b), **516.** (b), **517.** (a),

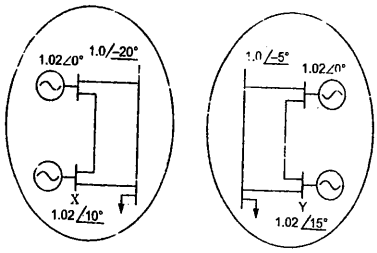
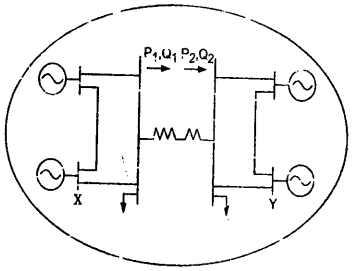
518. Consider the two power systems shown in figure A below, which are initially not interconnected, and are operating in steady state at the same frequency. Separate load flow solutions are computed individually for the two systems, corresponding to this scenario. The bus voltage phasors so obtained are indicated on figure A. These two isolated systems are now interconnected by a short transmission line as shown in figure B, and it is found that $P_1 = P_2 = Q_1 = Q_2 = 0$.





The bus voltage phase angular difference between generator bus X and generator bus Y after the interconnection is

(a) 10° (b) 25° (c) −30° (d) 30°

[GATE E.E. 2007]

Answers: 518. (a).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): In L.P.S. (Longitudinal Power Supply) system, the voltage regulation is generally poor.
(R): L.P.S. system has low level of short-circuit MVA.
[U.P.S.C. I.E.S. E.E.-II, 2000]

2. (A): When a Line-to-Line (L—L) fault takes place at the terminals of an open-circuited generator, phase voltages are sometimes 'indeterminate', though line-to-line voltages are always determinable.
(R): During a Line-to-Line fault, zero-sequence voltage is always indeterminate. [U.P.S.C. I.E.S. E.E.-II, 2002]

3. (A): In comparison to making capacity of a circuit breaker, its breaking capacity is normally higher.
(R): The breaking capacity of a circuit breaker (3-phase) is expressed as $\sqrt{3}$ VI × 10^{-6} MVA where V is the rated service voltage in volts and I is rms value of symmetrical breaking current in amperes.

4. (A): For ground fault protection, the reactance relay is preferred.
(R): Ground fault involves variable fault resistance and the operation of reactance relay is not affected by fault resistance.

5. (A): Reactance relay is more suitable for the protection of short lines.
(R): Operation of reactance relay is independent of arc fault resistance. [U.P.S.C. I.E.S. E.E.-II, 1994]

6. (A): A capacitor is connected in the polarizing circuit of the mho relay to prevent its operation when three-phase faults occur very close to the relay.
(R): Capacitor provides memory action and thus maintains polarizing flux for several cycles following the fault.
[U.P.S.C. I.E.S. E.E.-II, 2009]

7. (A): Residual earth fault relays cannot give satisfactory protection in th case of resonant earthed system.
(R): Earth fault currents are very large. [U.P.S.C. I.E.S. E.E.-II, 1998]

8. (A): Transistor static relays are the most widely used static relays.
(R): The transistor circuit not only perform the essential functions of a relay but also provide necessary flexibility to suit the various relay requirements.

9. (A): Testing of circuit breaker is more difficult than that of other electrical equipment like transformer or rotating machines.
(R): Short-circuit currents are very large and there is no satisfactory method for testing circuit breaker at reduced power.

10. (A): The core-balance leakage protection used for power transformers against earth fault on *hv* winding is inferior to combined leakage and overload protection.
(R): Relay does not operate in core-balance leakage protection when fault occurs between phases.

11. (A): Zero-sequence currents flow from a line into a transformer tank.
(R): Transformer windings are connected in grounded star/delta.

Answers: 1. (a), **2.** (c), **3.** (d), **4.** (a), **5.** (b), **6.** (a), **7.** (c), **8.** (a), **9.** (a), **10.** (a), **11.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

12. (A): Merz-Price protection system is not suitable for protection of feeders beyond 33 kV.
(R): Difficulties are experienced in balancing the secondaries of the two CTs above 33 kV.

13. (A): Mho relay is normally used for protection of long transmission lines.
(R): Under power swing conditions, Mho relay is stable.

14. (A): Thyrite arrestor is most common and is mostly used for the protection against high dangerous voltages.
(R): The thyrite arrester discharges several thousand amperes without the slightest tendency to flash-over on the edges and there is absolutely no time lag in its performance.

15. (A): Present-day surge diverters use nonlinear resistance elements.
(R): A nonlinear resistance element has the property that its resistance increases sharply as the voltage across it increases. [U.P.S.C. I.E.S. E.E.-II, 2006]

16. (A): To provide effective protection to the terminal apparatus against lightning long lead length to the feeder line and to the ground are recommended for arrester applications.
(R): Long lead length offers high impedance path to lighting surge current. [U.P.S.C. I.E.S. E.E.-II, 1995]

17. (A): Shunt capacitors are used in conjunction with lighting arresters for the protection of station equipment against surges.
(R): Shunt capacitors reduce the crest of surges.
[U.P.S.C. I.E.S. E.E.-II, 1996]

18. (A): A short length of cable between an overhead line and the substation is effective in reducing the incoming surge voltage.
(R): The surge impedance of the cable is quite low when compared with that of the incoming overhead line.
[U.P.S.C. I.E.S. E.E.-II, 1998]

19. (A): Voltage-time insulation coordinations curves for the equipment to be protected and the lightning arrester to be employed are used for determining the required insulation levels.
(R): Voltage time insulation coordination curves indicate the time of arrival of the peak of the surge wave at the equipment location. [U.P.S.C. I.E.S. E.E.-II, 2000]

20. (A): The 'short-circuit capacity' of a bus in a large power grid is defined as the product of the prefault voltage and the 3-phase fault current at a point very close to the bus.
(R): The larger the short-circuit capacity, the larger would be the equivalent source impedance at the bus.
[U.P.S.C. I.E.S. E.E.-II, 2008]

21. (A): The best method of improving transient stability is by use of high speed circuit breakers.
(R): The quicker the circuit breaker operates, the faster the fault is removed from the system and normal operating conditions are restored.

22. (A): Load flow studies are usually carried out using Y_{BUS}.
(R): Y_{BUS} is a sparse matrix and is generally matching with topology of the PS network. [U.P.S.C. I.E.S. E.E.-II, 2010]

23. (A): During the load-flow study, a voltage controlled bus is treated as a load bus when the magnitude of voltage is very much higher or very much lower than the scheduled voltage.
(R): A tap changing transformer is represented as a π-network in the load-flow model. [U.P.S.C. I.E.S. E.E.-II, 1997]

24. (A): Bus admittance matrix is a sparse matrix.
(R): In load flow studies, one of the buses is taken as a slack bus. [U.P.S.C. I.E.S. E.E.-II, 2006]

25. (A): The bus admittance matrix (Y_{Bus}) used in load-flow studies is a sparse matrix.
(R): The elements of Y_{Bus} exhibit the physical interconnection of nodes of the power system. [U.P.S.C. I.E.S. E.E.-II, 1994]

26. (A): For the load-flow solution of a large power system Newton-Raphson method is superior to the Gauss-Seidel method.
(R): In the Gauss-Seidel method, the number of iterations vary between 3 to 5, irrespective of the size of the system.
[U.P.S.C. I.E.S. E.E.-II, 1994]

27. (A): The main advantage of decoupled load flow (DLF) method as compared to Newton Raphson method is its reduced memory requirements in storing the Jacobian.
(R): An important characteristic of any practical electric power transmission system operating in steady state is the strong interdependence between the real power and bus voltage angies, and between the reactive powers and voltage magnitudes. [U.P.S.C. I.E.S. E.E.-II, 2004]

Answers: **12.** (a), **13.** (b), **14.** (a), **15.** (c), **16.** (c), **17.** (a), **18.** (a), **19.** (a), **20.** (c), **21.** (a), **22.** (a), **23.** (b), **24.** (b), **25.** (a), **26.** (c), **27.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Symbol for 3-phase Transformer Connections)	List 2 (Zero-Sequence Equivalent Circuits)
A. 	1. B. 	2. C. 	3. 
Answers: **1.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Codes:	A	B	C
(a)	2	1	3
(b)	2	3	1
(c)	1	2	3
(d)	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2007]

2.

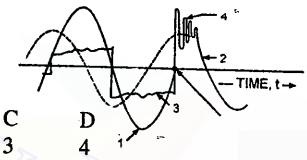
List 1	List 2
A. All types of faults.	1. Negative-sequence currents are present.
B. All unsymmetrical faults.	2. Zero-sequence currents are present.
C. Fault involving ground with neutral of the system grounded.	3. Zero-sequence currents are absent.
D. Fault involving ground with floating neutral.	4. Positive-sequence currents are present.

Codes:	A	B	C	D
(a)	3	1	2	4
(b)	4	1	2	3
(c)	3	2	1	4
(d)	4	2	1	3

[U.P.S.C. I.E.S. E.E.-II, 2010]

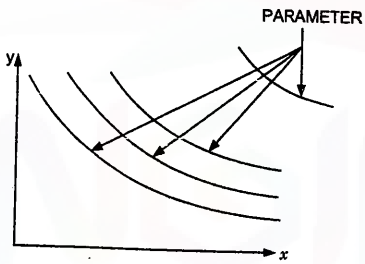
3.

List 1	List 2
A. Arc voltage.	
B. Recovery voltage.	
C. Restriking voltage.	
D. Short-circuit current.	



Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	2	4	1
(d)	3	4	2	1

4. The inverse characteristics of an induction-disc relay are shown below :



Match List 1 (x, y coordinates and parameter) with List 2 (Variables) and select the correct answer using the codes given below:

List 1 (x, y Coordinates and and Parameter)	List 2 (Variables)
A. x-coordinate	1. Plug setting voltage.
B. y-coordiante	2. Current as multiplier of plug setting.
C. Parameter	3. Operating time.
	4. Time multiplier setting.
	5. Power factor.

Codes :	A	B	C
(a)	5	4	1
(b)	2	3	4
(c)	5	3	4
(d)	2	4	1

U.P.S.C. I.E.S. E.E.-II, 2002]

5.

List 1	List 2
A. Mho relay.	
B. Plain impedance relay.	
C. Directional relay.	
D. Angle impedance relay.	

List 2

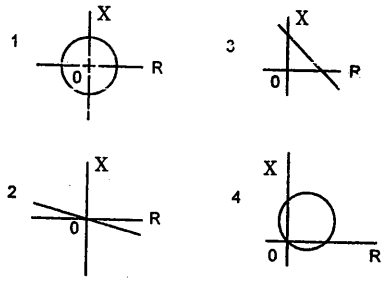


Fig. Q. 5.

Codes :	A	B	C	D
(a)	4	3	2	1
(b)	4	1	2	3
(c)	3	2	1	4
(d)	3	2	4	1

[U.P.S.C. I.E.S. E.E.-II, 1993; 2011]

6.

List 1 (Types of Relays)	List 2 (Types of Protection)
A. Directional relay.	1. Relay operates for fault within certain distacne of its location.
B. Impedance relay.	2. Relay will trip for fault in one location and block for all other locations.
C. Differential relay.	3. High speed protection for entire transmission line.
D. Pilot relay.	4. The principle of current continuity is used to devise a simple and effective relaying system over a small physical space.

[U.P.S.C. I.E.S. E.E. II, 2004]

Codes :	A	B	C	D
(a)	1	2	4	3
(b)	2	1	3	4
(c)	2	1	4	3
(d)	1	2	3	4

7.

List 1	List 2
A. Buchholz relay.	1. Feeder.
B. Translary relay.	2. Transformer.
C. Negative sequence relay.	3. Generator.
D. Directional over-current relay.	4. Long overhead line.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	1	3	4
(c)	2	1	4	3
(d)	1	2	4	3

[U.P.S.C. I.E.S. E.E.-II, 1998]

8.

List 1 (Type of Relay)	List 2 (Most Suited For)
A. Buchholz relay.	1. Feeder.
B. Translay relay.	2. Transformer.
C. Carrier current phase comparison relay.	3. Radial distributor.
D. Directional over-current relay.	4. Generator.
E. Negative sequence relay.	5. Ring main distributor.
	6. Long overhead transmission line.

Answers: **2.** (b), **3.** (c), **4.** (b), **5.** (b), **6.** (c), **7.** (b), **8.** (c),

10.

List 1 (Types of Relays)	List 2 (Protective Schemes)
A. Negative-sequence relay.	1. Distribution feeder protection.
B. Harmonic restraint differential relay.	2. Long ht lines protection.
C. Overcurrent relay with time-delay.	3. Transformer protection
D. Mho relay.	4. Rotor protection of alternators.

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	1	2	4	3
(c)	4	2	1	3
(d)	1	3	4	2

[U.P.S.C. I.E.S. E.E.-II, 2002]

11.

List 1 (Type of Transmission Line)	List 2 (Type of Distance Relay Preferred)
A. Short Line	1. Ohm Relay
B. Medium Line	2. Reactance Realy
C. Long Line	3. Mho Relay

(a) $a \rightarrow 2, b \rightarrow 1, c \rightarrow 3$
(b) $a \rightarrow 3, b \rightarrow 2, c \rightarrow 1$
(c) $a \rightarrow 1, b \rightarrow 2, c \rightarrow 3$
(d) $a \rightarrow 1, b \rightarrow 3, c \rightarrow 2$

[GATE E.E. 2009]

12.

List 1 (Type of Fault)	List 2 (Type of Protection)
A. External phase fault	1. Differential protection
B. Faults between phases	2. Earth fault relay
C. Phase to earth fault	3. Overcurrent protection (inverse time delay o/c relay)
D. Overheating	4. Thermal relay

Codes :	A	B	C	D

(b)	4	2	1	3
(c)	3	2	1	4
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2006]

13.

List 1 (Equipment)	List 2 (Function)
A. Circuit breaker.	1. Voltage control.
B. Lightning arrester.	2. Power control.
C. Governor.	3. Overvoltage protection.
D. Exciter.	4. Overcurrent protection.

[GATE E.E. 1992]

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	4	1	2	3
(c)	2	3	4	1
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 1995]

14.

List 1 (Equipments)	List 2 (Applications)
A. Metal oxide arrester.	1. Protects generator against short circuit faults.
B. Isolator.	2. Improves transient stability.
C. Auto-reclosing CB.	3. Allows CB maintenance.
D. Differential relay.	4. Provides protection against surges.

Codes :	A	B	C	D
(a)	4	3	2	1
(b)	3	4	1	2
(c)	4	3	1	2
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-II, 2001]

15.

List 1	List 2
A. Thyrite arrester.	1. Tower location.
B. Sag template.	2. Cross bonding.
C. Cable sheaths.	3. Restriking voltage.
D. Circuit breaker.	4. Nonlinear resistor.

Codes:	A	B	C	D
(a)	3	1	2	4
(b)	4	1	2	3
(c)	3	2	1	4
(d)	4	2	1	3

[GATE E.E. 2011]

16.

List 1	List 2
A. Transient stability. improvement	1. Incremental transmission loss.
B. Economic dispatch.	2. Area control error.
C. Load frequency control.	3. Power system stabilizers.
D. Dynamic stability.	4. Turbine fast valving.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	2	1	4	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2008]

17.

List 1 (Phenomenon)	List 2 (Dominant Features)
A. Voltage stability.	1. Power system stabilizer.
B. Transient stability.	2. Damping power.
C. Oscillatory instability.	3. 'Angle' stability.
D. Steady-state Dynamics.	4. Reactive power.

Codes :	A	B	C	D
(a)	1	3	2	4
(b)	4	2	3	1
(c)	1	2	3	4
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2002]

18.

List 1	List 2
A. Ryle's formula.	1. Interactive solution of load flow.
B. Gauss-Siedel method.	2. Surge impedence.
C. Stringing chart.	3. Transmission lower.
D. Line and machine charts.	4. Sag Vs temperature Vs tension.
	5. Voltage drop and regulation calculation.

Answers: **9.** (a), **10.** (a), **11.** (c), **12.** (a), **13.** (d), **14.** (a), **15.** (b), **16.** (b), **17.** (d), **18.** (b).

[A.M.I.E. Sec B. Power Systems Winter 1997]

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. A short-circuit current is identified heavy current flow.
2. The overcurrent fault occurs mainly because of short-circuit or leakage owing to corona and sometimes due to overload on the supply system.
3. Reverse power fault occurs only in interconnected systems.
4. The first peak short circuit current is $\sqrt{2}$ times the rms value of the periodic component of the short-circuit current 2-3 periods after the short-circuit is initiated.
5. The MVA at fault is equal to base MVA divided per unit equivalent fault impedance.
6. A sudden short-circuit in an ac power system causes a fall in current in the short-circuited phase.
7. The reactor limits the fault by limiting the current that can flow into it from other healthy parts of the system.
8. Oil immersed type reactors are used for voltages above 1.1 kV.
9. In a tie-bar system of bus-bar reactors the generators are connected to the common bus-bar through the reactors but the feeders are fed from the generator side of the reactors.
10. In delta-connected load, the line currents do not have zero sequence components.
11. In a power system, the 3-phase fault MVA is always higher than the single line-to-ground fault MVA at a bus. [GATE E.E. 1994]
12. For simulating a three-phase to ground fault positive and negative sequence networks are connected in series. [A.M.I.E. Sec B Summer 1999]
13. Zero-sequence currents flow in a transmission line when there is a double line to grounded fault.
14. Breaking capacity of a fuse is the rating corresponding to the rms value of the ac component of the maximum prospective current and the system voltage.
15. HRC fuses obey inverse time-current characteristic. [A.M.I.E. Sec B. Winter 1994]
16. HRC fuses are reusable after blowing off. [A.M.I.E. Sec B. Winter 1995]
17. A fuse has low braking capacity as compared to a circuit breaker. [A.M.I.E. Sec B. Summer 1999]
18. The relation between fusing current (I) and fuse wire diameter is $I \propto d^{1.5}$.
19. Rewirable fuse has linear time-current characteristic.
20. For the same rupturing capacity, the actual current to be interrupted by an HRC fuse is much more than that of any circuit breaker.
21. A circuit breaker is a current interrupting device.
22. On occurrence of fault on the protected circuit, a circuit breaker operates manually through a control switch.
23. Current chopping phenomenon is absent in ABCB. [A.M.I.E. Sec B. Winter 1998]
24. RRRV of a system is expressed in kV/km. [A.M.I.E. Sec B. Winter 1994]
25. For preventing arc strike in a circuit breaker the rate of transient recovery voltage must be greater than the rate of build-up of dielectric strength across the contacts. [A.M.I.E. Sec B. Summer 1999]
26. Successful arc interruption is achieved when the system recovery is faster than dielectric recovery. [A.M.I.E. Sec B. Winter 1998]
27. Bulk oil circuit breakers utilise oil for arc quenching only. [A.M.I.E. Sec B. Winter 1995]
28. In small oil volume circuit breaker insulation are provided to provide sufficient insulation of the current carrying parts of the circuit breaker. [A.M.I.E. Sec B. Winter 1996]
29. Magnetic blow out coils in air circuit breaker helps arc interruption. [A.M.I.E. Sec B. Winter 1998]
30. Air-blast circuit breakers at 220 kV level make great noise while breaking a circuit. [A.M.I.E. Sec B. Winter 1993]
31. The chances of arc interruption in subsequent current zero increase in case of OCB but decrease in air blast circuit breaker. [A.M.I.E. Sec B. Winter 1993]
32. Chimney effect occurs in an air blast circuit breaker. [A.M.I.E. Sec B. Winter 1996]
33. Current chopping leads to dangerously high voltages. [A.M.I.E. Sec B. Winter 1994]
34. Air-blast circuit breakers for 400 kV power system are designed to operate in 50 ms. [A.M.I.E. Sec B. Summer 1998]
35. At normal temperature and pressure SF_6 is a colourless liquid. [A.M.I.E. Sec B. Winter 1993]
36. SF_6 gas is not an efficient quenching medium because of its electronegativity. [A.M.I.E. Sec B. Summer 1998]
37. SF_6 gas is an excellent arc quenching medium. [A.M.I.E. Sec B. Winter 1998]
38. SF_6 gas is used as an efficient arc quenching medium because of its electronegativity. [A.M.I.E. Sec B. Winter 1996]
39. The behaviour of arc in high vacuum is affected by contact material and contact surface conditions.
40. The insulation requirements of switchgear are determined on the basis of transient voltage.
41. Making capacity of a circuit breaker is greater than breaking capacity. [A.M.I.E. Sec B. Winter 1998]

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (F), **5.** (T), **6.** (F), **7.** (T), **8.** (F), **9.** (T), **10.** (T), **11.** (T), **12.** (F), **13.** (T), **14.** (T), **15.** (T), **16.** (F), **17.** (T), **18.** (T), **19.** (F), **20.** (F), **21.** (T), **22.** (F), **23.** (F), **24.** (F), **25.** (F), **26.** (F), **27.** (F), **28.** (T), **29.** (T), **30.** (T), **31.** (T), **32.** (T), **33.** (T), **34.** (T), **35.** (T), **36.** (F), **37.** (T), **38.** (T), **39.** (T), **40.** (T), **41.** (T),

Downloaded From : www.EasyEngineering.net

42. The arcing contacts for a circuit breaker are made of stainless steel.
43. With the increase in mechanical force applied, the contact resistance decreases.
44. The fault clearing time of a circuit breaker is usually few cycles of supply voltage.
45. Bulk oil circuit breakers do use pneumatic operating mechanism.
46. Oil circuit reclosures are increasingly used in unattended substations and rural disribution schemes whereas the circuit breakers are installed in outlying areas.
47. Auto-recloser type breakers never close during a fault. [A.M.I.E. Sec B. Winter 1994]
48. A switch is used in an electric circuit as a device for making or breaking the electric circuit in a convenient way.
49. Isolators may be operated under short-circuit conditions.
50. While opening a transmission line under normal load condition the isolator should open first before the opening of the circuit breaker. [A.M.I.E. Sec B. Winter 1996]
51. Backup protection functions when primary protection fails to operate.
52. In the protection scheme relay functions as a switching device.
53. Relay contacts are usually made of silver.
54. By burden of the relay, we generally mean VA rating of the relay.
55. Holding ratio is the ratio of drop off value to pick up value.
56. The holding ratio of a relay is usually more than unity.
57. Bounce proof contacts are used in relays. [A.M.I.E. Sec B. Summer 1998]
58. Pressure at the relay contacts is kept low. [A.M.I.E. Sec B. Summer 1998]
59. The relay is designed for maximum torque/friction ratio. [A.M.I.E. Sec B. Summer 1998]
60. The cores of protection CT have high saturation level. [A.M.I.E. Sec B. Winter 1995]
61. Backup relays are more selective than primary relays. [A.M.I.E. Sec B. Winter 1994]
62. Interlocking prevents one set of contacts from closing while other set of contacts is closed.
63. In elecromagnetic relays the restraining torque is produced by springs.
64. Induction disc relays are faster in operation than induction cup relays. [A.M.I.E. Sec B. Winter 1994]
65. Induction type overcurrent relays can be used for the protection of a dc distributor. [A.M.I.E. Sec B. Winter 1995]
66. Relays using induction disc principle operate both on ac and dc system. [A.M.I.E. Sec B. Summer 1998]
67. The rotation of disc of an induction disc relay under the poles is from unshaded pole to shaded pole.
68. Induction cup relays are basically phase comparators. [A.M.I.E. Sec B. Winter 1993]
69. Buchholz relay is a current actuated relay.
70. Buchholz relays are used for protection of power transformers against all types of internal and external faults.
71. Overcurrent relay plug settings are determined from maximum fault current rating. [A.M.I.E. Sec B. Winter 1993]
72. The plug setting multiplier for a relay with 15% current setting CT ratio of 500/5 and primary fault current of 600 A is 8. [A.M.I.E. Sec B. Summer 1999]
73. Induction type reverse power relays are very suitable for the protection of parallel feeders.
74. Operation of distance relay is based upon the measurement of impedance between the location of the relay and the fault point.
75. Plain impedance relays are direction sensitive [A.M.I.E. Sec B. Winter 1994]
76. Plain impedance relays are non-directional in nature. [A.M.I.E. Sec B. Winter 1994]
77. Reactance relay is the best for ground fault protection. [A.M.I.E. Sec B. Winter 1998]
78. Reactance relay is a voltage restrained overcurrent relay. [A.M.I.E. Sec B. Winter 1994]
79. Mho relay is a voltage restrained over-current relay. [A.M.I.E. Sec B. Winter 1993]
80. Mho relay is used for short transmission line protection. [A.M.I.E. Sec B. Winter 1996]
81. Protection against unbalanced supply voltage is provided by negative phase sequence relays.
82. Directional overcurrent relays are used for protection of ring main distribution lines.
83. Mho relay has inherent directional properties.
84. Mho relays have an R-X plane characteristic depicted by a circle passing through origin.
85. Static relays cause more VA burden on CTs than their electromagnetic counter part. [A.M.I.E. Sec B. Winter 1993]
86. Static relays pose lower burden on protective circuits. [A.M.I.E. Sec B. Winter 1994]
87. Static relays offer low burden than electromagnetic relays. [A.M.I.E. Sec B. Winter 1995]
88. Frequency relays are used in aternators for overspeed protection.
89. Loss of excitation protection of generator is rendered by offset mho relay. [A.M.I.E. Sec B. Winter 1993]
90. It is not necessary to switch off the field supply on occurrence of a fault in the generator stator winding.
91. Differential protection does not provide protection against/turn-to-turn fault on the same phase winding of the stator of an alternator as it does not cause the imbalance between the CT pairs.
92. The main drawback of Merz-Price differential protection relay is its response to severe external faults.
93. The function of the AVR of a generator connected to the grid is to control the power factor. [A.M.I.E. Sec B. Winter 1998]
94. The most commonly used system for the protection of generator is circulating current system. [A.M.I.E. Sec B. Summer 1999]
95. In the event of prime mover failure, the generator starts motoring, and this can be detected by a directional relay.
96. Whatever be the cause of unbalance in an alternator, obviously negative phase sequence current will result in heating of stator.
97. Inter-turn fault on the same phase of the stator winding can be detected by longitudinal differential protection.
98. In Merz-Price protection scheme, the relays are located adjacent to the CTs. An earth fault is the stator winding of an alternator causes an increase in current through one CT, as compared to current through the other CT, causing current imbalance and spilting of current through relay and therefore, tripping of circuit.
99. The boundary of a protective system is determined by the location of CTs.

Answers: **42.** (F), **43.** (T), **44.** (T), **45.** (F), **46.** (T), **47.** (F), **48.** (T), **49.** (F), **50.** (F), **51.** (T), **52.** (F), **53.** (T), **54.** (T), **55.** (T), **56.** (F), **57.** (T), **58.** (F), **59.** (T), **60.** (T), **61.** (F), **62.** (T), **63.** (F), **64.** (F), **65.** (F), **66.** (F), **67.** (T), **68.** (T), **69.** (F), **70.** (F), **71.** (F), **72.** (T), **73.** (T), **74.** (T), **75.** (F), **76.** (T), **77.** (T), **78.** (F), **79.** (F), **80.** (F), **81.** (T), **82.** (T), **83.** (T), **84.** (T), **85.** (F), **86.** (T), **87.** (T), **88.** (T), **89.** (T), **90.** (F), **91.** (T), **92.** (T), **93.** (F), **94.** (T), **95.** (T), **96.** (T), **97.** (F), **98.** (T), **99.** (T),

100. Flow of unbalanced three-phase currents through the stator winding of an alternator will cause heating of the rotor.

101. A large-size generator is protected against overloads by providing overcurrent relays.

102. A single phasing relay is used with a large 3-phase squirrel cage induction motor.

103. For protection of motors against short circuits on stator winding thermal or dash pot type overcurrent tripping devices are used.

104. Heating effect of the positive phase sequence current is more than that of negative sequence current.

105. In a differential protection of star/delta transformer, the CTs on the star side are connected is delta and on delta side in star.
[A.M.I.E. Sec B. Summer 1999]

106. Buchholz relay can detect faults above oil level in the transformer.
[A.M.I.E. Sec B. Summer 1999]

107. Magnetising inrush current is transformers is rich in second harmonic contents. [A.M.I.E. Sec B. Summer 1998]

108. In a differential protection of a star/delta transformer the CTs on the star side are connected in star and on the delta side in delta.
[A.M.I.E. Sec B. Winter 1996]

109. Magnetising inrush occurs in a motor under fault condition.
[A.M.I.E. Sec B. Winter 1996]

110. Transformer, differential relays usually have high bias settings.
[A.M.I.E. Sec B. Winter 1995]

111. Bus-bar term is used for a main bar or conductor carrying an electric current to which many connections may be made.

112. Bus-bar operates at variable voltage. [A.M.I.E. Sec B. Summer 1999]

113. Bus-coupler is very essential in main and transfer bus.

114. Overcurrent/distance relays of other zones cannot be employed for protection of bus-bars.

115. Single line opening in a transmission system is detected by ground fault relays. [A.M.I.E. Sec B. Winter 1994]

116. Differential protection scheme for longer lines is very costly.
[A.M.I.E. Sec B. Summer 1999]

117. Pilot protection scheme is used for protection of long EHV transmission lines in interconnected power systems.

118. In a protective scheme of a feeder, a summation transformer is used. It has tappings on the primary and cannot operate with secondary open-circuited.

119. Unit type of protection responds to fault is protected zone alone.

120. Differential protection scheme compares the current entering and current leaving the protected circuit.

121. In a biased or percentage differential relay, the restraining coil provides a biasing feature and thus the flow of heavy out-of-balance current through the relay can be avoided.

122. Differential protection schemes employed for protection of feeders make use of pilot wires.

123. The relays used in balanced voltage schemes will behave in the same way as in circulating scheme on a pilot fault.

124. Power line carrier is a low frequency signal sent through the power line conductors.

125. Wavetraps are series resonating circuits. [A.M.I.E. Sec B. Winter 1994]

126. Wavetraps of carrier protection are series resonating circuits at carrier frequency. [A.M.I.E. Sec B. Winter 1993]

127. Line traps are used to restrict the flow of high frequency carrier signals between the local end transmitter and remote end receiver.
[A.M.I.E. Sec B. Winter 1996]

128. Line traps are series resonant circuits. [A.M.I.E. Sec B. Winter 1998]

129. Microwave pilot scheme need both a line trap and coupling capacitor. [A.M.I.E. Sec B. Summer 1998]

130. Carrier blocking scheme uses healthy line for carrier transfer.
[A.M.I.E. Sec B. Winter 1998]

131. First zone distance relays are never allowed to over reach.
[A.M.I.E. Sec B. Winter 1993]

132. Distance protection schemes widely used in transmission lines provides discriminative protection without using pilot wires.

133. Micro-pilot scheme need both line trap and coupling capacitor.

134. The most severe cause of switching overvoltage is closing of charged line.

135. Switching overvoltages are proportional to the square of system voltages.

136. The electrostatically induced emf in a line due to discharge of one cloud over another one is called the direct lightning stroke.

137. A surge may be considered as high voltage of very high frequency.

138. The damage caused by surge depends on steepness of the wave front.

139. Nonlinear resistors are employed in lightning arresters.

140. Lightning arresters are used before the switchgear.

141. Magnetically blow out type lightning arresters are designed to discharge the lightning overvoltages as well as switching over-voltages.

142. In EHV line ground wire is used to provide a shield to phase conductors from direct lightning strokes.

143. A lightning arrester should operate only at abnormal frequencies.

144. A rod gap arrester is capable of stopping power frequency to earth.

145. Expulsion type arrester is also called the protector tube.

146. Protector tubes can be used for the protection of station insulation.

147. The angle of protection should not exceed 30° for good shielding of the line conductor.

148. Earthling lightning rods are provided at the substations.

149. Location of lightning arrester is near a transformer.

150. Travelling wave gets reflected from short-circuited line with reflected current wave of opposite polarity and voltage wave of the same polarity.

151. In long transmission lines as we move away from the receiving end the reflected component of voltage increases in magnitude and phase.

Answers: **100.** (T), **101.** (F), **102.** (T), **103.** (T), **104.** (F), **105.** (T), **106.** (F), **107.** (T), **108.** (F), **109.** (F), **110.** (T), **111.** (T), **112.** (F), **113.** (T), **114.** (F), **115.** (F), **116.** (T), **117.** (T), **118.** (T), **119.** (T), **120.** (T), **121.** (T), **122.** (T), **123.** (F), **124.** (F), **125.** (T), **126.** (T), **127.** (T), **128.** (F), **129.** (F), **130.** (T), **131.** (T), **132.** (T), **133.** (F), **134.** (T), **135.** (F), **136.** (F), **137.** (T), **138.** (T), **139.** (T), **140.** (F), **141.** (T), **142.** (T), **143.** (T), **144.** (F), **145.** (T), **146.** (F), **147.** (T), **148.** (F), **149.** (T), **150.** (F), **151.** (F),

152. In long transmission lines incident and reflected waves travel in opposite directions.

153. Voltage surge travelling on a transmission line enters the lightning arrester first.

154. Surge impedance depends on tower height and base.

155. Small protective angles are used for low towers and large angles for high towers.

156. A surge diverter should provide a large impedance path to the travelling wave reaching the diverter.

157. Proper coordination will insure that the volt-time curve of the equipment will lie below the volt-time curve of the protective device. **[A.M.I.E. Sec B. Advanced Power Systems Summer 1999]**

158. The crest voltage of the standard wave that will not cause flashover of the insulation is called the basic impulse insulation (BIL).

159. BIL are reference levels expressed in impulse crest voltage with a standard wave not longer than 1.2×50 wave.

160. Impulse insulation breakdown strength of the protected equipment must be greater than that of the protecting device.

161. Insulation coordination depends upon voltage-time characteristics.

162. Insulation strength of EHV line is governed by lightning over-voltage.

163. Tail time of a wave means time from beginning of wave to half the crest value on the tail.

164. In transmission lines, the ground wires run below the line conductors.

165. The insulation strength of EHV lines is mainly governed by power frequency overvoltages.

166. Capacitive voltage transformer (CVT) is used to reduce the incidence of overvoltage surges on transmission lines.

167. All ac power systems operate with solid earthing nowadays.

168. Arcing ground is also called the earth fault.

169. The arc-suppression coil method of neutral grounding is normally confined to medium voltage overhead transmission lines which are supplied through transformers.

170. Neutral grounding resistors are normally designed to carry their rated current for a short period (usually 30 s).

171. When there are more than two or three generators or power transformer banks at one station, it is usually desirable to use only one resistor for neutral earthing.

172. With solid-grounded system 3 overload and 1 earth-leakage scheme is preferred over 2 overload and 1 earth-leakage scheme for protection of a feeder.

173. For effective application of counter poise it can be buried into the ground to any depth but the depth should be enough to avoid theft.

174. The induction regulator is essentially a step-up transformer.

175. Quadrature booster injects the voltage lagging the system voltage by 90°.

176. The addition of synchronous compensator in a transmission system causes the decrease in fault current.

177. The addition of SVS in a power system has no effect on fault current.

178. Bulk supply and industrial substations are installed separately for individual consumer.

179. Higher excitation voltage reduces the stability of the system.

180. Shunt compensation of lines is resorted to improve stability of the system. **[A.M.I.E. Sec B. Winter 1993]**

181. From stability point of view it is desirable to ground the neutral of the generator through a reactor and that of the motor through a resistor. **[A.M.I.E. Sec B. Winter 1993]**

182. Series compensation of lines normally should not exceed 60%. **[A.M.I.E. Sec B. Winter 1994]**

183. For better transient stability it is desirable to have machines with larger SCR. **[A.M.I.E. Sec B. Winter 1994]**

184. In comparison to synchronous condensers shunt capacitors have more losses.

185. Initial cost of synchronous condensers in comparison to shunt capacitor is less.

186. Transient stability limit is larger than steady state stability limit. **[Bharathiyar Univ. April 1997]**

187. A power system remains stable as long as a $\frac{\partial P_e}{\partial \delta}$ is less than zero.

$$P_e = \frac{E_1 E_2}{X} \sin \delta$$

[A.M.I.E. Sec B. Advanced Power Systems Summer 1999]

188. The swing equation gives the variation of torque angle δ w.r.t. time t.

189. The higher the operating time of the circuit breaker, the smaller will be the critical clearing angle.

190. In a dynamically stable system, oscillations of synchrounous machines after load changes will increase with time.

191. The synchronising coefficient between two areas of a 2-area power system is $\frac{\partial P}{\partial \delta}$.

192. By decreasing excitation of an alternator, its steady-state limit can be improved.

193. The critical clearing time is related to its transient stability limit.

194. An alternator with induced emf E_g supplies a motor with back emf E_b.

195. The equivalent circuit series reactance is X. The maximum power transferred will be $P_{max} = \frac{E_g E_b}{X}$.

196. The higher the initial load, the lower the critical clearing angle.

197. Maximum power has optimistic value when resistance is neglected.

198. Slack control bus is specified by real power and voltage magnitude.

199. The bus admittance matrix (Y_{bus}) of a power system is a null matrix.

200. In load-flow analysis, the load connected to a bus is represented as constant real and reactive power drawn from the bus.

Answers: **152.** (T), **153.** (T), **154.** (T), **155.** (F), **156.** (F), **157.** (F), **158.** (T), **159.** (T), **160.** (T), **161.** (T), **162.** (F), **163.** (T), **164.** (F), **165.** (F), **166.** (T), **167.** (F), **168.** (T), **169.** (T), **170.** (T), **171.** (T), **172.** (F), **173.** (T), **174.** (F), **175.** (F), **176.** (F), **177.** (T), **178.** (T), **179.** (F), **180.** (F), **181.** (F), **182.** (F), **183.** (T), **184.** (F), **185.** (F), **186.** (F), **187.** (F), **188.** (T), **189.** (F), **190.** (F), **191.** (T), **192.** (F), **193.** (T), **194.** (T), **195.** (T), **196.** (F), **197.** (T), **198.** (F), **199.** (F), **200.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. The frequency of occurrence of three-phase fault is _____ than that of line-to-line fault. [A.M.I.E. Sec B. Summer 1994]
2. In power system maximum numbers of fault involve _____. [A.M.I.E. Sec B. Winter 1995]
3. A 3-phase dead short circuit is _____ severe than a line-to-ground short circuit. [A.M.I.E. Sec B. Summer 1994]
4. The first peak short-circuit current is _____ times the rms value of the periodic component of short-circuit current 2-3 periods after the short-circuit is initiated. [A.M.I.E. Sec B. Winter 1993]
5. For a fault at generator, the fault current is maximum for _____ fault. [Bharathidasan Univ. Nov. 1996]
6. The synchronous reactance of a 200 MVA, 10 kV, 3-phase, 50 Hz generator is 1.0 pu at its own base. Its pu reactance at 100 MVA, 20 kV base will be _____. [GATE E.E. 1997]
7. The percentage impedance of a 100 kVA, 11 kV/400 V, delta/wye, 50 Hz transformer is 4.5%. For the circulation of half the full-load current during short-circuit test, with low voltage terminals shorted, the applied voltage on the high voltage side will be _____. [GATE E.E. 1995]
8. For limiting the short circuits we use _____. (resistors/reactors/capacitors)
9. Oil immersed type reactors are used for voltages _____ kV.
10. Zero-sequence component in 3-phase voltage of delta is _____.
11. In the case of balanced three-phase currents, the zero-sequence component of current is _____. (minimum/maximum)
12. Zero-sequence fault currents are absent when the fault is _____.
13. The negative- and zero-sequence networks contain no _____ but include the impedance of generators to negative and zero-sequence currents respectively. [A.M.I.E. Sec B. Winter 1995]
14. The zero-sequence impedance of high voltage OH transmission lines is about _____ times as large as positive-sequence impedance. [A.M.I.E. Sec B. Winter 1995]
15. Zero-phase sequence component consists of three phasors equal in magnitude and with _____ phase displacement from each other. [A.M.I.E. Sec B. Winter 1995]
16. The positive-sequence component of the voltage at the point of fault in a power system is zero for a _____ fault. [GATE E.E. 1995]
17. Negative-sequence currents are present in all types _____ of faults. [A.M.I.E. Sec B. Winter 1994]
18. For simulation of L-G fault the three sequence networks are to be connected in _____. [A.M.I.E. Sec B. Winter 1994]
19. For simulation of line-to-line fault, positive- and negative-sequence networks are to be connected in _____. [A.M.I.E. Sec B. Winter 1993]
20. A fault occurring at the terminals of an unloaded synchronous generator operating at its rated voltage has resulted in the following values of current and voltage.

$I_{a_0} = j\,2.37$ pu $\quad I_{a_1} = -j\,3.05$ pu

$I_{a_2} = j\,0.68$ pu $\quad V_{a_0} = V_{a_1} = V_{a_2} = 0.237$ pu

The fault that has ocurred is _____. [GATE E.E. 1991]

21. When a line-to-ground fault occurs, the current in a faulted phase is 300 A. The zero-sequence current in this case will be _____ amperes.
22. _____ is essentially a small piece of metal inserted in a circuit which melts when a predetermined value of current flows through it. (circuit breaker, fuse) [A.M.I.E. Sec B. Summer 2000]
23. Current rating of a fuse element depends upon the permissible _____ of the contacts of the fuse holder, fuse and upon the deterioration of fuse caused by oxidation.
24. _____ is defined as the minimum value of current at which the fuse element or fuse wire melts.
25. The fusing current depends upon the type of material used, x-sectional area, _____, size and location of the terminals, diameter of wire, type of enclosure used and type of surface.
26. If two stranded fuse wires are twisted together, then fusing current of this wire will be _____ the sum of fusing current of two wires. (equal to, less than) [A.M.I.E. Sec B. Summer 2000]
27. The ratio of minimum fusing current and the current rating of the fuse element is called the _____.
28. The value of fusing factor is always _____ than 1. (more, less) [A.M.I.E. Sec B. Summer 2000]
29. Breaking capacity of a fuse is the rating corresponding to the _____ value of ac component of the maximum prospective current and the system voltage. (average/rms) [A.M.I.E. Sec B. Summer 2000]
30. The maximum value to which the fault current reaches before the fuse melts is called the _____ current.
31. HRC fuses are capable of clearing _____ currents. [A.M.I.E. Sec B. Summer 2000]
32. Operating time of in HRC fuse in the event of a fault is _____ than one cycle. (less, more) [A.M.I.E. Sec B. Winter 1999]
33. The operating time of HRC fuse is _____ cycle. [A.M.I.E. Sec B. Winter 1993]
34. HRC fuses provide best protection against _____.
35. Heat generated in HRC fuses is dissipated mainly through _____. (radiation/conduction/convection)
36. The rating of fuse is expressed in terms of _____. (amperes/volts/VA)
37. The delays fuses are used for the protection of _____. (motors/transformers)
38. Arcing contacts of circuit breakers are normally made of _____.
39. Power factor of an arc is _____.
40. The normal frequency _____ voltage that appears across the circuit breaker poles after final arc extinction has occurred is termed as the recovery voltage. (average, rms) [A.M.I.E. Sec B. Summer 2000]
41. The _____ voltage that appears across the contacts of CB at the instant of arc extinction is called the restriking voltage. (rms, transient) [A.M.I.E. Sec B. Summer 2000]
42. The rate of rise of restriking voltage of a circuit breaker defined by the maximum slope of the voltage curve is called _____ rate of rise of restriking voltage. (average, maximum)
43. If the inductance and capacitance of a power system network up to a circuit breaker location are 1 H and 0.01 μF respectively, the value of the shunt resistor across the circuit breaker, required for critical damping of the restriking voltage is _____. [GATE 1995]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

44. The use of oil in a circuit breaker offers _____ dielectric strength. [A.M.I.E. Sec B. Summer 1993]

45. MOCB stands for _____ circuit breaker. [A.M.I.E. Sec B. Winter 1993]

46. Minimum oil type circuit breakers use oil for _____ purpose. [A.M.I.E. Sec B. Summer 1996]

47. _____ air circuit breakers are designed for use on dc circuits and low voltage ac circuits.

48. The speed of operation of air circuit breakers is _____ than that of oil circuit breakers. [A.M.I.E. Sec B. Winter 1999]

49. Air blast circuit breakers and SF_6 circuit breakers are preferred for _____ voltage applications.

50. For long EHV/UHV transmission lines we use _____ circuit breaker. [A.M.I.E. Sec B. Summer 1995]

51. Resistance switching is normally restored in case of _____ circuit breakers. [A.M.I.E. Sec B. Summer 1994]

52. SF_6 provides better arc quenching because of its _____ property. [A.M.I.E. Sec B. Winter 1993]

53. The order of vacuum in vacuum circuit breakers is _____. [A.M.I.E. Sec B. Winter 1993]

54. The rupturing capacity of a circuit breaker is expressed in _____. [A.M.I.E. Sec B. Winter 1999]

55. Short-circuit tests are conducted on circuit breakers to prove their _____.

56. A 3-phase circuit breaker is rated at 200 MVA, 33 kV, its making current will be _____ kamp. [A.M.I.E. Sec B. Summer 1994]

57. An oil circuit _____ consists essentially of an oil switch or breaker actuated by relays which make it to open when predetermined current flows through it.

58. The contact resistance of a circuit breaker is about _____ Ω. (20, 2, 20 m, 20 μ)

59. Sparking occurs on switching off the load due to circuit high _____. (resistance/inductance/capacitance)

60. For modern EHV circuit breakers the operating time between the instant of receiving trip signal and final contact separation is a about _____ second. (0.001/0.003/0.03/0.1)

61. The transient voltage that appears across the contacts at the instant of arc extinction is known as _____ voltage.

62. The normal frequency rms voltage that appears across the circuit breaker pole after final arc extinction has occurred is called the _____ voltage.

63. The recovery voltage will be maximum for power factor of _____. (0, 0.5, 0.707, 1.0)

64. In a circuit breaker the current that exists at the instant of contact separation is called the _____ current.

65. A fault is more severe from the view point of RRRV if it is a _____ line fault. (short/medium/long)

66. The maximum value of restriking voltage in a circuit breaker in term of system voltage will always be _____ times the normal peak. (1.5, 2, 2.5, 3)

67. Magnetic circuit breaker has _____ trip action.

68. Thermal circuit breaker has _____ trip action.

69. Resistance switching is normally employed in _____ circuit breakers. (all, bulk oil, minimum oil, air-blast)

70. Plain break oil CB can be used for voltage up to _____ kV.

71. Bulk-oil CB can be used for voltage up to _____ kV. (0.4, 1.1, 11, 33, 66)

72. MOCBs use oil for _____ only.

73. LVCBs are used for voltage up to _____ volts. (200/400/600/1100)

74. The medium used for arc extinction in air circuit breaker is _____. (air/compressed air/SF_6)

75. An ABCB is usually used for _____ duty. (short/repeated/intermittent)

76. The pressure of air used in ABCB is around _____ kg/cm^2. (1, 10, 20–30, 100–200)

77. The pressure of SF_6 gas in a circuit breaker is around _____ kg/cm^2. (0.25. 1, 4, 20)

78. In a vacuum circuit breaker, the vacuum is of the order of _____ torr. ($1, 10^{-3}, 10^{-6}, 10^{-12}$)

79. Insulation resistance of hv CBs is more than _____ MΩ. (1, 10, 200/2000)

80. The making current of a CB is normally specified in terms of _____ value. (average/effective/peak)

81. Making capacity of a CB is equal to _____ times symmetrical breaking current. ($1.5, \sqrt{2}, 2.55, \sqrt{3}$)

82. Magnetic blow-out coils are generally used in _____ circuit breaker. (oil, vacuum, air-break)

83. A circuit breaker, under normal conditions should be inspected once in _____ months.

84. For testing hv ac circuit breakers the rated short-circuit current is passed for _____ seconds. (2, 3, 5, 15)

85. For testing a hv circuit breaker for endurance, it is tested for at least _____ opening-closing operations. (20/200/1,000/5,000)

86. Autorecloser improves _____ stability. [A.M.I.E. Sec B. Summer 1994]

87. Isolators are never used for _____ short circuit current. [A.M.I.E. Sec B. Summer 1994]

88. A _____ isolator has three identical poles, which operate simultaneously.

89. Isolators used in transmission lines are capable of breaking _____ current. (lead/fault/nil/charging)

90. The protective relay performs the function of _____. [A.M.I.E. Sec B. Summer 1996]

91. Relay contacts are normally made up of _____. [A.M.I.E. Sec B. Summer 1996]

92. The operating force is a force which tends to _____ the contacts of the relay. (open, close) [A.M.I.E. Sec B. Summer 2000]

93. A relay is said to over reach when it operates at a current which is _____ than its setting. (lower, higher) [A.M.I.E. Sec B. Summer 2000]

94. The pick-up current of a relay is usually _____ than the drop-out value. (larger, smaller) [A.M.I.E. Sec B. Winter 1993]

95. In definite-time relays, the operating time is _____ of the operating current magnitude. [A.M.I.E. Sec B. Winter 1999]

96. The unit of burden of a current transformer is _____. (amperes, volt-amperes) [A.M.I.E. Sec B. Winter 1999]

97. 1 VA relay is _____ sensitive than 3 VA relay. [A.M.I.E. Sec B. Summer 1996]

98. _____ protection system can be employed for protection of any equipment or line against the current more than predetermined one.

99. The overcurrent relay operating coil is supplied through _____. [A.M.I.E. Sec B. Summer 1996]

100. In _____ relays the time of operation is approximately inversely proportional to the magnitude of the current or other quantity causing operation.

101. By placing a fuse in parallel with an instantaneous of definite time lag relay it can be made as _____ relay.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

102. _____ resistor is placed across relay contacts in order to avoid arc jumping across them causing their pitting and burning.

103. The shape of the disc of an induction disc relay is _____. (circular/spiral/elliptical)

104. The ratio of reset to pick-up current for an induction cup relay is approximately _____. (0.7/0.99/1.02/1.25)

105. Thermal relays are commonly used in _____.

106. Buchholz relay is connected between _____ and _____. [A.M.I.E. Sec B. Winter 1993]

107. Buchholz relay is used for the protection of _____. [A.M.I.E. Sec B. Summer 1984]

108. Buchholz relay is used is transformer for _____ fault. (external, internal) [A.M.I.E. Sec B. Summer 2000]

109. The ratio of pick-up current to set current of an IDMT induction disc relay is approximately _____. [A.M.I.E. Sec B. Winter 1996]

110. Plug setting multiplier is defined as the ratio of _____ current referred to CT secondary to the relay setting current. (full load, fault) [A.M.I.E. Sec B. Winter 1999]

111. The setting of an earth fault relay will be usually _____ than that of phase fault relay. (lower, higher) [A.M.I.E. Sec B. Winter 1999]

112. The relay with inverse time characteristic will operate within _____ seconds. (5 – 10, 10 – 25, exceeding 25)

113. In case of electromagnetic relay, coil is normally designed for _____ and _____ amperes.

114. If the time of operation of a relay for unity TMS is 10 seconds, the time of operation for 0.4 TMS will be _____ seconds.

115. An over current relay, having a current setting of 125% is connected to a supply circuit through a CT of ratio 400/5. The pick-up value is _____ A. (5/6.25/10/12.5/15)

116. Undervoltage relays are mostly used for _____ protection.

117. Earth fault relays have _____ current setting than over-current relays. [A.M.I.E. Sec B. Summer 1996]

118. If the time of operation for a relay with TMS = 1 and PSM 0.5 is 10 seconds, the time of operation for the same current with TMS = 0.5 and PSM = 1 will be _____ seconds. [A.M.I.E. Sec B. Winter 1996]

119. A protective system responding to the ratio of voltage and current is called the _____ protection.

120. The performance of distance relays is governed by _____. (current, ratio of voltage and current) [A.M.I.E. Sec B. Summer 2000]

121. Threshold characteristic of a plain impedance relay in a complex Z-plane is _____. [A.M.I.E. Sec B. Summer 1996]

122. The tendency of an impedance relay to operate at impedances _____ than its setting value is known as over reach. (larger, smaller) [A.M.I.E. Sec B. Winter 1999]

123. Reactance relay has a _____ characteristic on R-X plane. [A.M.I.E. Sec B. Summer 1996]

124. The distance relay with inherent directional property is known as _____ relay. [GATE 1995]

125. Mho relay is normally used for the protection of _____ lines. [A.M.I.E. Sec B. Winter 1994]

126. The admittance (mho) relay is inherently _____. [A.M.I.E. Sec B. Summer 1996]

127. The impedance relaying scheme is used for the protection of _____.

128. In the R-X plane the characteristics of an impedance relay is represented by a _____.

129. Reactance relays are employed for phase fault in _____ lines. (short/medium/long)

130. For phase fault _____ relay is used.

131. _____ relay is best suited for phase fault relaying for medium transmission lines.

132. _____ relay is used for the protection of EHV/UHV transmission lines.

133. A relay used for protection of motors against overload is _____ relay.

134. In a three-phase system, the minimum number of relays used to detect phase-to-phase fault is _____. (1/2/3/6)

135. The protection from negative-sequence currents is provided for _____. (motors/generators/transformers)

136. A relay which has no moving part and performs measurement with solid state circuit is called the _____ relay.

137. A static coincidence circuit is used for _____ comparison. (phase/amplitude)

138. A protective system responding to vector difference of two electrical quantities is called the _____ protection.

139. Relay used in differential protection should operate only for _____ faults. (external, internal) [A.M.I.E. Sec B. Summer 2000]

140. The differential protection trips the faulty feeder quickly _____ the necessity of time grading. (without, with) [A.M.I.E. Sec B. Summer 2000]

141. Translay scheme is used for the protection of _____. [A.M.I.E. Sec B. Summer 1994]

142. _____ relays do not use moving parts or elements. (electromagnetic, static) [A.M.I.E. Sec B. Summer 2000]

143. An underexcited alternator operates at _____ power factor. [A.M.I.E. Sec B. Winter 1994]

144. Merz-Price differential relay is used for _____ protection. [A.M.I.E. Sec B. Summer 1996]

145. Differential protection scheme is used for alternators of capacity more than _____ MVA. (1/2/5/25/500)

146. The most common type of protection used for stator winding faults in case of alternators is _____ protection.

147. The percentage bias for a generator protection lies between _____ to _____ percent. [A.M.I.E. Sec B. Winter 1996]

148. Prime mover failure of an alternator connected to a grid can be detected using _____ relay. (differential/reverse power) [A.M.I.E. Sec B. Winter 1999]

149. Field failure of an alternator connected to grid will result is the machine running as _____. (motor, induction generator) [A.M.I.E. Sec B. Winter 1999]

150. During loss of field excitation, the equivalent impedance of the generator drops, and this can be detected by a _____ relay.

151. In a motor starter, thermal relay provides _____ protection as well as single phasing protection.

152. Supply of an unbalanced voltage to a 3-phase, delta connected induction motor can be detected using _____ relay. (negative-sequence, zero-sequence) [A.M.I.E. Sec B. Winter 1999]

153. The overload protection is so designed that it closely matches the _____ curve of majority of motors.

154. Operation of an induction motor on undervoltage will cause _____ current.

155. Heating effect on the rotor windings due to negative sequence components is proportional to _____ times ac resistance value where s is the slip.

156. Heating effect on the rotor windings due to positive sequence component is proportional to _____ resistance value. (dc/ac)

157. The frequency of the negative sequence currents in the motor during unbalance is _____ where s is the slip and f is the supply frequency.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

158. Phase fault protection is provided by _____ high set instantaneous relay elements.

159. Core-balance leakage protection is used to provide protection against _____ faults.

160. A Buchholz relay has _____ float switches.

161. The way in which transformers are connected in 3-phase circuits does not affect the _____ impedance in the equivalent circuit. [A.M.I.E. Sec B. Winter 1995]

162. Magnetising inrush current is a transformer is rich in _____ harmonic component. [A.M.I.E. Sec B. Winter 1999]

163. Inter-turn fault in a power transformer can be detected using _____ relay. [differential, Buchholz] [A.M.I.E. Sec B. Winter 1999]

164. Magnetising current of transformer contains even harmonics due to _____ . (saruation, hysteresis) [A.M.I.E. Sec B. Winter 1999]

165. The differential protection scheme of an alternator will have a _____ bias setting than that of transformer. (larger, smaller) [A.M.I.E. Sec B. Winter 1999]

166. To protect a Δ-Y connected power transformer against internal fault, CTs should be connected in _____ . (star-delta delta-star) [A.M.I.E. Sec B. Summer 2000]

167. For differential protection of power transformers (delta-delta), the CTs will have _____ connections.

168. The percentage differential protection of a transformer protects the transformer against _____ fault.

169. The connections of CTs are opposite to that of transformer windings so that current in the plot wires of the two are/have _____ phase. (same/opposite)

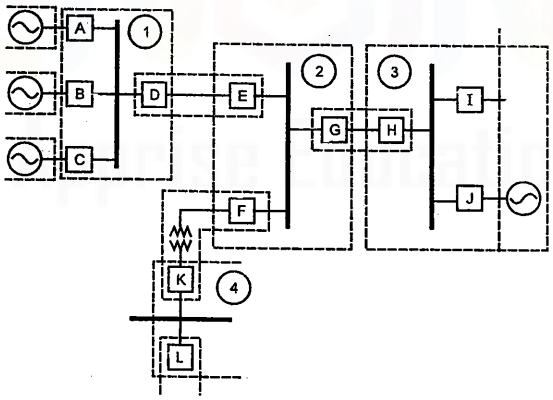
170. Differential protection scheme is employed for power transformers of rating exceeding _____ . [A.M.I.E. Sec B. Winter 1993]

171. Bus-bars are usually made of _____ .

172. The diameter of aluminium pipe for 400 kV bus-bar is _____ mm.

173. All bus-bar protection schemes are designed to respond to _____ only. (overcurrents, ground faults)

174. In a 4 bus system the circuit breakers and the various zones of protection are shown in figure. If the circuit breakers, *E*, *F* and *G* trip, the location of the fault is on _____ .



175. Tuned power lines have the property _____ and are used _____ . Tuning is done by _____ . [A.M.I.E. Sec B. Power Systems Winter 1997]

176. The protection system for transmission lines having no pilot wires are known as _____ type.

177. When an interconnector between substations is used in a ring main system the relays used on the interconnector must of the _____ type. (directional, non-directional)

178. Translay protection scheme used for protection of feeders is an example of _____ balance differential protection. (voltage, current)

179. Distance relays are adjusted on the basis of the _____ phase sequence impedance between the relay location and the fault location. (negative, positive)

180. _____ protection used for protection of transmission lines is a unit type protection.

181. For 3-phase feeder protection in a distribution network the number of earth fault relays required is _____ . (1/2/3/more)

182. The number of pilot wires required for protecting 3-phase transmission lines using Translay system of protection is _____ .

183. Summation transformers are used in _____ relays.

184. Carrier current protection scheme is normally used for protection of _____ transmission lines only.

185. The frequency of carrier in the carrier-current pilot scheme is in the range _____ Hz to _____ Hz. [A.M.I.E. Sec B. Summer 1996]

186. The line trap in the case of carrier current pilot scheme consists of _____ . [A.M.I.E. Sec B. Summer 1996]

187. The frequency of carrier transmitted by microwave pilot is in the range of _____ Hz to _____ Hz. [A.M.I.E. Sec B. Summer 1996]

188. Line traps used in carrier protection schemes are parallel resonant circuits tuned to _____ frequency. (carrier, power) [A.M.I.E. Sec B. Winter 1999]

189. Coupling capacitors used in carrier current protection give very _____ impedance to 50 Hz power currents. (low, high) [A.M.I.E. Sec B. Summer 2000]

190. Line traps in carrier current protection are _____ resonant circuit. (series, parallel) [A.M.I.E. Sec B. Summer 2000]

191. In an OH transmission line, wavetraps are used for the detection of _____ signals. (carrier/fault power)

192. Coupling capacitors used in carrier protection have values usually in the range of _____ to _____ pF.

193. On _____ transmission lines carrier pilot relaying is cheaper and more reliable than pilot-wire relaying. (short, long) [A.M.I.E. Sec B. Summer 2000]

194. Time graded overcurrent protection is used in _____ feeders. (radial/ring-main) [A.M.I.E. Sec B. Winter 1999]

195. In a _____ pilot-wire scheme, if the pilot circuit gets open-circuited, the relay will trip on full load. (circulating current/balanced voltage)

196. In a circulating current pilot-wire scheme, if pilot circuit gets short-circuited the relay will _____ for internal faults. (trip, fail to trip)

197. First zone distance relay protects a transmission line section up to _____ of its full length. (25/50/800/100%)

198. In distance protection of transmission line, the voltage at the relay point _____ with the increase of distance of fault point from the relay. (increases/decreases)

199. Switching overvoltage arising from energising of uncharged line can be reduced by using high voltage shunt _____ .

200. In horn gaps the arc is produced at the bottom during _____ voltage surge.

201. _____ type lightning arresters are employed for the protection of distribution transformers.

202. The _____ resistor in lightning arrester offers low resistance to the flow of discharge currents and high resistance to power frequency voltage.

203. The impulse ratio of rod gap is around _____ . [A.M.I.E. Sec B. Winter 1996]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

204. Lightning conductor is used for the protection of _____.
[A.M.I.E. Sec B. Winter 1993]

205. The insulation requirement of lightning arrester is ___ ___ than that of a power transformer. [A.M.I.E. Sec B. Winter 1993]

206. The lightning discharge current is of the order of _____.
(10 kA, 10 mA)

207. The gap length of rod type surge diverter used for 132 kV line should be _____.
(65 cm, 125 cm)

208. Most of the damaged caused due to lightning discharge depends on _____ of discharge.
(magnitude, duration)

209. A lightning stroke is actually _____ flash(es).

210. A lighting stroke rises to its maximum _____ but decays _____.

211. Flash-over voltage of the gap should be as _____ as possible.
(low, high)

212. Transmission lines can be protected against direct lightning strokes by providing _____. (auxiliary discharge path, drainage facility)

213. The coupling factors of earth wire should be _ _____. (low, high)

214. The main purpose of providing a lightning arrester in a substation is to protect _____.
(transformers, circuit breakers)

215. Lighting stroke attains its maximum in _____.

216. The order of energy in a lightning stroke is of _____ units.
[A.M.I.E. Sec B. Winter 1993]

217. In a lightning arrestor, flash-over occurs _____ times the arrestor rating.

218. The velocity of propagation of electromagnetic waves is _____ on overhead lines and on cables it depends on _____.

219. Time taken for surge to travel a 1,200 km long overhead transmission line is _____.

220. Ground wire causes _____ in the capacitance between conductor and earth.
(decrease, increase)

221. Capacitance of line and equipment _____ the wavefront of the surge.
(decreases, increases)

222. BIL is expressed as the impulse crest voltage of a standard wave not larger than _____ μs wave.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

223. For a 220 kV line, the impulse withstand kV crest voltage and one minute power frequency test voltage kV_{rms} are respectively _____.
(900, 395/1550, 660)

224. For a 400 kV transmission line the switching overvoltage crest is _____.
(825, 1155)

225. A suitable value of shielding angle for EHV transmission lines is _____.
(20^o, 45^o)

226. A suitable value of shielding angle for high voltage lines is _____.
(30^o, 20^o)

227. If a wave is represented by a step wave the analytical results are _____ __.
(optimistic, pessimistic)

228. In a cable with the insulation permittivity 4, the velocity of propagation of electromagnetic waves is _____ $\times 10^{-8}$ m/p.
(1.5, 6)

229. A voltage wave + 200/1/50 means a positive wave having a crest of _____ front of _____ ms and tail of _____ ms.

230. For an open-circuited line, the resulting current will be _____.

231. For a short-circuited line, the resulting voltage will be _____.

232. Steepness of the travelling waves is attenuated by line _____.
(resistance/inductance/capacitance)

233. For an open-circuited transmission line, the reflection coefficient is _____.

234. The real part of propagation constant of a transmission line is _____ constant.
(attenuation/phase)

235. Two transmission lines each having an impedance of 200 Ω is separated by a cable like, for zero reflection, the impedance of the the cable should be _____ Ω.
(100/200/400/600)

236. The earth wire should not be of size smaller than _____ SWG copper.
(4/6/8/10)

237. A system is said to be effectively grounded if $\frac{X_0}{X_1}$ is _____ and $\frac{R_0}{X_1}$ is ___ ___.

238. The arcing ground phenomenon is commonly experienced with _____ neutral systems.

239. Peterson coil has _____ reactance.

240. Grounding by Peterson coil _____ arcing ground.
[A.M.I.E. Sec B. Summer 1994]

241. Peterson coil is used for _____ grounding.
[A.M.I.E. Sec B. Summer 1994]

242. Tower footing resistance should be _____ (low, high)

243. The footing resistance of a tower depends on _____.
(soil conditions, material of tower)

244. Top most wire of a transmission line is _____ wire.
(ground, neutral)

245. Grounding is done generally at _____ end. (supply/load)

246. Solid earthing is done for voltage below _____ kV.
(11/33/66/0.4)

247. Grounding transformer in a system is usually connected in _____.
(delta-delta/star-delta/delta-star/star-star)

248. Arcing on transmission lines is prevented by connecting a/an _____ in the neutral. (resistor/inductor/capacitor)

249. During arcing ground conditions, the phase voltage of the system rises to _____ times its normal value. ($\sqrt{3}$, 5 – 6, 15, 20)

250. Electromechanical voltage regulators are used in _____.

251. The voltage regulator having dead zero effect is _____.

252. The electromechanical type of voltage regulators are of _____ type.

253. The magnetic amplifier type voltage regulators affect the VR by varying the _____.
(resistance/reactance)

254. In tap changing transformers, the tappings are provide on _____ winding.
(hv/lv/tertiary)

255. For effective use of a counterpoise wire, its leakage resistance should be _____ than surge impedance.
(less, more)

256. In an isolated neutral system, on occurrence of single line-to-ground fault, the persistency of the arc due to the flow of capacitive current give rise to a condition called the _____.

257. To restrict the value of circulating third-harmonic current flow in a generator _____ are used in the neutral grounding connections of generators, from which the harmonics emanate.

258. The long and high voltage lines arching earths are caused if the power system neutral is kept _____.
[A.M.I.E. Sec B. Advanced Power Systems Winter 1999]

259. Booster transformers are required for _____.
[A.M.I.E. Sec B. Power Systems Winter 1997]

260. Induction regulators are used for voltage control in _____ system.
(transmission/distribution)

261. The isolators used on both sides of a breaker are for _____
(isolating the breaker, backup protection of the breaker)
[A.M.I.E. Sec B. Winter 1999]

262. Shunt compensation in an EHV line is used to _____.

263. Step-up substations are associated with _____ substations.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

264. For cost and safety the outdoor substations are employed for voltages _____.

265. Shunt capacitors in a substations _____ lagging VARs. (delivers/consumes)

266. A device used for connecting a conductor to the earth is known as _____ switch. (earthing/limiting/isolator)

267. Earthting switch is usually installed on _____.

268. The angular displacement between two interconnected power stations is mainly due to _____ of the interconnector. (resistance/reactance)

269. The transfer of power between two stations is maximum when the phase displacement between the voltages of the two stations is _____. (0°/90°/120°/180°)

270. The steady-state stability of the power system can be increased by connecting lines in _____. (series/parallel)

271. The inertia of two groups of machines, which swing together are M_1 and M_2. The inertia constant of the system is _____.

272. The inertia constant H of a machine of 200 MVA is 2 pu, its value corresponding to 400 MVA is _____. [A.M.I.E. Sec B. Summer 1994]

273. The transient stability of a transmission systems may be better improved by using fast acting _____. (circuit breaker, voltage regulator) [A.M.I.E. Sec B. Winter 1996]

274. Automatic fast acting voltage regulators for synchronous generators _____ the dynamic stability of such machines. [A.M.I.E. Sec B. Advanced Power Systems Winter 1995]

275. The relative velocity between the rotor axis and the stator magnetic axis for transient stability is _____. [A.M.I.E. Sec B. Advanced Power Systems Winter 1994]

276. As compared to the stability of a cylindrical rotor alternator, the stability of a salient pole alternator is _____.

277. For stable operation of an interconnected system, the passive element used as an interconnecting element is _____. (reactor, capacitor)

278. Maximum power condition of $X = \sqrt{3}\,R$ for an under ground system is obtained by inserting _____. (series reactors, shunt capacitors)

279. The addition of a synchronous compensator in the power system network _____ the stability of the system. (improves, reduces)

280. Series compensation _____ stability limit. (increases, decreases)

281. A series compensated transmission line has better _____ stability. (transient, steady-state)

282. Slack bus is a _____ bus. (load/feeder/generator)

283. In load flow studies of a power system, the quantities specified at a voltage controlled bus are _____. [GATE E.E. 1994]

284. In load-flow analysis, a voltage controlled bus is treated as a load bus in subsequent iteration when its _____ limit is violated. [GATE E.E. 1995]

285. The diagonal elements of a nodal admittance matrix are strengthened by adding _____. (shunt inductances, shunt capacitor)

286. For accurate load-flow calculations on large power systems _____ method is the best one. (GS/NR/decoupled)

287. For fast load-flow calculations, the best method is _____ method. (GS/NR/decoupled)

288. An acceleration factor is used in _____ method of load-flow studies. (GS/NR/decoupled)

CHAPTER 11

Electrical Energy Utilisation and Electric Traction

Short Answer Type Questions With Answers

1. ELECTRIC DRIVE

Q. 1. What is an electric drive ?

Ans. An electric drive is defined as a form of equipment designed to convert electrical energy into mechanical energy and provide electrical control of this process.

Q. 2. What is group drive ?

Ans. Group drive, also sometimes called the line shaft drive, means a drive in which a single electric motor drives a line shaft by means of which an entire group of working machines may be operated.

Q. 3. What is multi-motor drive ?

Ans. Multi-motor drive consists of several individual drives each of which serves to operate one of many working members or mechanisms in some production unit.

Q. 4. How does active torque differ from passive torque ?

Ans. Active torques are due to either gravitational force or deformation in elastic bodies whereas passive torques are due to friction or due to shear and deformation in inelastic bodies. Active torque continues to act in the same direction even after the direction of drive has been reversed while passive torque always opposes the motion, retarding the rotation of the driven machine.

Q. 5. What is meant by two-quadrant operation of a dc motor ?

Ans. The operation of an electric motor in forward motoring mode and in regenerating (or braking mode) is called the two-quadrant operation of the motor.

Q. 6. Why speed-torque (not torque-speed) characteristic curves are commonly used in utilization studies ?

Ans. In application engineering, it is usually the load torque which is known and the speed at which the motor can drive this load is unknown and is to be determined. Thus the torque is independent variable and speed is dependent variable. Consequently speed-torque characteristic curves with torque as abscissa are commonly used in utilisation studies.

Q. 7. Why is series motor preferred for traction purposes ?

Ans. Because dc series motor develops large starting torque and slows down with the increase in load and so gets automatically relieved from heavy excessive load.

Q. 8. Why the dc motors are mostly gear motors ?

Ans. Because the low-speed motors are much more expensive than high-speed motors of the same kW output rating.

2. ELECTRIC HEATING

Q. 9. What are the different modes of heat transfer ?

Ans. There are three modes of heat transfer namely conduction, convection and radiation.

Q. 10. What is an oven ?

Ans. Low temperature heating chamber with provision for ventilation is termed as oven.

Q. 11. What properties are considered for selecting material for heating element ?

Ans. The properties to be considered in selection of material for heating elements are resistivity, melting point, temperature coefficient of resistance, and freedom from oxidation.

Q. 12. Name few materials, that are widely used as heating element materials.

Ans. The materials widely used as materials for heating elements are nickel-chromium (Nichrome) alloy, Ni-Cr-Fe alloy, nickel-copper alloy (Eureka or constantan), iron-chromium-aluminium alloy (Kanthal) and alloys containing iron, chromium, cobalt and aluminium.

Q. 13. What are the causes of failure of heating elements ?

Ans. The chief causes of failure of heating elements are formation of hot spots, oxidation and intermittency of operation, embrittlement due to grain growth, contamination and corosion.

Q. 14. Name few applications of infrared heating.

Ans. Infrared heating finds applications in (*i*) paint stoving (*ii*) drying of radio-cabinets and wood furniture (*iii*) preheating of plastics prior to moulding (*iv*) softening of thermoplastic sheets, (*v*) drying of pottery, paper, textiles etc. where moisture content is not large.

Q. 15. Name the types of electrodes used in arc furnaces.

Ans. The electrodes used in arc furnaces are of three types namely carbon, graphite and self-baking electrodes.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 16. How is power input to submerged arc furnace controlled ?

Ans. The power input to submerged arc furnace is controlled by varying distance between electrodes or by varying the voltage applied to the electrodes.

Q. 17. How is control of power affected in electric arc furnaces ?

Ans. The power input to arc furnaces can be controlled by raising or lowering the electrodes or by varying the voltage applied to the arc furnace (by changing of tapping on supply transformer); preferably both voltage and electrode controls.

Q. 18. At what power factor would you like to operate the electric arc furnace ?

Ans. At power factor of about 0.9, but not below 0.8 in any case.

Q. 19. What type of supply is used for direct core type induction furnace in our country ?

Ans. Single-phase, 50 Hz, 600 V supply is used for direct core type induction furnaces.

Q. 20. How amount of heating is controlled in high frequency eddy current heating ?

Ans. The amount of heating is controlled by controlling the supply frequency and the flux density in high frequency eddy current heating.

Q. 21. What are the applications of high frequency eddy current heating ?

Ans. The applications of high frequency eddy current heating are surface hardening, annealing, soldering, welding, drying of paints, melting of precious metals, sterlization of surgical instruments and forging of bolt-heads and rivet heads.

Q. 22. How can the rate of dielectric heating be varied ?

Ans. Rate of dielectric heating can be varied by varying either supply voltage or supply frequency.

Q. 23. Why dielectric heating is employed only where other methods are impracticable or too slow ?

Ans. Because of very high cost of equipment required for dielectric heating.

3. ELECTRIC WELDING

Q. 24. What is welding ?

Ans. Welding is a materials-joining process that produces coalescence of materials by heating them to the welding temperature, with or without application of pressure or by the application of pressure alone, and with or without the use of filler metal.

Q. 25. "All metals can be joined by one welding process or another". Comment on this statement.

Ans. The above statement needs slight modification and may be stated as follows.

All metals commercially employed for structural or strength parts are weldable. In general, metal that have a low melting point or low strength would not be welded.

Q. 26. What is the difference between plastic welding and fusion welding ? [Gorakhpur Univ. 1983]

Ans. In the plastic welding, also called the pressure welding, the pieces of metal to be joined are heated to a plastic state and then forced together by external pressure whereas in fusion welding, also called the non-pressure welding, the material at the joint is heated to a molten state and allowed to solidify. Former one includes forge welding, resistance welding, thermit welding and gas welding while the latter includes gas welding, arc welding and thermit welding without pressure.

Q. 27. What is resistance welding ?

Ans. Resistance welding is a group of welding processes that produce coalescence of the faying surfaces with the heat obtained from resistance of the work to the flow of welding current in a circuit of which the work is a part and by the application of pressure.

Q. 28. What is the fundamental difference between electric arc welding and resistance welding ? [Gorakhpur Univ. Sept. 1983]

Ans. The resistance welding processes differ from arc welding in that pressure is used but filler metal or fluxes are not.

Q. 29. Why alternating current is found most suitable for resistance welding ? [Gorakhpur Univ. 1980]

Ans. Alternating current is found most suitable for resistance welding as it can provide any desired combination of current and voltage by means of a transformer.

Q. 30. What is main drawback of electron beam process ?

Ans. The main drawback of electron beam process is its high capital cost. The price of the equipment required is very high, and it is expensive to operate, due to the requirement of vacuum pumps. In addition, fitup must be precise and locating the parts w.r.t. the beam must be perfect.

Q. 31. The location of the focal point of the beam w.r.t. the surface of the work piece is very important in laser beam welding. Why ?

Ans. Maximum penetration occurs when the beam is focused slightly below the surface. Penetration is less when the beam is focused on the surface or deep within the surface.

Q. 32. What is meant by welding electrode ?

Ans. An electrode is a piece of wire or rod (of a metal or alloy), with or without flux covering, which carries current for welding.

Q. 33. What type of dc generator is used in electric-arc welding ?

Ans. Differential compound wound dc generator.

4. ILLUMINATION

Q. 34. What are the advantages of artificial lighting produced electrically ?

Ans. Artificial lighting produced electrically have the advantages of cleanliness, ease of control, reliability, steady output as well as low cost.

Q. 35. What is Angstrom unit (AU) ?

Ans. Angstrom unit (AU) is unit of wavelength of light and equals to 10^{-10} m.

Q. 36. What is difference between illumination and light ?

Ans. Light is the cause and illumination is the result of that light on surface on which it falls.

Q. 37. What is relation between candela (cd) and lumens per steradian ?

Ans. Candela (cd) and lumens per steradian, both, are units of luminous intensity. 1 Candela = 1 lumen per steradian.

Q. 38. What is relation between lux and lumens/m^2 ?

Ans. Lux and lumens/m^2, both, are units of illumination.

$$1 \text{ lux} = 1 \text{ lumen/m}^2$$

Q. 39. Differentiate between lamp efficiency and specific consumption.

Ans. Lamp efficiency is the ratio of the luminous flux in lumens to the power input in watts while the specific consumption is the ratio of the power input in watts to the average candle power in candela.

Q. 40. What is difference between maintenance factor and depreciation factor ?

Ans. Maintenance factor is defined as the ratio of illumination under normal working conditions to the illumination when everything is perfectly clean. Depreciation factor is merely inverse of the maintenance factor.

Q. 41. What are the two laws of illumination ?

Ans. (*i*) Law of inverse squares (*ii*) Lambert's cosine law.

Q. 42. Why none of the practical type of lamp provides uniformly distributed light in all directions ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Because of unsymmetrical shape of the practical types of lamps.

Q. 43. Why the glass globe of a filament lamp is completely evacuated ?

Ans. The glass globe of a filament of incandescent lamp is completely evacuated to prevent the oxidization and convection currents of the filament and also to prevent the temperature being lowered by radiation.

Q. 44. Why is tungsten selected as the filament material ?

[Agra Univ. 1983]

Ans. Nowadays tungsten is the most commonly used metal for filament due to its high melting point (3,400°C), high resistivity, low temperature coefficient (0.0051), low vapour pressure, being ductile and mechanical strong to withstand vibration during use.

Q. 45. Why does the efficiency of a filament lamp increase with the increase in operating voltage ?

Ans. The efficiency (lumens/watt) of a lamp increases with the increase in operation voltage owing to increase in temperature and is proportional to the square of the operating voltage.

Q. 46. Why sodium vapour discharge lamps are not used for general lighting ? **[Gorakhpur Univ. 1981]**

Ans. Sodium vapour discharge lamps are not used for general lighting because they have got drawback of colour discrimination.

Q. 47. Why thermal type starter for use in fluorescent tubes have become obsolete nowadays ?

Ans. Because of more complicated construction, greater cost and greater power loss.

Q. 48. What is floodlighting ?

Ans. Floodlighting means flooding of large surfaces with light from powerful projector(s).

Q. 49. How projectors are classified according to the beam spread ?

Ans. Projectors, according to beam spread, are classified as narrow beam angle projectors (beam spread 12-25°); medium beam angle projectors (beam spread 25-40°) and wide beam angle projectors (beam spread 40-90°)

5. ELECTROLYTIC PROCESSES

Q. 50. What is meant by electrochemical equivalent of a substance ?

Ans. Electrochemical equivalent (ECE) of a substance is the amount of substance deposited on passing a steady electric current of 1 A for one second through its solution.

Q. 51. What is relation between chemical equivalent, atomic weight and valency of any substance ?

Ans. Chemical equivalent of any substance may be defined as the ratio of its atomic weight to its valency

i.e., $\text{Chemical equivalent} = \dfrac{\text{Atomic weight}}{\text{Valency}}$.

Q. 52. What is electrodeposition ?

Ans. The process of depositing a coating of one metal over another metal or non-metal electrically is called the electrodeposition.

Q. 53. What for electrodeposition process is used ?

Ans. The electrodeposition process is used for protective, decorative and functional purposes and includes electroplating, electroforming, electrotyping, electrofacing, electrometallisation, electrodeposition of rubber, building-up of wornout parts for repairs etc.

Q. 54. Enumerate the factors on which the quality of electrodeposition depends.

Ans. The factors on which the quality of electrodeposition depends are (*i*) nature of electrolyte (*ii*) current density (*iii*) temperature (*iv*) conductivity and concentration of electrolyte (*v*) additional agents (*vi*) throwing power and (*vii*) polarisation.

Q. 55. What is meant by 'throwing power' and how it can be improved ?

[Gorakhpur Univ. Sept. 1981]

Ans. Throwing power is the ability of electrolyte to produce uniform deposit on an article of irregular shape and is one of the important characteristics of plating or depositing bath.

It can be improved in two ways—firstly, by increasing the distance between the anode and cathode, and secondly, by reducing the voltage drop at the cathode surface.

Q. 56. What is polarisation and how can it be made negligible ?

Ans. Use of current density, in electrodeposition process, beyond a certain limit causes electrolysis of water and hydrogen liberation on the cathode. This hydrogen evolved on the cathode blankets the base metal which reduces the rate of metal deposition. This phenomenon is called polarization.

Polarisation can be reduced by agitating the electrolyte and can be made negligible by reverse current process.

Q. 57. What do you understand by "reverse current process" in electroplating ?

Ans. In reverse current process in electroplating, at regular intervals plating current is reversed for a second or so.

Q. 58. What is electroplating ?

Ans. Electroplating is an art of depositing a superior or more noble metal on an inferior or a base metal by means of electrolysis of an aqueous solution of a suitable electrolyte.

Q. 59. What for electroplating done ?

Ans. Electroplating is done occasionally for ornamentation and decoration purposes. Sometimes, it is done, with a view to repair worn-out parts of a machinery.

Q. 60. Why the article to be electroplated is thoroughly cleaned, polished and degreased before putting it for electro-plating ?

[Gorakhpur Univ. 1980]

Ans. In case the object to be electroplated is not cleaned, polished, and degreased, the deposit formed may not be well adherent to the base metal and is likely to peel off.

Q. 61. What is meant by anodising ?

Ans. Anodizing is a process of anodic oxidation in which a thin uniform passive (tough, thin, uniform and impermeable) film is produced artificially by the passage of electric current.

Q. 62. What type of power supply is required for electrolytic processes ?

Ans. Power supply required for electrolytic processes is dc and at very low voltage ; usually very small in magnitude (between 100 and 200 A at 10 or 12 V).

Q. 63. Why it is preferred to instal large chemical plants near hydroelectric or atomic power plants ?

Ans. Because of huge power requirement and 100 percent load factor, large chemical plants are located near the hydroelectric or atomic power plants. The advantage of a high load factor is greater with such plants than with steam power plants.

6. REFRIGERATION AND AIR CONDITIONING

Q. 64. What is practical unit of refrigeration ? Define it.

Ans. Tonne of refrigeration (TR) is the practical unit of refrigeration and is defined as the amount of refrigeration effect produced by the uniform melting of one tonne (1,000 kg) of ice from and at 0°C in 24 hours.

Q. 65. What are the applications of vapour compression refrigeration cycle ?

Ans. The vapour compression refrigeration cycle is used in most of the modern refrigeration systems in large industrial plants requiring rapid removal of large amount of heat and in most of the domestic refrigerators.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 66. On what principle does thermoelectric refrigeration system operate ?

Ans. Thermoelectric refrigeration system operates on the principle of 'Peltier effect'.

Q. 67. Why is ammonia the only common refrigerant used in the absorption system ?

Ans. Because ammonia is cheap, readily available and has the highest efficiency.

Q. 68. Why thermostat is used in a domestic refrigerator ?

Ans. Thermostat switch is provided in a domestic refrigerator to control the temperature inside a refrigerator.

Q. 69. Define the effective temperature in air conditioning ?

Ans. An arbitrary index which combines into a single value the degree of sensation warmth or coolness felt by a human body due to the effect of air, temperature, humidity and air movement is called the effective temperature.

7. ELECTRIC TRACTION

Q. 70. How is speed controlled in direct IC engine drive ?

Ans. By using a gearbox.

Q. 71. What is the operational efficiency of IC engine electric drive ?

Ans. About 25 percent.

Q. 72. What are the limitations of battery electric drive ?

Ans. The major limitations of the battery electric drive are the small capacity of the batteries and the necessity for frequent charging and limited speed range.

Q. 73. What is the major drawback of electric traction ?

Ans. The greatest drawback of electric traction is that it involves a heavy initial expenditure for the power supply system and, in the case of tramways, for the track rails and electrical return system, in addition to the cost of vehicles, depots etc.

Q. 74. What are the major disadvantages of the tramway ?

Ans. The great disadvantage of tramway is that it needs laying of overhead supply system and track for its use which is costly to maintain and constitutes a source of danger to other road users. The other main drawback of tramway is lack of manoeuvrability in congested areas and noise.

Q. 75. Which of the system (dc or ac) is preferred for suburban services and road transport where stops are frequent and distances of run are small ?

Ans. DC system.

Q. 76. What is the value of voltage used is overhead supply for trains in India ? **[A.M.I.E. Sec B. Winter 1999]**

Ans. 25 kV.

Q. 77. What are the most important requirements of the main line railway service ?

Ans. High maximum (crest) speed and minimum cost of overhead structure.

Q. 78. Which of the system is preferred for main line railway service ?

Ans. Single phase ac system.

Q. 79. What are the most important requirements of suburban line railway service ?

Ans. Rapid acceleration and retardation, no interference to nearby communication lines and operation of motors free from adverse effects of voltage fluctuations.

Q. 80. What is meant by speed-time curve ?

Ans. The curve drawn between speed and time taking speed on the Y-axis and time on the X-axis is known as speed-time curve.

Q. 81. What is meant by schedule speed of a train ? **[Gorakhpur Univ. 1975]**

Ans. The ratio of distance covered between two stops and total time of run including time of stop is known as schedule speed.

Q. 82. What are those factors which affect the average speed of a train ?

Ans. The average speed of a given train when running on a given service (*i.e.* distance between two stops) is affected by the (*i*) acceleration and retardation and (*ii*) crest speed.

Q. 83. What are the factors which affect the schedule speed of a train ?

Ans. The schedule speed of a given train when running on a given service is affected by (*i*) acceleration and retardation (*ii*) maximum or crest speed and (*iii*) time duration of stop.

Q. 84. How does increase in acceleration and braking retardation affect the schedule speed of a train for a given run with fixed crest speed ?

Ans. For a given run and with fixed crest speed the increase in acceleration will result in decrease in actual time of run, and therefore, increase in schedule speed. Similarly increase in braking retardation will affect the schedule speed.

Q. 85. How does increase in crest speed affect the schedule speed for a given run with fixed acceleration and retardation ?

Ans. For a given run with fixed acceleration and retardation the actual time of run will decrease, and therefore, schedule speed will increase with the increase in crest speed.

Q. 86. How does increase in duration of stop affect the schedule speed ?

Ans. For a given average speed, the schedule speed will increase with the decrease in duration of stop.

Q. 87. What is meant by coefficient of adhesion ?

Ans. The coefficient of adhesion is defined as the ratio of tractive effort to slip the wheels and adhesive weight.

Q. 88. How does coefficient of adhesion vary with the increase in speed ?

Ans. The coefficient of adhesion decreases with the increase in speed.

Q. 89. Why the accelerating weight of an electric train is greater than its dead weight ? **[Gorakhpur Univ. 1981]**

Ans. With the linear acceleration of the train, the rotating parts of the train such as wheels and motors also accelerate in an angular direction, and therefore, the tractive effort required is equal to the arithmetic sum of tractive effort required to have the angular acceleration of rotating parts and tractive effort required to have the linear acceleration. Hence the equivalent or accelerating weight of the train is taken higher than the dead weight.

Q. 90. What is meant by the term 'specific energy consumption' ?

Ans. Specific energy consumption is the total energy consumption of the train divided by the product of the weight of the train and distance of run.

Q. 91. What are those factors which affect the specific energy consumption of a train ?

Ans. The specific energy consumption of a train operating at a given schedule speed depends upon (*i*) distance between stops (*ii*) acceleration (*iii*) retardation (*iv*) crest speed (*v*) nature of route and (*vi*) the type of train equipment.

Q. 92. How is specific energy consumption affected by variation in distance between stops ?

Ans. Greater the distance between stops lesser will be the specific energy consumption.

Q. 93. How does the value of acceleration and retardation affect the specific energy consumption for a given run at a given schedule speed ?

Ans. For a given run at a given schedule speed, greater the value of acceleration and retardation more will be the period of coasting and, therefore, lesser the period during which power is on and, therefore specific energy consumption will accordingly be less.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 94. What is meant by the term 'adhesive weight' ?

Ans. The total weight to be carried on the driving wheels is known as adhesive weight.

Q. 95. Why the magnetic circuit of a traction motor is not made of cast iron ?

Ans. Because cast iron cannot withstand continuous vibrations but traction motors operate in extremely severe service conditions.

Q. 96. Why the traction motor must be small in overall dimensions specially in its overall diameter ?

Ans. The traction motor is located underneath a motor coach (except in few electric locomotives) and the space underneath a motor coach is limited by the size of the driving wheels.

Q. 97. Why are the ac single phase series motors not suitable for urban and suburban services ?

Ans. Single phase ac series motors develop low starting torque and poor power factor at start and for urban and suburban services large starting torque is an essential feature to provide high acceleration and frequent starting is involved.

Q. 98. Why ac series motors used for traction services are designed to operate at low frequency *i.e.* $16\frac{2}{3}$ or 25 Hz ?

Ans. Single phase ac series motors have better performance (improved pf, higher efficiency, improved commutation, better starting etc.) if operated on low frequency ($16\frac{2}{3}$ or 25 Hz).

Q. 99. Why ac series motors used in traction services are designed to operate at low voltage (300 to 400 V) ?

Ans. The operating voltage is kept low (300 to 400 V) in order to reduce inductance. Because high voltage motor with proportionately low current would require a large number of turns to produce the required flux.

Q. 100. Why 3-phase induction motors are not used in electric traction ?

Ans. Because of flat speed-torque characteristics, constant speed operation, developing low starting torque, drawing higher current at start, complicated speed control system and complicated overhead feeding system, 3-phase induction motors are not suitable for electric traction.

Q. 101. The resistors employed for control of traction motors are designed for short-time rating. Why ?

Ans. Because control resistors are required only during starting of traction motors.

Q. 102. Under what conditions is field weakening adopted for controlling the speed of a dc series traction motor ?

Ans. The field weakening method of speed control is used for increasing the speed of traction motors when they have attained maximum possible speed by series-parallel control system.

Q. 103. Under what circumstances series-parallel method of speed control of dc series traction motors adopted ?

Ans. The series-parallel method of speed control of dc series motors is adopted when motors employed are two, four, six or more than this even.

Q. 104. What is the main difficulty associated with series-parallel control ?

Ans. The main difficulty associated with series-parallel control is in obtaining a satisfactory method of transition from series to parallel without interrupting the torque or permitting any heavy rush of current.

Q. 105. What are the advantages of thyristor control of traction motors ?

Ans. The advantages of thyristor control of traction motors are accurate control and fast response, elimination of bulky on-load tap changer and electromagnetic devices, saving of energy, notchless control, increase in pulling ability of the motive power, and minimum wear and tear.

Q. 106. Enumerate the methods employed for speed control of 3-phase induction motors used in electric traction.

Ans. The methods employed for speed control of 3-phase induction motors used in electric traction are (*i*) rheostatic control (*ii*) pole-changing control, (*iii*) cascade control (*iv*) combination of cascading and pole-changing control method and (*v*) thyristorised control.

Q. 107. Why ordinary mechanical braking cannot be totally replaced by electrical braking ?

Ans. Because electric braking cannot hold the vehicle stationary.

Q. 108. On what factors does the amount of energy returned to the line depend ?

Ans. The amount of energy returned to the line depends upon (*i*) the initial and final speeds during regenerative braking (*ii*) the train resistance and gradient of the track also in case the train is moving down the gradient and (*iii*) efficiency of the system.

Q. 109. Why is regenerative braking not recommended for tramways and trolley buses ?

Ans. Because it will unnecessarily increase the capital cost as well as enhance the operating problems.

Q. 110. What is meant by mechanical regenerative braking ?

Ans. During coasting a part of the stored energy (kinetic energy) is utilized in propelling the train against frictional and other resistances to motion and, therefore, speed falls. Thus coasting may be considered as a form of mechanical regenerative braking.

Q. 111. Why gear drive is necessary ?

Ans. The size of the motor is reduced with the increase in speed for a given output, so gear drive is necessary to reduce the size of the motor for given output by operating it at higher speed.

Q. 112. Why is master controller usually equipped with 'dead mans handle' ?

Ans. So as to stop the train in case the driver faints or becomes incapacitated.

Q. 113. What is the arrangement of power supply on Kanpur-Tundla section ?

Ans. 132 kV supply is taken at one point from the supply authorities and then it is distributed by the railway authorities.

Q. 114. Name the current collection systems employed for electric locomotives, tramways or trolleys.

Ans. There are mainly two systems of current collection for locomotives, tramways or trolleys viz. (*i*) conductor-rail system and (*ii*) overhead system.

Q. 115. The design of overhead system is more complex as compared to conductor-rail system. Why ?

Ans. Because great difficulty is experienced in ensuring that the current collector and contact wire remain in contact at a fairly even pressure.

Q. 116. Enlist the major equipment that is provided at traction substations.

Ans. The major equipment provided at traction substations are (*i*) traction transformer (*ii*) circuit breakers and (*iii*) interrupters.

Q. 117. What for TPC stands ?

Ans. TPC stands for traction power controller.

Q. 118. Why are insulated overlaps installed ?

Ans. Insulated overlaps are installed mainly to provide isolating facilities required for the operation and maintenance of OHE.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The basic elements of an electric drive are :
(a) electric motor and the transmission system.
(b) electric motor, the transmission and control system.
(c) the transmission and control system.
(d) electric motor and conversion equipment.

2. Electric drive is becoming more and more popular because
(a) it is simple, clean, compact and reliable.
(b) it provides easy and smooth control, flexibility in layout, easy starting and facility for remote control.
(c) it is cheaper in initial as well as in maintenance cost.
(d) all of the above.

3. The main drawback of electric drive is that
(a) it is cumbersome drive.
(b) it is costlier in initial as well as in maintenance cost.
(c) electrical power supply failure makes the drive standstill.
(d) all of the above.

4. An existing workshop is to be changed over from an engine drive to an electric drive. The type of drive likely to be adopted is
(a) individual drive. (b) group drive.
(c) multimotor drive. (d) any of the above.

5. The type of drive used for a paper mill requiring constant speed operation and flexibility of control is
(a) group drive. (b) multimotor drive.
(c) individual or multimotor drive.
(d) individual drive.

6. Introduction of automation in production processes has become possible only because of use of
(a) an electric drive. (b) group drives.
(c) individual and multimotor drives.
(d) individual drive.

7. The selection of an electric motor is governed by
(a) nature of load to be handled.
(b) environmental conditions.
(c) nature of electric supply available. (d) all of the above.

8. DC motors are still preferred for use in
(a) electric excavators, steel mills and cranes.
(b) lathes and machine tools.
(c) flour mills and jaw crushers.
(d) paper industry.

9. The least significant electrical characteristic in selection of electric motor for a flour mill is
(a) starting characteristics. (b) braking.
(c) running characteristics. (d) efficiency.

10. The least significant feature while selecting a motor for centrifugal pump is
(a) speed control. (b) power rating of motor.
(c) operating speed. (d) starting characteristics.

11. A typical active load is
(a) hoist. (b) blower. (c) pump. (d) lathe.
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 1998]

12. An elevator drive is required to operate in
(a) one quadrant only. (b) two quadrants.
(c) three quadrants. (d) four quadrants.
[A.M.I.E. Sec B. Electric Drives & Their Control Winter 1996; Summer 2000]

13. Load torque constant at all speeds is represented by a
(a) fan. (b) compressor.
(c) centrifugal pump load.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1997]

14. An example of a motor having short-time duty is found in
(a) centrifugal pumps. (b) crane drives.
(c) drilling machines. (d) all of the above.
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 2000]

15. The load, for which the motor always starts on load is
(a) fan motor. (b) conveyor motor.
(c) flour mill motor. (d) all of the above.

16. The load cycle for a motor driving a power press will be
(a) continuous. (b) variable.
(c) intermittent and variable.
(d) continuous but periodical.

17. The application(s) that need(s) frequent starting and stopping is/are
(a) paper mills. (b) lifts and hoists.
(c) blowers and fans. (d) grinding mills.

18. An electric motor, in jaw crushers, has to often start against
(a) heavy load. (b) normal load.
(c) medium load. (d) low load.

19. The application(s) in which the load on the motor changes in cyclic order is/are
(a) rolling mills. (b) cranes.
(c) electric shovels. (d) all of the above.

20. The machine having heavy fluctuation of load is
(a) lathe. (b) planer.
(c) punching machine. (d) printing machine.

21. Variable speed operation is preferred in
(a) water pump. (b) ceiling fan.
(c) exhaust fan. (d) refrigerator.

22. The application in which the motor is to start with high acceleration is
(a) lifts and hoists. (b) centrifugal pump.
(c) oil expeller. (d) flour mill.

23. While selecting a motor for air-conditioner the feature of utmost importance is
(a) type of enclosure. (b) type of bearing.
(c) noise.
(d) power transmission arrangement.

24. Belt conveyors offer...starting torque.
(a) high (b) medium
(c) low (d) zero

Answers: **1.** (b), **2.** (d), **3.** (c), **4.** (b), **5.** (c), **6.** (c), **7.** (d), **8.** (a), **9.** (b), **10.** (a), **11.** (a), **12.** (d), **13.** (b), **14.** (b), **15.** (d), **16.** (d), **17.** (b), **18.** (a), **19.** (d), **20.** (c), **21.** (b), **22.** (a), **23.** (c), **24.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

25. The characteristic(s) of drive for crane hoisting and lowering is are
(a) fast speed control. (b) smooth movement.
(c) precise control. (d) all of the above.

26. The capacity of a crane is expressed in terms of
(a) span. (b) tonnes.
(c) type of drive. (d) any of the above.

27. The travelling speed of a crane varies from
(a) 20 to 25 m/s. (b) 10 to 20 m/s.
(c) 1.0 to 2.5 m/s. (d) 0.2 to 1.0 m/s.

28. Light duty cranes are generally used in
(a) power houses. (b) pumping stations.
(c) automobile workshops. (d) all of the above.

29. Heavy duty cranes are employed in
(a) powerhouses and pumping stations.
(b) automobile workshops.
(c) steel plants and ore handling plants.
(d) both (a) and (c).

30. In case of centrifugal pumps the starting torque is usually
(a) less than running torque. (b) same as running torque.
(c) slightly higher than running torque.
(d) double of running torque.

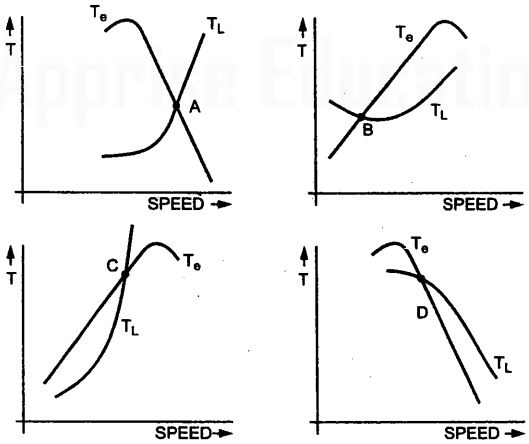
31. The size of an excavator is usually expressed in terms of
(a) crowd motion. (b) m^3.
(c) travel in metres. (d) angle of swing.

32. The range of rating of electric motor used for rolling mills is of the order of
(a) 10 to 25 kW (b) 25 to 85 kW
(c) 85 to 400 kW (d) 400 to 1,000 kW

33. If the liquid to be pumped has relative density of 1.25, the output power required in comparison to that required for pumping water in case of centrifugal pump will be
(a) 1.25 times. (b) the same.
(c) 0.8 times. (d) 15 times (roughly).

34. The load torque decreases with the increase in speed in case of
(a) lathes, boring machines, milling machines.
(b) hoist winches, machine tool feed mechanism.
(c) blowers, fans, centrifugal pumps.
(d) both (a) and (b).

35. The electromagnetic torque T_e of a drive, and its connected load torque T_L are as shown below. Out of the operating points A, B, C and D, the stable ones are



(a) A, C, D (b) B, C
(c) A, D (d) B, C, D [GATE E.E. 2007]

36. In synthetic fibre mills motors with
(a) variable speeds are required.
(b) constant speeds are preferred.
(c) low starting torque are required.
(d) high starting torque are preferred.

37. In case of kiln drives, starting torque is
(a) more than double of the running torque.
(b) almost $\sqrt{2}$ times of the running torque.
(c) almost equal to running torque.
(d) almost zero.

38. The diameter of the rotor shaft for an electric motor depends upon
(a) speed only. (b) power output only.
(c) speed and power output.
(d) speed, power output and power factor.

39. Which one of the following is not necessarily the advantage of dc motors over ac motors ?
(a) Low cost.
(b) Excellent torque and speed operating characteristics.
(c) Flexible speed control. (d) None of the above.

40. An unsaturated dc shunt motor drives a constant torque load at a speed at 1,000 rpm taking an armature current of 20 A when 230 V is applied to the motor. If the applied voltage is reduced to 115 V, the motor runs at.
(a) 500 rpm taking an armature current of 20 A.
(b) 1,000 rpm taking an armature current of 20 A.
(c) 500 rpm taking an armature current of 40 A.
(d) 1,000 rpm taking an armature current of 40 A.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1994]

41. An electric train employing a dc series motor is running at a fixed speed, when a sudden slight drop in the mains voltage occurs. This would result in
(a) drop in speed and rise in current.
(b) rise in speed and drop in current.
(c) rise in speed and rise in current.
(d) drop in speed with current unaltered. [U.P.S.C.I.E.S. E.E.-II, 1995]

42. A dc series motor is used for an overhauling load. It can work stably if
(a) the armature is shunted by a resistor.
(b) the field winding is reversed.
(c) a resistor is put in series with the machine.
(d) a divertor is put across the field.
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 1993]

43. DC series motors are very suitable for heavy duty applications such as electric railways, rolling mills because of
(a) low initial as well as maintenance cost.
(b) high starting torque. (c) possibility of speed control.
(d) nearly constant speed.

44. A flywheel is normally fitted to
(a) dc series motor driving a constant torque load.
(b) separately excited dc motor driving pulsed torque load.
(c) cumulatively compound motor driving pulsed torque load.
(d) differentially compound motor driving pulsed torque load.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1994]

45. Which motor should not be used for centrifugal pumps ?
(a) Shunt. (b) Series.
(c) Cumulatively compound. (d) Differentially compound.
[U.P.S.C. I.E.S. E.E.-II, 1992]

Answers: **25.** (d), **26.** (b), **27.** (c), **28.** (d), **29.** (c), **30.** (a), **31.** (b), **32.** (c), **33.** (a), **34.** (a), **35.** (c), **36.** (b), **37.** (a), **38.** (c), **39.** (a), **40.** (d), **41.** (a), **42.** (a), **43.** (b), **44.** (c), **45.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

46. For continuously running rolling mills with intermittent loading, the most suitable dc drive is
(a) dc series motor. (b) dc shunt motor.
(c) dc differentially compounded motor.
(d) dc cumulatively compounded motor. [U.P.S.C. I.E.S. E.E.-II, 1992]

47. For quick speed reversal the motor preferred is
(a) dc motor. (b) squirrel cage induction motor.
(c) slip-ring induction motor. (d) synchronous motor.

48. The motor, owing to its inherent characteristics, best suited for the rolling mills is
(a) dc shunt motor.
(b) dc cumulative compound wound motor.
(c) squirrel cage induction motor.
(d) synchronous motor.

49. Squirrel cage induction motors with high slip and slip-ring induction motors develop maximum torque at standstill and are used for
(a) elevators. (b) machine tools.
(c) presses and punches. (d) all of the above.

50. Belted slip-ring induction motor is almost invariably employed for
(a) conveyors. (b) jaw-crushers.
(c) centrifugal blowers. (d) water pumps.

51. Belted wound induction motors are preferred for
(a) gyratory crushers. (b) screw pumps.
(c) machine tools. (d) water pumps.

52. The pair used for frequency converters is
(a) squirrel cage induction motor and synchronous motor.
(b) slip-ring induction motor and synchronous motor.
(c) slip-ring induction motor and squirrel cage induction motor.
(d) all of above.

53. For the same rating, the size of the single-phase induction motor is about _____ that of the corresponding three-phase induction motor.
(a) three times (b) the same as
(c) 1.5 times (d) one-third
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1999]

54. A fluctuating voltage supply is detrimental to a refrigerator motor but not to a ceiling fan, although both are single-phase induction motors because, the refrigerator motor
(a) is made more robust than the fan motor.
(b) is subjected to short-duty cycle but the fan motor is subjected to continuous duty.
(c) is enclosed in a sealed unit while the fan motor is open to the environment.
(d) load is constant, but the fan motor load is voltage dependent.
[U.P.S.C. I.E.S. E.E.-II, 1993]

55. Ward-Leonard controlled dc drives are usually used for... duty excavators.
(a) light (b) medium (c) heavy

56. Speed control by variation of field flux results in
(a) constant power drive. (b) variable power drive.
(c) constant torque drive. (d) variable torque drive.
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 1994]

57. In variable speed dc motor drive the armature voltage control leads to
(a) constant power operation.
(b) constant torque operation.
(c) variable torque operation.
(d) randomly varying power operation.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1998]

58. Speed of an induction motor is controlled by injecting voltage into the rotor winding. Frequency of the injected voltage should be
(a) main frequency.
(b) frequency corresponding to required speed.
(c) frequency corresponding to rotor speed.
(d) slip frequency.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1994]

59. The slip power recovery scheme is used in induction motor for speed control in the range
(a) above synchronous speed.
(b) below synchronous speed.
(c) both above and below synchronous speed.
(d) none of the above.
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 1999]

60. The electric braking system commonly employed in rolling mills, elevators and printing presses is
(a) plugging. (b) rheostatic.
(c) dynamic. (d) regenerative.

61. For rheostatic braking of two series motors connected in parallel
(a) cross-connection is better.
(b) equaliser connection is better.
(c) both are equally good.
(d) none of the two is required.

62. Dynamic braking is employed to brake
(a) non-reversing drive. (b) reversing drive.
(c) in both (a) and (b).
[A.M.I.E. Sec B. Elec. Drives & Their Control Summer 2000]

63. The condition of regenerative braking can be achieved by
(a) speed higher than no-load speed of overhauling load.
(b) increasing the excitation while supply voltage remains constant.
(c) increasing the armature current.
(d) either (a) or (b).

64. In a dc shunt motor, regenerative braking is limited by
(a) saturation of flux at high speed.
(b) saturation of flux at low speed.
(c) armature current at high speed.
(d) either (a) or (b).

65. For regenerative braking with dc series motors, its field windings are _____ excited.
(a) separately (b) series
(c) shunt (d) either (b) or (c)

66. The most economical method of electric braking is
(a) plugging
(b) dynamic braking with separate excitation.
(c) dynamic braking with self excitation.
(d) regenerative braking.

67. The plugging provides _____ braking torque in comparison to rheostatic and regenerative braking systems.
(a) negligible (b) small
(c) highest

68. Rheostatic braking may be applied to an induction motor provided
(a) it is a squirrel cage type.
(b) it is a wound type.
(c) separate dc source for field excitation is available.
(d) variable external resistance is available.

69. The motor enclosure used for collieries, chemical plants is
(a) flame proof type. (b) splash proof type.
(c) totally enclosed type. (d) pipe ventilated type.

Answers: **46.** (d), **47.** (a), **48.** (b), **49.** (c), **50.** (b), **51.** (a), **52.** (a), **53.** (c), **54.** (d), **55.** (c), **56.** (a), **57.** (b), **58.** (d), **59.** (c), **60.** (a), **61.** (a), **62.** (c), **63.** (d), **64.** (b), **65.** (a), **66.** (d), **67.** (c), **68.** (c), **69.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

70. The motor enclosure used in woodworking industry is
(a) protected type.
(b) totally enclosed fan cooled type.
(c) flame-proof type. (d) splash-proof type.

71. The motor enclosure used for industrial purposes is
(a) protected type. (b) drip proof type.
(c) totally enclosed type. (d) open type.

72. Rotor of a motor is usually supported on
(a) bush bearings. (b) thrust bearing.
(c) ball or roller bearings. (d) any of the above.

73. Ball-bearings are
(a) used up to 75 kW motors.
(b) of long life and low friction loss.
(c) costlier and noisy particularly at high motor speed.
(d) all of the above.

74. Sleeve bearings
(a) are normally of bronze.
(b) have self-lubricating properties.
(c) are used where noise is to be avoided.
(d) all of the above.

75. Hot bearings of a dc motor may be caused by
(a) poor ventilation. (b) incorrect voltage.
(c) loose coupling. (d) lack of or dirty lubricant.
[A.M.I.E. Sec B. Electric Drives & Their Control Winter 1999]

76. Excessive motor vibration is caused by
(a) worn bearings. (b) open armature coil.
(c) bent shaft. (d) excessive brush tension.

77. Excessive sparking at the brushes may be caused due to
(a) loose coupling. (b) worn bearings.
(c) dirt on commutator. (d) open armature coil.

78. Intermittent sparking at the brushes of a dc motor may be caused due to
(a) intermittent load. (b) open armature coil.
(c) loose coupling. (d) incorrect voltage.

79. The least expensive drive is
(a) belt drive. (b) rope drive.
(c) chain drive. (d) gear drive.

80. For very high speed ratio the indispensable drive is
(a) direct drive. (b) rope drive.
(c) chain drive. (d) any of the above.

81. In rotating electrical machines, the insulation temperature limit for class B type is
(a) 105°C (b) 130°C
(c) 150°C (d) 180°C
[A.M.I.E. Sec B. Electric Drives & Their Control Winter 1996]

82. For a particular motor, the cooling time constant is usually
(a) smaller than the heating time constant.
(b) greater than the heating time constant.
(c) equal to the heating time constant.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

83. For a particular type of motor, the heating time constant
(a) increases with the increase in size.
(b) decreases with the increase in size.
(c) same for all sizes.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

84. For estimation of power rating of an electric drive, its losses can be considered to be proportional to
(a) power. (b) $(\text{power})^2$.
(c) $(\text{power})^3$. (d) torque.
[A.M.I.E. Sec B. Electric Drives & Their Control Winter 1996]

85. The duty cycle of a motor is

Load	Duration
20 kW	120 s
10 kW	120 s
stopped	280 s

The continuous rating of motor suitable for above application would be
(a) 20 kW (b) 16.4 kW
(c) 14.14 kW (d) 9 kW
[U.P.S.C. I.E.S. E.E.-II, 1992]

86. The heating time constant of a totally enclosed motor is relatively
(a) lower. (b) higher.
(c) independent of type of enclosure.

87. For a certain industrial application, an overrated ac motor was selected. It will lead to operation with
(a) higher efficiency and better pf.
(b) lower efficiency and poorer pf.
(c) higher efficiency and poorer pf.
(d) lower efficiency and better pf.
[A.M.I.E. Sec B. Electric Drives & Their Control Winter 1998]

88. A flywheel is generally used in
(a) a cement mill drive. (b) a paper mill drive.
(c) a rolling mill drive. (d) a sugar centrifuge drive.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1996; Summer 1998]

89. In overhead travelling cranes
(a) continuous rating motors are used.
(b) continuous minimum rating motors are used.
(c) short-time rating motors are used.
(d) any of the above.

90. 15 minute rated motors are suitable for
(a) light duty cranes. (b) medium duty cranes.
(c) heavy duty cranes. (d) all of the above.

91. For medium duty cranes the short-time rating motor used is
(a) 10 minutes. (b) 15 minutes.
(c) 30 minutes. (d) one hour.

92. Load equalisation is desirable in the case of
(a) very large refrigeration and air-conditioning plants.
(b) rolling mills, electric hammers, presses, reciprocating pumps.
(c) lathes, woodworking machines, paper making machines, shapers and slotters.
(d) travelling cranes, lifts.

93. The phase controlled rectifiers used in speed control of dc motors converts fixed ac supply voltage into _____ output voltage.
(a) variable dc (b) variable ac
(c) variable frequency ac (d) full rectified ac

94. A four quadrant operation requires
(a) two full converters in series.
(b) two full converters connected back to back.
(c) two full converters connected in parallel.
(d) two semi converters connected back to back.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

95. The following converters can feed power in any of the four quadrants
(a) semi-converter. (b) full converter.
(c) dual converter.
(d) combination of a semi- and full-converters.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1993]

96. For speed control of dc motors using controlled rectifiers, armature voltage control gives speed

Answers: **70.** (b), **71.** (a), **72.** (c), **73.** (d), **74.** (d), **75.** (d), **76.** (a), **77.** (c), **78.** (b), **79.** (a), **80.** (b), **81.** (b), **82.** (b), **83.** (a), **84.** (b), **85.** (c), **86.** (b), **87.** (b), **88.** (c), **89.** (c), **90.** (a), **91.** (c), **92.** (b), **93.** (a), **94.** (b), **95.** (c), **96.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) above rated speed. (b) below rated speed.
(c) above as well as below rated speed.
[A.M.I.E. Sec B. Power Electronics Summer 1996]

97. Armature of a dc motor is fed from a phase controlled rectifier where as its field is supplied from a constant dc source. To reduce the speed of the motor regeneratively
(a) the firing angle of the converter should be increased.
(b) the polarity of the dc voltage should be reversed.
(c) the polarity of the armature induced voltage should be reversed.
(d) the firing angle should be varied in the range 90° to 180° simultaneously reversing the armature connections.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1994]

98. For the speed control of ac drive, the preferred method using thyristors is
(a) phase control. (b) integral cycle control.
(c) chopper control. (d) all are equally good.
[A.M.I.E. Sec B. Elec. Drives and Their Control Winter 1995]

99. The semiconductor device used for speed control of single phase induction motors in every day domestic use is
(a) SCR. (b) power transistor.
(c) Triac. (d) power MOS.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1999]

100. Which of the following motor is suitable for driving cranes, hoists, centrifugal pumps, conveyor belt etc. ?
(a) DC series motor. (b) DC shunt motor.
(c) DC compound wound motor.
(d) Any of the above.

101. Heavy-duty steel-works cranes having wide load variations are equipped with
(a) dc series motors.
(b) plain squirrel cage induction motors.
(c) wound rotor induction motors.
(d) synchronous motors.

102. The most suitable motor for a steel mill requiring a motor having high starting torque, wide speed range and precise speed control is
(a) plain squirrel cage induction motor.
(b) wound rotor induction motor.
(c) dc series motor. (d) dc shunt motor.

103. For automatic drives the preference is for
(a) synchronous motors.
(b) Ward-Leonard controlled dc shunt motors.
(c) plain squirrel cage induction motors.

104. The type of motor that can be used for hoisting machinery is
(a) dc compound motor.
(b) Ward-Leonard controlled dc shunt motor.
(c) wound rotor induction motor.
(d) any of the above.

105. The motor normally used for crane travel is
(a) wound rotor induction motor.
(b) synchronous motor.
(c) dc differentially compounded motor.
(d) plain squirrel cage induction motor.

106. The drive, that can be used for derricks and winches is
(a) pole-changing squirrel cage induction motor.
(b) ac slip-ring induction motor with variable resistance.
(c) dc shunt motor with Ward-Leonard control.
(d) any of the above.

107. Ward-Leonard controlled dc drives are generally used for _____ duty excavators
(a) light (b) medium (c) heavy (d) none of these.

108. The motor suitable for a reciprocating pump required to start under load is
(a) plain squirrel cage induction motor.
(b) double-squirrel cage induction motor.
(c) synchronous motor. (d) dc shunt motor.

109. A pole-changing squirrel cage induction motor employed in derricks has four, eight and twenty four poles. The lowest speed is used in
(a) hoisting. (b) landing the load.
(c) lifting. (d) lowering.

110. A pole-changing type squirrel cage induction motor employed in derricks has four, eight and twenty four poles. The medium speed is used in
(a) landing the load. (b) hoisting.
(c) lowering. (d) lifting.

111. Motor preferred for kiln drive is usually
(a) wound rotor induction motor.
(b) cascaded controlled ac motor.
(c) Ward-Leonard controlled dc shunt motor.
(d) any of the above.

112. The motor used in mines is
(a) flame-proof squirrel cage induction or wound rotor motor.
(b) dc series motor.
(c) dc shunt motor. (d) any of the above.

113. The motor used in punches, presses and shears is
(a) dc series or shunt motors.
(b) dc cumulative compound motor.
(c) high slip squirrel cage or wound rotor induction motor.
(d) both (b) and (c).

114. A domestic mixer uses the following motor
(a) induction motor. (b) reluctance motor.
(c) universal motor.
(d) permanent magnet synchronous motor.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1998]

115. A perfect black body is one which
(a) absorbs all incident radiations.
(b) reflects all incident radiations.
(c) transmits all incident radiations.
(d) all of the above.

116. For the transmission of heat from one body to another it is essential that
(a) both bodies are solids.
(b) the two bodies are at different temperatures.
(c) both bodies are in contact.
(d) at least one of the bodies has some source of heating.

117. Heat is transferred simultaneously by conduction, convection and radiation
(a) during melting of ice.
(b) from refrigerator coils to refrigerator freezer.
(c) inside boiler furnaces.
(d) through the surface of the insulated pipe carrying steam.

118. The highest value of thermal conductivity is for
(a) aluminium. (b) brass. (c) copper. (d) iron.

119. The highest value of thermal conductivity is for
(a) steam. (b) water. (c) melting ice. (d) solid ice.

Answers: **97.** (a), **98.** (c), **99.** (c), **100.** (a), **101.** (a), **102.** (c), **103.** (b), **104.** (d), **105.** (d), **106.** (d), **107.** (c), **108.** (b), **109.** (b), **110.** (d), **111.** (d), **112.** (a), **113.** (d), **114.** (c), **115.** (a), **116.** (b), **117.** (c), **118.** (c), **119.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

120. The thermal conductivity will be highest in case of
(a) dry concrete.
(b) concrete having 10% moisture by volume.
(c) concrete having 0.4% reinforcement.
(d) concrete having 10% moisture by volume and 0.4% reinforcement.

121. Radiations from a black body are proportional to
(a) T^2 (b) T^3 (c) T^4 (d) $1/T^4$

122. A body reflecting entire radiations incidenting on it is called the
(a) white body. (b) gray body.
(c) black body. (d) transparent body.

123. The insulating material suitable for low temperature applications is
(a) cork. (b) diatomaceous earth.
(c) asbestos paper. (d) 75 per cent magnesia.

124. The quantity of heat absorbed from the heater by convection depends upon
(a) the temperature of heating element above the surroundings.
(b) the surface area of the heater.
(c) the position of the heater.
(d) all of the above.

125. The material of the heating element should be
(a) such that it may withstand the required temperature without getting oxidised.
(b) of low resistivity. (c) of low melting point.
(d) of high temperature coefficient.

126. The material to be used for heating element should be of high resistivity so as to
(a) increase the life of the heating element.
(b) reduce the length of the heating element.
(c) reduce the effect of oxidation.
(d) produce large amount of heat.

127. The material to be used for heating element should be of low temperature coefficient so as to
(a) avoid initial rush of current.
(b) avoid change in kW rating with temperature.
(c) reduce the effect of oxidation.
(d) both (a) and (b) above.

128. Which of the following heating element will have the least temperature range ?
(a) Eureka. (b) Silicon carbon.
(c) Nichrome. (d) Kanthal.

129. Which of the following heating element can give highest temperature in resistance heating ?
(a) Nichrome. (b) Silicon carbide.
(c) Copper. (d) Nickel-Cr-Fe alloy.

130. Ni-Cr-Fe alloy wires can be safely used for temperatures up to
(a) 2,500°C (b) 2,000°C
(c) 1,150°C (d) 850°C

131. The heating element to be used in a furnace employed for heating around, 1,600°C should be of material
(a) nichrome. (b) eureka.
(c) molybdenum. (d) silicon-carbide.

132. For radiant heating around 2,000°C the heating elements used should be of material
(a) tungsten alloy. (b) copper alloy.
(c) carbon. (d) Stenleess

133. The heating element to be used in vacuum furnaces should be of the material
(a) molybdenum because of high vapour pressure.
(b) tungsten because of low vapour pressure.
(c) molybdenum because of low vapour pressure.
(d) tungsten because of high vapour pressure.

134. In an electric press, mica is used
(a) for induction heating. (b) for dielectric heating.
(c) as an insulator.
(d) for improvement of power factor.

135. Maximum operating voltage is limited
(a) to 600 V. (b) from safety consideration.
(c) by electrical insulation at high temperatures.
(d) all of the above.

136. The heat produced in the heating element(s) is also to overcome the losses occurring because of
(a) heat used in raising the temperature of oven (or furnace) and container (or carriers).
(b) heat conducted through the walls.
(c) escapement of heat due to opening of door.
(d) all of the above.

137. In a resistance furnace, the temperature is controlled by
(a) variation of operating voltage.
(b) variation of resistance of heating circuit.
(c) switching on and off the supply periodically.
(d) all of the above.

138. For temperature control in resistance furnaces resistance variation can be affected by connecting resistance elements in
(a) series. (b) parallel.
(c) series-parallel. (d) star or delta.
(e) any of the above.

139. The simplest and most commonly used method for temperature control is
(a) external series resistance in the heating circuit.
(b) change of connections of heating circuit.
(c) use of variable number of heating elements.
(d) transfomer tappings.

140. The device necessarily used for automatic temperature control in a furnace is
(a) thermostat. (b) auto-transformer.
(c) thermocouple. (d) any of the above.

141. Control of power input to salt-bath furnace is affected by
(a) varying the depth of immersion of electrodes.
(b) varying the distance between the electrodes.
(c) both (a) and (b). (d) none of (a) and (b).

142. The temperature inside a furnace is usually measured by
(a) mercury thermometer. (b) optical pyrometer.
(c) alcohol thermometer. (d) any of the above.

143. In a resistance furnace the atmosphere is
(a) oxidising. (b) deoxidising.
(c) reducing. (d) neutral.

144. On increasing the thickness of refractory walls of the furnace
(a) energy consumption will increase.
(b) heat loss through furnace walls will increase.
(c) temperature on the outer surface of furnace walls will drop.
(d) temperature inside the furnace will drop.

145. Radiant heating is used for
(a) melting of ferrous metals.
(b) annealing of metals.
(c) drying of paints and varnishes.
(d) any of the above.

Answers: **120.** (d), **121.** (c), **122.** (a), **123.** (b), **124.** (d), **125.** (a), **126.** (b), **127.** (d), **128.** (a), **129.** (b), **130.** (d), **131.** (c), **132.** (a), **133.** (b), **134.** (c), **135.** (d), **136.** (d), **137.** (d), **138.** (e), **139.** (b), **140.** (a), **141.** (c), **142.** (b), **143.** (a), **144.** (c), **145.** (c),

146. Direct resistance heating is used in
(a) electrode boiler. (b) salt-bath furnace.
(c) resistance welding. (d) all of the above.

147. Resistance ovens are used for
(a) domestic and commercial heating.
(b) vulcanizing and hardening of synthetic materials.
(c) drying of varnish coatings, drying and baking of potteries.
(d) all of the above.

148. The function(s) of an heating chamber is/are to
(a) store as much of the heat supplied as may be practicable and economical.
(b) confine the atmosphere around the charge.
(c) control the cooling rate of the charge (if required) and control the distribution of heat within the chamber.
(d) all of the above.

149. For obtaining best results, the infrared lamps should be located from the object to be heated at distance of
(a) 10-20 cm. (b) 25-30 cm.
(c) 40-50 cm. (d) 50-60 cm.

150. In direct arc furnace which of the following is of high value ?
(a) Current. (b) Voltage.
(c) Power factor. (d) all of the above.

151. The power factor at which the direct arc furnace operates is
(a) low lagging. (b) low leading.
(c) unity. (d) high leading.

152. For arc heating, the electrodes used are made of
(a) copper. (b) graphite.
(c) tungsten. (d) aluminium.

153. In an arc furnace, the choke is provided to
(a) reduce the surge severity.
(b) stabilize the arc. (c) improve the power factor.
(d) all of the above.

154. It is desirable to operate the arc furnaces at a power factor of
(a) zero. (b) unity.
(c) 0.707 lagging. (d) 0.707 leading.

155. It is desirable to keep the arc length short in order to
(a) have better heating.
(b) have better stirring action and reduce oxidation problem.
(c) increase the life of roof refractory.
(d) all of the above.

156. Arc drawn between the two electrodes produces heat and has a temperature
(a) between 0–600°C. (b) between 500°C–1,000°C.
(c) between 1,000°C–3,500°C.
(d) of the order of 4,000°C.

157. The arc furnaces of conical shapes have the advantage(s) of
(a) large surface area per unit bath volume.
(b) low power consumption.
(c) reduced radiation losses.
(d) all of the above.

158. In arc furnace, energy losses that take place in the furnace are
(a) losses through walls.
(b) losses through escape gasses.
(c) losses through water cooling.
(d) all of the above.

159. In submerged arc furnaces the power is controlled by
(a) varying the spacing between the electrodes.
(b) varying the voltage applied to the electrodes.
(c) either (a) or (b).
(d) varying the arc length.

160. For arc furnaces the low voltage high current power supply is needed because
(a) heavy currents produce large amount of heat resulting in higher temperatures.
(b) maximum secondary voltage is also limited to 275 V (line-to-line on open circuit) owing to insulation and safety consideration.
(c) life of the roof refractory is increased.
(d) all of the above.

161. The main application of indirect arc furnace is to melt
(a) iron. (b) steel.
(c) non-ferrous metals. (d) none of the above.

162. For power transformers employed for arc furnaces, it is desirable to arrange the furnace and the transformer in such a way that leads are
(a) shorter in length and placed distant apart.
(b) shorter in length and placed close together.
(c) longer in length and placed close together.
(d) in any arrangement.

163. In induction heating
(a) heat is produced due to currents induced in the charge by electromagnetic action.
(b) the resistance of the charge must be low and voltage applied must be high in order to produce sufficient heat.
(c) magnetic materials can be easily treated in comparison to non-magnetic materials.
(d) all of the above.

164. In heating the ferromagnetic materials by induction heating, heat is produced owing to
(a) flow of induced current through the charge.
(b) hysteresis loss occuring below Curie temperature.
(c) hysteresis loss as well as eddy current loss occurring in the charge.
(d) any of the above factors.

165. Induction heating takes place in
(a) insulating materials.
(b) conducting and magnetic materials.
(c) conducting but non-magnetic materials.
(d) conducting materials may be magnetic or non-magnetic.

166. Induction hardening is possible in case of
(a) dc supply only. (b) ac supply only.
(c) ferrous materials only.
(d) non-conducting materials only.

167. Low frequency supply is necessary for direct core type induction furnaces because
(a) magnetic coupling between the primary and secondary circuit is poor.
(b) with normal frequency supply the electromagnetic forces cause severe stirring action in the molten metal.
(c) both (a) and (b). (d) none of (a) and (b).

168. In induction heating, which of the following is of high value?
(a) Frequency. (b) Current.
(c) Voltage. (d) Power factor.

169. Induction furnaces are used for
(a) heat treatment of castings.
(d) heating of insulators. (c) melting of aluminium.
(d) all of the above.

Answers: **146.** (d), **147.** (d), **148.** (d), **149.** (b), **150.** (a), **151.** (a), **152.** (b), **153.** (b), **154.** (c), **155.** (d), **156.** (c), **157.** (d), **158.** (d), **159.** (c), **160.** (d), **161.** (c), **162.** (b), **163.** (d), **164.** (c), **165.** (d), **166.** (b), **167.** (c), **168.** (a), **169.** (a),

170. In induction heating, the depth up to which current will penetrate is proportional to
(a) $1/(\text{frequency})^{1/2}$. (b) 1/ frequency.
(c) frequency. (d) $(\text{frequency})^2$.

171. The advantage(s) of eddy current heating is/are
(a) easy temperature control, little wastage of heat and possibility of heating in vacuum or other special atmosphere.
(b) heat can be made to penetrate into metal surface to any desired depth.
(c) the area of surface over which heat is produced can be accurately controlled.
(d) all of the above.

172. The supply frequency usually employed for high frequency eddy current heating is
(a) 10 MHz (b) 10 kHz to 400 kHz
(c) 5 kHz (d) 1 kHz

173. In case of core-loss induction furnace, the charge should be in
(a) solid state. (b) molten state.
(c) either of (a) or (b).

174. High frequency induction heating is used for
(a) ferrous metals only. (b) non-ferrous metals only.
(c) both ferrous and non-ferrous metals.

175. In dielectric heating current flows through
(a) air. (b) dielectric.
(c) metallic conductor.
(d) ionic discharge between dielectric medium and metallic conductor.

176. Dielectric loss is proportional to
(a) frequency. (b) $(\text{frequency})^2$.
(c) $(\text{frequency})^3$. (d) $(\text{frequency})^{1/2}$.

177. The dielectric loss in a dielectric is proportional to
(a) voltage impressed on the dielectric.
(b) the square of the voltage impressed on the dielectric.
(c) the square root of the voltage impressed on the dielectric.
(d) none of the above.

178. For heating of plywood, the frequency should be
(a) 1–2 MHz (b) 10–25 kHz (c) 1 kHz (d) 100 Hz

179. The normal voltage used in dielectric heating is
(a) 1.5 kV (b) 15 kV (c) 33 kV (d) 66 kV

180. For dielectric heating, with the increase of mass of workpiece, the optimum frequency _____ for maximum power transfer.
(a) increases (b) decreases
(c) independent of mass

181. For dielectric heating the range of frequency normally employed is
(a) 10 kHz to 100 kHz (b) 100 kHz to 10 MHz
(c) 1 MHz to 10 MHz (d) 10 MHz to 40 MHz

182. The power factor will be maximum in case of
(a) electric arc heating. (b) resistance heating.
(c) induction heating. (d) dielectric heating.

183. Furnaces used for cremation are
(a) electric resistance heating.
(b) electric arc heating. (c) dielectric heating.
(d) high frequency eddy current heating.

184. In an electric room heat convector the method of heating used is
(a) arc heating. (b) resistance heating.
(c) induction heating. (d) infrared heating.

185. When the composition of non-ferrous metal is to be varied frequently or when heating is intermittent _____ furnace is desirably used.
(a) direct resistance (b) direct arc
(c) indirect resistance (d) Ajax Wyatt

186. Hysteresis loss and eddy current loss are used in
(a) resistance heating. (b) dielectric heating.
(c) induction heating of steel.
(d) induction heating of brass.

187. The power factor will be leading in case of
(a) dielectric heating. (b) induction heating.
(c) electric arc heating. (d) resistance heating.

188. The method of heating used for non-conducting materials is
(a) induction heating. (b) dielectric heating.
(c) electric resistance heating.
(d) electric arc heating.

189. The method appropriate for heating of non-ferrous metals is
(a) indirect resistance heating.
(b) radiant heating. (c) indirect arc heating.
(d) dielectric heating.

190. The method suitable for heating of conducting medium is
(a) induction heating. (b) indirect arc heating.
(c) eddy current heating. (d) radiant heating.

191. The most modern method for food processing is
(a) induction heating. (b) resistance heating.
(c) dielectric heating. (d) eddy current heating.

192. The main advantage of dielectric heating is that
(a) it can be used for drying the explosives.
(b) heating occurs in the material itself.
(c) heating occurs due to the high frequency.
(d) none of the above.

193. _____ is not an application of dielectric heating.
(a) Food processing. (b) Soldering.
(c) Gluing of wood. (d) Diathermy.

194. Which of the following falls under the category of plastic or non-fusion welding ?
(a) Resistance welding. (b) Electron beam welding.
(c) Electro-slag welding. (d) Arc welding.

195. Which of the following falls under the category of fusion or non-pressure welding?
(a) Resistance welding. (b) Metal-arc welding.
(c) Ultrasonic welding. (d) Explosive welding.

196. Proper selection of welding depends upon, in addition to cost involved,
(a) kinds of metals to be joined.
(b) nature of products to be fabricated.
(c) production technique used.
(d) all of the above.

197. The metal surfaces for electrical resistance welding must be
(a) cleaned. (b) lubricated.
(c) moistened. (d) rough.

198. Resistance welding cannot be used for
(a) ferrous materials. (b) non-ferrous materials.
(c) dielectrics. (d) any of the above.

199. In electrical resistance welding the greatest resistance is offered by
(a) metal surface.
(b) contact layer of metals to be welded.

Answers: **170.** (a), **171.** (d), **172.** (b), **173.** (c), **174.** (c), **175.** (b), **176.** (a), **177.** (b), **178.** (a), **179.** (a), **180.** (b), **181.** (d), **182.** (b), **183.** (a), **184.** (b), **185.** (c), **186.** (c), **187.** (a), **188.** (b), **189.** (c), **190.** (a), **191.** (c), **192.** (b), **193.** (b), **194.** (a), **195.** (b), **196.** (d), **197.** (a), **198.** (c), **199.** (b),

Downloaded From : www.EasyEngineering.net

(c) contact point of electrode with metal top.
(d) contact point of electrode with metal bottom.

200. In electric resistance welding
(a) the current required exceeds 100 A.
(b) the voltage required ranges from 4 to 12 V.
(c) the amount of power supplied to the weld usually ranges from 60 watts to 80 watts for each square mm of area.
(d) all of the above.

201. Resistance to the flow of current is made of
(a) resistance of current path in the work.
(b) resistance between the contact surfaces of the parts being welded.
(c) resistance between the electrodes and the surface of the parts being welded.
(d) all of the above.

202. In resistance welding, the magnitude of current is controlled
(a) by varying the primary voltage of the welding transformer using an auto-transformer between supply and welding transformer.
(b) by changing the primary turns of the welding transformer.
(c) by varying the magnitude and waveform of the primary as well as secondary current by using thyratron or ignitron.
(d) any of the above.

203. The main drawback of resistance welding is
(a) high initial as well as maintenance cost.
(b) difficult shapes and sections cannot be welded.
(c) only similar metals can be welded.
(d) parent metal is affected.

204. Plain and butt welds may be used on materials upto thickness of about
(a) 5 mm (b) 10 mm (c) 25 mm (d) 40 mm

205. In upset butt welding
(a) the faces of the metal pieces to be joined are prepared for even contact.
(b) heating is obtained by the contact resistance of metal pieces to be welded.
(c) the voltage required is 2-8 V and current required ranges from 50 A to several hundred amperes depending upon material and the area to be welded at a time.
(d) all of the above.

206. In flash-butt welding
(a) no special preparation of the faces to be welded is necessary.
(b) clean and pure weld is obtained.
(c) power requirement is less.
(d) all of the above.

207. Spot welding process basically depends on
(a) generation of heat.
(b) application of forging pressure.
(c) both (a) and (b). (d) ohmic resistance.

208. In spot welding, composition and thickness of the base metal determines the
(a) holding time. (b) amount of weld current.
(c) amount of squeeze pressure.
(d) all of the above.

209. The tips of the electrodes, for spot welding are made of
(a) carbon.
(b) copper alloy or pure copper.
(c) mica. (d) porcelain.

210. The power factor of a spot welding machine is expected to be about
(a) 0.3 to 0.5 lagging. (b) 0.8 to 0.85 lagging.
(c) 0.75 to 0.85 leading. (d) unity.

211. During spot welding, the current flows for
(a) fraction of a minute.
(b) fraction of a second to several seconds.
(c) few milliseconds. (d) few microseconds.

212. Spot welding is employed for
(a) thin metal sheets (thickness being usually limited to 10-12 mm).
(b) castings only. (c) thick sections.
(d) rough and irregular surfaces.

213. Spot welding
(a) makes the weld air tight.
(b) makes the weld water tight.
(c) provides mechanical strength.
(d) all of the above.

214. In spot welding
(a) it is desirable to clean the sheets thoroughly before welding.
(b) the work-pieces being welded are pressed together by mechanical pressure exerted through electrodes.
(c) current required is above 5,000 A and the voltage between the electrodes is usually less than 2 V (open-circuit voltage less than 12 V).
(d) all of the above.

215. Projection welding can be considered as a mass production form of
(a) seam welding. (b) spot welding.
(c) upset welding. (d) flash welding.

216. In comparison to spot welding, projection welding has the advantage(s) of
(a) simple welding process, more output and good finished appearance.
(b) electrode life is increased owing to use of low current density and low pressure.
(c) it is easy to weld certain parts which cannot be welded by spot welding .
(d) all of the above.

217. In seam welding
(a) the workpiece is fixed and disc electrodes move.
(b) the workpiece moves but rotating electodes are fixed.
(c) the electrodes used are of disc or roller shape.
(d) either (a) or (b) and (c).

218. In case of seam welding, the flow of current through the electrode should be
(a) intermittent. (b) continuous.
(c) either (a) or (b).

219. In _____ welding it is essential that the surfaces to be welded are clean, dust and dirt free.
(a) butt (b) spot (c) seam
(d) both spot and seam

220. Seam welding is normally not recommended for
(a) aluminium alloys. (b) stainless and coated steels.
(c) copper and high copper alloys.
(d) alloys of nickel and magnesium.

221. In percussion welding
(a) the process used depends on the arc effect for heating and not on the resistance.

Answers: **200.** (d), **201.** (d), **202.** (d), **203.** (a), **204.** (c), **205.** (d), **206.** (d), **207.** (c), **208.** (d), **209.** (b), **210.** (a), **211.** (b), **212.** (a), **213.** (c), **214.** (d), **215.** (b), **216.** (d), **217.** (d), **218.** (a), **219.** (c), **220.** (c), **221.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) the action of process is so rapid that there is little heating effect in the material adjacent to the weld.
(c) the equipment used is quite expensive.
(d) all of the above.

222. The basic electrical requirement in arc welding is that there should be
(a) high open-circuit voltage.
(b) no arc blow. (c) dc power supply.
(d) coated electrodes.

223. In arc welding, the temperature of the arc produced is of the order of
(a) 1,000°C (b) 3,500–4,000°C
(c) 5,000–7,500°C (d) 7,500–10,000°C

224. The electric arc has
(a) linear resistance characteristic.
(b) positive resistance characteristic.
(c) negative resistance characteristic.
(d) highly inductive characteristic.

225. In an electric arc welding, the voltage required to strike dc arc is about
(a) 50–60 V (b) 80–90 V (c) 100–120 V (d) 220 V

226. In an electric arc welding, the voltage required to strike ac arc is about
(a) 50–60 V (b) 80–90 V (c) 100–120 V (d) 230 V

227. In an electric arc welding, the voltage required to maintain the arc will be
(a) 250–500 V (b) 150-250 V
(c) 20–30 V (d) below 10 V

228. For an electric arc welding the current range is usually
(a) 50–1,000 A (b) 30–50 A
(c) 20–30 A (d) below 20 A

229. Increased heat due to shorter arc is harmful owing to
(a) burn through. (b) excessive porosity.
(c) undercutting of base material.
(d) all of the above.

230. Arc blow results in
(a) non-uniform weld beads.
(b) shallow weld puddle giving rise to weak weld.
(c) splashing out of metal from weld puddle.
(d) all of the above defects.

231. Arc blow effects occurring with dc welding machines can be reduced by
(a) shortening the arc column length.
(b) reducing the welding current or electrode size or rate of travel of the electrode.
(c) wrapping the welding electrode cable a few turns around the work.
(d) all of the above.

232. In an electric welding, major personal hazards are
(a) weld spatter. (b) flying sparks.
(c) harmful infrared and ultraviolet rays from the arc.
(d) all of the above.

233. During electric arc welding as the thickness of the metal to be welded increases
(a) voltage is increased keeping current the same.
(b) current is increased keeping voltage unchanged.
(c) current and voltage, both are increased.
(d) current and voltage, both are reduced.

234. In a dc arc welding
(a) both electrode as well as workpiece are made + ve.
(b) both electode as well as workpiece are made - ve.
(c) electrode is made –ve and workpiece + ve.
(d) electrode is made +ve and workpiece – ve.

235. The length of arc required depends on
(a) kind of electrodes used, its coating and its diameter.
(b) magnitude of current used.
(c) position of welding. (d) all of the above.

236. Overhead welding position is thought to be the most
(a) hazardous. (b) economical.
(c) useful. (d) difficult.

237. In arc welding best results are obtained when arc length is equal to
(a) 25 mm. (b) 19 mm.
(c) diameter of electrode.
(d) double the diameter of the electrode.

238. Flat position welding is cosidered to be the most
(a) easiest and economical. (b) hazardous.
(c) adaptable for welding of both ferrous and non-ferrous metals particularly for cast iron.
(d) both (a) and (c).

239. In direct current straight polarity (DCSP) or electrode negative welding
(a) heavily coated electrodes are used.
(b) base metal penetration is narrow and deep.
(c) electrode is the hottest.
(d) workpiece is relatively cooler.

240. In direct current reverse polarity or electrode positive welding
(a) workpiece is the hottest.
(b) bare and medium coated electrodes can be used.
(c) electrode is the hottest.
(d) base metal penetration is narrow and deep.

241. The electrode is coated in order to
(a) improve bead quality. (b) cleanse the base metal.
(c) provide shielding to weld pool.
(d) prevent atmospheric contamination.

242. In DCRP or electrode positive welding, the heat produced at the electrode is _____ of total heat produced.
(a) one-third. (b) two-third. (c) three-fourth. (d) one-fourth.

243. A 10 SWG electrode usually operates in the current range of
(a) 95–135 A (b) 80–95 A (c) 45–70 A (d) 20–30 A

244. Electrode of 8 SWG is to be employed for welding two 12.5 mm steel plates. The current required will of the order of
(a) 20 A (b) 50 A (c) 150 A (d) 250 A

245. The purpose of coating on arc welding electrodes is to
(a) provide a protective covering.
(b) provide slag for protection of the molten metal.
(c) stabilise the arc. (d) all of the above.

246. 20 per cent duty cycle of a welding machine means
(a) operation of machine for 2 minutes in a duration of 10 minutes.
(b) machine output is 20 per cent of rated output.
(c) machine operates at 20 per cent efficiency.
(d) operation of machine is for 1 minute in a duration of 5 minutes.

247. In carbon arc welding, if the electrode is connected to the + ve terminal of the dc supply
(a) arc will not strike. (b) arc will be dull.

Answers: **222.** (a), **223.** (b), **224.** (c), **225.** (a), **226.** (b), **227.** (c), **228.** (a), **229.** (d), **230.** (d), **231.** (d), **232.** (d), **233.** (b), **234.** (c), **235.** (d), **236.** (a), **237.** (c), **238.** (d), **239.** (b), **240.** (c), **241.** (a), **242.** (b), **243.** (a), **244.** (c), **245.** (d), **246.** (a), **247.** (c),

Downloaded From : www.EasyEngineering.net

(c) carbon arc will have tendency to go in to the weld joint.
(d) metal will not melt.

248. Carbon arc welding has the main drawback of
(a) occurrence of blow holes owing to magnetic arc blow especially while welding near edges of the workpiece.
(b) need of separate filler. (c) necessity of bare electrodes.
(d) fast consumption of electrodes.

249. Carbon arc welding
(a) uses carbon or graphite rod as a negative electrode and work to be welded as a positive.
(b) cannot be done with ac supply.
(c) is not suitable for vertical and overhead welding.
(d) all of the above.

250. Carbon arc welding is suitable particularly for _____ metals.
(a) ferrous. (b) nonferrous. (c) all.

251. For metal arc welding
(a) both dc and ac can be used but ac is preferred.
(b) bare electrodes are no longer used except for automatic welding having arrangement to protect the weld area from the atmosphere.
(c) correct welding current, voltage and speed are very important.
(d) all of the above.

252. The atomic hydrogen welding is based on the principle(s) of
(a) obtaining atomic hydrogen by means of an electric arc between two tungsten electrodes, in an atmosphere of hydrogen at atmospheric pressure.
(b) development of very high temperature by recombination of atoms which occurs in the cooler regions immediately outside the arc.
(c) very large heat conductivity of hydrogen at high temperatures.
(d) all of the above.

253. In atomic hydrogen arc welding
(a) an arc is maintained between two tungsten electrodes.
(b) a stream of hydrogen gas under a pressure of 0.5 kg/cm^2 is passed through the arc and around the electrodes.
(c) ac supply is used.
(d) all of the above.

254. In atomic hydrogen welding, electrodes are of long life. It is because
(a) of being non-pressure process.
(b) of arc being in the shape of a fan.
(c) of ac supply.
(d) two arcs are used at a time.

255. Helium produces
(a) faster welding speeds. (b) deep penetration.
(c) narrower heat affected zone in base metal.
(d) all of the above.

256. In argon arc welding, argon is used as
(a) an agent for heat transfer.
(b) a shield to protect the work from oxidation.
(c) a source of heat. (d) a flux.

257. In argon arc welding, the argon is used to
(a) prevent oxidation of metal by coming in contact with air.
(b) create inert atmosphere around the work.
(c) obviate the necessity for using flux.
(d) all of the above.

258. Submerged arc process is characterized by
(a) high welding current.
(b) exceptionally smooth beads.
(c) deep penetration. (d) all of the above.

259. Electrode is not consumed in case of
(a) TIG welding.
(b) atomic hydrogen arc welding.
(c) MIG welding. (d) all of the above.

260. Unlike TIG welding, MIG welding
(a) needs no post-weld cleansing.
(b) needs no flux.
(c) uses consumable electrodes.
(d) provides complete protection from atmospheric contamination.

261. MIG welding is becoming more and more popular as it
(a) is easy in operation.
(b) has high metal deposite rate.
(c) both (a) and (b).
(d) can be used for both ferrous and nonferrous metals.

262. In MAG (metal active gas) welding the gas used is
(a) argon or helium.
(b) carbon dioxide or its mixture with other gas.
(c) hydrogen. (d) any of the above.

263. A weld bead of wineglass design is produced in
(a) plasma arc welding. (b) MAG welding.
(c) electron beam welding. (d) all of the above.

264. In electro-slag welding, theoretically there is no limit to the
(a) rate of metal deposit. (b) thickness of weld bead.
(c) temperature of salt bath.
(d) rate of slag consumption.

265. In manual arc welding of mild steel, the metal deposition rate will be about
(a) 10–15 kg per hour. (b) 5–10 kg per hour.
(c) 2–5 kg per hour. (d) below 1 kg per hour.

266. In ultrasonic welding, the frequency range is usually
(a) 20–60 kHz (b) 50–100 kHz
(c) 100–200 kHz (d) above 250 kHz

267. Welding is not done directly from the supply mains as
(a) its voltage is too high.
(b) it is impracticable to draw heavy currents directly from the supply mains.
(c) its voltage remains fluctuating.
(d) none of the above.

268. AC welding machine cannot be used for
(a) resistance welding. (b) submerged arc welding.
(c) MIG welding. (d) atomic hydrogen welding.

269. In electric welding, arc blow can be avoided by
(a) using ac machines. (b) increasing arc length.
(c) using bare electrodes.
(d) welding away from ground connections.

270. Welding leads have
(a) high current carrying capacity.
(b) high flexibility. (c) both (a) and (b).
(d) none of the above.

271. The welding load
(a) is always intermittent.
(b) is always continuous and constant.

Answers: **248.** (a), **249.** (d), **250.** (b), **251.** (d), **252.** (d), **253.** (d), **254.** (c), **255.** (d), **256.** (b), **257.** (d), **258.** (d), **259.** (a), **260.** (c), **261.** (c), **262.** (b), **263.** (a), **264.** (b), **265.** (c), **266.** (a), **267.** (b), **268.** (c), **269.** (a), **270.** (c), **271.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) is always continuous but varying.
(d) may be any one of the above.

272. The load power factor using welding transformer depends on
(a) arc length. (b) material to be welded.
(c) type of electrode to be used.
(d) all of the above.

273. For power factor correction in a welding circuit, a capacitor is usually connected
(a) across the mains.
(b) across secondary side of welding transfomer.
(c) across primary side of welding transformer.
(d) across arcing electrodes.

274. Which of the following is different from the remaining ?
(a) Butt welding. (b) Electro-slag weiding.
(c) TIG welding. (d) MIG welding.

275. Chipping hammers are used
(a) for slag welding.
(b) for aligning the pieces to be welded.
(c) for removing slag from welding.
(d) for marking spots to be welded.

276. The danger of electric shock is maximum
(a) before welding. (b) during arcing.
(c) while inserting electrode into the holder.
(d) after welding.

277. The eyes of welding operator must be protected against
(a) infrared radiations. (b) ultraviolet radiations.
(c) both (a) and (b). (d) solar radiations.

278. Which of the following automatic welding processes is likely to give maximum rate of metal deposition ?
(a) Multiple power submerged arc.
(b) Gas shielded bare wire.
(c) Single wire submerged arc.
(d) Continuous flux covered electrode.

279. In a welded joint poor fusion is on account of
(a) improper current. (b) high welding speed.
(c) uncleaned metal surface.
(d) lack of flux.

280. Which of the following uses consumable electrodes?
(a) TIG. (b) MIG.
(c) laser. (d) None of the above.

281. In which of the following welding methods the molten metal is poured for joining the metals?
(a) Gas welding. (b) Thermit welding.
(c) TIG welding. (d) Arc welding.

282. The porosity of weld joint may be caused by
(a) poor base metal. (b) incorrect size of electrode.
(c) low welding current. (d) any of the above.

283. In welding, weld spatter defect is generally because of too _____ during welding.
(a) high voltage (b) high current
(c) low voltage (d) low current

284. High temperature metals, such as columbium can be easily welded by
(a) MIG welding. (b) TIG welding.
(c) electron beam welding. (d) flash butt welding.

285. _____ welding is used for welding of car body.
(a) Gas (b) Spot
(c) Carbon-arc (d) Atomic hydrogen

286. Grey iron is usually welded by
(a) gas welding. (b) resistance welding.
(c) TIG welding. (d) arc welding.

287. The method recommended for the welding of aluminium alloy is ..... welding.
(a) dc arc (b) ac arc
(c) acetylene-oxygen gas (d) tungsten arc

288. Steel pipes are manufactured by
(a) arc welding. (b) argon arc welding.
(c) resistance welding. (d) thermit welding.

289. Steel rails are welded by
(a) thermit welding. (b) argon arc welding.
(c) gas welding. (d) resistance welding.

290. Aluminium is difficult to weld as
(a) it has an oxide coating.
(b) it conducts away heat very rapidly.
(c) both (a) and (b). (d) none of the above.

291. Electronic components are joined by
(a) spot welding. (b) soldering.
(c) brazing. (d) none of the above.

292. Aircraft body is
(a) rivetted. (b) seam welded.
(c) gas welded. (d) spot welded.

293. A seamless pipe has
(a) arc welded joint. (b) spot welded joint.
(c) no joint. (d) either (a) or (b).

294. The method usually not preferred for welding of chromium molybdenum steel is
(a) thermit welding. (b) resistance welding.
(c) submerged arc welding.
(d) oxyacetelyne gas welding.

295. Light
(a) is a form of heat energy.
(b) is a form of electrical energy.
(c) consists of electromagnetic waves.
(d) consists of shooting particles.

296. Radiant efficiency of the luminous source depends on
(a) temperature of the source.
(b) wavelength of light rays.
(c) shape of the source. (d) all of the above.

297. A substance which changes its electrical resistance when illuminated by light is called
(a) photoconductive. (b) photovoltaic.
(c) photoelectric. (d) none of the above.

298. Materials which reflect all wavelength in the spectrum of light appear to be
(a) opaque. (b) transparent.
(c) black to white. (d) green to red.

299. An object, which appears red to the eyes, absorbs
(a) blue radiations. (b) violet radiations.
(c) green radiations. (d) all of the above.

300. The sensors in the eye are known as
(a) retina and antenna. (b) wires and nerves.
(c) rodes and cones. (d) none of the above.

Answers: **272.** (b), **273.** (c), **274.** (a), **275.** (c), **276.** (c), **277.** (c), **278.** (a), **279.** (a), **280.** (b), **281.** (b), **282.** (a), **283.** (b), **284.** (c), **285.** (b), **286.** (a), **287.** (d), **288.** (c), **289.** (a), **290.** (c), **291.** (b), **292.** (a), **293.** (c), **294.** (b), **295.** (c), **296.** (a), **297.** (a), **298.** (c), **299.** (d), **300.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

301. The colour temperature of daylight is about
(a) 100 K (b) 200 K (c) 500 K (d) 600 K

302. Sky appears blue due to
(a) radiation. (b) reflection.
(c) refraction.
(d) scattering of light over dust particles.

303. Colour of light depends upon
(a) velocity of light. (b) frequency.
(c) wavelength. (d) both (b) and (c).

304. The wave length of 5,500 Å will give light of
(a) green colour. (b) red colour.
(c) orange colour. (d) yellow-green colour.

305. Which of the following colour has wavelength between blue and yellow ?
(a) Violet. (b) Orange. (c) Red. (d) Green.

306. Luminous flux is
(a) the rate of energy radiation in the form of light waves.
(b) the part of light energy, radiated by Sun that is received on earth.
(c) measured in lux.

307. Candle power is
(a) the luminous flux emitted by the source per unit solid angle.
(b) the light radiating capacity of a source in a given direction.
(c) the unit of illumination.

308. Glare is caused due to
(a) excessive luminance.
(b) excessive lighting contrast in the field of vision.
(c) either (a) or (b).

309. A perfect diffuser surface is one that
(a) transmits all the incident light.
(b) absorbs all the incident light.
(c) diffuses all the incident light.
(d) all of the above.

310. The illumination at a surface due to a source of light placed at a distance 'd' from the surface varies as
(a) $1/d^2$ (b) $1/d$ (c) d (d) d^2

311. The illumination at various points on a horizontal surface illuminated by the same source varies as
(a) $\cos\theta$ (b) $\cos^2\theta$ (c) $\cos^3\theta$ (d) $1/\cos\theta$

312. Carbon arc lamps are commonly used in
(a) cinema projectors. (b) domestic lighting.
(c) factory lighting. (d) street lighting.

313. Fine diameter tungsten wires are made by
(a) turning. (b) wire drawing.
(c) swaging. (d) compressing.

314. The melting point of tungsten is
(a) 3,400°C (b) 2,800°C (c) 2,600°C (d) 2,400°C

315. The vacuum inside an incandescent lamp is of the order of
(a) 10^{-2} mm Hg (b) 10^{-4} mm Hg
(c) 10^{-6} mm Hg (d) 10^{-8} mm Hg

316. The rate of evaporation of tungsten filament in a lamp depends upon
(a) exhaust tube diameter. (b) glass shell diameter.
(c) vapour pressure inside. (d) none of the above.

317. Heat from the lamp filament is transmitted to the surrounding mainly through
(a) circulation. (b) conduction.
(c) convection. (d) radiation.

318. Which of the following material is most commonly used for the filaments in incandscent lamps ?
(a) Tungsten. (b) Osmium.
(c) Tantalum. (d) Silver.

319. A zero watt lamp consumes power of
(a) zero watt. (b) 5–10 W.
(c) about 15 W. (d) about 25 W.

320. The safe operating temperature of a tungsten filament lamp is
(a) 1,000°C (b) 2,000°C
(c) 3,000°C (d) 3,500°C

321. The output of a tungsten filament depends on
(a) size of the shell. (b) size of the lamp.
(c) temperature of filament. (d) all of the above.

322. What percentage of the input energy is radiated by filament lamps ?
(a) 60–70 per cent. (b) 40–50 per cent.
(c) 25–30 per cent. (d) 10–15 per cent.

323. An electric bulb, when broken, produces bang. It is on account of
(a) vacuum inside the bulb.
(b) pressure inside is equal to that outside.
(c) pressure of air in the bulb. (d) none of the above.

324. In an incandescent lamp, bird cage filament is usually used in vacuum bulb so as to
(a) increase the life span of the filament.
(b) give uniform radiations.
(c) reduce the oxidation phenomenon.
(d) reduce the convection losses.

325. Filament lamps normally operate at a power factor of
(a) 0.5 lagging. (b) 0.8 lagging.
(c) unity. (d) 0.85 leading.

326. Most affected parameter of a filament lamp due to variation in operating voltage is
(a) life. (b) light output.
(c) luminous efficiency. (d) wattage.

327. The lumens output of an incandescent lamp with the variation in operating voltage is given as lumens output $\alpha\ V^n$ where n is a constant. The value of n for tungsten is
(a) from 1.0 to 2.2 (b) from 3 to 4
(c) from 8 to 10 (d) from 10 to 12

328. Which gas is sometimes used in filament lamps ?
(a) Nitrogen. (b) Carbon dioxide.
(c) Argon. (d) Krypton.

329. Which of the following vapour/gas will give yellow colour in a filament lamp ?
(a) Helium. (b) Mercury. (c) Magnesium. (d) Sodium.

330. Magnesium vapour in a filament lamp gives
(a) green colour light. (b) pink colour light.
(c) blue colour light. (d) white colour light.

331. The gas used in a gas-filled filament lamp is
(a) helium. (b) oxygen. (c) nitrogen. (d) ozone.

332. In filament lamps, coiled coil filaments are used in
(a) coloured lamps. (b) gas-filled lamps.
(c) low wattage lamps. (d) higher wattage lamps.

Answers: **301.** (d), **302.** (d), **303.** (d), **304.** (d), **305.** (d), **306.** (a), **307.** (b), **308.** (c), **309.** (d), **310.** (a), **311.** (c), **312.** (a), **313.** (b), **314.** (a), **315.** (b), **316.** (c), **317.** (d), **318.** (a), **319.** (b), **320.** (c), **321.** (c), **322.** (d), **323.** (a), **324.** (b), **325.** (c), **326.** (a), **327.** (b), **328.** (c), **329.** (d), **330.** (a), **331.** (c), **332.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

333. In electric discharge lamps, light is produced by
(a) magnetic effect of current.
(b) heating effect of current. (c) cathode ray emission.
(d) ionisation in a gas or vapour.

334. In electric discharge lamps for stabilization of arc
(a) a choke is connected in series with the supply.
(b) a variable resistance is connected in series with the circuit.
(c) a condenser is connected across the supply.
(d) any of the above.

335. Glow lamps
(a) have hot cathode. (b) have cold cathode.
(c) draw more power. (d) cannot withstand shocks.

336. Halogen lamps have the advantage(s) of
(a) reduced dimensions of the lamp.
(b) better colour rendition and longer life (about 2,000 hours).
(c) high operating temperature with increased luminous efficiency.
(d) all of the above.

337. The filament of a GLS lamp is made of
(a) aluminium. (b) tungsten.
(c) carbon. (d) copper.

338. Which of the following is not the GLS lamp of the standard rating ?
(a) 15 W (b) 40 W (c) 75 W (d) 100 W

339. The luminous efficiency of GLS lamps is normally in the range of _____ lumens/watt.
(a) 100 to 150 (b) 75 to 100
(c) 50 to 75 (d) 10 to 18

340. Nitrogen or argon is filled in GLS lamps so as to
(a) retard evaporation of tungsten filament.
(b) improve efficiency.
(c) change the colour of the light.
(d) reduce the glare.

341. In case of frosted GLS lamps, frosting of shell is done by
(a) acid etching. (b) ammonia.
(c) ozone. (d) salt water.

342. In case of GLS lamps the increase in supply voltage reduces
(a) power consumption. (b) lumens output.
(c) life. (d) efficiency.

343. Sodium vapour lamp needs an ionisation voltage of about
(a) 5 V (b) 20 V (c) 50 V (d) 100 V

344. The ignition voltage for a sodium lamp is about
(a) 100–125 V (b) 200–240 V
(c) 300–400 V (d) 400–600 V

345. When a sodium vapour lamp is switched on, initially the colour is
(a) red. (b) pink. (c) yellow. (d) blue.

346. The colour of light given out by a sodium vapour discharge lamp is
(a) pink. (b) bluish green. (c) yellow. (d) blue.

347. An auto-transformer used with a sodium vapour lamp should have
(a) high step-up ratio. (b) high step-down ratio.
(c) high leakage reactance. (d) high resistance.

348. Leak transformer in a sodium vapour lamp initially provides
(a) high current. (b) low voltage.
(c) high voltage.

349. In a sodium vapour discharge lamp the neon gas
(a) changes the colour of light.
(b) prevents vapourization of filament.
(c) acts as a shield around the filament.
(d) assists in developing enough heat to vapourize the sodium.

350. The capacitor is used in auto-transformer circuit of a sodium vapour lamp in order to
(a) regulate discharge voltage.
(b) improve the circuit power factor.
(c) control lamp illumination level.
(d) protect the lamp against over-voltage.

351. The sodium vapour lamp
(a) is only suitable for ac and so needs choke control.
(b) needs capacitor in its auto-transformer circuit to improve the power factor which is very low (about 0.3 lagging).
(c) comes up to its rated output in approximately 15 minutes.
(d) all of the above.

352. The luminous efficiency of a sodium vapour lamp is _____ lumens per watt.
(a) 40-50 (b) 50-100 (c) 120-200 (d) 10-12

353. Phosphor zinc silicate produces light of
(a) pink colour. (b) green colour.
(c) red colour. (d) yellow colour.

354. A mercury vapour lamp gives light of
(a) pink colour. (b) yellow colour.
(c) greenish-blue colour. (d) red colour.

355. High pressure mercury vapour lamps
(a) are similar in construction to sodium vapour lamps.
(b) need 4 or 5 minutes to attain full brilliancy.
(c) are generally used for general industrial lighting, railway yards, work areas, shoping centres etc.
(d) all of the above.

356. In high pressure mercury vapour lamps
(a) the main electrodes are made of tungsten wire in the form of helix.
(b) the choke is provided to limit the current to a safe value.
(c) in addition to two main electrodes a starting (auxiliary) electrode is connected through a high resistance .
(d) all of the above.

357. The luminous efficiency of high pressure mercury vapour lamps ranges from _____ lumens per watt.
(a) 30 to 40 (b) 60 to 100 (c) 100 to 150 (d) 250 to 400

358. In mercury iodide lamps
(a) a number of iodides are added, in addition to mercury, to fill up the gaps in the light spectrum.
(b) a separate ignition device, in addition to the choke, is provided.
(c) both (a) and (b). (d) none of the above.

359. Mercury iodide lamps
(a) are similar in construction to high pressure mercury vapour lamps.
(b) have luminous efficiency of the order of 80 lumens per watt.
(c) are suitable for applications in the field of floodlighting, industrial lighting and public lighting.
(d) all of the above.

360. Which of the following lamps is a cold cathode lamp ?
(a) Sodium vapour lamp. (b) Neon lamp.
(c) Mercury vapour lamp. (d) None of the above.

Answers: **333.** (d), **334.** (a), **335.** (b), **336.** (d), **337.** (b), **338.** (c), **339.** (d), **340.** (a), **341.** (b), **342.** (c), **343.** (a), **344.** (d), **345.** (b), **346.** (c), **347.** (c), **348.** (c), **349.** (d), **350.** (b), **351.** (d), **352.** (a), **353.** (b), **354.** (c), **355.** (d), **356.** (d), **357.** (a), **358.** (c), **359.** (d), **360.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

361. Neon lamps
(a) are of the size of ordinary incandescent lamps.
(b) have power consumption of the order of 5 watts.
(c) are used as indicator lamps, night lamps, for determination of polarity of dc mains.
(d) all of the above.

362. In neon signs argon gas is used to give
(a) red colour. (b) blue colour.
(c) pink colour. (d) green colour.

363. In neon signs, neon with a mixture of mercury is used to give
(a) blue colour. (b) green colour.
(c) pink colour. (d) yellow colour.

364. The electrodes of neon tube work at
(a) very low temperatures. (b) ordinary voltage.
(c) 2 kV to 6 kV. (d) 33 kV.

365. Neon tubes are widely used for
(a) advertising. (b) indoor lighting.
(c) road signalling. (d) airport lighting.

366. The vapour discharge tube used for domestic light has
(a) one filament. (b) two filaments.
(c) four filaments. (d) no filament.

367. The fluorescent tube is coated from inside with a thin layer of fluorescent material in the form of powder in order to
(a) absorb invisible ultraviolet rays and radiate visible rays.
(b) improve the appearance.
(c) reduce glare. (d) improve life.

368. A stabilising choke is connected in the fluorescent tube circuit so as to
(a) reduce the flicker.
(b) act as a ballast in operating conditions and provide a voltage impulse for starting.
(c) act as a starter. (d) avoid radio-interference.

369. A capacitor is connected across the fluorescent tube circuit in order to
(a) eliminate the noise. (b) limit the current.
(c) improve the power factor of the tube circuit.
(d) all of the above.

370. Which of the following is present inside the fluorescent tube ?
(a) Helium and oxygen. (b) Argon and neon.
(c) Argon and carbon dioxide.
(d) Mercury vapour.

371. In a fluorescent tube, a ballast resistance is connected in series with the choke
(a) when the tube is operated on dc supply.
(b) when the tube is operated on ac supply.
(c) to reduce radio-interference.
(d) to reduce stroboscopic effects.

372. For operation of fluorescent tube on dc supply the additional device incorporated in the tube circuit is a
(a) transformer. (b) resistor. (c) inductor.

373. The light of fluorescent tube appears cooler than that from an incandescent lamp. This is due to the fact that
(a) the tube consumes less power.
(b) surface area of tube is larger than that of the incandescent lamp.
(c) tungsten is not used in the tube .
(d) none of the above.

374. Sometimes the wheels of the rotating machinery, in fluorescent tube lighting, appear to be stationary . This is due to
(a) luminescence effect. (b) light fluctuations.
(c) stroboscopic effect. (d) all of the above.

375. The flicker effect of fluorescent lamps is more pronounced at
(a) lower voltages. (b) higher voltages.
(c) higher frequencies. (d) lower frequencies.

376. The frequency of flickers in a fluorescent tube operating at 220 V, 50 Hz supply is
(a) 200 per second. (b) 100 per second.
(c) 50 per second. (d) 25 per second.

377. Standard wattage of a 1 m fluorescent tube is
(a) 25 W (b) 65 W (c) 80 W (d) 100 W

378. A fluorescent tube can be operated on
(a) both dc as well as ac.
(b) ac only. (c) dc only.
(d) satisfactorily only on dc.

379. Radio-interference from a fluorescent tube can be reduced by
(a) eliminating choke.
(b) connecting a small capacitor across starter terminals.
(c) putting two tubes in parallel..
(d) any of the above.

380. In a mercury vapour lamp light, red objects appear black. This is on account of
(a) colour mixing.
(b) high wavelengths of red colour.
(c) absence of red light from lamp radiations.
(d) absorption of red light by the lamp.

381. Blinking of a fluorescent tube may be on account of
(a) low circuit voltage. (b) loose contact.
(c) defective starter. (d) any of the above.

382. The cost of a fluorescent tube is more than that of an incandescent lamp on account of
(a) more components in the tube.
(b) more quantity of glass in the tube.
(c) more labour required. (d) all of the above.

383. The life of a fluorescent tube is affected by
(a) low voltage. (b) high voltage.
(c) frequency of switching and blinking.
(d) all of the above.

384. The disadvantage(s) of fluorescent tubes in comparison to filament lamps is/are
(a) high cost. (b) noise in choke.
(c) stroboscopic effect. (d) all of the above.

385. The ratio of radiant heat produced by a fluorescent tube and that by a filament lamp of the same rating is
(a) 0.2 (b) 0.35 (c) 0.6 (d) 0.75

386. The lamp that cannot sustain much voltage fluctuations is
(a) sodium vapour lamp. (b) mercury vapour lamp.
(c) incandescent lamp. (d) mercury iodide lamp.

387. The lamp that gives nearly ultraviolet light is
(a) carbon arc lamp. (b) vacuum type filament lamp.
(c) argon gas filled filament lamp.
(d) all of the above.

388. For the same wattage the cheapest lamp is
(a) sodium vapour lamp. (b) GLS lamp.
(c) halogen lamp. (d) fluorescent tube.

Answers: **361.** (d), **362.** (a), **363.** (b), **364.** (c), **365.** (a), **366.** (b), **367.** (a), **368.** (b), **369.** (c), **370.** (d), **371.** (a), **372.** (b), **373.** (c), **374.** (c), **375.** (d), **376.** (b), **377.** (a), **378.** (a), **379.** (b), **380.** (c), **381.** (d), **382.** (d), **383.** (d), **384.** (d), **385.** (a), **386.** (c), **387.** (a), **388.** (b),

Downloaded From : www.EasyEngineering.net

389. Power factor is highest in case of
(a) sodium vapour lamp. (b) mercury vapour lamp.
(c) incandescent lamp. (d) neon lamp.

390. The lamp which gives nearly monochromatic light is
(a) sodium vapour lamp. (b) mercury vapour lamp.
(c) tungsten filament lamp. (d) fluorescent tube.

391. The lamp that does not have separate choke is
(a) mercury vapour lamp. (b) sodium vapour lamp.
(c) fluorescent tube. (d) all of the above.

392. For the same wattage the lamp that will produce minimum radiant heat is
(a) sodium vapour lamp. (b) fluorescent lamp.
(c) tungsten filament lamp. (d) mercury vapour lamp.

393. The lamp/tube preferred for air-conditioned spaces is
(a) sodium vapour lamp. (b) mercury vapour lamp.
(c) fluorescent tube. (d) GLS lamp.

394. The lamp that causes radio-interference is
(a) fluorescent tube. (b) halogen lamp.
(c) mercury vapour lamp. (d) all of the above.

395. The lamp that cannot be used for dimming is
(a) cold cathode lamp. (b) fluorescent lamp.
(c) GLS lamp. (d) all of the above.

396. Which of the following application does not require ultraviolet lamps ?
(a) Aircraft cockpit dashboard lighting.
(b) Blue print machines. (c) Car lighting.
(d) None of the above.

397. Floodlighting is not used for
(a) industrial purposes. (b) advertising purposes.
(c) aesthetic purposes. (d) any of the above.

398. The lumens emitted from a 100 W incandescent lamp will not increase if
(a) supply voltage is increased.
(b) filament temperature is increased.
(c) the diameter of the glass shell is increased.
(d) any of the above.

399. Total flux required in any lighting scheme depends inversely on
(a) surface area. (b) space-height ratio.
(c) illumination. (d) coefficient of utilisation.

400. To avoid glare
(a) object should be viewed from a distance.
(b) object should be moved constantly.
(c) object should be viewed from a close vicinity.
(d) viewer should move constantly.

401. The illumination level on a surface is least affected by
(a) candle power of light source.
(b) ambient temperature.
(c) type of reflector used.
(d) distance of the light source.

402. Desired illumination level on the working plane depends upon
(a) age group of observers.
(b) whether the object is stationary or moving.
(c) size of the object to be seen and its distance from the observer.
(d) all of the above.

403. Which of the following will need the highest level of illumination ?
(a) Living room. (b) Kitchen.
(c) Proof reading. (d) Hospital wards.

404. Which of the following will need the lowest level of illumination ?
(a) Workshop. (b) Displays.
(c) Railway platform. (d) Garage.

405. The illumination level in houses is in the range of
(a) 20–50 lux. (b) 100–200 lux.
(c) 300–500 lux. (d) 700 lux.

406. The illumination level required for precision work is about
(a) 500–1,000 lux. (b) 250 lux.
(c) 100 lux. (d) 50 lux.

407. The illumination level required for important traffic routes carrying fast traffic is about
(a) 30 lux. (b) 100 lux.
(c) 200 lux. (d) 5 lux.

408. Illumination due to moon light is about
(a) 0.03 lumen/m^2. (b) 0.3 lumen/m^2.
(c) 30–50 lumens/m^2. (d) 300–500 lumens/m^2.

409. The luminous flux reaching the working plane least depends on
(a) proportion of the room.
(b) the lumen output of the lamps.
(c) colour of the working plane surface.
(d) reflectance of internal surfaces.

410. The depreciation factor depends upon
(a) ageing of the lamp(s). (b) lamp cleaning schedule.
(c) type of work carried out at the premises.
(d) all of the above.

411. Utilisation factor depends upon
(a) size of the room.
(b) space-height ratio of the lamps.
(c) colour of walls/ceiling. (d) all of the above.

412. Glare is reduced by
(a) increasing the mounting height of the lamp.
(b) using diffusers.
(c) using reflectors to cut-off the light at certain angle.
(d) all of the above.

413. The glass that transmits the maximum light is
(a) clear glass. (b) milk glass.
(c) serrated glass. (d) opalescent glass.

414. The glass that transmits the least amount of light is
(a) clear glass. (b) milk glass.
(c) serrated glass. (d) opalescent glass.

415. The surface that has the lowest reflection factor for white light is
(a) white oil paint. (b) white plaster work.
(c) blue curtains. (d) aluminium sheet.

416. The lamp is provided with a reflector in order to
(a) avoid glare. (b) provide better illumination.
(c) protect the lamp. (d) all of the above.

417. Reflectors are provided with slits at the top so as to
(a) reduce heating effect. (b) reduce colour effect.
(c) introduce chimney effect for cleaning.
(d) all of the above.

418. Heat from light source is particularly of importance in
(a) designing for air-conditioning.
(b) designing for illumination level.
(c) designing for floor space utilization.
(d) all of the above.

Answers: **389.** (c), **390.** (a), **391.** (b), **392.** (b), **393.** (c), **394.** (a), **395.** (b), **396.** (c), **397.** (a), **398.** (c), **399.** (b), **400.** (a), **401.** (b), **402.** (d), **403.** (c), **404.** (c), **405.** (b), **406.** (a), **407.** (a), **408.** (b), **409.** (c), **410.** (d), **411.** (d), **412.** (d), **413.** (a), **414.** (b), **415.** (c), **416.** (d), **417.** (d), **418.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

419. Dimming systems for lights are used in
(a) auditoriums. (b) theatres.
(c) ball room. (d) all of the above.

420. The voltage required to pass the necessary current through an electrolytic cell is of the order of
(a) 1–2 V (b) 10–20 V
(c) 100–120 V (d) 150–200 V

421. The energy consumption for production of ammonium sulphate is of the order of
(a) 2,000–2,500 kWh/tonne. (b) 3,000–4,000 kWh/tonne.
(c) 4,000–7,000 kWh/tonne. (d) 70–80 kWh/tonne.

422. Materials used for copper plating are
(a) copper suiphate and sulphuric acid.
(b) copper sulphate and nitric acid.
(c) copper carbonate and ammonium carbonate.
(d) copper nitrate and sulphuric acid.

423. Materials used for chromium plating are
(a) chromium carbonate and sulphuric acid.
(b) chromic acid and sulphuric acid.
(c) chromium chloride and hydrochlroride acid.
(d) none of the above.

424. The gold plating is carried out
(a) with a current density of 150–250 A/m^2 at a voltage of 1–2 V.
(b) with a current density of 50–150 A/m^2 at a voltage of 5–15 volts.
(c) with a current density of 100–150 A/m^2 at a voltage of 1–4 volts.
(d) with a current density of 50–150 A/m^2 at a voltage of 1 volt.

425. Power supply required for electrolytic processes is
(a) alternating current (100–200 A) at very low voltage (10 or 12 V).
(b) direct current (100–200 A) at very high voltage.
(c) direct current (100–200 A) at very low voltage (10 or 12 V).
(d) alternating current at very high voltage.

426. The plants for extraction and refining of metals or large scale manufacturing are located near the
(a) atomic power station. (b) hydroelectric power station.
(c) steam power station.
(d) either atomic power station or hydroelectric power station.

427. The process of coating of a metallic surface with a harder metal by electrodepostion is called
(a) electrofacing. (b) electroforming.
(c) electrometallisation. (d) either (a) or (b).

428. Basically electroplating means
(a) formation of ions by two metallic plates in the acidic liquid.
(b) electrodeposition of metal on electrodes.
(c) electrodeposition of metal upon metallic surfaces.
(d) none of the above.

429. Electroplating is done for
(a) replacement of worn out material.
(b) protection of metals against corrosion.
(c) giving a shining appearance to articles.
(d) all of the above.

430. The preparation of an object for electroplating involves the
(a) removal of oil, grease or other organic material.
(b) removal of rust, scale, oxides, or other inorganic coatings adhering to the metal.
(c) mechanical preparation of the metal surface by polishing, buffing etc.
(d) any or all of the above operations.

431. A one tonne refrigerating machine means that
(a) the total weight of the machine is one tonne.
(b) the quantity of the refrigerant used is one tonne.
(c) one tonne of water can be converted into ice.
(d) one tonne of ice when melts from and at 0°C in 24 hours, the refrigerating effect is equivalent to 14,000 kJ per hour.

432. The capacity of a refrigerating machine is expressed as
(a) inside volume of the cabinet.
(b) lowest temperature attained.
(c) gross weight of machine in tonnes.
(d) rate of abstraction of heat from the space being cooled.

433. Which of the following properties of a refrigerant is undesirable ?
(a) High critical temperature.
(b) Low specific heat of liquid.
(c) High boiling point.
(d) Low specific volume of vapour.
(e) High latent heat of vapourisation.

434. Various desirable properties which should be possessed by refrigerants are
(a) non-corrosive and non-inflammability.
(b) no-toxic and freedom from objectionable odour with low working pressure.
(c) both (a) and (b). (d) none of the above.

435. In a refrigeration cycle, the flow of refrigerant is controlled by
(a) compressor. (b) expansion valve.
(c) condenser. (d) evaporator.

436. Which part of the vapour compression refrigeration cycle, produces the refrigeration effect ?
(a) Evaporator. (b) Condenser.
(c) Expansion valve. (d) Compressor.

437. _____ is used as refrigerant in a vapour absorption refrigerator.
(a) Acqua ammonia (b) Freon
(c) Water (d) Sulphur dioxide

438. The refrigerant Freon 12 is a compound consisting of
(a) carbon, fluorine and chlorine.
(b) carbon, chlorine and hydrogen.
(c) carbon, fluorine and hydrogen.
(d) chlorine, bromine and iodine.

439. Ammonia is preferred as a refrigerant in large commercial installations because
(a) it is non-tonic.
(b) it has a low working pressure.
(c) it is relatively cheap. (d) it has low latent heat.

440. In a vapour compression system, which of the following units is adversely affected by the presence of moisture ?
(a) Evaporator. (b) Expansion valve.
(c) Compressor. (d) Condenser.

441. In a vapour absorption system lithium bromide is used as
(a) refrigerant. (b) lubricant.
(c) absorbent. (d) cooling substance.

442. Vapour absorption refrigeration systems have the advantage(s) of
(a) absence of moving parts.
(b) universal power source.
(c) automatic defrostration. (d) both (a) and (b).

443. Thermoelectric refrigeration system has the advantage(s) of
(a) small initial cost. (b) absence of moving parts.

Answers: **419.** (d), **420.** (a), **421.** (a), **422.** (a), **423.** (b), **424.** (b), **425.** (c), **426.** (d), **427.** (a), **428.** (c), **429.** (d), **430.** (d), **431.** (d), **432.** (d), **433.** (c), **434.** (c), **435.** (b), **436.** (a), **437.** (a), **438.** (a), **439.** (b), **440.** (b), **441.** (c), **442.** (d), **443.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) ease of automatic control by variation of magnitude of current.
(d) both (b) and (c).

444. In a domestic refrigerator, compressor and motor are assembled in a single unit known as _____ sealed unit.
(a) hermetically (b) homogeneously
(c) heterogeneousiy (d) none of these

445. Hermetically sealed units have the advantage(s) of
(a) relatively silent operation.
(b) minimum gas leakage problem because no moving part extends through the sealing housing.
(c) minimum maintenance requirement.
(d) all of the above.

446. Which of the following motors is used in household refrigerators ?
(a) DC shunt motor. (b) Reluctance motor.
(c) Single phase induction motor.
(d) Synchronous motor.

447. The compressor of a domestic refrigerator has been noted to run for comparatively large durations, it indicates that
(a) thermostat has become defective.
(b) the machine is overloaded.
(c) capillary tube is choked.
(d) none of the above.

448. In a refrigerator, defrosting may be done by
(a) opening the door of the refrigerator.
(b) stopping the compressor for a while.
(c) placing trays of warm waters in the refrigerator.
(d) any of the above.

449. Types of water coolers are
(a) instantaneous or pressure type.
(b) storage type. (c) exhaust fan type.
(d) both (a) and (b).

450. Air-conditioning is the simultaneous control of _____ in a confined space.
(a) temperature (b) humidity
(c) air movement
(d) temperature, humidity, purity and movement of air

451. _____ is a process which is generally used for summer air-conditioning.
(a) Cooling with dehumidification
(b) Chemical dehumidification
(c) Adiabatic cooling
(d) Cooling with humidification

452. _____ is a process that is generally used in winter air-conditioning.
(a) Humidification (b) Dehumidification
(c) Heating and humidification
(d) Heating and dehumidification

453. Air is dehumidified by
(a) cooling. (b) chemical absorption.
(c) heating. (d) both (a) and (b).

454. Compared to individual systems, the central air-conditioning system has _____ overall efficiency.
(a) higher (b) lower (c) same (d) unpredictable

455. The main disadvantage(s) of central type air-conditioning s/are that
(a) dusting is very costly.
(b) absence of any individual room temperature adjustments.
(c) cigarette smoke and bacteria present in the return air from infected rooms redistribute to healthy rooms.
(d) all of the above.

456. Which of the following unitary-central systems are in common use ?
(a) Fan coil units. (b) Induction units.
(c) All air high velocity systems.
(d) All of the above.

457. The conditions conductive to comfort depends upon _____
(a) humidity (b) temperature
(c) air movement (d) air purity
(e) all of the above factors

458. Main traction systems used in India are those using _____ locomotives.
(a) steam engine (b) diesel engine
(c) diesel-electric (d) electric
(e) all of the above

459. The steam engine provided on steam locomotive is
(a) double acting condensing type.
(b) double acting non-condensing type.
(c) single acting condensing type.
(d) single acting non-condensing type.

460. In case of steam locomotives the tractive effort is provided by
(a) double cylinder, double acting steam engine.
(b) double cylinder, single acting steam engine.
(c) single cylinder, double acting steam engine.
(d) single cylinder, single acting steam engine.

461. In case of a steam locomotive an average coal consumption per km of run is around
(a) 5–10 kg (b) 25–30 kg
(c) 60–80 kg (d) 100–150 kg

462. The pressure of steam used in steam locomotives is about
(a) 1–5 kgf/cm^2 (b) 5–10 kgf/cm^2
(c) 10–15 kgf/cm^2 (d) 20–30 kgf/cm^2

463. The maximum horse power of steam locomotive is
(a) up to 1,500 (b) 1,500–2,000
(c) 2,000–3,000 (d) 3,000–4,000

464. The speed of a steam locomotive is controlled by
(a) applying brakes. (b) gearbox.
(c) regulating steam flow to engine.
(d) flywheel.

465. The pulsating torque exerted by steam locomotives causes
(a) jolting and skidding. (b) hammer blow.
(c) pitching. (d) all of the above.

466. Steam engine drive
(a) has limited overload capacity.
(b) is not clean drive.
(c) is not suitable for urban or suburban services or for hauling heavy loads on steep gradients.
(d) all of the above..

467. Steam locomotives
(a) cannot be put into service at any moment.
(b) cause considerable wear on the track.
(c) need more repair and maintenance.
(d) all of the above.

468. Steam engine drive is not suitable for urban and suburban services as
(a) it is not clean drive.
(b) coefficient of adhesion of steam locomotives is quite low.
(c) steam locomotive causes considerable wear on the track.
(d) steam locomotive has limited speed.

Answers: **444.** (a), **445.** (d), **446.** (c), **447.** (b), **448.** (d), **449.** (d), **450.** (d), **451.** (a), **452.** (c), **453.** (d), **454.** (a), **455.** (c), **456.** (d), **457.** (e), **458.** (e), **459.** (b), **460.** (a), **461.** (b), **462.** (c), **463.** (a), **464.** (c), **465.** (a), **466.** (d), **467.** (d), **468.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

469. Direct internal combustion drive
(a) has higher maintenance and operating costs.
(b) has no starting torque and needs some auxiliary means for its starting.
(c) has shorter life of propulsive equipment.
(d) all of the above.

470. Diesel electric traction has comparatively limited overload capacity because
(a) diesel engine is a constant output prime mover.
(b) diesel engine has shorter life span.
(c) regenerative braking cannot be employed.
(d) diesel-electric locomotive is heavier than an ordinary electric locomotive.

471. The range of horse power of diesel locomotives is
(a) 100–500 (b) 1,500–2,500
(c) 3,000–4,500 (d) 4,500–5,000

472. In India, diesel locomotives are manufactured at
(a) Varanasi. (b) Kolkata. (c) Bangalore. (d) Ajmer.

473. In diesel-electric drive
(a) initial investment required is low.
(b) locomotive and train is a self-contained unit.
(c) power loss in speed control is low.
(d) all of the above.

474. Battery driven vehicles
(a) are easy to control and very convenient to use.
(b) have low maintenance cost.
(c) cause no pollution. (d) all of the above.

475. Battery operated trucks are used
(a) in power stations.
(b) for local delivery of goods in large towns with maximum daily run up to 50–60 km.
(c) in narrow gauge traction. (d) for main line service.

476. Electric traction in comparison to other traction systems has the advantage(s) of
(a) higher acceleration and braking retardation.
(b) cleanest system and so ideally suitable for the underground and tube railways.
(c) better speed control. (d) all of the above.

477. Electric railway can handle the traffic upto double the amount possible with steam railway. It is because of
(a) better speed control.
(b) larger passenger carrying capacity.
(c) higher schedule speed. (d) both (b) and (c).

478. Electric traction in comparison to other traction systems has the drawback(s) of
(a) interference with communication lines running along the track.
(b) heavy initial expenditure in laying out overhead electric supply system.
(c) interruption of traffic for hours owing to short time power failure.
(d) all of the above.

479. The most vital factor against electric traction is
(a) its high maintenance cost.
(b) possibility of power failure.
(c) high initial cost in laying out overhead electric supply system.
(d) necessity of providing a negative booster.

480. The locomotive that has the highest operational availability is
(a) diesel-electric. (b) electric.
(c) steam. (d) steam-electric.

481. Unbalanced forces are maximum in case of
(a) diesel shunters. (b) diesel locomotives.
(c) steam locomotives. (d) electric locomotives.

482. Maintenance requirements are minimum in case of
(a) electric locomotives. (b) steam locomotives.
(c) diesel electric locomotives.
(d) diesel engines.

483. A drive suitable for mines where explosive gas may exist, is
(a) steam engine. (b) battery locomotive.
(c) diesel engine. (d) any of the above.

484. A submarine is provided driving power through (while moving under water)
(a) diesel engines. (b) steam engines.
(c) batteries. (d) gas turbine.

485. Ordinary tramway is the most economical means of transport for
(a) very dense traffic in large cities.
(b) rural services. (c) suburban services.

486. Unlike a tramway, a trolley bus needs no
(a) driving axles. (b) running rail.
(c) hand brakes. (d) overhead contact wire.

487. The direct current system employed for tramways operates on
(a) 3,000 V (b) 1,500 V (c) 750 V (d) 400 V

488. For tramways the return circuit is
(a) track rails. (b) neutral wire.
(c) common earthing. (d) cables.

489. For 600 V dc line for tramcars, track is connected to the
(a) positive of the supply. (b) negative of the supply.
(c) midvoltage of 300 V. (d) none of the above.

490. In tramways
(a) the power is supplied at 600 V dc from a single overhead conductor of + ve polarity.
(b) the speed is controlled by field weakening or series-parallel control.
(c) rheostatic and mechanical brakings are employed for normal service.
(d) all of the above.

491. The main drawback of tramways is that
(a) the life of tramcar equipment is short.
(b) it has restricted manoeuvrability.
(c) it needs laying overhead supply system and track for its use, which is costly to maintain and constitutes a source of danger to other road users.
(d) all of the above.

492. The trolley bus
(a) is an electrically operated pneumatic tyred vehicle, usually fed at 600 V dc from two overhead contact wires.
(b) is able to manoeuvre in a traffic over a width of several metres on either side of the central line of the trolley wires.
(c) uses field weakening method for its speed control.
(d) all of the above.

493. The trolley buses
(a) do not require laying of track for its use as return conductor.
(b) make use of foot operated master controllers.
(c) make use of stabilised rheostatic braking.
(d) all of the above.

Answers: **469.** (d), **470.** (a), **471.** (b), **472.** (a), **473.** (d), **474.** (d), **475.** (b), **476.** (d), **477.** (d), **478.** (d), **479.** (c), **480.** (b), **481.** (c), **482.** (a), **483.** (b), **484.** (c), **485.** (a), **486.** (b), **487.** (c), **488.** (a), **489.** (b), **490.** (d), **491.** (c), **492.** (d), **493.** (d),

494. In diesel electric traction
(a) the driving motors are dc series type and fed from the dc generators driven by the diesel engine put on the same locomotive.
(b) the starting and speed control is affected by varying the excitation of the generator.
(c) regenerative braking is not possible.
(d) all of the above.

495. Suburban railways use
(a) 1,500 V dc. (b) 400 V, 3-phase ac.
(c) 3,300 V, 3-phase ac. (d) 600 V, 3-phase ac.

496. Long distance railways operate on
(a) 600 V dc. (b) 25 kV single-phase ac.
(c) 25 kV three-phase ac. (d) 15 kV three-phase ac.

497. The electric locomotives run faster at curved routes in comparison to steam locomotives because
(a) its centre of gravity is lower than that of steam locomotive.
(b) its centre of gravity is higher than that of steam locomotive.
(c) the speed at curved routes is independent of locations of centre of gravity.
(d) none of the above.

498. Low frequency operation of overhead line in traction system
(a) increases the spacing between substations.
(b) reduces the spacing between substations.
(c) spacing is independent of frequency of supply.

499. In Kando system of track electrification
(a) single-phase ac is converted into dc.
(b) single-phase ac is converted into 3-phase ac.
(c) 3-phase ac is converted into dc.
(d) 3-phase ac is converted into single-phase ac.

500. The composite system (single-phase ac to dc system) has been chosen for all future track electrification in India as
(a) it needs light overhead catenary.
(b) it needs less number of substations.
(c) it combines the advantages of high-voltage ac distribution at 50 Hz with dc series traction motors.
(d) it provides flexibility in the location of substations.

501. Single-phase ac system is preferred for main line railway service because
(a) the initial, maintenance and operating costs of ac substations are less as the substation equipment required in single-phase ac system is less, cheap and efficient.
(b) number of substations required is less.
(c) of reduced cost of distribution system.
(d) all of the above.

502. In underground traction, the supply system is
(a) 500 V to 1,000 V dc (b) 25 kV, 50 Hz
(c) 50 kV, 50 Hz (d) 25 kV, 25 Hz
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1996]

503. Problem(s) of single-phase traction systems is/are
(a) current and voltage unbalance.
(b) electrostatic and electromagnetic induction.
(c) generation of harmonics. (d) all of the above.

504. The chief requirements of main line railway services are
(a) high maximum speed.
(b) minimum cost of overhead structure.
(c) high acceleration and braking retardation.
(d) both (a) and (b).

505. The main requirements of suburban railway services are
(a) rapid acceleration and braking retardation.
(b) no interference to the communication circuits running along the track.
(c) high maximum speed. (d) both (a) and (b).

506. The acceleration rate for urban or suburban services is
(a) 1.5–4 kmphps. (b) 3–4 kmphps.
(c) 5–10 kmphps. (d) 0.5–1.5 kmphps.

507. The braking retardation for urban or suburban services is
(a) 1.5–2.5 kmphps. (b) 3–4 kmphps.
(c) 5–10 kmphps. (d) 0.5–1.5 kmphps.

508. The coasting retardation for main line railway services is about
(a) 10 kmphps. (b) 3 kmphps.
(c) 0.16 kmphps. (d) 0.01 kmphps.

509. The maximum speed at which trains run on main line railway service is
(a) 160 kmph. (b) 120 kmph.
(c) 100 kmph. (d) 200 kmph.

510. In main line services as compared to urban and suburban services
(a) distance between the stops is more (exceeding 10 km).
(b) maximum speed attained is high.
(c) acceleration and braking retardation rates are low.
(d) all of the above.

511. The speed-time curve for urban service has no
(a) coasting period. (b) free running period.
(c) braking period. (d) acceleration period.

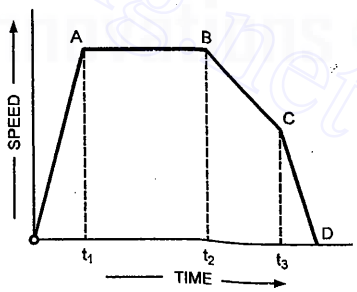
512. Free running and coasting periods are generally long in case of
(a) city service. (b) suburban serivce.
(c) main line service. (d) outer suburban service.

513. In suburban services as compared to urban services
(a) the coasting period is longer.
(b) the coasting period is smaller but free running period is longer.
(c) the coasting and free running periods are smaller.
(d) none of the above is true.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

514. Trapezoidal speed-time curve pertains to
(a) main line service. (b) urban service.
(c) suburban service. (d) urban/suburban service.

515. Quadrilateral speed-time curve is the close approximation for
(a) urban service. (b) suburban service.
(c) urban/suburban service. (d) main line service.

516. The speed-time curve for a main line service is illustrated in figure given below.
In figure given below AB represents
(a) coasting.
(b) free running.
(c) acceleration.
(d) average speed.



517. Area under the speed-time curve represents
(a) total distance travelled. (b) average speed.
(c) average acceleration. (d) none of the above.

518. The duration of coasting is represented by the duration
(a) $0 - t_1$ (b) $t_1 - t_2$ (c) $t_2 - t_3$ (d) $t_3 - t_4$

Answers: **494.** (d), **495.** (a), **496.** (b), **497.** (a), **498.** (a), **499.** (b), **500.** (c), **501.** (d), **502.** (a), **503.** (d), **504.** (d), **505.** (d), **506.** (a), **507.** (b), **508.** (c), **509.** (a), **510.** (d), **511.** (b), **512.** (c), **513.** (a), **514.** (a), **515.** (c), **516.** (b), **517.** (a), **518.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

519. From figure given in Q. 516, it can be concluded that
(a) average acceleration is zero.
(b) during coasting and braking the acceleration is negative.
(c) acceleration during free running is zero.
(d) both (b) and (c).

520. The speed of train estimated taking into account the stoppage time at a station in addition to the actual running time between stops, is called the _____ speed.
(a) average (b) schedule (c) free running (d) notching

521. The average speed of a train is independent of
(a) duration of stops.
(b) acceleration and braking retardation.
(c) distance between stops. (d) running time.

522. The schedule speed of a given train when running on a given service (with given distance between stations) is affected by
(a) acceleration and braking retardation.
(b) maximum or crest speed.
(c) duration of stop. (d) all of the above.

523. Skidding of a vehicle always occurs when
(a) braking effort exceeds its adhesive weight.
(b) brake is applied suddenly.
(c) it negotiates a curve.
(d) it passes over points and crossings.

524. The adhesive weight is the
(a) total weight of the locomotive and the train.
(b) weight coming over the driving wheels.
(c) same as the accelerating weight.
(d) none of the above.

525. Coefficient of adhesion is the ratio of tractive effort to slip the wheels and
(a) dead weight. (b) accelerating weight.
(c) adhesive weight. (d) none of the above.

526. The normal value of coefficient of adhesion is
(a) 0.25 (b) 0.35 (c) 0.50 (d) 0.65

527. Coefficient of adhesion reduces due to the presence of
(a) dew on rails. (b) oil and grease on rails.
(c) dry sand on rails. (d) both (a) and (b).

528. Coefficient of adhesion improves due to presence of
(a) dry sand on rails. (b) rust on rails.
(c) dust on rails. (d) all of the above.

529. The value of coefficient of adhesion will be high when rails are
(a) wet. (b) cleaned with sand.
(c) greased. (d) sprayed with oil.

530. The coefficient of adhesion for wet or greasy rails is
(a) 0.35 (b) 0.25 (c) 0.08 (d) zero

531. The coefficient of adhesion
(a) same on dc and ac traction.
(b) high in ac traction and low in dc traction.
(c) high in dc traction and low in ac traction.
(d) any of the above.

532. Higher value of tractive effort can be used in electric traction as compared to steam traction because
(a) of greater adhesive weight (the weight on driving wheels is 70 percent of dead weight in case of electric locomotive whereas in case of steam locomotive it is 50 percent).
(b) the torque exerted in electric traction is continuous whereas in steam traction it is pulsating one.
(c) the driving wheels are distributed over a much greater length in electric traction whereas in steam traction they are close to each other.
(d) all of the above.

533. When a bogie negotiates a curve, reduction in adhesion occurs resulting in sliding. This sliding is acute when
(a) degree of curvature is more.
(b) wheel base of axles is more.
(c) none of the above. (d) both (a) and (b).

534. For a given maximum axle load tractive effort with ac locomotive will be
(a) less than that of dc locomotive.
(b) more than that of dc locomotive.
(c) equal to that of dc locomotive. (d) none of the above.

535. The resistance encountered by a train in motion is on account of
(a) resistance offered by air. (b) friction at the track.
(c) friction at various parts of the rolling stock.
(d) all of the above.

536. The air resistance to the movement of the train is proportional to
(a) 1/speed. (b) (speed). (c) $(\text{speed})^2$. (d) $(\text{speed})^3$

537. The friction at the track is proportional to
(a) speed. (b) $(\text{speed})^2$. (c) $(\text{speed})^3$. (d) $(1/\text{speed})^2$.

538. If the resistance to electric train movement is given by
$F_r = a + bv + cv^2$
In the above expression b is likely to cover
(a) air resistance. (b) track resistance.
(c) frictional resistance. (d) none of the above.

539. Tractive effort of an electric locomotive can be increased by
(a) using high output motors.
(b) increasing the supply voltage.
(c) increasing dead weight over the driving axles.
(d) both (a) and (c).

540. A locomotive with a mass of 50,000 kg on a track whose coefficient of adhesion is 20 per cent will produce a tractive effort of (approximately)
(a) 1 kN (b) 100 kN (c) 25 kN (d) 250 kN
[A.M.I.E. Sec B. Drives & Their Control Winter 1996]

541. Energy consumption in propelling the train is required for
(a) accelerating of train mass.
(b) overcoming the gradient while moving up the gradient.
(c) overcoming the train resistance.
(d) all of the above.

542. Longer coasting period for a train results in
(a) higher schedule speed .
(b) lower specific energy consumption.
(c) higher retardation. (d) higher acceleration.

543. Specific energy consumption is affected by
(a) acceleration and retardation values.
(b) the crest speed and nature of route.
(c) distance between stops. (d) all of the above.

544. Specific energy consumption is minimum in _____ services.
(a) main line (b) urban
(c) suburban (d) equal for all type of

545. For a given run and given schedule speed, the specific energy consumption is
(a) lower, the higher the acceleration and retardation.
(b) higher, the higher the acceleration and retardation.
(c) lower, the higher the acceleration and lower the retardation.
(d) lower, the lower the acceleration and higher the retardation.

Answers: **519.** (d), **520.** (b), **521.** (a), **522.** (d), **523.** (a), **524.** (b), **525.** (c), **526.** (a), **527.** (d), **528.** (d), **529.** (b), **530.** (c), **531.** (b), **532.** (d), **533.** (d), **534.** (b), **535.** (d), **536.** (c), **537.** (a), **538.** (b), **539.** (d), **540.** (b), **541.** (d), **542.** (b), **543.** (d), **544.** (a), **545.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

546. Specific energy consumption
(a) increases with the increase in maximum speed.
(b) decreases with the increase in maximum speed.
(c) is independent of maximum speed.
(d) none of the above.

547. If the speed-time curves are similar (not identical), the specific energy consumption of the curve having higher maximum speed is _____ than that of lower maximum speed.
(a) lower (b) equal (c) higher (d) none

548. Specific energy consumption becomes
(a) more when distance between stops is more.
(b) more with the higher values of acceleration (or retardation).
(c) more with high train resistance.
(d) less with the increase in crest speed.

549. The specific energy consumption for suburban services is usually _____ watt-hours per tonne-km.
(a) 20–30 (b) 30–45 (c) 50–75 (d) 100–150

550. The specific energy consumption for main line services is around ..... watt hours per tonne-km.
(a) 20–30 (b) 30–45 (c) 50–75 (d) 100–150

551. Specific energy consumption is maximum in _____ services.
(a) urban (b) suburban
(c) main line (d) equal for all types of

552. The electric motor used for traction work should be mechanically
(a) small in overall dimensions (specially in its overall diameter).
(b) light in weight and robust in construction.
(c) capable to withstand continuous vibrations.
(d) all of the above.

553. The electric motor used for traction work, electrically should be
(a) capable of developing high starting torque and withstanding voltage fluctuations, and temporary supply interruptions.
(b) amenable to simple speed control methods, self protective against excessive overloading and amenable to easy and simple methods of rheostatic and/or regenerative braking.
(c) of such characteristics that when they are operated in parallel and coupled mechanically, they share the load almost equal.
(d) all of the above.

554. In suburban trains, the traction motors are installed on
(a) locomotive only. (b) locomotive and coaches.
(c) coaches only.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1996]

555. The type of dc motor used in electric traction is
(a) series. (b) shunt.
(c) separately-excited. (d) none of the above.
[A.M.I.E. Sec B. Electric Drives & Their Control Summer 1999]

556. The dc series motor is most suitable for traction services but more particularly for urban/suburban services because
(a) dc series motors are suitable for regenerative braking.
(b) dc series motors are capable of withstanding rapid fluctuations in supply voltage.
(c) dc series motors are capable of developing high torque at start.
(d) dc series motors are capable of withstanding temporary interruption of supply without undue rush of current.

557. The three-phase induction motors have the advantages of simple and robust in costruction, trouble free operation, high voltage operation consequently requiring reduced amount of current and automatic regeneration but are not suitable for traction work. This is because of their
(a) flat speed-torque characteristics, constant speed operation and low starting torque.
(b) complicated speed control system and complicated overhead feeding systems.
(c) higher initial as well maintenance cost.
(d) both (a) and (b).

558. DC shunt motors are not suitable for traction services because of their
(a) hard characteristics. (b) large time constant.
(c) power varying directly with developed torque.
(d) wide variation in torque and flux due to variation in voltage in electric traction.
(e) all of the above

559. Two dc shunt motors having identical characteristics are used to drive a train car with unequal wheel diameters. The two motors share load equally if they are connected in
(a) series. (b) parallel.
(c) the loading will always be unequal.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

560. Two locomotives having identical tractive effort-slip characteristics haul a heavy train. The loco with larger diameter shares _____ tractive effort.
(a) larger (b) smaller (c) equal

561. For single-phase ac system of track electrification, low frequency is desirable as
(a) it improves commutation properties of ac motors.
(b) it increases efficiency of ac motors.
(c) it improves power factor of ac motors.
(d) all of the above.

562. At low frequency of the order of 1/2 Hz to 10 Hz, the induction motor develops
(a) high starting torque with excessive starting current.
(b) high starting torque without excessive starting current.
(c) low starting torque with excessive starting current.
(d) low starting torque without excessive starting current.

563. A locomotive exerts a tractive effort of 40,000 N in pulling a train at 60 kmph on a level track. If the same train is to be hauled at the same speed but on gradient, the tractive effort required will be 60,000 N. The output delivered by the motor will be more if it is driven by
(a) a 3-phase induction motor.
(b) a dc series motor. (c) an ac series motor.
(d) equal in all the three cases.

564. When two or more motors are used for traction service, the method of speed control used will be
(a) rheostatic control. (b) series-parallel control.
(c) field control. (d) motor generator control.

565. The advantage(s) of series-parallel starting is/are
(a) small energy loss and higher efficiency.
(b) economical speed control.
(c) higher reliability of operation.
(d) all of the above.

566. Parallel operation of traction motors is easier with
(a) dc shunt motors. (b) dc series motors.
(c) induction motors. (d) none of these.

567. Series traction motor operating on undulating dc supply has undulation
(a) $\frac{I_{max}-I_{min}}{I_{max}+I_{min}}$ (b) $\frac{I_{max}-I_{min}}{I_{max}}$
(c) $\frac{I_{max}}{I_{max}}$ (d) $\frac{I_{max}-I_{min}}{2I_{min}}$

Answers: **546.** (a), **547.** (b), **548.** (c), **549.** (c), **550.** (a), **551.** (a), **552.** (d), **553.** (d), **554.** (a), **555.** (a), **556.** (c), **557.** (d), **558.** (e), **559.** (a), **560.** (a), **561.** (d), **562.** (b), **563.** (a), **564.** (b), **565.** (d), **566.** (b), **567.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

568. In motor-generator locomotive control
(a) rheostatic control is used.
(b) series parallel control is used.
(c) the output voltage of generator is regulated by means of field control from exciter.
(d) any one of the above method is used.

569. In metadyne control.
(a) current throughout the accelerating period remains constant.
(b) tractive effort developed is uniform.
(c) there is no wastage of energy in starting rheostat.
(d) all of the above.

570. The method of speed control adopted in 25 kV, single-phase, 50 Hz traction is
(a) tap changing control of transformer.
(b) reduced current method. (c) series-parallel control.
(d) rheostatic control.

571. The preferable method of speed control of linear induction motor is
(a) variable flux control. (b) PAM control.
(c) variable frequency and constant voltage control.
(d) variable frequency and variable voltage control.

572. Which of the following braking systems on the locomotives is costly ?
(a) Vacuum braking on steam locomotives.
(b) Vacuum braking on diesel locomotives.
(c) Regenerative braking on electric locomotives.
(d) All braking systems are equally costly.

573. The braking system employed with steam locomotives is
(a) vacuum system. (b) pneumatic system.
(c) hyraulic system. (d) any of the above.

574. Braking system employed in diesel electric traction is
(a) hydraulic type. (b) vacuum type.
(c) regenerative type. (d) any of these.

575. The type of braking used in electric traction is
(a) mechanical braking. (b) vacuum brake system.
(c) electropneumatic braking.
(d) both (a) and (c).

576. Vacuum is created by
(a) vacuum pumps. (b) ejector.
(c) vacuum pump or ejector. (d) none of the above.

577. Bearings employed for supporting axles of rolling stock are
(a) bush bearings. (b) roller bearings.
(c) ball bearings. (d) journal bearings.

578. The wheels of a train, engine as well as bogies, are slightly tapered so as to
(a) reduce friction. (b) increase friction.
(c) facilitate in taking turns. (d) facilitate braking.

579. B_0B_0 locomotives have two bogies with
(a) two driving axles with individual drive motors.
(b) two driving axles with group drives.
(c) four driving axles with individual drive motors.
(d) four driving axles with group drives.

580. A locomotive for Indian Railways has been designated as WAM. In this W indicates that
(a) the locomotive is to run on metre gauge track.
(b) the locomotive is to operate on broad gauge track.
(c) the locomotive is for goods trains only.
(d) the locomotive is only for shunting duty.

581. Locomotives with manometer bogies
(a) are suited both for passengers as well as freight service.
(b) have better coefficient of adhesion.
(c) have better riding qualities owing to reduction of lateral forces.
(d) all of the above.

582. Factor(s) affecting the design of rolling stock is/are
(a) environmental condition. (b) vibrations and shocks.
(c) unbalanced and fluctuating supply voltages for auxiliaries.
(d) all of the above.

583. In electric traction if contact voltage exceeds 1,500 V, current collection is invariably by
(a) a contact rail. (b) a conductor rail.
(c) overhead wire. (d) third rail.

584. Conductor rail system of supply is
(a) cheap and easy to repair and inspection.
(b) suitable for heavy current collection at voltages up to 1,200 V.
(c) universally used for all ac railways.
(d) both (a) and (b).

585. Overhead lines for power supply to tram cars are at a minimum height of a
(a) 10 m (b) 8 m (c) 5 m (d) 15 m

586. The current collector that can be employed with different speeds under all wind conditions and stiffness of OHE is known as the
(a) messenger collector. (b) pantograph collector.
(c) trolley collector. (d) bow collector.

587. DC track circuit consists of
(a) amplitude modulation equipment.
(b) a negative booster, feeding points and signals.
(c) insulated joint and track, track bonding, regulating resistance, track battery to track relay.
(d) all of the above.

588. In case of bow and pantograph current collectors
(a) the pantograph current collector is employed for large currents at higher speeds.
(b) the pantograph current collector is employed for large currents at lower speeds.
(c) the bow current collector is employed for large currents at higher speeds.
(d) the bow current collector is employed for large currents at lower speeds.

589. Contact with wire is maintained by
(a) air pressure in both bow and pantograph current collectors.
(b) springs in both bow and pantograph current collectors.
(c) spring in case of bow and air pressure in case of pantograph.
(d) spring in case of pantograph and air pressure in case of bow collectors.

590. Factors affecting quality of current collection in pantograph is/are
(a) contact pressure.
(b) effective mass of frame and span.
(c) adequate damping in the frame.
(d) all of the above.

591. Advantages of two-stage pantograph is/are
(a) inertia forces are reduced.
(b) takes care of variation in contact height and displacement of contact wire between supports.
(c) takes care of low amplitude displacement of contact wire between droppers.
(d) all of the above.

Answers: **568.** (c), **569.** (d), **570.** (a), **571.** (c), **572.** (c), **573.** (a), **574.** (b), **575.** (c), **576.** (c), **577.** (b), **578.** (c), **579.** (a), **580.** (b), **581.** (d), **582.** (d), **583.** (c), **584.** (d), **585.** (a), **586.** (b), **587.** (c), **588.** (a), **589.** (b), **590.** (d), **591.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

592. Span length between supports in electric traction is determined by
(a) weight of wire per unit length.
(b) maximum wind pressure.
(c) permissible tension in the wire and speed of train.
(d) all of the above.

593. Electrical circuit breaker is
(a) connected between the current collector and the main wiring.
(b) provided on the electric locomotive to protect the electrical equipment against excessive overloads automatically.
(c) provided with a handle to trip it when it is moved to the OFF position by hand.
(d) all of the above.

594. The characteristics of OHE depend on
(a) loss of contact and its duration.
(b) temperature and wear of contact wire.
(c) quality of current collection and pantograph pressure on contact wire.
(d) height, stagger, push up of an gradient of contact wire.
(e) all of the above

595. Insulated overlaps are employed in electric traction to provide
(a) protection of transmission equipment in electric locomotives.
(b) isolating facilities required for the maintenance and operation of OHE.
(c) protection of signals in EMU trains.
(d) gap between adjacent terminal sections of railways.

596. Neutral sections are provided in single-phase ac traction as
(a) to protect the system from lightning strokes.
(b) supply cannot be maintained from adjacent substations at reduced voltage drops.
(c) adjacent substations tap different phases of three-phase system to achieve balancing.
(d) to provide return section for the communication purpose.

597. Use of booster transformers is restricted to urban areas because
(a) there are no earth and water currents.
(b) they are subjected to densely populated areas and so need protection.
(c) they complicate the OHE and cause more faults in the system and thus reduce the system reliability.
(d) they increase the impedance and need feeding posts to be located at close intervals.
(e) both (c) and (d). (f) all of the above.

598. Negative booster
(a) is a separately-excited generator whose armature is connected to negative busbar and far end of the track through negative feeder.
(b) creates low voltage level in the track to allow all currents to flow through it.
(c) provides protection against earth fault currents.
(d) causes additional voltage drop necessary for smooth operation.
(e) both (a) and (b).

599. In long distance electric trains power for lighting in passenger coaches is provided
(a) through rails. (b) through locomotive.
(c) through individual generator of bogie and batteries.
(d) directly from overhead electric lines.

600. Power requirements of a train lighting and air-conditioning is met by
(a) servogenerators.
(b) chargeable batteries in each compartment.
(c) axle driven generators in conjunction with batteries.
(d) either of (b) or (c).

601. Coach air-conditioning equipment includes
(a) standard refrigeration equipment.
(b) mechanical power generating equipment.
(c) electrical equipment for control with accessories.
(d) an air-conditioner with its standard accessories.
(e) all of the above except (d).

602. Requirement(s) of a railway coach air-conditioning is/are
(a) to provide heating/cooling.
(b) to supply clean, fresh air at a controlled uniform temperature.
(c) sufficient power requirement.
(d) to account for charging passenger traffic.
(e) all of the above.

Answers: **592.** (d), **593.** (b), **594.** (e), **595.** (b), **596.** (c), **597.** (e), **598.** (e), **599.** (c), **600.** (c), **601.** (e), **602.** (e).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

1. (A): The prime mover and the transmission system are embraced by the common term drive.
(R): In a machine unit, the prime mover and the transmission system keep the working machine in motion.

2. (A): The modern trend is to use individual and multimotor drives.
(R): Individual and multimotor drives are cheaper than group drives in initial cost.

3. (A): A dc series motor is most suitable for cranes and hoists.
(R): A dc series motor runs at high speed at light loads and low speed when load is heavy. Light loads are lifted quickly and heavy loads slowly.

4. (A): Cumulative compound wound motor is most suitable for elevators, presses, shears, compressors and reciprocating tools.
(R): The speed-torque characteristic of a cumulatively compounded motor is intermediate between those of a series and a shunt motor. This motor is used when a series

Answers: **1.** (a), **2.** (c), **3.** (a), **4.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

characteristic is desired and the load is likely to be almost entirely removed.

5. (A): For vacuum cleaners fractional kilowatt output ac series motors and universal motors are used.
(R): AC series motors and universal motors operate at high speed and develop large starting torque.

6. (A): The capacitor-start, capacitor-run motor is well suited for driving fixed loads in hospitals, studios and other places where silence is very important.
(R): The capacitor-start, capacitor-run motor behaves as a true 2-phase motor only when it operates on full-load. The motor is then vibration free.

7. (A): The well suited motor for driving air compressors, large fans, pumps and high-inertia loads is capacitor-start induction motor.
(R): The capacitor-start induction motor develops high starting torque.

8. (A): Solid-state fan regulators are preferred for speed control over resistance or inductance regulators.
(R): Solid-state regulators are compact, energy efficient, more reliable, noise free and economical.

9. (A): AC motors are widely used in electric drive.
(R): AC motors have excellent torque and speed operating characteristics in comparison with those of dc motors.

10. (A): Electrical connections to the motor are usually made by means of (a) flexible pipe rather than by a conduit pipe.
(R): It avoids transmission of vibrations.

11. (A): The motor is usually mounted on a heavy concrete or cast-iron block or alternatively on a flexible support provided by rubber pads or spring.
(R): It minimizes the transmission of noise from one part of the building to another.

12. (A): Electrical heating is economical in comparison to other heating systems.
(R): Electric heating is clean, hygienic, efficient and safe in operation.

13. (A): Ni-Cr-Fe alloy is recommended to be used as an heating element for temperatures up to 1,150°C.
(R): The addition of iron to the Ni - Cr alloy reduces the temperature at which oxidation takes place but the cost of the product is also reduced.

14. (A): The voltage across an oven can be controlled by varying the external resistance connected in series with the heating circuit.
(R): The mehod of temperature control of an oven by external series resistance is not economical and so its use is limited to small furnaces.

15. (A): Salt-bath furnaces are started with highest tap and as the temperature rises, the tap is gradually brought down.
(R): The salt resistance increases with the increase in temperature of salt.

16. (A): The general trend is to use graphite electrode in arc furnaces.
(R): Owing to low resistivity graphite is required half in size for the same current resulting in easy replacement and under normal conditions the consumption of graphite electrodes is about half of that of carbon electrodes.

17. (A): Alternating current is found most suitable for resistance welding.
(R): AC can provide any combination of current and voltage with the help of a transformer.

18. (A): For flash-butt welding there is no need to level rough or irregular ends of the metal pieces to be welded and clean and pure weld is obtained.
(R): In flash-butt welding all irregularities are burnt away during flashing period.

19. (A): Electric resistance spot welding is probably the best known and most widely used type of welding.
(R): Electric resistance spot welding is cheap in cost, fast in action and dependable. It can be easily performed by even a semi-skilled operator.

20. (A): Coated electrodes are always to be stored in a dry place and if dampness is suspected they are to be dried in a warm cabinet for a few hours.
(R): Dampness impaires the coated electrodes.

21. (A): An inductor is used in series with carbon arc for its stabilization in case of dc supply.
(R): The carbon arc is unstable.

22. (A): In a sodium vapour lamp, the discharge envelope is usually bent into U-shape.
(R): Long discharge paths are necessary in sodium vapour lamps.

23. (A): True colour rendition is not possible with mercury vapour lamps.
(R): There is complete absence of red light from mercury vapour lamp radiations.

24. (A): For neon lamps used on ac the electrodes are of equal size but for dc the negative electrode is made larger in size.
(R): When neon lamp is used on dc the gas glows near the positive electrode.

25. (A): A high series resistance of few thousands ohms is mounted in the cap of neon lamp.
(R): In neon lamps, the current drawn may increase indefinitely owing to discharge of the gas between the electrodes in the form of an arc.

26. (A): Ammonia is preferred as a refrigerant in large commercial installations.
(R): Ammonia is highly toxic and inflammable.

27. (A): Direct internal combustion engine drive is widely used for road transport.
(R): Speed control and braking system employed in direct internal combustion drive is very simple.

28. (A): The trolley bus needs only a single driving axle while the tramway needs minimum, two driving axles.
(R): The adhesion between a rubber-tyred wheel and the roadways is sufficiently high.

29. (A): Trolley buses are used for the inner suburbs with medium traffic density.
(R): In trolley buses, the speed can be controlled by field weakening method.

30. (A): The starting efficiency of ac locomotive is higher than that of a dc locomotive.
(R): In case of ac locomotive supply voltage for starting can be reduced by means of 'on load tap changer'.

31. (A): DC traction system is preferred for main line railway service.
(R): The dc locomotive and motor coach equipment is lighter in weight, cheaper in initial as well as in maintenance cost and more efficient.

Answers: **5.** (a), **6.** (a), **7.** (a), **8.** (a), **9.** (c), **10.** (a), **11.** (a), **12.** (b), **13.** (d), **14.** (b), **15.** (c), **16.** (a), **17.** (a), **18.** (a), **19.** (a), **20.** (a), **21.** (d), **22.** (a), **23.** (a), **24.** (c), **25.** (a), **26.** (b), **27.** (b), **28.** (a), **29.** (b), **30.** (a), **31.** (d),

Downloaded From : www.EasyEngineering.net

32. (A): Traction motors are usually high speed motors.
(R): The weight of high speed motors is comparatively low and so the pay load capacity of the vehicle is increased.

33. (A): The traction motor should be capable to withstand temporary interruptions of supply without undue rush of current.
(R): Supply is interrupted at the instants of crossing over the cross-overs and section insulators.

34. (A): Traction motors should be of such speed-torque characteristics that when they are operated in parallel and mechanically coupled, they share the load almost equally.
(R): In traction work, usually more than one motor (two or four motors per motor car) are required.

35. (A): AC series motors are not very suitable for suburban services where stops are frequent.
(R): For given kW output, the single-phase ac series motors are lighter in weight in comparison to dc series motors.

36. (A): The trolley collector is suitable only for comparative low speeds.
(R): There is a poor contact between the wheel and the trolley wire.

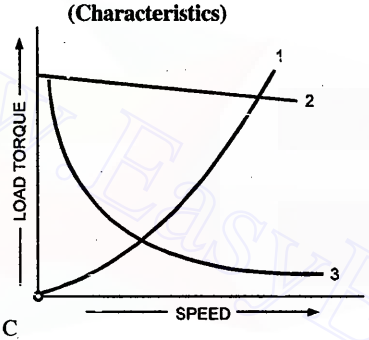
Answers: **32.** (a), **33.** (a), **34.** (a), **35.** (c), **36.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Load)	List 2 (Characteristics)
A. Hoist winches.	1
B. Blowers.	2
C. Boring machines.	3



Codes:	A	B	C
(a)	2	1	3
(b)	1	2	3
(c)	3	1	2
(d)	3	2	1

2.

List 1 (Types of electrical loads)	List 2 (Torque-speed characteristics)
A. Hoist	1. Torque $\propto$ (speed)^2
B. Fans	2. Torque $\propto$ (speed)
C. Machine tools (lathe, milling machine etc.)	3. Constant torque
D. Loads with fluid friction	4. Torque $\propto$ 1/(speed)

Codes:	A	B	C	D
(a)	1	3	2	4
(b)	1	3	4	2
(c)	4	1	3	2
(d)	3	1	2	4

[U.P.S.C. I.E.S E.E.-II, 2002]

3.

List 1 (Motors)	List 2 (Applications)
A. DC series motor.	1. Shearing and pressing.
B. Squirrel-cage induction motor.	2. Haulage and hoisting.
C. DC shunt motor.	3. Rolling mill.

Codes:	A	B	C
(a)	1	2	3
(b)	2	3	1
(c)	3	1	2
(d)	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2001]

4.

List 1 (Machine)	List 2 (Performance)
A. Three-phase induction motor.	1. Adjustable speed.
B. Synchronous motor.	2. High starting torque.
C. DC series motor.	3. Not self-starting.
D. DC shunt motor.	4. Self-starting.

Codes:	A	B	C	D
(a)	3	4	1	2
(b)	4	3	1	2
(c)	3	4	2	1
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2004]

5.

List 1 (Types of motors)	List 2 (Characteristics)
A. DC series motor.	1. Constant speed.
B. DC shunt motor.	2. High starting torque.
C. 3-phase induction motor.	3. Low starting torque.
D. Synchronous motor.	4. Poor stability.

Codes:	A	B	C	D
(a)	2	4	3	1
(b)	3	1	2	4
(c)	2	1	3	4
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-II, 2002]

6. The electromagnetic torque T_e of a drive and its connected load torque T_L are as shown below. Out of the operating points A, B, C and D, the stable ones are

(a) A, C, D
(b) B, C
(c) A, D
(d) B, C, D [GATE E.E. 2007]

7.

List 1 (Type of enclosure)	List 2 (Application)
A. Protected type.	1. Collieries.
B. Splash proof.	2. Sawmills.
C. Total enclosed fan cooled type.	3. Industrial purpose.
D. Flame-proof type.	4. Rain.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	4	1	2	3
(c)	2	3	4	1
(d)	3	4	2	1

8.

List 1 (Applications)	List 2 (Type of duty)
A. Blowers, fans.	1. Intermittent periodic duty.
B. Sirens.	2. Continuous duty.
C. Machine tools.	3. Short-time duty.
D. Wire drawing machine.	4. Continuous duty with starting and braking.

Codes:	A	B	C	D
(a)	2	3	4	1
(b)	1	2	3	4
(c)	3	4	1	2
(d)	4	1	2	3

9.

List 1 (Type of motor)	List 2 (Relative cost)
A. Squirrel cage type motor.	1. 3–4
B. DC motor.	2. 2.0
C. Synchronous motor.	3. 1.0
D. Schrage motor.	4. 1.5–3.0

Codes:	A	B	C	D
(a)	4	1	2	3
(b)	2	3	4	1
(c)	3	4	2	1
(d)	1	2	3	4

10.

List 1 (Type of motor)	List 2 (Application)
A. Synchronus motor.	1. Vacuum cleaner.
B. Multispeed motor.	2. Haulage and hoist work.
C. 3-phase series motor.	3. Ventilating fans.
D. Single-phase series motor.	4. Voltage control and pf improvement.

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	1	2	3	4
(c)	2	3	4	1
(d)	3	4	1	2

11.

List 1 (Application)	List 2 (Type of motor suggested for use)
A. Shapers and slotters.	1. Flame-proof squirrel cage motor.
B. Very large refrigeration and air-conditioning plants.	2. Synchronous motors.
C. Mines.	3. Constant speed squirrel cage induction motor.
D. Kiln.	4. Ward-Leonard controlled dc shunt motor.

Codes:	A	B	C	D
(a)	3	2	4	1
(b)	2	3	1	4
(c)	3	2	1	4
(d)	1	4	2	3

12.

List 1 (Type of electric heating)	List 2 (Applications)
A. Direct resistance heating.	1. Surface hardening.
B. Arc heating.	2. Commercial cooking.
C. Indirect resistance heating.	3. Electrode boiler.
D. High frequency eddy	4. Electric arc welding current heating.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	1	3	4
(c)	4	1	2	3
(d)	3	4	2	1

13.

List 1 (Type of Furnace)	List 2 (Application)
A. Resistance furnaces.	1. Manufacture of ferro-alloys such as ferrochrome and ferromanganese.
B. Direct arc furnaces.	2. Melting and refining of brass and other heavy non-ferrous metals.
C. Submerged arc furnaces.	3. Heat treatment of steel.
D. Vertical core type induction furnaces.	4. Melting and refining of steel.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	4	1	2
(d)	4	1	2	3

14.

List 1 (Type of weding)	List 2 (Applications)
A. Laser beam welding.	1. Welding of pipes, conduits, tanks, gasoline tanks.
B. Submerged arc welding.	2. Welding of sheet steel, copper alloys, brass, bronze and aluminium.
C. Carbon arc welding.	3. Welding of low alloy high tensile steels, mild low carbon steels, nickel, monel and non-ferrous metals such as copper.
D. Seam welding.	4. In aircraft and electronic industries for light gauge metals.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	1	4
(c)	3	4	1	2
(d)	4	3	2	1

15.

List 1 (Metal to be refined)	List 2 (Energy consumption in kWh/tonne)
A. Copper.	1. 150–300
B. Nickel.	2. 300–350
C. Silver.	3. 400–425
D. Gold.	4. 2,500–4,000

Answers: **7.** (d), **8.** (a), **9.** (c), **10.** (a), **11.** (c), **12.** (d), **13.** (c), **14.** (d), **15.** (d),

(b)	2	3	4	1
(c)	3	4	1	2
(d)	1	4	3	2

16.

List 1 (Service)	List 2 (Type of traction recommended)
A. Urban/suburban service.	1. Steam locomotive drive.
B. Main line railway service.	2. Diesel or electric locomotive drive.
C. Branch line railway scrvice.	3. Direct internal combustion engine drive.
D. Outer suburbs and country districts.	4. Tramways trolley bus and dc electric trains.

Codes:	A	B	C	D
(a)	4	2	1	3
(b)	1	2	4	3
(c)	1	2	3	4
(d)	4	2	3	1

17.

List 1 (Type of traction motor)	List 2 (Traction service)
A. DC series motor.	1. None.
B. AC series motor.	2. Urban/suburban services.
C. Linear induction motor.	3. Main line railway services.
D. DC shunt motor.	4. Trolley cars for internal transport in workshops or as a propulsion unit in marshalling-yards.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	2	3	1	4
(c)	2	3	4	1
(d)	3	4	1	2

18.

List 1 (Current collector)	List 2 (Application)
A. Trolley collector.	1. Railways for operating speeds as high as 100–130 kmph.
B. Bow collector.	2. Tramways.
C. Pantograph.	3. Trolleys and tramways operating at comparative slow speeds.

Codes:	A	B	C
(a)	1	2	3
(b)	2	3	1
(c)	3	1	2
(d)	3	2	1

Answers: **16.** (a), **17.** (c), **18.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F).

1. The group drive is economical in consideration of the initial cost of the motors and the control gear.
2. For driving heavy machines such as for lifts, cranes, shapers, group drive is preferred.
3. For paper mills and textile industry individual drive is preferred.
4. Multimotor drive is essential in complicated metal-cutting machine tools, paper making machines and rolling mills.
5. The motor designed for high speed and incorporating a reduction gear in the motor frame is usually found cheaper than that of the corresponding low speed motor.
6. For the same output kW, a higher speed motor is costlier than a slow speed motor.
7. When the motor is loaded, the electrical power input to the motor automatically changes to match the load.
8. Intermittent rating motor is desired for traction loads.
9. Series-parallel control is widely used in electric traction.
10. The motor produces noise because of bearings, vibrations and magnetic pulsations.
11. For a reversing drive (such as for colliery winder), the Ward-Leonard control system is generally used.
12. Smaller size machine have their critical speeds above their synchronous speeds.
13. An amplidyne is basically a dc amplifier.
14. A body cools from 60°C to 50°C in 10 minutes. The body will take the same time (*i.e.* 10 minutes) in further cooling down from 50°C to 40°C, the external conditions remaining unchanged.
15. In electric press mica is used because it is bad conductor of heat and good conductor of electricity.
16. Molybdenum is not suitable for heating elements of vacuum furnaces because of its high vapour pressure.
17. Nickel-chrome-iron alloy is the most useful material as heating element in electric furnaces.
18. Graphite resistors are suitable for any temperature that can be used but need protection against oxidation about exceeding 600°C.
19. In indirect resistance heating, an enclosure is required for transfer of heat by conduction.
20. The inside proportions of a heating chamber are made to suit the character of the charge and type of the furnace or oven.
21. In case of batch type chambers, the charge is heated as it moves through the chamber.
22. Direct arc furnaces are usually of 3-phase type where as indirect arc furnaces are usually of single-phase type.
23. Stirring action by rocking the furnace is achieved in single-phase arc furnaces and by electromagnetic force is achieved in 3-phase arc furnaces.
24. For direct core type induction furnaces high frequency supply is essential.

Answers: **1.** (T), **2.** (F), **3.** (T), **4.** (T), **5.** (T), **6.** (F), **7.** (T), **8.** (T), **9.** (T), **10.** (T), **11.** (T), **12.** (T), **13.** (T), **14.** (F), **15.** (F), **16.** (T), **17.** (T), **18.** (T), **19.** (F), **20.** (T), **21.** (F), **22.** (T), **23.** (T), **24.** (F),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

25. Ajax Wyatt vertical core type furnace is suitable only for continuous operation.
26. Gas welding, arc welding, thermit welding, electroslag welding fall under the category of plastic welding.
27. In order to avoid the surface distortion, the portion of the metal adjacent to the weld or joint should not be allowed to be overheated.
28. For welding thick materials the resistance of the current path in the work is kept minimum.
29. For welding thick materials of low conductivity, the resistance of the current path is of comparatively greater value and the control of contact resistance is not necessary.
30. For welding thick materials of high conductivity either reduced pressure or high resistance electrodes having melting point higher than that of metal to be joined, can be used.
31. For welding two dissimilar metals having different conductivity, low conductivity electrode on high conductivity metal side and vice-versa are used in order to prevent overheating on the high conductivity metal and to develop sufficient heat to melt light conductivity metal side.
32. Materials above 5 mm thickness should be shot-blasted before being taken to the resistance welding machine and there should be no delay between the shot- blasting and welding in order to avoid new corrosion which might eliminate the advantage gained by the former.
33. The lower cost of equipment makes spot welding economical for small quantities.
34. Spot welding is used for thick metal sheets.
35. The range of open-circuit voltage for an electric arc welding is usually 100–250 V.
36. Down hill welding is preferred for thick metals because it is faster than uphill welding.
37. Uphill welding is preferred for thin metals because it produces stronger welds.
38. Arc can be produced by either ac or dc.
39. The carbon arc is very stable and easy to maintain.
40. The length of the carbon arc can be varied over wide limits without causing the arc to go out.
41. There is a tendency for the electrode to freeze or stick as in the case of metallic electrode.
42. For carbon arc welding both dc and ac can be used.
43. In metal-arc welding, too high voltage results in too small beads.
44. In metal-arc welding, too high welding speed causes excessive piling up of weld metal.
45. Post-welding cleansing is required in MIG welding.
46. The load taken by welding transformer is highly inductive.
47. The power factor of load using welding transformer is usually very low of the order of 0.4 lagging.
48. The sensation of colour is due to the difference in the wavelengths of the light radiations.
49. Colour of light depends upon wavelength only.
50. Solid angle subtended at a point in space is 2π steradians.
51. While illumination of surface is independent of reflection factor, the value of brightness is not independent of it.
52. For the same power output low voltage lamps willl be more sturdy.
53. Filament lamps at starting will take current less than its normal operating current.
54. Incandescent filament lamps are generally of copper filaments.
55. Incandescent lamps should be used with luminaires.
56. Maintenance of discharge lamps is more cumbersome.
57. Halogen lamps are preferred for outdoor illumination of buildings.
58. In GLS lamps the cap is secured to the glass shell by cementing compound.
59. Sodium vapour lamp is only suitable for operation on dc .
60. A leak transformer used in sodium vapour lamp acts as a step-down transformer initially.
61. In a sodium vapour lamp, the neon gas serves as to start the discharge and to develop sufficient heat to vapourize the sodium.
62. In mercury vapour lamp the harmful ultraviolet rays are absorbed by outer bulb.
63. Sodium vapour lamps use metallic sodium sealed in translucent aluminium oxide tubes.
64. Power factor of high pressure mercury vapour lamp is nearly unity and so do not need capacitor for power factor correction.
65. In a colour-corrected high pressure mercury vapour lamp, the outer glass envelope is coated with fluorescent powder.
66. Mercury iodide lamps are not suitable for use for floodlighting.
67. The luminous efficiency of mercury iodided lamps ranges from 75 to 90 lumens per watt.
68. Starters used in fluorescent tubes are usually of thermal type.
69. In fluorescent tubes low voltage is required for starting.
70. Fluorescent tubes operating on dc are generally free from stroboscopic effect.
71. In a fluorescent tube starter is required for preheating the electrodes.
72. According to the Stefan Boltzmann's law intensity of emitted radians is proportional to T^4 where T is the absolute temperature.
73. For the same lumens output, the operating cost of fluorescent lamp is less than the filament lamp.
74. Low voltage generally facilitates starting of fluorescent tubes.
75. With use, walls of a fluorescent tube blacken a little and dark rings appear near the ends owing to the deposition of active material from the electrodes.
76. The lumen output of a fluorescent tube is reduced, after about 4,000 hours of use, by 15-20 percent.
77. Power factor of fluorescent lamps is high.
78. One high power LED chip used in LED lights can emit up to 10,000 lumens for an electrical power consumption of only 100 watts (100 lumens per watt)
79. Lumen method takes into account the interreflections of light inside a room.
80. Luminaires are generally categorized as industrial, commercial or residential.
81. Lenses with prismatic patterns refract light sources to disperse the rays or to direct them most effectively.
82. Greater the size of the room lesser will be the coefficient of utilisation.
83. Maintenance factor and depreciation factor are two different names of same concept.
84. Space-height ratio is less with dispersive type reflectors than that with concentric type reflectors.

Answers: **25.** (T), **26.** (F), **27.** (T), **28.** (F), **29.** (T), **30.** (T), **31.** (F), **32.** (T), **33.** (T), **34.** (F), **35.** (F), **36.** (F), **37.** (F), **38.** (T), **39.** (T), **40.** (T), **41.** (F), **42.** (F), **43.** (T), **44.** (T), **45.** (F), **46.** (T), **47.** (T), **48.** (T), **49.** (F), **50.** (F), **51.** (T), **52.** (T), **53.** (F), **54.** (F), **55.** (T), **56.** (T), **57.** (T), **58.** (T), **59.** (F), **60.** (F), **61.** (T), **62.** (T), **63.** (T), **64.** (F), **65.** (T), **66.** (F), **67.** (T), **68.** (F), **69.** (F), **70.** (T), **71.** (T), **72.** (T), **73.** (T), **74.** (F), **75.** (T), **76.** (T), **77.** (F), **78.** (T), **79.** (T), **80.** (T), **81.** (T), **82.** (F), **83.** (T), **84.** (F),

85. Smaller the space-height ratio lesser the number of lamps required by a given installation.
86. In a lighting installation selection of proper space-height ratio ensures uniformity of illumination.
87. Ratio of light flux reaching the working plane to that emitted by the lamp(s) is called the maintenance factor.
88. Depreciation factor is merely the inverse of utilisation factor.
89. The load factor of chemical plants is about 50 per cent.
90. For copper plating, material used is copper sulphate and nitric acid.
91. The main drawback of thermoelectric refrigeration system is its initial prohibitive cost.
92. The main functions of a condenser in a refrigeration system is to remove the heat absorbed by the evaporator.
93. A room air-conditioner should, preferably, be fitted to a window which is not exposed to the direct Sun rays.
94. The use of air-conditioner at peak load periods should be the minimum.
95. Steam locomotives in India, use single acting reciprocating engines.
96. The overall efficiency of a steam locomotive is 10-15 per cent.
97. Maintenance and repair cost of steam locomotives is less in comparison to that of electric locomotives.
98. Steam locomotives cannot be used for underground railways.
99. The coefficient of adhesion is better in steam traction than that in electric traction.
100. In direct steam engine drive, the reciprocating steam engine is invariably used for getting the necessary motive power because of its inherent simplicity, operational dependability, simplified maintenance and easy speed control.
101. In direct IC engine drive, speed control is possible only by employing a gearbox.
102. A diesel engine has an overload capacity of 35%.
103. Steam electric drive (employing steam turbine for driving a generator used for supplying current to electric motors) is commonly used in railways.
104. In IC engine-electric drive, the reduction gear and gearbox are eliminated.
105. IC engine-electric drive has found considerable favour for railway work and locomotives of this type are becoming widely used.
106. Regenerative braking cannot be employed with IC engine-electric drive but there is no bar in using rheostatic braking.
107. Battery-electric drive is commonly used for urban and suburban services.
108. Battery vehicles are started by series-parallel grouping of batteries in parallel for starting and running at the speed upto half maximum speed and in series for running at maximum speed.
109. In Calcutta city tramways are still a means of public transport.
110. Owing to better speed control in electric drive locomotion on steep gradients at slow speed is possible.
111. The electric drive is healthier from the hygienic point of view owing to complete absence of smoke and fumes.
112. The braking employed in case of tramways is regenerative one.
113. The equipment used in tramways is similar to that used in railways but of considerably smaller output (not exceeding 50 kW).
114. The trolley bus employs a dc compound motor of output of 50-100 kW.
115. The trolley bus makes use of series-parallel control method for its speed control.
116. Plain rheostatic braking is used in trolley buses.
117. Power for lighting in passenger coaches, in a long distance train, is provided through individual generator of bogie and batteries.
118. The overhead distribution system in the case of traction is identical with that of power system.
119. The cost involved in substations in case of dc traction system is less than that involved in ac system.
120. Cost of ac electrification of track is more than that of dc electrifcation.
121. In similar conditions the energy consumption in dc traction system is more as compared with ac traction system.
122. For exerting the same torque, current required in dc traction system is more than that in ac system.
123. The acceleration is constant during notching up.
124. During notching period, the tractive effort developed by the traction motor fluctuates between a maximum and minimum about the mean.
125. Distance between stops divided by the actual time of run is called the schedule speed.
126. In main line service free running and coasting periods are longer but acceleration and braking periods are smaller.
127. Weight transfer is a desirable quality.
128. Dead weight is smaller than accelerating weight.
129. The ratio of the dead weight to the maximum value of tractive effort developed without wheel slipping is called coefficient of adhesion.
130. The coefficient of adhesion reduces as the speed falls.
131. Increase of motor torque beyond adhesive limit does not increase the tractive effort but causes wheel skidding.
132. Increasing of braking torque beyond adhesive limit causes wheel slipping.
133. Gears are used in electric traction to increase the tractive effort at the driving wheel.
134. During starting the train resistance increases linearly with speed.
135. Power output from the driving axles is the product of tractive effort and speed.
136. Steep gradient will involve less energy consumption.
137. In a train, the energy output of the driving axles is used in accelerating the train, overcoming the gradient and train resistance.
138. The energy output of a train for a given speed-time curve is independent of the type of drive used, but energy consumption depends upon the type of drive used.
139. Specific energy output is independent of locomotive overall efficiency but the specific energy consumption depends upon the overall efficiency of the locomotive.
140. In a single-phase ac traction system ac series motors are employed for getting necessary motive power.
141. Initial rush of current on temporary interruption of supply is more with dc series motors than that with dc shunt motors.
142. In a dc series motor operating on undulating dc supply, the undulating factor will be less than unity.

Answers: **85.** (F), **86.** (T), **87.** (F), **88.** (F), **89.** (F), **90.** (F), **91.** (T), **92.** (T), **93.** (T), **94.** (T), **95.** (F), **96.** (F), **97.** (F), **98.** (T), **99.** (F), **100.** (T), **101.** (T), **102.** (F), **103.** (F), **104.** (T), **105.** (T), **106.** (T), **107.** (F), **108.** (T), **109.** (T), **110.** (T), **111.** (T), **112.** (F), **113.** (T), **114.** (T), **115.** (F), **116.** (F), **117.** (T), **118.** (F), **119.** (F), **120.** (F), **121.** (F), **122.** (F), **123.** (T), **124.** (T), **125.** (F), **126.** (T), **127.** (F), **128.** (T), **129.** (F), **130.** (F), **131.** (T), **132.** (T), **133.** (T), **134.** (T), **135.** (T), **136.** (F), **137.** (T), **138.** (T), **139.** (T), **140.** (T), **141.** (T), **142.** (T),

143. Single-phase compensated series motors, which can be built in sizes up to several hundred kW output, are usually used for electric traction work.
144. The speed of the linear induction motor drive will be lesser than that of the travelling field.
145. Linear induction motor has superiority over conventional rotary induction motor for speeds exceeding 200 kmph.
146. Speed control of motors in ac traction is difficult and wasteful than that in dc traction.
147. Rheostatic control of 3-phase induction motors is used in light-locomotives and motor coaches where single economical speed is sufficient and energy consumption is of no importance.
148. In a buck and boost method of control, the number of machines used is 4.
149. Regenerative braking is more efficient and less complicated in ac system in comparison to that with dc system.
150. Negative boosters have to be used in dc traction to confine ground currents to rails.
151. In ac traction, booster transformers are necessary in order to confine the return current through the rails.
152. The rectifiers used in modern electric traction are based on the principle of silicon controlled rectifiers.
153. Staggar in the contact wire is provided to even out the wear on the contact strip of pantograph.
154. Single ended fairelay type pantograph is employed in dc traction whereas the diamond type pantograph is used in ac traction.
155. Neutral section in OHE is provided to avoid short-circuiting of two live phases by the pantographs.
156. Interference with communication system is more with dc than that with ac.
157. Magnetic brakes are usually employed on trolley buses and cars.
158. Individual drive is employed for high speed locomotives and collective drive for low speed locomotives (goods locomotives).
159. Overhead construction is universal for all ac railways.
160. The substations for track electrification are unattended type and arranged for remote control operation.

Answers: **143.** (T), **144.** (T), **145.** (T), **146.** (F), **147.** (T), **148.** (T), **149.** (F), **150.** (T), **151.** (T), **152.** (T), **153.** (T), **154.** (F), **155.** (T), **156.** (F), **157.** (T), **158.** (T), **159.** (T), **160.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Hoist and cranes require _____ starting torque.
2. _____ is defined as a form of machine equipment designed to convert electrical energy into mechanical energy and provide electrical control of this process.
3. _____ rating is an output which a motor can deliver for a specified period.
4. Type of cooling fan motor is _____.

[Mahamaya Technical Univ. Second Semester 2010-11]

5. Amplidynes should never be operated on _____.
6. Thermal conductivity is measured in _____.
7. The ratio of heat flow from two walls of same thickness having thermal conductivity in the ratio of 1 : 0.8 and for the same temperature difference will be _____.
8. In case of immersion type water heater, the heat is transferred by _____.
9. In electric press, mica is used because it is _____ conductor of heat but _____ conductor of electricity.
10. Heating element in an incandescent lamp is of _____.
11. Heating elements used in household appliances are made of _____.
12. An enclosure of a charge to be heated by radiation or convection or by the joint effect of these modes of heat transfer is called the _____.
13. In the indirect resistance heating method, maximum heat transfer takes place by _____.
14. Heating chambers may be of _____ or _____ type.
15. Large furnace installations are often equipped with _____ charging.
16. Indirect furnaces are usually made in _____ sizes than direct arc furnaces.
17. Standard size of Ajax Wyatt vertical core type furnaces ranges from 60 to 300 kW, all _____ phase, 50 Hz for standard voltage upto _____ V.
18. Indirect core type induction furnace has comparatively _____ power factor in comparison to that of resistance ovens.
19. In the plastic or _____ welding, the pieces of metal to be joined are heated to plastic state and then forged together under external pressure.
20. In the fusion or _____ welding, the material at the joint is heated to a molten state and allowed to solidify.
21. Project welding uses the same equipment as the _____ welding.
22. _____ welding can be defined as series of continuous spot welds.
23. For spot welding the tips of the electrodes used are made of _____ alloy.
24. In metal-arc welding, too excessive welding current results in _____.
25. A 10 SWG electrode has approximate diameter of _____.
26. The electrode that can be used for welding two 3 mm thick mild steel sheets is _____.
27. In atomic hydrogen welding, the electrodes used are made of _____.
28. In argon arc welding, the electrodes used are made of _____.
29. Argon is an _____ gas.
30. TIG welding is _____ welding.
31. MIG welding is _____ welding.
32. DC generator in a M-G set used in arc welding is of _____ characteristics.
33. The transformer used in a welding set is _____ transformer.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

34. The dc generator used in M-G set employed in arc welding is of _____ type.
35. A rectifier used for welding has voltage-current characteristic as _____.
36. _____ supply is used in atomic hydrogen welding.
37. One Angstrom is equal to _____.
38. Human eye is most sensitive for a wavelength of _____ Å.
39. The amount of light entering the eye is controlled by _____.
40. Light is a form of _____ energy.
41. Light wave travels with a velocity of _____.
42. The colour having shortest wavelength is _____.
43. The colour having longest wavelength is _____.
44. Steradian is defined as the solid angle that subtends a surface on the sphere equivalent to the square of the _____.
45. Light is expressed in _____.
46. _____ may be defined as the brightness within the field of vision of such a character as to cause annoyance, discomfort, interference with vision or eye fatigue.
47. The unit of illumination is _____.
48. Candela is the unit of _____.
49. 1 lumen/m^2 is equal to _____.
50. The luminous flux is measured in _____
51. Lumens/watt is the unit of _____.
52. A lamp has a total luminous flux of 1,570 lumens. Its *mscp* is _____.
53. _____ factor is defined as the ratio of reflected light to incident light and is always _____ than unity.
54. _____ lamp has least capacity to sustain voltage fluctuations.
55. _____ lamps emit only a faint glow and are used as indicating lamps on panels and appliances.
56. The diameter of tungsten filament for GLS lamps is of the order of _____.
57. In GLS lamps, button incorporates _____ wires.
58. In GLS lamps, the blackening of lamps is on account of the deposits of _____.
59. Caps of GLS lamps are made of brass or _____.
60. Translucent materials are used as _____ materials for light sources.
61. Power factor of a sodium vapour lamp is nearly _____ lagging.
62. Leak transformer used in a sodium vapour lamp acts as a choke coil for limiting the _____ when the lamp starts conducting.
63. The light from a sodium vapour lamp is nearly _____.
64. CFL stands for _____.
65. The usual operating voltage for neon tubes is _____ volts.
66. Neon tube consists of a length of glass tubing containing two electrodes, normally cylindrical in shape, of iron, steel or _____.
67. Fluorescent lamp operating on dc supply needs _____ in addition to a starter and a choke.
68. In comparison to typing rooms, drawing office needs _____ level of illumination.
69. To achieve uniform illumination the whole area to be illuminated is divided into a number of _____ as far as possible.
70. The SI unit of electrochemical equivalent is _____.
71. Rating of a domestic refrigerator is of the order of _____.
72. The refrigerating capacity of 165 domestic refrigerator is approximately equal to _____ tonne.
73. The capacity of a 1 tonne air conditioner is _____ kcal/hour.
74. One ton capacity of the refrigeration plant needs approximately _____ watt motor.
75. Various refrigerants used are SO_2, CO_2, methylchrolide, ammonia and _____.
76. Temperature inside the refrigerator is to be maintained between _____ and _____ °C.
77. Temperature inside the freezer of a refrigerator is _____ °C.
78. In air-conditioning system the quantity of free air required per person is usually _____ m^3/minute.
79. The air coming out of the outlet is known as _____ air.
80. As compared to men, women need _____ °C higher effective temperature.
81. Package units may be of _____ or _____ type.
82. A desert cooler operates on the principle of _____ cooling.
83. The temperature of water in a water cooler is controlled by a _____ switch.
84. In a steam locomotive, electric power is provided through a _____.
85. The overall thermal efficiency of steam locomotive is about _____ %.
86. Overload capacity of diesel engine is usually restricted to _____ %.
87. The efficiency of diesel locomotives is about _____ %.
88. _____ is cheaper for low traffic density areas.
89. For standard passenger locomotives the cruising range is around _____ km.
90. Because of low coefficient of adhesion power-weight ratio of steam locomotive is _____.
91. Owing to high centre of gravity of steam locomotive, the speed is _____.
92. The efficiency of IC engine at its normal speed is about _____ per cent.
93. Maintenance and operating costs of diesel-electric locomotives are _____.
94. For the same power diesel-electric locomotive is _____ than steam or electric locomotive.
95. _____ drive is ideally suitable for underground and tube railways.
96. An electric locomotive needs much _____ time for maintenance and repairs in comparison to a steam locomotive.
97. Operating voltage for dc traction is _____ volts.
98. The tram car is provided with at least _____ driving axles in order to achieve necessary adhesion and make control possible from either end.
99. Efficiency of dc substations is _____ in comparison to that of ac substations.
100. During free running _____ remains constant.
101. During coasting the speed of the train _____.
102. During coasting the power supply remains _____.
103. _____ precedes braking.
104. Coasting is followed by _____.
105. The maximum speed attained by the vehicle during the run is called the _____ speed.
106. Suburban railway service needs _____ acceleration and braking retardation and _____ stopping and starting.
107. The total weight of the locomotive and train to be pulled up is called the _____ weight.
108. In electric traction the torque exerted is _____ whereas in steam traction it is _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

109. Slipping will take place when tractive effort is _____ than the maximum frictional force between the wheels and the track.
110. The coefficient of adhesion is _____ on wet rails in comparison to that of clean dry rails.
111. The effective force necessary to propel the train, at the wheels of the locomotive is called the _____.
112. The accelerating weight is taken _____ to _____ per cent more than dead weight.
113. The starting efficiency with four motors in series parallel is _____ whereas with rheostatic starting it is 50%.
114. Mechanical braking is required at a speed of _____ kmph to bring the locomotive to rest.
115. Generally regenerative braking is desirable and necessary for services having long gradients exceeding _____ per cent.
116. Electromechanical drum brakes are usually employed on _____.
117. _____ drive is not suitable for high speed locomotives owing to stresses and vibrations in the connecting rods at high speeds.
118. Power supply frequency for 25 kV single-phase ac system in India is _____ Hz.
119. The motor for _____ drive needs not be paid so much attention in designing with regard to dimensions as much that for _____ drive.
120. The gearing ratio usually employed in transmission of drive in electric traction is usually _____.
121. _____ is usually employed for motor coaches and tramways.
122. _____ is not used on large locomotives because of the relatively large unsprung weight.
123. _____ system is cheap and easy to repair and inspection and is suitable for heavy current collection (top contact system for voltages upto 750 V and side contact system upto 1,200 V).
124. The trolley collector is suitable for comparative low speeds, say _____ to _____ kmph and beyond this speed there is every possibility of its jumping.
125. In addition to main traction motors, the motor-generator set is installed on the electric locomotive to supply lighting, control system and other power circuits at low voltage from _____ to _____ V.

ANSWERS

1. high
2. An electric drive
3. Short-time
4. self-cooling
5. short circuit
6. MJ/m²/°C/hour
7. 1:0.8
8. convection
9. good, bad
10. tungsten
11. nichrome
12. heating chamber
13. radiation
14. batch; continuous

12 CHAPTER

Electronic Components and Devices

Short Answer Type Questions With Answers

Q. 1. What is difference between active and passive devices ?

Ans. In passive devices, the time average power delivered to the device over an infinite time period is always greater than or equal to zero while active devices are capable of supplying power.

Q. 2. Why is it necessary to connect an electrolytic capacitor in a circuit with correct polarity ?

Ans. It needs to be strongly emphasized that the electrolytic capacitor should only be connected in a circuit with the proper polarities. If one connects the positive lead of the capacitor to the negative lead of a circuit, chemical action by the electrolyte will rupture the oxide dielectric and destroy the capacitor. (With reversed polarity, the oxide no longer acts like an insulator and as a result, a substantial leakage current can flow and disintegrate the oxide).

Q. 3. What is Fermi level ?

Ans. The maximum energy that an electron in a metal has at the absolute zero temperature is called the Fermi level of energy and is designated by E_F.

Q. 4. What is meant by work function of a metal ?

Ans. The work function, ϕ or E_W, of a metal may be defined as the difference between the energy required to move an electron of a metal to an infinitely large distance and the maximum energy an electron can have at absolute zero temperature ?

Q. 5. What is meant by the threshold frequency ?

Ans. The minimum frequency which can cause photoelectric emission is called the threshold frequency.

Q. 6. Enlist the elements included in Group IV.

Ans. The elements in group IV are (*i*) Carbon (*ii*) Silicon (*iii*) Germanium (*iv*) Tin and (*v*) Lead.

Q. 7. Why copper is a good conductor ?

Ans. In case of copper, the electrons in the conduction band are very large. An electron in the conduction band experiences almost negligible nuclear attraction. In fact, an electron in the conduction band does not belong to any particular atom. But it moves randomly throughout the solid. Due to overlapping of valence and conduction bands, a slight pd across conductors causes the electrons in conduction band, called the free electrons, to constitute electric current. So copper is a good conductor of electricity.

Q. 8. Classify materials into conductors, semiconductors and insulators.

Ans. According to the free electron theory, the total energy which is equal to the kinetic as well as the potential energy is assumed to be zero, is related to the wave number by the relation

$$E = \frac{h^2k^2}{2m} \quad \text{where } k = \frac{2\pi}{\lambda}$$

In the free electron theory, when one considers the interaction of the electron with the period potential of the lattice, one finds that band gaps occur at Brillouin zone boundaries. In case the lower valence band is half filled, the material is said to be a good conductor. There is overlapping of zones/bands. This also refers to case where the material behaves like a metal or good conductor. At higher temperature ($K_BT > E_G$) an appreciable number of electrons get excited from the top of the valence band into the bottom of the conduction band. The material is then said to exhibit intrinsic semiconductivity; the magnitude of conductivity depends on the density and mobility of electrons in the conduction band and holes in the valence band. If the band gap is very large so that thermal excitation of electrons from valence to conduction band is negligible even at high temperatures, the material is deemed to be as an insulator.

Q. 9. What is the basis for classifying a material as a conductor, semiconductor or a dielectric ? What is the conductivity of perfect dielectric ? **[I.E.S. 2002]**

Ans. Conductors possess high conductivity whereas the characteristic property of insulating materials (or dielectrics) is poor conductivity. Semiconductors occupy an intermediate position between conductors and insulators. Though there is no rigid line separating the conductors from semiconductors and semiconductors from insulators, but still according to resistivity

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

the materials of resistivity of the order from 10^{-8} to 10^{-3}, 10^{-3} to 10^{6} and 10^{6} to 10^{18} ohm-metres may be classified as conductors, semiconductors and dielectrics respectively.

Another classification is based on temperature coefficient of resistivity. Metals have positive temperature coefficient of resistivity; semiconductors have small negative temperature coefficient of resistivity and insulators have large negative temperature coefficient of resistivity.

Q. 10. What is the importance of valence shell and valence electrons ?

Ans. The outermost shell of an atom is called the valence shell and electrons in this shell are called the valence electrons. Formation of energy bands occur owing to overlapping of energy levels of these valence electrons in valence shells. With the decrease in interatomic distance between the atoms in a crystal, the energy levels of electrons in outermost shells of atoms overlap to form energy bands.

Q. 11. What is the forbidden energy gap ? How does it occur ? What is its magnitude for Ge and Si ?

Ans. The energy gap between the valence band and conduction band is known as forbidden energy gap. It is a region in which no electron can stay as there is no allowed energy state. Magnitude of forbidden energy gap in germanium and silicon is 0.72 eV and 1.12 eV respectively at 300 K and 0.785 eV and 1.21 eV respectively at absolute zero temperature.

Q. 12. Define a hole in a semiconductor.

Ans. When an energy is supplied to a semiconductor, a valence electron is lifted to a higher energy level, the departing electron leaves a vacancy in the valence band. This vacancy is called a hole. Thus, a vacancy left in the valence band because of lifting of an electron from valence band to conduction band is known as hole.

Q. 13. What is hole current ?

Ans. The movement of the hole (positively charged vacancy in the valence band) from positive terminal of the supply to the negative terminal through semiconductor constitutes hole current.

Q. 14. Why silicon and germanium are the two widely used semiconductor materials ?

Ans. Because the energy required to release an electron from their valence band (*i.e.*, to break their covalent bonds) is very small (1.12 eV for Si and 0.72 eV for Ge).

Q. 15. Which of the two semiconductor materials Si or Ge has larger conductivity at room temperature ? Why ?

Ans. Since energy required in transferring electrons from valence band to conduction band is more in case of silicon than that in case of germanium, the conductivity of Ge will be more than that of Si at room temperature.

Q. 16. Why does a pure semiconductor behave like an insulator at absolute zero temperature ?

Ans. For a pure semiconductor at a temperature of absolute zero (– 273.15°C) the valence band is usually full and there may be no electron in the conduction band and it is difficult to provide additional energy required for lifting electron from valence band to conduction band by applying electric field. Hence the conductivity for a pure semiconductor at absolute zero temperature is zero and it behaves like an insulator.

Q. 17. What is the main factor for controlling the thermal generation and recombination ?

Ans. Temperature, because with the increase in temperature, concentrations of free electrons and holes increase and the rate of recombination is proportional to the product of concentrations of free electrons and holes and also the rate of production of electron-hole pairs (thermal generation) increases with the rise in temperature.

Q. 18. Define mean life time of a carrier.

Ans. The amount of time between the creation and disappearance of a free electron is called the life time. It varies from a few nanoseconds to several microseconds depending how perfect the crystal is and other factors.

Q. 19. In which bands do the movement of electrons and holes take place ?

Ans. Free electrons move in conduction band while holes in valence bands.

Q. 20. What is the mechanism by which conduction takes place inside the semiconductor.

Ans. Conduction occurs in any given material when an applied electric field causes electrons to move in a desired direction within the material. This may be due to one or both of two processes, electron motion and hole transfer. In case of former process, free electrons in the conduction band move under the influence of the applied electric field. Hole transfer involves electrons which are still attached to the atoms *i.e.* those in valence band.

Q. 21. What do you mean by drift velocity and mobility of a free electron ? **[A.M.I.E. Sec B. Summer 1988]**

Ans. The average velocity of a free electron is known as drift velocity whereas mobility of an electron is defined as the drift velocity per unit electric field.

Q. 22. Define mobility of a carrier. Show that the mobility constant of electron is larger than that of a hole.

Ans. Mobility is defined as the average particle drift velocity per unit electric field.

The mobility of electrons is more than that of holes because the probability of an electron having the energy required to move to an empty state in the conduction band is much greater than the probability of an electron having the energy required to move to the empty state in valence band. The mobility of electron is about double that of an hole.

Q. 23. Define diffusion current in a semiconductor.

Ans. The diffusion of charge carriers is as a result of a gradient of carrier concentration (*i.e.*, the difference of carrier concentration from one region to another). In this case concentrations of charge carriers (either electrons or holes) tend to distribute themselves uniformly throughout the semiconductor crystal. This movement continues until all the carriers are evenly distributed throughout the material. This type of movement of charge carriers is called the diffusion current.

Q. 24. Define drift current in a semiconductor.

Ans. The steady flow of electrons in one direction caused by applied electric field constitutes an electric current, called the drift current.

Q. 25. What happens to the conductivity of the semiconductor with the rise in temperature? Compare with the conductivity of metals.

Ans. With the increase in temperature, the concentration of charge carriers increases resulting in increase of conductivity of semiconductors. The conductivity of metal decreases with the increase in temperature.

Q. 26. Why the temperature coefficient of resistance of a semiconductor is negative?

Ans. With the increase in temperature, the concentration of charge carriers (electrons and holes) increases. As more charge carriers are made available, the conductivity of a pure semiconductor increases *i.e.* resistivity of a pure semiconductor decreases with the rise in temperature *i.e.* semiconductors have negative temperature coefficient of resistance.

Q. 27. What is meant by Fermi level in semiconductor ? Where does the Fermi level lie in an intrinsic semiconductor ?

Ans. Fermi level in a semiconductor can be defined as the maximum energy that an electron in a semiconductor have at absolute zero temperature.

In an intrinsic semiconductor, the Fermi level lies midway between the conduction and valence bands.

Q. 28. Differentiate between intrinsic semiconductors and extrinsic semiconductors ? Give examples.

Ans. An intrinsic semiconductor is one which is made of the semiconductor material in its extremely pure form.

When a small amount of impurity is added to a pure semiconductor crystal during the crystal growth in order to increase its conductivity, the resulting crystal is called the extrinsic semiconductor.

Q. 29. Give reasons—Doping is done in semiconductors.

Ans. Intrinsic (or pure) semiconductor by itself is of little significance as it has little current conduction capability at ordinary room temperature but if very small amount of impurity (of the order of one atom per million atoms of pure semiconductor) is added to it in the process of crystallization, the electrical conductivity is increased many times.

Q. 30. Describe the difference between P-type and N-type semiconductor materials.

Ans. When a small amount of trivalent impurity (such as boron, gallium, indium or aluminium) is added to a pure semiconductor crystal during crystal growth, the resulting crystal is called the P-type semiconductor.

When a small amount of pentavalent impurity (such as arsenic, antimony, bismuth or phosphorus) is added to a pure semiconductor crystal during crystal growth, the resulting crystal is called the N-type semiconductor.

Q. 31. What do you mean by donor and acceptor impurities?

Ans. Donor impurities (such as arsenic, antimony, bismuth or phosphorus) when added to a pure semiconductor lattice, form N-type extrinsic semiconductor. The pentavalent impurities are called the donor type impurities as such impurities donate electrons to the lattice.

Acceptor impurities (such as boron, gallium, indium or aluminium) when added to a pure semiconductor lattice form P-type extrinsic semiconductor. The trivalent impurities are called the acceptor type impurities because such impurities accept electrons from the lattice.

Q. 32. Explain the term doping and its need.

Ans. The electrical conductivity of intrinsic semiconductor, which has little current conduction capability at ordinary room temperature and so is of little use, can be increased many times by adding very small amount of impurity (of the order of one atom per million atoms of pure semiconductor) to it in the process of crystallization. This process is called the doping.

Q. 33. What are the majority and minority carriers in P-type semiconductor materials ?

Ans. Holes are majority carriers and free electrons are minority carriers in P-type semiconductor materials.

Q. 34. What is the effect of temperature on extrinsic semiconductors ?

Ans. With the increase in temperature of an extrinsic semiconductor, the number of thermally generated carriers is increased resulting in increase of concentration of minority carriers. At temperature exceeding critical temperature the extrinsic semiconductor behaves like an intrinsic semiconductor but with higher conductivity.

Q. 35. For the same order of doping, why does N-type semiconductor exhibit larger conductivity than P-type semiconductor ?

Ans. Since the mobility of electrons is greater than that of holes, for same level of droping, N-type semiconductor exhibits larger conductivity.

Q. 36. Define the term intrinsic concentration.

Ans. Intrinsic concentration of holes or free electrons is called the intrinsic concentration, n_i, which varies with temperature according to the relation $n_i = A_0 T^3 e^{-EGo/kT}$.

where A_o is a constant and independent of temperature, k is a Boltzmann constant in eV per K and E_{Go} is the energy gap in eV at absolute zero temperature, T is the temperature in degrees absolute and n_i is the concentration in number/m^3. A_o is taken as 2.33×10^{43}.

Q. 37. Give the continuation equation for electrons.

Ans. Continuation equation indicates that the rate of thermal generation of electrons equals the rate of electrons lost due to recombination under equilibrium condition.

Q. 38. Describe Hall effect.

Ans. When a specimen (metal or semiconductor) is placed in a transverse magnetic field and a direct current is passed through it, then an electric field is induced across its edges in the perpendicular direction of current as well as magnetic field. This phenomenon is called the Hall effect.

Q. 39. "Hall effect has played a decisive role in revealing the mechanism of conduction in semiconductors." Explain the statement. [U.P.S.C. I.E.S. 2003]

Ans. The conductivity of a semiconductor does determine the mobility and density of charge carriers separately. But in case there is only one type of charge carriers (either electrons or holes), the density of charge carriers can be found from a measurement of the Hall coefficient of the material. Hence, the given statement is justified.

Q. 40. What properties of a semiconductor are determined from a Hall effect ?

Ans. The Hall effect may be used to determine (*i*) whether a semiconductor is of N-type or P-type (*ii*) the carrier concentration and (*iii*) measure the conductivity of a material and then compute mobility.

Q. 41. What is Hall coefficient ? Where is it used ?

Ans. Hall coefficient $R_H = \frac{1}{\rho} = \frac{\mu}{\sigma}$

where ρ is the charge density, μ is the mobility and σ is the conductivity of specimen.

It is used to determine mobility of specimen.

Q. 42. What is a P-N junction ?

Ans. The contact surface between the layers of P-type and N-type semiconductor pieces placed together so as to form a P-N junction is called the P-N junction.

Q. 43. How do the transition region width and contact potential across a P-N junction vary with the applied bias voltage ?

Ans. When the P-N junction is forward biased, the transition region width is reduced and the contact potential is also reduced with the increase in applied bias voltage.

When the P-N junction is reverse biased, the transition is widened, and the contact potential is increased with the increase in applied bias voltage.

Q. 44. Which type of charges are present on the two opposite faces of the junction ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Positive charge on N-side and negative charge on P-side of the junction.

Q. 45. What types of carriers are present in space charge region.

Ans. No mobile carrier is present in the space charge region.

Q. 46. Why is space region called the depletion region ?

Ans. The region around the junction is completely ionised on formation of P-N junction. As a result, there are no free electrons on the N-side nor the holes on the P-side. Since the region around the junction is depleted of mobile charges, it is called the depletion region.

Q. 47. Why an electric field is produced in a depletion region of a P-N junction ?

Ans. The separation of positive and negative space charge densities in a P-N junction results in an electric field.

Q. 48. What is space charge width ?

Ans. The space charge region extends into the N and P-regions from the metallurgical junction. The distance is known as the space charge width.

Q. 49. The electric field in the space charge region decreases with forward bias and increases with reverse bias. Why ?

Ans. Because applied electric field opposes built-in field.

Q. 50. Define cut-in voltage of a p-n junction diode ?

Ans. The forward voltage, at which the current through the P-N junction starts increasing rapidly, is called the cut-in voltage.

Q. 51. What do you understand by reverse saturation current of a diode ?

Ans. Reverse saturation current of a diode is due to minority carriers and is caused when the diode is reverse biased. Only a very small voltage is required to direct all minority carriers across the junction, and when all minority carriers are flowing across, further increase in bias voltage will not cause increase in current. This current is referred to as a reverse saturation current.

Q. 52. What is the effect of temperature on the reverse current of a P-N junction ?

Ans. Reverse current of a P-N junction increases with the increase in junction temperature.

Q. 53. Why is silicon preferred to germanium in the manufacturing of semiconductor devices ?

Ans. Silicon is preferred to germanium in the manufacturing of semiconductor devices because such devices have higher peak inverse voltage and current ratings and wider temperature range than germanium one.

Q. 54. Define peak inverse voltage ?

Ans. Peak inverse voltage is the maximum voltage that can be applied to the P-N junction without damage to the junction. If the reverse voltage across the junction exceeds its peak-inverse voltage (PIV), the junction may get destroyed owing to excessive heat.

Q. 55. Define the limitations in the operating conditions of P-N junction.

Ans. Every P-N junction has limiting values of (*i*) maximum forward current (*ii*) peak inverse voltage (PIV) and (*iii*) maximum power rating. The P-N junction provides satisfactory performance when operated within these limiting values. The P-N junction diode may get destroyed due to excessive heat if any of these values is exceeded.

Q. 56. What does the arrowhead represent in a schematic symbol of a P-N junction ?

Ans. The arrowhead in the schematic symbol of a P-N junction indicates the direction of conventional current flow when the diode is forward biased.

Q. 57. What are the two mechanisms of breakdown in a P-N junction ?

Ans. Avalanche and zener breakdowns.

Q. 58. Name the breakdown mechanism in a lightly doped P-N junction under reverse biased condition.

Ans. Avalanche breakdown.

Q. 59. Name the breakdown mechanism in a heavily doped P-N junction under reverse biased condition.

Ans. Zener breakdown.

Q. 60. What is an ideal diode ?

Ans. An ideal diode is a two terminal polarity sensitive device that has zero resistance when it is forward biased and infinite resistance when reverse biased.

Q. 61. Is reverse saturation current of a junction diode independent of reverse bias voltage ?

Ans. Yes.

Q. 62. Germanium is more temperature dependent than silicon. Why ?

Ans. Because the reverse saturation current in case of a germanium diode is approximately 1,000 times larger.

Q. 63. What is the effect of temperature on the reverse saturation current of a diode ?

Ans. Reverse saturation current, theoretically, increases by 8 percent per °C for silicon and 11 percent per °C for germanium. But from experimental data it is found that the reverse saturation current increases 7 percent per °C for both silicon and germanium. This is because a surface leakage current component of reverse saturation current is independent of temperature. Since $(1.07)^{10} \simeq 2.0$, the reverse saturation current approximately doubles for every 10°C rise in temperature.

Q. 64. Explain the effect of temperature on the V-I characteristics of the diode.

Ans. Reverse saturation current I_0 and volt-equivalent of temperature V_T increase with the increase in temperature. I_0 doubles for every 10°C rise in temperature. This causes lowering of threshold or cut-in voltages. With the increase in temperature, forward characteristic become more ideal. In reverse-bias, the breakdown voltage increases with the increase in temperature.

Q. 65. What is static resistance of a diode ?

Ans. The static or dc resistance of a diode is the resistance offered by it to the direct current. It is defined as the ratio of the diode voltage and current at the point of interest and is not sensitive to the shape of V-I characteristic curve. It decreases with the increase in diode current or voltage.

Q. 66. Define dynamic resistance of a P-N junction diode in forward biased condition.

Ans. The resistance offered by a P-N junction diode to the changing forward current is defined as the dynamic resistance.

It may be given as

AC or dynamic resistance,

$$r = \frac{\text{Small change in forward voltage}}{\text{Small change is forward current}}$$

Thus ac resistance of a diode is sensitive to the shape of *v-i* characteristic curve in the region of interest. It decreases for higher level of diode current or voltage.

Q. 67. Explain what do you understand by the expression "linearization of a nonlinear device".

Ans. A nonlinear device, such as a diode, has a nonlinear voltage-current characteristic. In a diode V and I are related by equation

$$I = I_0 \left(e^{V/\eta V_T} - 1\right)$$

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Diode shows nonlinearity until the threshold or cut-in-voltage V_T is reached. Voltage-current characteristics of the diode follow a linear relationship after it has attained the cut-in-voltage, just as for a resistance of very low magnitude. It means that diode exhibits nonlinearity for lower voltages ($V < V_T$) but linearity for voltages exceeding V_T.

The equivalent circuit for the linear approximation is a constant-voltage source in series with a resistor.

Q. 68. What is step graded junction ?

Ans. A junction is said to be step graded if there is an abrupt change from acceptor ion concentration on the P-side to donor ion concentration on the N-side such as alloyed or fused junctions.

Q. 69. What is linear graded junction ?

Ans. A junction is said to be linearly graded if the charge concentration varies gradually with the distance in its transition region such as a growth junction.

Q. 70. What are the two types of capacitances across P-N junction ? Which of these is more important in case of forward bias ?

[Pb. Technical Univ. 2003]

Ans. In a P-N junction, there are two capacitive effects which are to be considered. Thus, there are two types of capacitances namely transition or depletion region capacitance and diffusion or storage capacitance. In the case of a forward biased diffusion capacitance is much larger than transition Capacitance (more than a million times).

Q. 71. Define transition and diffusion capacitances.

Ans. When a P-N junction is reverse biased, the depletion region acts like an insulator or dielectric material while the P- and N-type regions on either side have a low resistance and act as the plates. Thus P-N junction may be considered a parallel plate capacitor. The junction capacitance is termed as space charge *capacitance* or *transition capacitance* or *depletion region capacitance* and is denoted by C_T.

When a P-N junction is forward biased, a capacitance which is much larger than the transition capacitance, comes into play. This type of capacitance is called the diffusion capacitance C_D.

Q. 72. How will you represent capacitive effect of a practical diode on an ideal diode ?

Ans. The capacitive effect of a practical diode on an ideal diode may be represented by a capacitor connected in parallel with an ideal diode.

Q. 73. How does diffusion capacitance C_D vary with dc diode current ?

Ans. In a P-N junction diode, the diffusion capacitance is directly proportional to the diode forward current.

Q. 74. How does transition capacitance vary with junction voltage in a P-N junction diode ?

Ans. Transition capacitance is inversely proportional to the square root of the junction voltage.

Q. 75. What is meant by reverse recovery time ?

Ans. Reverse recovery time is the maximum time for the device to switch from *on* to *off*.

Q. 76. Is 'reverse recovery time' due to majority carriers or the minority carriers ?

Ans. Reverse recovery time is due to large number of minority carriers in both of the P- and N-regions.

Q. 77. How can the switching speed of a diode be improved ?

Ans. Switching speed of a diode can be improved by adding efficient recombination centres to the bulk material. For silicon diodes Au doping can serve this purpose.

A diode switching time can also be improved by making the lightly doped neutral region shorter than a minority carrier diffusion length.

Q. 78. What is a zener diode ?

Ans. Zener diode is a P-N junction diode specially designed for operation in its breakdown region.

Q. 79. What is zener voltage ?

Ans. The voltage at which the zener diode breakdown is called the zener voltage.

Q. 80. What is meant by the temperature coefficient ?

Ans. The effect of temperature on zener voltage is given in terms of temperature coefficient which is defined as the percentage change in nominal zener voltage for each degree centigrade of change in junction temperature.

Mathematically it is given as $\frac{\Delta V_Z}{V_Z(t-t_0)} \times 100$ where ΔV_Z is the change in zener voltage due to temperature variation of $(t - t_0)$.

Q. 81. What happens to the series current, load current and zener current when the dc input voltage of a zener regulator increases ?

Ans. Zener current and series current increase while the load current remains unchanged.

Q. 82. Explain how zener diode maintains constant voltage across the load ?

Ans. Zener diode has the property of behaving like a dc battery in 'on' state. If the zener diode is shunted across the load R_L and the voltage across zener diode is more than zener voltage V_Z then zener diode is in 'on' state, and any variation in voltage across the zener diode due to variations either in supply voltage or in load resistance is not able to change the output voltage. Thus zener diode maintains voltage constant across the load.

Q. 83. What is tunnel diode ?

Ans. Tunnel diode is a highly conductivity two-terminal P-N junction doped heavily (about 1,000 times higher than a normal diode).

Q. 84. What is tunneling ?

Ans. The mechanism of conduction in a semiconductor diode in which charge carriers (possessing very little energy) punch through a barrier directly instead of climbing over it is called tunneling.

Q. 85. What are the applications of tunnel diodes ?

Ans. Tunnel diodes are used as amplifiers, oscillators or switching devices, being an exclusive high-frequency component because of its very fast response of inputs.

Q. 86. What is PIN diode ?

Ans. PIN diode is composed of three sections with a high resistivity intrinsic layer sandwiched between P and N regions. It offers a variable resistance (decreasing with the increase in forward current) in the forward bias mode and infinite resistance in reverse bias mode.

Q. 87. What is a varactor diode ?

Ans. A varactor diode is a specially fabricated P-N junction with proper impurity concentration profile and operated under reverse-biased mode so as to give a variable junction capacitance.

Q. 88. Which device produces voltage variable capacitor ? How the voltage variable capacitance varies with the change in voltage across it ? **[U.P. Technical Univ. 2005-06]**

Ans. The varactor diode produces voltage variable capacitor. The junction capacitance of a varactor diode varies inversely as the square root of the reverse bias voltage in case of alloyed junction and varies inversely as the cube root of the reverse bias voltage for diffuse junction.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 89. What is point contact diode ?

Ans. Point contact diode consists of an N-type germanium or silicon (preferably germanium) wafer about 1.25 mm square by 0.5 mm thick, one face of which is soldered to a metal and the other face has a phosphor bronze or tungsten spring pressed against it. Because of very low capacitance, point contact diode is very much suitable for high frequency applications (of the order of 10 GHz).

Q. 90. What is step-recovery diode and why is it so called ?

Ans. Step-recovery diode is a voltage-dependent variable capacitor diode with graded droping profile (concentration of charge carriers decreasing near the junction). Because of step or sudden recovery from the reverse current ON to reverse current OFF, it is called the step-recovery diode.

Q. 91. What is Schottky diode ?

Ans. Schottky diode is quite different in construction from the normal P-N junction diode. It has metal (such as gold, silver, platinum, molybdenum, chrome or tungsten) on one side and N-type doped silicon on the other side of the junction. It has no storage charge. The junction barrier is called the Schottky barrier.

Q. 92. Why is Schottky diode called hot-carrier diode ?

Ans. Since in forward bias operation of the Schottky diode, the electrons on the N-side gain enough energy to cross the junction and plunge into the metal with very large energy, they are usually called hot carriers and the diode is called the hot-carrier diode.

Q. 93. What is back diode ?

Ans. Back diode is similar to a tunnel diode except that tunneling effect is large but only in the reverse direction. This is also called a unilateral diode.

Q. 94. What are power diodes ?

Ans. The power diodes are similar to P-N junction signal or low-power diodes but have large power-, voltage- and current-handling capabilities than those of conventional P-N junction diodes. Power diodes find many applications in electronics and electrical engineering circuits.

Q. 95. Why the current in power diodes varies linearly rather than exponentially with voltage ?

Ans. The large magnitude of current in power diodes leads to ohmic drop that hides the exponential part of the V-I characteristic curve.

Q. 96. What are thermistors ?

Ans. The word thermistor is a combination of *thermal* and *resistor*. A thermistor is a resistor with definite thermal characteristics. Most thermistors have a *negative temperature coefficient,* but positive temperature coefficient devices are also available.

Q. 97. Why most of the thermistors have negative temperature coefficient ?

Ans. The reason of negative temperature coefficient of resistance of a semiconductor is that when its temperature is increased, the concentration of charge carriers increases resulting in a decrease in resistance.

Q. 98. What are the applications of negative temperature coefficient (NTC) thermistors ?

Ans. Thermistors are widely used for *temperature compensation i.e.* for cancelling the effect of temperature on other electronic devices. They are also used for measurement and control of temperature, liquid level, gas flow etc.

Q. 99. What is a rectifier ?

Ans. A rectifier is a device which converts alternating current (or voltage) into unidirectional current (or voltage).

Q. 100. What is PIV of a diode in a rectifier circuit ?

Ans. Peak inverse voltage (PIV) is the maximum possible voltage that occurs across a diode when it is reverse biased.

Q. 101. What is the importance of peak inverse voltage ?

Ans. If the applied voltage in reverse biased condition exceeds peak inverse voltage (PIV) rating of the diode, then the diode may get damaged.

Q. 102. Why half-wave rectifiers are generally not used in dc power supply ?

Ans. The type of supply available from half-wave rectifier is not satisfactory for general power supply. That is why it is generally not used in dc power supply.

Q. 103. Why diodes are not operated in the breakdown region in rectifiers ?

Ans. In breakdown region, a diode has a risk of getting damaged or burnt because the magnitude of current flowing through it increases in an uncontrollable manner. That is why diodes are not operated in the breakdown region in rectifiers.

Q. 104. Define ripple as referred to in a rectifier circuit.

Ans. The ac component contained in the pulsating output of a rectifier is known as ripple.

Q. 105. What is transformer utilisation factor ?

Ans. Transformer utilisation factor is defined as the ratio of power delivered to the load and ac rating of secondary of supply power transformer.

Q. 106. The output of a 60 Hz full-wave bridge rectifier has a 60 Hz ripple. Is the circuit working properly ?

[A.M.I.E. Sec B. Summer 2006]

Ans. A full-wave rectifier with 60 Hz input must have lowest ripple frequency equal to twice the input frequency *i.e.* 120 Hz. If the ripple frequency is 60 Hz, it means some diodes in the circuit are not working.

Q. 107. What is meant by filter ?

Ans. Filter is a device that converts pulsating output of rectifier into a steady dc level.

Q. 108. Why series inductor and L-section filters cannot be used with half-wave rectifiers ?

Ans. Series inductor and L-section filters cannot be used with half-wave rectifiers because operation of series inductor depends upon the current through it and needs a minimum current to flow at all times.

Q. 109. Why capacitor input filter is preferred to choke input filter ?

Ans. In capacitor input filter, the dc output is much larger and ripples are less in comparison to those in choke input filter. So capacitor input filter is preferred to choke input filter.

Q. 110. Why π-filters are not suitable for varying loads ?

Ans. Voltage regulation in case of π-filters is very poor and, therefore, π-filters are not suitable for varying loads.

Q. 111. Why R-C filters are suitable only for light loads ?

Ans. R-C filters have poor voltage regulation and need adequate ventilation to dissipate the heat developed in the resistor R. Thus R-C filters are suitable only for light loads.

Q. 112. Why is bleeder resistance employed in a filter circuit ?

Ans. A resistance, called the bleeder resistance, is placed across the filter output, to provide flow of necessary minimum current through the choke at all times.

Q. 113. What is the purpose of bleeder resistance in a rectifier circuit using L-C filter ?

Ans. Bleeder resistance R_B is placed in parallel with the load so as to maintain a certain minimum current through the choke, even

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

the load resistor gets open-circuited, and improves filtering action.

Q. 114. What is meant by voltage regulation of a dc power supply ?

Ans. The change in voltage from no-load to full-load condition is known as voltage regulation.

Q. 115. Why is it necessary to include voltage stabilizer in a power supply ?

Ans. The magnitude of output dc voltage may vary with the variation of either the input ac voltage or the magnitude of load current. So at the output of a rectifier-filter combination a voltage stabilizer is required.

Q. 116. What is the drawback of a full-wave voltage doubler ?

Ans. The drawback of a full-wave voltage doubler is that a common ground between input and output is not available.

Q. 117. What is waveforming ?

Ans. Waveforming is a process of generating new waveshapes from older waveshapes by using some network.

Q. 118. What is difference between linear and nonlinear waveshaping circuits ? **[P.T.U. December 2004]**

Ans. Linear waveshaping involves passage of signal through linear systems such as R-C, R-L, R-L-C circuits and the operations involved are linear operations such as integration, differentiation, summation, filtering etc. On the other hand, nonlinear wave shaping involves passage of signal through a nonlinear system. Nonlinear wave shaping permits transformation of analog signal to digital signal and vice-versa. The clipping operation and rejection of negative peaks by rectification are nonlinear operations.

Q. 119. What is meant by nonlinear waveshaping ?

Ans. When any wave is applied at the input of a nonlinear device (such as a diode or transistor), the shape of the output wave varies nonlinearly with input wave. This process is called the nonlinear waveshaping.

Q. 120. What is meant by a clipping circuit ?

Ans. A wave shaping circuit which controls the shape of the output waveform by removing or clipping a portion of the input wave is known as the clipping circuit.

Q. 121. What is the difference between a positive clipper and negative clipper ?

Ans. The positive clipper removes the positive half cycles of the input waveform while the negative clipper removes the negative half cycles of the input waveform.

Q. 122. What is the drawback of having a diode as a series element in a clipper ?

Ans. The use of the diode as a series element has a drawback that when the diode is in 'off' condition, there should be no transmission of input signal to the output. But in case of high-frequency signals, transmission occurs through diode capacitance which is undesirable.

Q. 123. What is the drawback of having a diode as a shunt element in a clipper ?

Ans. The use of the diode as a shunt element has a drawback that when the diode is in the 'off' condition, transmission of input signal should take place to output. But in case of high-frequency input signals, diode capacitance affects the circuit operation adversely and the signal gets attenuated (*i.e.* it passes through diode capacitance to ground).

Q. 124. What is meant by a clamping circuit ?

Ans. A circuit that places either the positive or negative peak of a signal at a desired level is known as a clamping circuit. It simply adds or subtracts a dc component to the input signal and, therefore, it is also called a dc restorer.

Q. 125. What is the difference between a positive clamping circuit and a negative clamping circuit ?

Ans. A positive clamper pushes the signal on the positive side or upward while a negative clamper pushes the signal on the negative side or downward.

Q. 126. A clamper circuit sometimes uses a dc battery in addition to a diode, a capacitor and a resistor, why ?

Ans. A clamper circuit uses sometimes a dc battery in addition to a diode, a capacitor and a resistor to cause an additional shift.

Q. 127. How does a clamper circuit affect the peak-to-peak and rms values of a waveform ?

Ans. No change.

Q. 128. What is the difference between clipping and clamping ? **[P.T.U. 2006-07; U.P.T.U. January 2007]**

Ans. The clipping circuit removes some portion of an input signal whereas clamping circuit places either the positive or negative peak of the signal at a desired level.

Q. 129. What is the difference between the output from a clipping circuit and a clamping circuit ?

Ans. The output of a clipping circuit appears as if a portion of the input signal were clipped off but a clamper circuit simply clamps (lifts up or down) the input to a different dc level.

Q. 130. List two uses of clamping circuits. **[Pb. Technical Univ. 5th Semester 2005-06]**

Ans. Clamping circuits are often employed in television receivers as dc restorers. Clamping circuits are also used in storage counter, analog frequency meter, capacitance meter, divider and staircase waveform generator.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Electronics is that branch of engineering which deals with the application of
(a) electronic devices.
(b) production of electronic components.
(c) fission of uranium nuclei.
(d) generation of small power.

2. An electron device means the device in which the conduction of electrons takes place through
(a) a gas. (b) vacuum.
(c) a semiconductor.
(d) a gas, semiconductor or vacuum.

3. Which one of the following is used as an active device in electronic circuits ?
(a) Transformer. (b) Electric heater.
(c) SCR. (d) Loudspeaker.

4. The colour code of a 1 kΩ resistance is
(a) black, brown, red. (b) red, brown, brown.
(c) brown, black, red. (d) black, black, red.
[GATE E.E. 1999]

5. Neutralizing capacitors are normally used in
(a) Audio amplifiers. (b) Video amplifiers.
(c) RF and IF amplifiers. (d) Operational amplifiers.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

6. Which one of the following has the ability to act as an open circuit for dc and a short circuit for ac of high frequency.
(a) An inductor. (b) A capacitor.
(c) A resistor. (d) None of the above.
[U.P.T.U. 2008-09]

7. A device having characteristics very close to that of an ideal voltage source is
(a) vacuum diode. (b) zener diode.
(c) transistor. (d) FET.

8. The maximum number of electrons which the valence shall of an atom can have is
(a) 6 (b) 8 (c) 18 (d) 2
[A.M.I.E. Sec B. Solid State Physics & Semiconductor Devices Winter 2006]

9. An electron with velocity u is placed in an electric field E and magnetic field B. The force experienced by the electron is given by
(a) $-e\mathrm{E}$ (b) $-eu \times \mathrm{B}$
(c) $-e(u \times \mathrm{E} + \mathrm{B})$ (d) $-e(\mathrm{E} + u \times \mathrm{B})$ [GATE E.E. 2000]

10. According to free electron theory, electrons in a metal are subjected to
(a) constant potential. (b) sinusoidal potential.
(c) square-wave potential. (d) non-periodic potential.
[U.P.S.C. I.E.S. E.E-I, 2011]

11. For thermionic emission
(a) a material with high work function is preferable.
(b) a material with low work function is preferable.
(c) the work function of the material has no importance.

12. Thermionic emission is employed in
(a) semiconductor devices. (b) vacuum tubes.
(c) only in BJTs. (d) photo devices.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2005]

13. A semiconductor has a band gap of 2 eV. The wavelength of radiation emitted from the semiconductor when electrons and holes recombine is
(a) 625 nm (b) 625 μm (c) 625 mm (d) 625 cm
[U.P.S.C. I.E.S. E.E-I, 2010]

14. A photocell is illuminated by a small bright source placed 1m away. When the same source of light is placed two metres away, the electrons emitted by the photocathode
(a) each carry one quarter of their previous energy.
(b) each carry one quarter of their previous moments.
(c) are half as numerous. (d) are one-quarter as numerous.
[U.P.S.C. I.E.S. E.E.-I, 1992]

15. Which of the following statements is not correct ?
(a) Electron emission takes place in vacuum.
(b) The amount of energy required for the escape of electrons varies with different materials.
(c) Metals with lower work function will emit electrons at lower temperatures.
(d) At ordinary temperature, the energy of free electrons in the metal is more than the work function of the metal.

16. In almost all applications, vacuum tubes have been replaced by the solid-state devices. But the vacuum tubes are still in use because
(a) they are very cheap. (b) they have long life.
(c) they are easy to handle and transport.
(d) they are capable of handling large power.

17. For a vacuum triode the relation between plate resistance, r_p, transconductance g_m and amplification factor μ is
(a) $\mu = r_p / g_m$ (b) $\mu = r_p \times g_m$
(c) $\mu = r_p + g_m$ (d) $\mu = g_m / r_p$

18. In a vacuum tetrode secondary emission is because of emission of
(a) electrons from the filament due to heat energy.
(b) high velocity electrons from the cathode.
(c) electrons from the plate due to bombardment of the fast moving electrons emitted from the cathode.
(d) electrons belonging to the second orbit of the atoms of cathode.

19. The function of control grid in a pentode tube is to
(a) collect electrons from the space charge.
(b) control the secondary emission from the plate.
(c) accelerate the electrons emitted from the cathode.
(d) control the number of electrons moving from cathode to plate.

20. The best vacuum tube for amplification is
(a) pentode. (b) tetrode. (c) triode. (d) diode.

21. In a pentode plate characteristics there is no –ve resistance region just like tetrode because
(a) it operates at very low voltage.
(b) there is no secondary emission.

Answers: **1.** (a), **2.** (d), **3.** (c), **4.** (c), **5.** (c), **6.** (b), **7.** (b), **8.** (b), **9.** (d), **10.** (a), **11.** (b), **12.** (b), **13.** (a), **14.** (d), **15.** (d), **16.** (d), **17.** (b), **18.** (c), **19.** (d), **20.** (a), **21.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) screen grid is maintained at low voltage.
(d) the suppressor grid does not allow secondary electrons to reach the screen grid.

22. Typical lattice spacings in atomic structures is
(a) 10 Å (b) 100 Å
(c) a few angstrom. (d) cannot be determined
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

23. III-V alloy semiconductor crystallizes in what form?
(a) Simple cubic structure. (b) Body-centered cubic structure.
(c) Zinc blende structure. (d) Wurtzite structure.
[U.P.S.C. I.E.S. E.E.-I, 2006]

24. In a crystal lattice, what are the vacancies created by the absence of certain atoms known as?
(a) Hertz defects. (b) Schottky defects.
(c) Pauli defects. (d) Crystal defects.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

25. Epitaxial III-V group semiconductor compounds have which one of the following crystal structures?
(a) BCC. (b) FCC.
(c) Hexagonal. (d) Zinc blende.
[U.P.S.C. E.T.E.-I, 2008]

26. Typical value of ionisation energy of an electron for an N-type semiconductor can be about
(a) 0.001 eV (b) 0.01 eV
(c) 1.1 eV (d) 0.15 eV
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

27. The bonding forces in compound semiconductors, such as GaAs, arise from
(a) ionic bonding. (b) metallic bonding.
(c) covalent bonding.
(d) combination of ionic and covalent bonding.
[U.P.S.C. I.E.S. E.E.-II, 2002]

28. Elements can reach a stable atomic structure by
(a) losing electrons only. (b) gaining electrons only.
(c) losing or gaining or sharing electrons.
(d) collisions between atoms. [U.P.S.C. I.E.S E.E.-I, 2006]

29. Which one of the following materials does not have a covalent bond ?
(a) Metal. (b) Silicon.
(c) Organic polymers. (d) diamond.
[U.P.S.C. I.E.S. E.E.-I, 2000]

30. The nature of crystal binding in germanium is
(a) ionic. (b) metallic.
(c) covalent. (d) van der Waal type.
[U.P.S.C. I.E.S. E.E.-I, 1992]

31. The covalent bond is formed by
(a) transfer of electrons between atoms.
(b) sharing of electrons between atoms.
(c) sharing of variable number of electrons by a variable number of atoms.
(d) removing the electron completely.

32. Conduction electrons have more mobility than holes because they
(a) are lighter.
(b) experience collision less frequently.
(c) have negative charge.
(d) need less energy to move them.
[A.M.I.E. Sec B. Solid State Devices & Semiconductor Physics Winter 2006]

33. Which of the following statements is correct ?
(a) Copper has partially filled conduction band.
(b) Diamond has a completely filled conduction band but an empty valence band.
(c) Silicon has a partially filled conduction band and an empty valence band.
(d) Energy gap between conduction and valence bands in diamond is smaller than in silicon. [U.P.S.C. I.E.S. E.E.-I, 1992]

34. With respect to a completely filled band, which one of the following statements is correct ?
(a) The total wave vector and the total velocity of all electrons in the band is always zero.
(b) The total wave vector is zero but the total velocity of all electrons in the band is not necessarily zero.
[U.P.S.C. I.E.S. E.E.-I, 1993]

35. An atom is said to be ionized when any one of its orbiting electron
(a) is raised to an higher orbit.
(b) jumps from one orbit to another.
(c) comes to the ground state.
(d) is completely removed.

36. An electron in the conduction band
(a) is bound to its parent atom.
(b) has no charge.
(c) is located near the top of the crystal.
(d) has a higher energy than an electron in the valence band.
[A.M.I.E. Summer 1996]

37. For insulators, the forbidden gap is of the order of
(a) 5 eV (b) 1 eV (c) 0.1 eV (d) zero
[U.P.S.C. I.E.S. E.E.-I, 2000]

38. Fermi level is the
(a) highest occupied energy level at 0 K.
(b) highest occupied energy level at 0° C.
(c) energy level at which electron emission occurs.
(d) minimum energy level in the conduction band.
[U.P.S.C. I.E.S. E.E.-I, 1998]

39. Which one of the following is the Fermi function $f(E)$?
(a) $\frac{1}{1+e^{(E-E_F)/(kT)}}$ (b) $\frac{1}{1-e^{(E-E_F)/(kT)}}$
(c) $\frac{1}{1+e^{(E_F-E)/(kT)}}$ (d) $\frac{1}{1-e^{(E_F-E)/(kT)}}$
[U.P.S.C. I.E.S E.E.-I, 2007]

40. The Fermi function for an electron is $f(E)$, where E is energy. Then, the Fermi function for a hole is
(a) $f(E)$ (b) $1-f(E)$
(c) $1/f(E)$ (d) $1+f(E)$
[U.P.S.C. I.E.S. E.E-II, 2010]

41. The Fermi energy E_F of a metal is proportional to (n is the number of free electrons per unit volume of the metal) as
(a) n^2 (b) $n^{1/2}$ (c) $n^{2/3}$ (d) $n^{3/2}$
[U.P.S.C. I.E.S. E.E-I, 2011]

42. Assuming the Fermi level E_F to be independent of temperature, E_F may be defined as the level with an occupancy probability of
(a) 0% (b) 50% (c) 75% (d) 100%
[U.P.S.C. I.E.S E.E.-I, 2002]

43. A semiconductor has a
(a) negative temperature coefficient of resistance.
(b) positive temperature coefficient of resistance.
(c) constant temperature coefficient of resistance.
[U.P.T.U. 2008-09]

44. The resistivity of a semiconductor is of the order of
(a) 10^{-6} Ω-m (b) 10^{-6} to 100 Ω-m
(c) 10^{-4} to 10^{4} Ω-m (d) above 10^{4} Ω-m
[A.M.I.E. Sec B. Winter 1993]

Answers: **22.** (c), **23.** (d), **24.** (b), **25.** (d), **26.** (b), **27.** (c), **28.** (c), **29.** (a), **30.** (c), **31.** (b), **32.** (d), **33.** (a), **34.** (b), **35.** (d), **36.** (d), **37.** (a), **38.** (a), **39.** (a), **40.** (b), **41.** (c), **42.** (b), **43.** (a), **44.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

45. Consider the following statements :
If the temperature is increased, the resistivity of a metal increases because of
1. decrease in carrier concentration.
2. an increase in the extent of scattering of carriers.
3. increase in density of impurity.
Of these statements
(a) 1, 2 and 3 are correct. (b) 2 alone is correct.
(c) 1 alone is correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I 1998]

46. In an intrinsic semiconductor, the number of electrons is equal to the number of holes at which temperature ?
(a) 0 K (b) 0°C
(c) high temperature. (d) all temperatures.
[U.P.S.C. I.E.S. E.E.-I, 2006]

47. In an intrinsic semiconductor
(a) there are no holes in the material.
(b) the number of holes is too small.
(c) electrons in the material are neutralized by holes.
(d) there are no electrons in the material. [A.M.I.E. Summer 1998]

48. Which one of the following statements is correct?
If the Fermi level lies midway between the conduction and valence bands, then the semiconductor is
(a) intrinsic. (b) extrinsic.
(c) *p*-type. (d) *n*-type. [U.P.S.C. I.E.S. E.E.-I, 2004]

49. With an increase in temperature, the Fermi level in an intrinsic semiconductor
(a) Moves closer to the conduction band edge.
(b) Moves closer to the valence band edge.
(c) Moves into the conduction band.
(d) Remains at the centre of the forbidden gap.
[U.P.S.C. I.E.S E.E.-I, 2003]

50. An intrinsic semiconductor at a temperature of absolute zero behaves like an insulator because of
(a) Non-availability of free electrons.
(b) Non-recombination of electrons with holes.
(c) Low drift velocity of free electrons.
(d) Low (almost zero) electron energy. [U.P.S.C I.E.S. E.E.-I, 2003]

51. In an intrinsic semiconductor, the mobility of electrons in the conduction band is
(a) zero.
(b) less than the mobility of holes in the valence band.
(c) equal to mobility of holes in the valence band.
(d) greater than the mobility of holes in the valence band.
[U.P.S.C. I.E.S. E.E.-I, 1994]

52. With increasing temperature, the resistivity of an intrinsic semiconductor decreases. This is because, with the increase of temperature
(a) both the carrier concentration and mobility of carriers decrease.
(b) the carrier concentration increases but the mobility of carriers decreases.
(c) the carrier concentration decreases but the mobility of carriers increases.
(d) the carrier concentration remains the same but the mobility of carriers decreases. [U.P.S.C. I.E.S. E.E.-I, 1993]

53. In a semiconductor, the movement of holes is due to
(a) movement of electrons in conduction band.
(b) movement of holes in conduction band.
(c) movement of holes in valence band.
(d) movement of electrons in valence band.

54. Major part of the current in an intrinsic semiconductor is because of
(a) valence band electrons. (b) conduction band electrons.
(c) thermally generated electrons.
(d) holes in the valence band.

55. There is no hole current in good conductors because they
(a) have overlapping of conduction and valence bands.
(b) have no valence band.
(c) have large forbidden energy gap.
(d) are full of electron gas.

56. On which of the following factors does the electrical conductivity of a semiconductor depend?
1. Carrier concentration. 2. Carrier mobility. 3. Sign of the carrier.
Select the correct answer using the codes given below:
(a) 1 and 2 (b) 1 and 3 (b) 2 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 2003]

57. Mobility of electrons and holes
(a) remain constant irrespective of temperature and electric field intensity.
(b) varies with temperature alone.
(c) varies with electric field intensity alone.
(d) varies with both temperature and electric field intensity.

58. The resistivity of a metal is a function of temperature because
(a) the electron density varies with temperature.
(b) the electron gas density varies with temperature.
(c) the amplitude of vibration of atoms varies with temperature.
(d) all of the above.

59. Which of the following statements is not true for an intrinsic semiconductor ?
(a) The number of holes is less than the number of electrons.
(b) The number of holes is equal to number of electrons.
(c) The net charge density of the material is zero.
(d) The product of hole concentration and electron concentration is constant.

60. Controlled addition of group III element to an elemental semiconductor results in the formation of
(a) intrinsic semiconductor. (b) *n*-type semiconductor.
(c) *p*-type semiconductor. (d) degenerate semiconductor.
[U.P.S.C. I.E.S. E.E-I, 2011]

61. Consider the following statement:
Extrinsic semiconductors show high electrical conductivity because the impurities are
1. of high conductivity. 2. highly mobile.
3. highly charged.
Which of these statements are NOT correct?
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 2001]

62. The electrical conductivity of a semiconductor increases with increase in temperature because
(a) The mobility of the carriers increases.
(b) The carrier concentration increases.
(c) Both carrier concentration and mobility increase.
(d) Thermal energy of electrons increases.
[U.P.S.C. I.E.S. E.E.-I, 2005]

63. The primary reason for the widespread use of Silicon semiconductor device technology is
(a) abundance of Silicon on the surface of the Earth.
(b) larger bandgap of Silicon in comparison to Germanium.
(c) favourable properties of Silicon-dioxide (SiO_2).
(d) lower melting point. [GATE E.C.E. 2005]

Answers: **45.** (b), **46.** (a), **47.** (c), **48.** (a), **49.** (d), **50.** (a), **51.** (d), **52.** (b), **53.** (d), **54.** (c), **55.** (a), **56.** (a), **57.** (d), **58.** (c), **59.** (a), **60.** (c), **61.** (a), **62.** (b), **63.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

64. A silicon wafer has 100 nm of oxide on it and is inserted in a furnace at a temperature above 1,000°C for further oxidation in dry oxygen. The oxidation rate
(a) is independent of current, oxide thickness and temperature.
(b) is independent of current, oxide thickness but depends on temperature.
(c) slows down as the oxide grows.
(d) is zero as the existing oxide prevents further oxidation.
[GATE E.C.E. 2008]

65. Consider the following statements :
Pure germanium and pure silicon are examples of
1. direct bandgap semiconductors.
2. indirect bandgap semiconductors.
3. degenerate semiconductors.
Of these statements
(a) 1 alone is correct. (b) 2 alone is correct.
(c) 3 alone is correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1997]

66. P and Si have valencies of
(a) 5 and 4. (b) 4 and 5. (c) 3 and 5. (d) 3 and 4.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 1999]

67. The forbidden energy gap for germanium is
(a) 0.3 eV (b) 3.5 eV
(c) 0.72 eV (d) 1.1 eV
[A.M.I.E. Sec B. Summer 1995]

68. The bandgap of Silicon at room temperature is
(a) 1.3 eV (b) 0.7 eV (c) 1.1 eV (d) 1.4 eV
[GATE E.C.E. 2005]

69. Typical value of band gap for cadmium sulphide semiconductors at room temperature is
(a) 1.43 eV (b) 1.12 eV (c) 3.1 eV (d) 2.40 eV
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

70. The energy required for releasing an electron from the valence band for GaAs is
(a) 0.66 eV (b) 1.08 eV (c) 1.58 eV (d) 1.47 eV
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2007]

71. Which of the following has the greatest mobility?
(a) Positive ion (b) Negative ion
(c) Electron (d) Hole [U.P.S.C. I.E.S. E.E.-I, 2002]

72. Mobility is defined as
(a) Diffusion velocity per unit field.
(b) Drift velocity per unit field.
(c) Displacement per unit field.
(d) Number of free electrons/number of bound electrons.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

73. The mobility of electrons in a material is expressed in units of
(a) V/s (b) m^2/V-s (c) m^2/s (d) J/K
[U.P.S.C. I.E.S. E.E.-II, 2000]

74. The mean free path for electron drift increases with
(a) purity. (b) strain hardening.
(c) elastic modulus. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-I, 1992]

75. Mobility of electron is highest in
(a) Si (b) Ge (c) GaAs (d) C
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]

76. The drift velocity of electrons in silicon varies with applied electric field in which one of the ways?
(a) It monotonically increases with increasing field.
(b) It first increases linearly, then sublinearly and finally attains saturation with increasing field.
(c) It first increases, then decreases showing a negative differential region, again increases and finally saturates.
(d) The drift velocity remains unchanged with increase in field.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

77. In a semiconductor material doping is done to
(a) decrease the number of charge carriers.
(b) change the chemical properties of semiconductor.
(c) make semiconductor less than 100% pure.
(d) all the crystal structure of the pure semiconductor.

78. Donor type impurities
(a) have five valence electrons.
(b) create excess free electrons.
(c) are used to make N-type semiconductors.
(d) all of the above.

79. The temperature coefficient of a resistance of a doped semiconductor is
(a) always positive. (b) always negative.
(c) zero.
(d) positive or negative depending on the level of doping.
[U.P.S.C. I.E.S. E.E-I, 2011]

80. *n*-type silicon is obtained by doping silicon with
(a) Germanium. (b) Aluminium.
(c) Boron (d) Phosphorus. [GATE E.C.E. 2003]

81. To obtain *n*-type semiconductor, the impurity added to a pure semiconductor is
(a) trivalent (b) tetravalent
(c) pentavalent (d) none of these.
[U.P.T.U. 2008-09]

82. Consider the following statements: *n*-type of silicon can be
1. formed by adding impurity of phosphorus.
2. formed by adding impurity of arsenic.
3. formed by adding impurity of boron.
4. formed by adding impurity of aluminium.
Which of the statements given above are correct?
(a) 1 and 3 only (b) 3 and 4 only
(c) 1 and 2 only (d) 1, 2, 3 and 4
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

83. In an *n*-type silicon crystal at room temperature, which of the following can have a concentration of 4×10^{19} cm^{-3}?
(a) Silicon atoms. (b) Holes.
(c) Dopant atoms. (d) Valence electrons.
[GATE E.C.E. 2009]

84. A piece of copper and another of germanium are cooled from room temperature to 80 K. The resistance of
(a) each of them increases.
(b) each of them decreases.
(c) copper increases and germanium decreases.
(d) copper decreases and germanium increases.
[U.P.S.C. I.E.S. E.E.-I, 1992]

85. Which of the following will serve as a donor impurity in silicon ?
(a) Boron. (b) Indium.
(c) Germanium. (d) Antimony.
[U.P.S.C. I.E.S. E.E.-I, 1992]

86. N-type semiconductors
(a) are negatively charged.
(b) are produced when indium is added as an impurity to germanium.
(c) are produced when phosphorus is added as an impurity to silicon.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-I, 1992]

Answers: **64.** (d), **65.** (a), **66.** (a), **67.** (c), **68.** (c), **69.** (d), **70.** (d), **71.** (c), **72.** (b), **73.** (b), **74.** (a), **75.** (b), **76.** (b), **77.** (d), **78.** (d), **79.** (d), **80.** (d), **81.** (c), **82.** (c), **83.** (c), **84.** (d), **85.** (d), **86.** (c),

87. Consider the following types of semiconductors:
1. N type 2. P type 3. Intrinsic 4. Extrinsic
Which of these types of semiconductors are formed by doping germanium with gallium ?
(a) 1 and 3. (b) 2 and 4. (c) 1 and 4. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2000]

88. If an intrinsic semiconductor is doped with a very small amount of boron, then in the extrinsic semiconductor so formed, the number of electrons and holes will
(a) decrease. (b) increase and decrease.
(c) increase. (d) decrease and increase.
[U.P.S.C. I.E.S. E.E.-II, 1997]

89. An N-type semiconductor as a whole is:
(a) positively charged. (b) negatively charged.
(c) positively or negatively charged depending on doping.
(d) electrically neutral.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

90. If a small amount of arsenic is added to silicon
(a) the resistance will increase.
(b) the arsenic becomes an acceptor type impurity.
(c) the silicon will become a P-type semiconductor.
(d) there will be more free electrons than holes in the semiconductor.

91. When an intrinsic semiconductor is doped with an acceptor type impurity
(a) electrons are generated and the material is called N-type semiconductor.
(b) holes are generated and the material becomes P-type semiconductor.
(c) holes are generated and the material becomes N-type semiconductor.
(d) electrons are generated and the material becomes P-type semiconductor.

92. In P-type semiconductor, there are
(a) no majority carriers. (b) electrons as majority carriers.
(c) immobile positive ions. (d) immobile negative ions.

93. In N-type semiconductor, there are
(a) immobile positive ions. (b) immobile negative ions.
(c) no majority carriers. (d) holes are majority carriers.

94. When an extrinsic semiconductor is doped with a P-type impurity, each impurity atom will
(a) acquire negative charge. (b) acquire positive charge.
(c) remain electrically neutral. (d) give away one electron.

95. The impurity atoms in semiconductors
(a) inject more charge carriers. (b) reduce the energy gap.
(c) increase the kinetic energy of valence electrons.
(d) all of the above.

96. The movement of a hole is brought about by
(a) the vacancy being filled by a free electron.
(b) the movement of an atomic core.
(c) the vacancy being filled by a valence electron from a neighbouring atom.
(d) the atomic core changing from a + 4 to a + 5 charge.

97. Excess minority carriers are the minority carriers that
(a) are thermally agitated. (b) are impurity generated.
(c) are in excess of the number of majority carriers.
(d) are in excess of equilibrium number.

98. In an N-type semiconductor, the concentration of minority carriers mainly depends upon the
(a) doping technique. (b) temperature of material.
(c) number of donor atoms.
(d) quality of the intrinsic semiconductor material.

99. Intrinsic concentration of charge carriers in a semiconductor varies as
(a) T (b) T^2 (c) $T^{3/2}$ (d) T^{-1}

100. Which of the following is true?
(a) A silicon wafer heavily doped with boron is a p^+ substrate.
(b) A silicon wafer lightly doped with boron is p^+ substrate.
(c) A silicon wafer heavily doped with arsenic is a p^+ substrate.
(d) A silicon wafer lightly doped with arsenic is a p^+ substrate.
[GATE E.C.E. 2008]

101. Fermi level in a *p*-type semiconductor lies close to which one of the following?
(a) The top of the valence band.
(b) The bottom of the valence band.
(c) The top of the conduction band.
(d) The bottom of the conduction band. [U.P.S.C. I.E.S. E.E.-I, 2005, 08]

102. Which one of the following statements is not true for a *p*-type semiconductor?
(a) Conduction is by the movement of holes in the valence band.
(b) Holes constitute the majority charge carriers.
(c) Fermi level lies closer to the conduction band between the conduction and valence bands.
(d) It is formed by adding an acceptor impurity to germanium.
[U.P.S.C. I.E.S. E.E.-I, 2006]

103. Consider the following statements:
In an *n*-type semiconductor
1. Fermi level lies below the donor level at room temperature (T).
2. Fermi level lies above the donor level as $T \to 0$.
3. Fermi level lies in valence band.
4. Fermi level remains invariant with temperature.
Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 2 only.
(c) 2, 3 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E-I, 2009]

104. The Fermi level in an *n*-type semiconductor at zero degree Kelvin lies
(a) below the donor level.
(b) half-way between the conduction band and the donor level.
(c) half-way between the conduction band and the valence level.
(d) close to the valence band. [U.P.S.C. I.E.S. E.E-I, 2011]

105. Consider the following statements about semiconductors?
1. The forbidden energy gap in semiconductors lies between the valence band and conduction band.
2. The forbidden energy gap in germanium at 0 K is about 0.72 eV.
3. Semiconductors have negative temperature coefficient of resistivity.
Which of the statements gives above are correct?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-I, 2008]

106. Consider a single crystal of an intrinsic semiconductor. The number of free carriers at the Fermi level at room temperature is
(a) half the total number of electrons in the crystal.
(b) half the number of free electrons in the crystal.
(c) half the number of atoms in the crystal.
(d) zero.
[U.P.S.C. I.E.S. E.E.-I, 1994]

Answers: **87.** (b), **88.** (d), **89.** (d), **90.** (d), **91.** (b), **92.** (d), **93.** (a), **94.** (a), **95.** (b), **96.** (c), **97.** (d), **98.** (b), **99.** (c), **100.** (a), **101.** (a), **102.** (c), **103.** (b), **104.** (c), **105.** (d), **106.** (b),

Downloaded From : www.EasyEngineering.net

107. The effect of doping intrinsic semiconductor is to
(a) move the Fermi level away from the centre of the forbidden band.
(b) move the Fermi level towards the centre of the forbidden band.
(c) change the crystal structure of the semiconductor.
(d) keep the Fermi level at the middle of the forbidden band.
[U.P.S.C. I.E.S. E.E.-I, 1994]

108. As the temperature of a P-type semiconductor is gradually and continuously increased, the Fermi level will move
(a) into the valence band.
(b) into the conduction band.
(c) towards the middle of the forbidden gap.
(d) into the region between the acceptor level and the valence band. [U.P.S.C. I.E.S. E.E.-I, 1997]

109. A germanium wafer is doped with 10^7 indium atoms per cc. The wafer is
(a) N-type degenerate semiconductor.
(b) P-type degenerate semiconductor.
(c) P-type non-degenerate semiconductor.
(d) N-type non-degenerate semiconductor.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

110. An intrinsic semiconductor is doped lightly with *p*-type impurity. It is found that the conductivity actually decreases till a certain doping level is reached. Why does this occur?
(a) The mobility of holes decreases.
(b) The mobility of both electrons and holes decreases.
(c) The hole density actually reduces.
(d) Effect of reduction in electrons due to increase in holes compensates than the effect of increase in holes on conductivity. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

111. For an *n*-type semiconductor having any doping level, which of the following hold(s) good:
1. $P_n N_D = n_i^2$ 2. $p_p N_D = n_i^2$
3. $n_n N_D = n_i^2$ 4. $P_n n_n = n_i^2$
Select the correct answer using the code given below:
(a) 1 and 4. (b) 2 and 4. (c) 3 and 4. (d) only 4.
[U.P.S.C. I.E.S E.E.-II, 2006]

112. The electron and hole concentrations in an intrinsic semiconductor are n_i per cm^3 at 300 K. Now, if acceptor impurities are introduced with a concentration of N_A per cm^3 (where $N_A >> n_i$) the electron concentration per cm^3 at 300 K will be
(a) n_i (b) $n_i + N_A$ (c) $N_A - n_i$ (d) n_i^2/N_A
[GATE E.C.E. 2007]

113. The electron and hole concentrations, *n* and *p* respectively obey the relation $np = n_i^2$ where n_i is the intrinsic carrier density. This expression is valid for which of the following?
(a) For all semiconductors under any condition.
(b) For direct bandgap semiconductor only.
(c) For non-degenerate semiconductor under thermal equilibrium condition.
(d) For degenerate semiconductors having excess electrons and holes. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

114. The intrinsic carrier concentration of silicon sample at 300 K is $1.5 \times 10^{16}/m^3$. If after doping, the number of majority carriers is $5 \times 10^{20}/m^3$, the minority carrier density is
(a) $4.50 \times 10^{11}/m^3$ (b) $3.33 \times 10^4/m^3$
(c) $5.00 \times 10^{20}/m^3$ (d) $3.00 \times 10^{-5}/m^3$
[GATE E.C.E. 2003]

115. An intrinsic semiconductor (intrinsic electron density = 10^{16} m^{-3}) is doped with donors to a level of 10^{22} m^{-3}. What is the hole density assuming all donors to be ionized?
(a) 10^7 m^{-3} (b) 10^8 m^{-3} (c) 10^{10} m^{-3} (d) 10^6 m^{-3}
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

116. In a *p*-type silicon sample, the hole concentration is 2.25×10^{15} cc. If the intrinsic carrier concentration is 1.5×10^{10}/cc, what is the electron concentration in the *p*-type silicon sample ?
(a) zero. (b) 10^{10}/cc. (c) 10^5/cc. (d) 1.5×10^{25}/cc.
[U.P.S.C. I.E.S E.E.-II 2005]

117. A specimen of intrinsic germanium with the density of charge carriers of $2.5 \times 10^{13}/cm^3$ is doped with donor impurity atoms such that there is one donor impurity atom for every 10^6 germanium atoms. The density of germanium atoms is $4.4 \times 10^{22}/cm^3$. The hole density would be
(a) $4.4 \times 10^{16}/cm^3$ (b) $1.4 \times 10^{10}/cm^3$
(c) $4.4 \times 10^{10}/cm^3$ (d) $1.4 \times 10^{16}/cm^3$
[U.P.S.C. I.E.S. E.E.-II, 2001]

118. A silicon wafer (intrinisic carrier concentration 1×10^{16} m^{-3}) is doped with 2×10^{22} aluminium atoms / m^3 and 1×10^{22} arsenic atoms/m^3. Assume complete dopantionization, the minority carrier concentration will be
(a) $1 \times 10^{22}/m^3$ (b) $1 \times 10^{10}/m^3$
(b) $2 \times 10^6/m^3$ (d) $0.05 \times 10^{-6}/m^3$
[U.P.S.C. I.E.S. E.E.-I, 1993]

119. For intrinsic GaAs, the room-temperature electrical conductivity is 10^{-6} (ohm-m)$^{-1}$, the electron and hole mobilities are, respectively, 0.85 and 0.04 m^2/V-s. What is the intrinsic carrier concentration n_i at the room temperature?
(a) 10^{21} m^{-3} (b) 10^{-20} m^{-3}
(c) $7.0 \times 10^{+12}$ m^{-3} (d) 7.0×10^{-20} m^{-3}
[U.P.S.C. I.E.S. E.E-I, 2009]

120. Two initially identical samples *A* and *B* of pure germanium are doped with donors to concentrations of 1×10^{20} m^{-3} and 3×10^{20} m^{-3} respectively. If the hole concentration in *A* is 9×10^{12} m^{-3}, then hole concentration in B at the same temperature will be
(a) 3×10^{12} m^{-3} (b) 7×10^{12} m^{-3}
(c) 11×10^{12} m^{-3} (d) 27×10^{12} m^{-3}
[U.P.S.C. I.E.S. E.E.-I, 1997]

121. The concentration of minority carriers in an extrinsic semiconductor under equilibrium is
(a) directly proportional to the doping concentration.
(b) inversely proportional to the doping concentration.
(c) directly proportional to the intrinsic concentration.
(d) inversely proportional to the intrinsic concentration.
[GATE E.C.E. 2006]

122. For a semiconductor, the conductivity is a function of the products of the number of charge carriers and their mobilities. As a result, if the temperature of a slab of intrinsic silicon increases, how does its conductivity vary?
(a) Decreases. (b) Increases.
(c) Remains unaffected.
(d) Increases or decreases depending upon the rise in temperature.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

123. Consider the following statements :
The energy band gap GaAs
1. is indirect. 2. is direct. 3. is 1.43 eV.
4. corresponds to wave length of 0.89 μm. Given $h = 6.63 \times 10^{34}$ J-s.

Answers: **107.** (a), **108.** (b), **109.** (c), **110.** (b), **111.** (a), **112.** (d), **113.** (c), **114.** (a), **115.** (c), **116.** (c), **117.** (b), **118.** (b), **119.** (c), **120.** (a), **121.** (b), **122.** (b), **123.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Of these statements
(a) 1 alone is correct. (b) 2, 3 and 4 are correct.
(c) 2 and 3 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1994]

124. Mobility of charge carrier is given by
(a) v/E. (b) E/v. (c) D_n (d) D_p
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 2000]

125. Einstein's relation is given by
(a) $\frac{\mu}{D} = \frac{e}{kT}$ (b) $\frac{\mu}{D} = \frac{kT}{e}$
(c) $\mu/D = k$ (d) $\mu/D = T$
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 2000]

126. The room temperature resistivity (in Ω-m) of pure silicon is
(a) 3,000 (b) 300 (c) 30 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 1995]

127. Assuming carrier mobility to be temperature independent, it can be shown that pure Si (E_g = 1.1 eV) and G_e (E_g = 0.7 eV) have the same conductivity at a temperature of
(a) 191 K (b) 300 K (b) 471 K (d) 1,470 K
[U.P.S.C. I.E.S. E.E.-i, 1995]

128. The resistivity and electron density in a metal are 1.54×10^{-8} Ω-m and $5.8 \times 10^{28}/m^3$ respectively Electron mobility in the metal [in units of $m^2 V^{-1} s^{-1}$] is
(a) 0.007 (b) 0.07 (c) 0.7 (d) 1.05
[U.P.S.C. I.E.S. E.E.-I, 1996]

129. The electron relaxation time of metal A is 2.7×10^{-4} s, that of B is 1.35×10^{-4} s. The ratio of resistivity of B to resistivity of A will be
(a) 4 (b) 2.0 (c) 0.5 (d) 0.25
[U.P.S.C. I.E.S. E.E.-I, 1994]

[**Hint:** Resistivity = $\frac{m}{ne^2\tau}$ where m is mass of electron; n is electron concentration, e is electron charge and τ is relaxation time]

130. The conductivity of material 'A' is half that of material B. The ratio of relaxation time of 'A' to that of 'B' is
(a) 0.5 (b) 1 (c) 2 (d) 4
[U.P.S.C. I.E.S. E.E.-I, 2000]

131. Value of intrinsic carrier concentration of germanium samples at 300 K is
(a) 1.6×10^{16} per cc. (b) 1.6×10^{10} per cc.
(c) 2.5×10^{13} per cc. (d) 2.5×10^{19} per cc.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

132. If for intrinsic silicon at 27°C, the charge concentration and mobilities of free electrons and holes are $1.5 \times 10^{16}/m^3$, 0.13 m^2/Vs and 0.05 m^2/Vs respectively, its conductivity will be
(a) 2.4×10^{-3} (Ω-m) (b) 3.15×10^{-3} (Ω-m)
(c) 5×10^{-4} (Ω-m) (d) 4.32×10^{-4} (Ω-m)
[U.P.S.C. I.E.S. E.E.-II, 2001]

133. A heavily doped n-typed semiconductor has the following data:
Hole-electron mobility ratio: 0.4
Doping concentration: 4.2×10^8 atoms/m^3
Intrinsic concentration : 1.5×10^4 atoms/m^3
The ratio of conductance of the n-type semiconductor to that of the intrinsic semiconductor of same material and at the same temperature is given by
(a) 0.00005 (b) 2,000 (c) 10,000 (d) 20,000
[GATE E.E. 2006]

134. In a homogeneously doped n-type semiconductor bar, holes are injected at one end of the bar. How will the holes flow to the other end?
(a) By drift mechanism only. (b) By diffusion mechanism only.
(c) By combination of drift and diffusion mechanisms.
(d) By recombination mechanism. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

135. A Si sample is doped with a fixed number of group V impurities. The electron density is measured from 4 K to 1200 K for the sample. Which one of the following is correct?
(a) n remains constant over the temperature range.
(b) n increases monotonically with increasing temperature.
(c) n increases first, remains constant over a range and again increases with increasing temperature.
(d) n increases, shows a peak and then decreases with rise in temperature. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

136. Why does the mobility of electrons in a semiconductor decrease with increasing donor density?
(a) Doping increases the effective mass of electrons.
(b) Doping decreases the relaxation time of electrons.
(c) Electrons are trapped by the donors.
(d) More holes are generated so that the effective mobility decreases. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

137. In addition to conduction, which one of the following mechanisms can account for the transport of charges in a semiconductor (not ordinarily encountered in metals)?
(a) EMF generated within the body of the semiconductor.
(b) Mutual attraction between charges.
(c) Mutual repulsion between charges.
(d) Diffusion. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

138. Under low level injection assumption, the injected minority carrier current for an extrinsic semiconductor is essentially the
(a) diffusion current. (b) drift current.
(c) recombination current. (d) induced current.
[GATE E.C.E. 2006]

139. The longest wavelength that can be absorbed by silicon, which has the band gap of 1.12 eV, is 1.1μm. If the longest wavelength that can be absorbed by another material is 0.87 μm, then the bandgap of this material is
(a) 1.416 eV (b) 0.886 eV
(c) 0.854 eV (d) 0.706 eV [GATE E.C.E. 2004]

140. The Fermi function for hole is expressed as
(a) $\frac{1}{1+\exp\left(\frac{E-E_F}{kT}\right)}$ (b) $\frac{1}{1+\exp\left[-\left(\frac{E-E_F}{kT}\right)\right]}$
(c) $\exp\left[-\left(\frac{E-E_F}{kT}\right)\right]$ [U.P.S.C. I.E.S. E.E.-II, 2001]

141. The angular momentum of the electron in an orbit is always an integral multiple of
(a) Boltzmann's constant. (b) Plancks constant.
(c) Rayleigh constant. (d) Brillouin constant.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

142. The maximum depletion layer width in silicon is
(a) 0.143 μm (b) 0.857 μm
(c) 1 μm (d) 1.143 μm
[U.P.S.C. I.E.S. E.C.E.-2007]

143. The values of radiative and non-radiative lifetime of minority carriers in a semiconductor are 50 ns and 100 ns, respectively. What is the effective lifetime?
(a) 12.2 ns (b) 150 ns (c) 33.3 ns (d) 75 ns
[U.P.S.C. I.E.S. E.E.-I, 2006]

Answers: **124.** (a), **125.** (a), **126.** (a), **127.** (d), **128.** (a), **129.** (b), **130.** (a), **131.** (c), **132.** (d), **133.** (d), **134.** (b), **135.** (c), **136.** (c), **137.** (d), **138.** (a), **139.** (a), **140.** (c), **141.** (b), **142.** (c), **143.** (d),

Downloaded From : www.EasyEngineering.net

144. Assuming that the electron mobility in intrinsic silicon is 1500 cm^2/Vs at room temperature (T = 300 K) and the corresponding volt equivalent of temperature V_T = 25.9 mV, what is the approximate value of the electron diffusion constant?
(a) 40 cm^2/s. (b) 4 cm^2/s.
(c) 400 cm^2/s. (d) 4000 cm^2/s.
[U.P.S.C. I.E.S. E.T.E.-I-2008]

145. In a semiconductor J, J_p and J_n indicate total diffusion current density, hole current density and electron current density respectively, $\delta n/\delta x$ and $\delta p/\delta x$ are the electron and hole concentration gradients respectively in x-direction and D_p and D_n are the hole and electron diffusion constants respectively. Which one of the following equations is correct ? (q denotes the charge of an electron).
(a) $J_n = -q D_n \frac{\delta n}{\delta x}$ for electrons.
(b) $J_p = -q D_p \frac{\delta p}{\delta x}$ for holes.
(c) $J = -q D_p \frac{\delta p}{\delta x} - q D_n \frac{\delta n}{\delta x}$
(d) $J = q D_p \frac{\delta p}{\delta x} + q D_n \frac{\delta n}{\delta x}$ [U.P.S.C. I.E.S. E.E.-I, 1994]

146. The energy bandgap of germanium is 0.72 eV at 300 K. The fraction of the total number of electrons (conduction band as well as valence band) in the conduction band at 300 K is
(a) 10^{-6}. (b) 10^{-4}. (c) 10^{-2}. (d) 0.1.
[U.P.S.C. I.E.S. E.E.-I, 1996]

147. Semiconductor A has a higher bandgap than semiconductor B. If both A and B have the same dimensions, the same number of electrons at a given temperature and the same electron and hole mobilities then
(a) A has the same number of holes as B.
(b) A has a large number of holes than B.
(c) A has lesser number of holes than B.
(d) Any of the above statements at (a). (b) or (c) could be true.
[U.P.S.C. I.E.S. E.E.-I, 1993]

148. Silicon is doped with boron to a concentration of 4×10^{17} atoms/cm^3. Assume the intrinsic carrier concentration of silicon to be $1.5 \times 10^{10}/cm^3$ and the value of kT/q to be 25 mV at 300 K. Compared to undoped silicon, the Fermi level of doped silicon.
(a) goes down by 0.13 eV (b) goes up by 0.13 eV
(c) goes down by 0.427 eV (d) goes up by 0.427 eV
[GATE E.C.E.-2008]

149. Which one of the following expressions may be used to correctly describe the temperature (T) variation of the intrinsic carrier density (n_i) of a semiconductor?
(a) $n_i(T) = (A/T) \exp(-E_g/kT^2)$
(b) $n_i(T) = A(E_g/kT)^{10}$ (c) $n_i(T) = A \exp(-E_g/2kT)$
(d) $n_i(T) = AT^{3/2} \exp(-E_g/2kT)$
E_g is the band gap, A is prefactor, k is Boltzmann constant.
[U.P.S.C. E.T.E.-I, 2007]

150. Which one of the following equations represents the energy gap (E_G) variation of silicon with temperature (T)?
(a) $E_G(T) = 2.11 - 3.60 \times 10^{-4} T$
(b) $E_G(T) = 1.21 - 3.60 \times 10^{-4} T$
(c) $E_G(T) = 1.41 - 2.23 \times 10^{-4} T$
(d) $E_G(T) = 0.785 - 2.23 \times 10^{-4} T$ [U.P.S.C. I.E.S. E.E.-II, 2007]

151. Assuming an operating temperature T = 300 K and corresponding V_T = 26 mV, what is the change in semiconductor silicon diode forward voltage V_D to produce a 10 : 1 change in diode current I_D, while operating in the forward bias region (< 25 mA)?
(a) 60 mV (b) 120 mV (c) 180 mV (d) 240 mV
[U.P.S.C. I.E.S. E.T.E.-I,-2008]

152. The electron concentration in a sample of uniformly doped n-type silicon at 300 K varies linearly from $10^{17}/cm^3$ at $x = 0$ to $6 \times 10^{16}/cm^3$ at $x = 2$ μm. Assume a situation that electrons are supplied to keep this concentration gradient constant with time. If electronic charge is 1.6×10^{-19} Coulomb and the diffusion constant $D_n = 35\ cm^2/s$, the current density in the silicon, if no electric field is present, is
(a) zero (b) $-1120\ A/cm^2$
(c) $-560\ A/cm^2$ (d) $+1120\ A/cm^2$
[GATE E.C.E.-2003]

153. The ratio of the mobility to the diffusion coefficient in a semiconductor has the unit
(a) V^{-1} (b) cm V^{-1} (c) V-cm^{-1} (d) V.s
[GATE E.C.E.-2009]

154. An intrinsic semiconductor with energy gap 1 eV has a carrier concentration N at temperature 200 K. Another intrinsic semiconductor has the same value of carrier concentration N at temperature 600 K. What is the energy gap value for the second semiconductor?
(a) (1/3) eV (b) (3/2) eV (c) 3 eV (d) 9 eV
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

155. An n-type silicon bar 0.1 cm long and 100 μm^2 in cross-sectional area has a majority carrier concentration of $5 \times 10^{20}/m^3$ and the carrier mobility is 0.13 m^2/V-s at 300 K. If the charge of an electron is 1.6×10^{-19} Coulomb, then the resistance of the bar is
(a) 10^6 ohm. (b) 10^4 ohm.
(c) 10^{-1} ohm. (d) 10^{-4} ohm. [GATE E..C.E. - 2003]

156. The resistivity of a uniformly doped n-type silicon sample is 0.5Ω-cm. If the electron mobility (μ_n) is 1250 cm^2/V-sec and the charge of an electron is 1.6×10^{-19} Coulomb, the donor impurity concentration (N_D) in the sample is
(a) $2 \times 10^{16}/cm^3$ (b) $1 \times 10^{16}/cm^3$
(c) $2.5 \times 10^{15}/cm^3$ (d) $2 \times 10^{15}/cm^3$
[GATE E.C.E. - 2004]

157. A silicon sample A is doped with 10^{18} atoms/cm^3 of Boron. Another sample B of identical dimensions is doped with 10^{18} atoms/cm^3 of phosphorus. The ratio of electron to hole mobility is 3. The ratio of conductivity of the sample A to B is
(a) 3 (b) 1/3 (c) 2/3 (d) 3/2
[GATE E.C.E.-2005]

158. The electron concentration in a silicon sample doped with 10^{15} cm^{-3} P atoms, will vary, in the temperature range of 4.2–1000 K, as follows:
(a) It will be 10^{15} cm^3 over the whole range.
(b) It will be 10^{15} cm^{-3} up to a temperature T at which intrinsic concentration is 10^{15} cm^{-3} and then it will increase exponentially.
(c) It will first increase exponentially up to a temperature T, then remain constant at 10^{15} cm^{-3} over the remaining range.
(d) It will first increase exponentially up to a temperature T_1, then remain constant at 10^{15} cm^{-3} up to a temperature T_2 and then increase exponentially. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

159. Consider the following statements :
In a semiconductor, the measurement of Hall coefficient provides quantitative information on
1. density of carriers. 2. polarity of carriers.
3. effective mass of carriers. 4. mobility of the carriers.
Of these statements
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 1 and 3 are correct. (d) 1, 2, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1997]

Answers: **144.** (a), **145.** (b), **146.** (a), **147.** (b), **148.** (c), **149.** (d), **150.** (b), **151.** (b), **152.** (b), **153.** (a), **154.** (a), **155.** (a), **156.** (b), **157.** (b), **158.** (d), **159.** (a),

169. The majority carriers in an *n*-type semiconductor have an average drift velocity in a direction perpendicular to a uniform magnetic field B. The electric field E induced due to Hall effect acts in the direction
(a) $v \times B$ (b) $B \times v$ (c) along v (d) opposite to v
[GATE E.C.E. 2006]]

161. What is the output voltage produced across the crystal by Hall effect, due to
(a) Drop across the crystal due to current passing through it.
(b) Movement of charge carriers towards one end.
(c) Induced voltage by the applied magnetic field.
(d) Induced voltage by the applied electric field.
[U.P.S.C. I.E.S. E.E.-I, 2007]

162. In which one of the following ways can the Hall voltage across an impurity semiconductor crystal be increased ?
(a) By increasing the thickness of the crystal.
(b) By increasing the concentration of impurity atoms in the crystal.
(c) By increasing the width of the crystal.
(d) By increasing the current flowing through the crystal.
[U.P.S.C. I.E.S. E.E.-I, 2004]

163. The Hall coefficient of sample A of a semiconductor is measured at room temperature. The Hall coefficient of A is 4×10^{-4} m^3 $coulomb^{-1}$. The carrier concentration in sample A at room temperature is
(a) $\sim 10^{-4}$ m^{-3} (b) $\sim 10^{24}$ m^{-3}
(c) $\sim 10^{4}$ m^{-3} (d) $\sim 10^{22}$ m^{-3}
[U.P.S.C. I.E.S. E.E.-I, 1994]

164. If μ_e = electron mobility, μ_h = hole mobility n_h = hole density, n_e = electron density, then the measurement of the Hall coefficient of a semiconductor with two types of charge carriers would give the value of Hall coefficient as positive if
(a) $\mu_n n_h > \mu_e n_e$ (b) $\mu_n n_h^2 > \mu_e n_e^2$
(c) $\mu_h^2 n_h > \mu_e^2 n_e$ (d) $\mu_n^2 n_n^2 > \mu_e^2 n_e^2$
[U.P.S.C. I.E.S. E.E.-I, 1993]

165. The Hall angle θ of a metal sample is
(a) independent of the magnetic flux density B.
(b) independent of the carrier mobility.
(c) independent of the density of free carriers.
(d) dependent on magnetic flux density, carrier mobility and density of free carriers. [U.P.S.C. I.E.S. E.E.-I, 1994]

166. The Hall effect voltage in intrinsic silicon
(a) is positive. (b) is zero.
(c) is negative.
(d) changes sign on application of magnetic field.
[U.P.S.C. I.E.S. E.E.-I, 1997]

167. If the lattice temperature is increased, the Hall coefficient of a semiconductor will
(a) decrease. (b) increase.
(c) first increase to a peak and then decrease.
(d) remain constant. [U.P.S.C. I.E.S. E.E.-I, 1995]

168. For which one of the following materials, is the Hall coefficient zero ?
(a) metal. (b) insulator.
(c) intrinsic semiconductor. (d) alloy. [U.P.S.C. I.E.S. E.E.-I 2006]

169. Which one of the following statements is correct ? The Hall coefficient of an intrinsic semiconductor is
(a) positive (b) negative (c) zero (d) infinite
[U.P.S.C. I.E.S. E.E.-I, 2004]

170. A current of 50 A is passed through a metal strip which is subjected to a magnetic flux density of 1.2 Wb/m^2. The magnetic field is directed at right angles to the current direction. Thickness of the strip in the direction of the magnetic field is 0.5 mm. If the Hall voltage is found to be 150 V, the number of conduction electrons per m^3 in the metal is
(a) 5×10^{27} (b) 0.5×10^{27}
(c) 50×10^{27} (d) 5×10^{26}
[U.P.S.C. I.E.S. E.E.-I, 2009]

171. The principle of Hall effect is made use of in the construction of which one of the following ?
(a) Ammeter. (b) Voltmeter.
(c) Gaussmeter. (d) Galvanometer.
[U.P.S.C. I.E.S. E.E.-I, 2008]

172. Which one of the following is the correct statement ? The type of majority charge carriers in a semiconductor can be found by
(a) Hall effect. (b) Piezoelectric effect.
(c) Photoelectric effect. (d) Meissner effect.
[U.P.S.C. I.E.S. E.E.-I, 2008]

173. The measurement of which one the following will reveal the sign of charge carriers ?
(a) Conductivity. (b) Mobility.
(c) Hall coefficient. (d) Diffusion constant.
[U.P.S.C. I.E.S. E.E.-I, 2007]

174. Which of the following can be determined by using a Hall crystal?
1. Concentration of holes in a *p*-type semiconductor.
2. Concentration of electrons in an *n*-type.
3. Temperature of the set-up with any type of semiconductor.
4. Diffusion constant and lifetime of minority carriers of any type of semiconductors.
Select the correct answer using the code given below :
(a) Only 1 and 2. (b) 1, 2 and 4.
(c) Only 3 and 4. (d) Only 2 and 4.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

175. Hall effect can be used
(a) to find type of semiconductor (whether P-type or N-type).
(b) to find carrier concentration.
(c) to measure conductivity. (d) all of the above.
[U.P.S.C. I.E.S. E.E.-I, 2005]

176. In a Hall effect experiment, a P-type semiconductor sample with hole concentration p_1 is used. The measured value of the Hall voltage is V_{H1}. If the P-type sample is now replaced by another P-type sample with hole concentration p_2 where $p_2 = 2p_1$, what is the new Hall voltage V_{H2} ?
(a) $2\ V_{H1}$ (b) $4\ V_{H2}$ (c) $1/2V_{H1}$ (d) $1/4V_{H1}$
[U.P.S.C. I.E.S. E.E.-II, 2006]

177. The Hall coefficient of a specimen of doped semiconductor is 3.06×10^{-4} m^3 C^{-1} and the resistivity of the specimen is 8.93×10^{-3} Ω-m. The majority carrier mobility (in units of m^2 V^{-1} s^{-1}) will be
(a) 0.0078 (b) 0.035 (c) 0.151 (d) 0.350.
[U.P.S.C. I.E.S. E.E.-I, 1996]

178. The Hall coefficient of a sample of silicon having 10^{22} arsenic atoms per m^3 is
(a) 3.49×10^{-3} m^3/C (b) 6.25×10^{-4} m^3/C
(c) 1.37×10^{-4} m^3/C (d) 9.44×10^{-5} m^3/C
[U.P.S.C. I.E.S. E.E.-I, 1999]

179. A magnetic field $\bar{B}$ of 2 T is normal to a copper strip 0.5 mm thick carrying an electron current of 40 A. If the electron density is 10.0×10^{28} per cubic metre, then voltage across the strip in micro volt is
(a) 40 (b) 30 (c) 20 (d) 10
[U.P.S.C. I.E.S. E.E-I, 2010]

Answers: **160.** (b), **161.** (b), **162.** (d), **163.** (d), **164.** (c), **165.** (d), **166.** (c), **167.** (b), **168.** (b), **169.** (b), **170.** (a), **171.** (c), **172.** (a), **173.** (c), **174.** (a), **175.** (d), **176.** (c), **177.** (b), **178.** (b), **179.** (d),

180. Consider the following statements for a p-n junction diode :
1. It is an active component.
2. Depletion layer width decreases with forward biasing.
3. In the reverse biasing case, saturation current increases with increasing temperature.

Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

181. The doping concentration on the *n*-side of a *p-n* junction diode is enhanced. Which one of the following will get affected ?
(a) Width of the depletion region on *n*-side.
(b) Width of the depletion region on *p*-side.
(c) Width of the depletion region on both sides.
(d) No change in widtn of depletion regions.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

182. The depletion layer in a *p-n* junction is made of which of the following ?
(a) Ionized donors in *p*-side and ionized acceptors in *n*-side.
(b) Ionized acceptors in *p*-side and ionized donors in *n*-side.
(c) Accumulated holes in *p*-side and accumulated electrons in *n*-side.
(d) Accumulated electrons in *p*-side and accumulated holes in *n*-side.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

183. In a P-N junction, holes diffuse from P-region to N-region because
(a) the free electrons in the N-region attract them.
(b) there is greater concentration of holes in P-region in comparison to that in N-region.
(c) they are swept across the junction by the potential difference.
(d) none of the above.

184. In a P-N junction, the barrier potential offers opposition to only
(a) holes in P-region. (b) free electrons in N-region.
(c) majority carriers in both regions.
(d) minority carriers in both regions.

185. For a germanium *P-N* junction, the maximum value of barrier potential is
(a) 0.3 V (b) 0.7 V (c) 1.3 V (d) 1.7 V
[U.P.T.U. 2008-09]

186. At room temperature of 25°C, the barrier potential for silicon is 0.7 V. Its value at 125°C is _____ V.
(a) 0.5 (b) 0.3 (c) 0.9 (d) 0.7
[A.M.I.E. Sec B. Solid State Physics & Semiconductor Devices Winter 2006]

187. Current flow in a semiconductor depends on the phenomenon of
(a) drift. (b) diffusion.
(c) recombination. (d) all of the above.
[A.M.I.E. Sec B. Solid State Physics & Semiconductor Devices Winter 2006]

188. The current flow in a semiconductor is due to
1. drift current
2. displacement current
3. diffusion current

(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 1 and 3 only. (d) 2 and 3 only.
[U.P.S.C. I.E.S. E.E-I, 2011]

189. The diffusion current is proportional to
(a) applied electric field. (b) square of the electric field.
(c) concentration gradient of charge carriers.
(d) both (a) and (c).

190. In a P-N junction, to make the depletion region extend predominantly into P-region, the concentration of impurities in the P-region must be
(a) much less than the concentration of impurities in N-region.
(b) much higher than the concentration of impurities in N-region.
(c) equal to the concentration of impurities in N-region.
(d) zero.
[U.P.S.C. I.E.S. E.E.-II, 2003]

191. The depletion region or space charge region or transition region in a semiconductor P-N junction diode has
(a) electrons and holes. (b) positive ions and electrons.
(c) positive ions and negative ions.
(d) no ions, electrons or holes.
[GATE E.E. 1996]

192. The width of depletion layer of a P-N junction
(a) decreases with light doping.
(b) increases with heavy doping.
(c) is independent of applied voltage.
(d) is increased under reverse bias.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

193. Consider the following statements :
An applied bias voltage in a P-N junction diode (N-region) positive with respect to P-region) results in
1. increase in potential barrier.
2. reduction in space charge layer width.
3. increases in space charger layer width
4. increase in magnitude of electric field.

Which of the statements given above are correct ?
(a) 1 and 2. (b) 1 and 3. (c) 1 and 4. (d) 1, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2006]

194. Increase in the applied reverse voltage to a *p-n* junction results an increase in the
(a) depletion width. (b) barrier height.
(c) depletion width and barrier height.
(d) junction temperature.
[U.P.S.C. I.E.S. E.E-I, 2010]

195. When we apply reverse bias to a junction diode, it
(a) lowers the potential barrier.
(b) raises the potential barrier.
(c) greatly decreases the minority carrier current.
(d) greatly increases the majority carrier current.
[U.P.T.U. Electronics Engineering Even Semester 2009-10]

196. When a positive dc voltage is applied to the *n*-side relative to *p*-side, a diode is said to be given a
(a) Forward bias. (b) Reverse bias.
(c) Zero bias. (d) Neutral bias.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

197. Which one of the following is the correct statement?
When a *p-n* junction is reverse biased, then
(a) holes and electrons move away from the junction.
(b) depletion region decreases. (c) barrier breaks down.
(d) minority carriers are not affected. [U.P.S.C. I.E.S. E.E.-I, 2008]

198. In a p^+n junction diode under reverse bias, the magnitude of electric field is maximum at
(a) the edge of the depletion region on the *p*-side.
(b) the edge of the depletion region on the *n*-side.
(c) the p^+n junction.
(d) the centre of the depletion region on the *n*-side.
[GATE E.C.E., 2007]

199. When the reverse voltage across a P-N junction is gradually decreased, the depletion region inside the diode
(a) does not change in width.
(b) initially increases upto a certain width and then decreases.
(c) continuously increases in width.
(d) continuously decreases in width. [U.P.S.C. I.E.S. E.E.-II, 1994]

Answers: **180.** (a), **181.** (a), **182.** (b), **183.** (b), **184.** (c), **185.** (a), **186.** (d), **187.** (d), **188.** (c), **189.** (c), **190.** (a), **191.** (c), **192.** (d), **193.** (d), **194.** (c), **195.** (b), **196.** (b), **197.** (a), **198.** (c), **199.** (d),

200. The development of barrier potential in the depletion zone of a PN junction is consequent to
(a) Diffusion of majority carriers across junction.
(b) Drift of minority carriers across junction.
(c) Generation of minority carriers due to thermal energy.
(d) Initial flow of conduction current. [U.P.S.C. I.E.S. E.E.-I, 2003]

201. The potential barrier existing across a P-N junction
(a) prevents flow of minority carriers.
(b) prevents neutralization of acceptor and donor ions.
(c) prevents total recombination of holes and electrons.
(d) facilitates recombination of holes and electrons.

202. The minority carrier concentration is largely a function of
(a) temperature. (b) the amount of doping.
(c) forward biasing voltage. (d) reverse biasing voltage.

203. In an unbiased P-N junction, the junction current at equilibrium is
(a) due to diffusion of minority carriers only.
(b) due to diffusion of majority carrier only.
(c) zero, because equal and opposite drift and diffusion currents for electrons and holes cross the junction.
(d) zero, because no charges cross the junction.
[U.P.S.C. I.E.S. E.E.-II, 2006]

204. In an unbiased junction the thickness of charge depletion region is of the order of
(a) 0.005 μm (b) 0.5 μm (c) 5 mm (d) 10^{-10} m
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1993]

205. In an abrupt *p-n* junction, the doping concentrations on the *p*-side and *n*-side are $N_A = 9 \times 10^{16}/cm^3$ and $N_D = 1 \times 10^{16}/cm^3$ respectively. The *p-n* junction is reverse biased and the total depletion width is 3 μm. The depletion width on the *p*-side is
(a) 2.7 μm (b) 0.3 μm (c) 2.25 μm (d) 0.75 μm
[GATE E.C.E., 2004]

206. A *p-n* junction has a built-in potential of 0.8 V. The depletion layer width at a reverse bias of 1.2 V is 2 μm. For a reverse bias of 7.2 V, the depletion layer width will be
(a) 4 μm (b) 4.9 μm (c) 8 μm (d) 12 μm
[GATE E.C.E., 2007]

207. The number of minority carriers crossing the junction of a P-N junction diode depends primarily on
(a) concentration of doping impurities.
(b) magnitude of potential barrier.
(c) magnitude of forward bias voltage.
(d) rate of thermal generation of electron hole pairs.
[A.M.I.E. Summer 1996]

208. Reverse saturation current in a germanium diode is of the order of
(a) 1 nanoampere. (b) 1 microampere.
(c) 1 mA. (d) 10 mA.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter, 2005]

209. The reverse saturation current of a reverse-biased P-N junction diode increases 32 times due to rise in ambient temperature. If the original temperature was 40°C, what is the final temperature ?
(a) 90°C (b) 72°C (c) 45°C (d) 50°C
[U.P.S.C. I.E.S. E.E.-II, 2006]

210. When a reverse bias is applied to a germanium P-N junction diode, the reverse saturation current at room temperature is 0.3 μA. The current flowing in the diode when 0.15 V forward bias is applied at room temperature is
(a) 120.73 mA (b) 120.73 nA
(c) 120.73 A (d) 120.73 μA
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer, 2006]

211. At 300 K, for a diode current of 1 mA, a certain germanium diode requires a forward bias of 0.1435 V, whereas a certain silicon diode requires a forward bias of 0.718 V. Under the conditions stated above, the closest approximation of the ratio of reverse saturation current in germanium diode to that in silicon diode is
(a) 1 (b) 5 (c) 4×10^3 (d) 8×10^3
[GATE E.C.E. 2003]

212. A silicon PN junction at a temperature of 20°C has a reverse saturation current of 10 pico-Amperes (pA). The reverse saturation current at 40°C for same bias is approximately
(a) 30 pA (b) 40 pA (c) 50 pA (d) 60 pA
[GATE E.C.E. 2005]

213. What is the typical value for the ratio of current in a *p-n* junction diode in the forward bias and that in the reverse bias ?
(a) 1 (b) 10 (c) 100 (d) 1,000

214. In a biased step-graded P-N junction, what is the correct expression for the equilibrium contact potential (V_0) ?
(a) $V_0 = V_T \log \left(N_A/N_D\, n_i^2\right)$
(b) $V_0 = V_T \log \left(N_D/N_A\, n_i^2\right)$
(c) $V_0 = V_T \log \left(N_A N_D/n_i^2\right)$
(d) $V_0 = V_T \log \left(n_i^2/N_A N_D\right)$
where $V_T \propto T/q$, T being the temperature, q the electronic charge, N_A and N_D are the doping levels of the *p* and *n* regions, respectively, and n_i is the intrinsic carrier concentration.
[U.P.S.C. I.E.S. E.E.-II, 2006]

215. Which of the following are the effects of increasing the reverse bias voltage across a P-N junction ?
1. Decrease in junction capacitance of the diode.
2. Increase in carrier generation current.
3. Increase in carrier recombination in the depletion layer.
Select the correct answer using the codes given below :
Codes :
(a) 1 alone (b) 2 and 3 (c) 1 and 2 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-II, 1996]

216. Energy band diagram of all P-N junction shows a band bonding equal to
(a) $q\, V_0$ (b) q/V_0
(c) $\sqrt{q/V_0}$ (d) $qV_0\left(\frac{1}{N_A}+\frac{1}{N_D}\right)$
[A.M.I.E. Sect. B Solid State Physics and Semiconductor Devices, Winter 2005]

217. The amount of band bending that occurs in a P-N junction in equilibrium is equal to
(a) qV_0 (b) q^2V_0 (c) q/V_0 (d) $qV_0/2$
[A.M.I.E. Sect. B Solid State Physics and Semiconductor Devices, Winter 2005]

218. If x_p and x_n denotes the extent of the penetration of depletion region of a P-N junction on the P and N sides, the
(a) $x_p \cdot x_n = N_A N_D$ (b) $x_p N_A = x_n N_D$
(c) $x_p N_D = x_n N_A$ (d) $x_p x_n = \sqrt{\frac{N_A N_D}{n^2}}$
[A.M.I.E. Sect. B Solid State Physics and Semiconductor Devices, Winter 2005]

219. The current flowing in a certain PN junction at room temperature 300 K is 2×10^{-7} A when a large reverse bias voltage is applied. The current flowing when a forward bias of 0.1 V is applied will be
(a) $2 \times 10^{-7} \exp\left[\frac{-1.6 \times 10^{-19} \times 0.1}{1.38 \times 10^{-23} \times 300}\right]$

Answers: **200.** (a), **201.** (c), **202.** (a), **203.** (d), **204.** (b), **205.** (b), **206.** (a), **207.** (d), **208.** (b), **209.** (a), **210.** (d), **211.** (c), **212.** (b), **213.** (d), **214.** (c), **215.** (a), **216.** (d), **217.** (d), **218.** (b), **219.** (a),

Downloaded From : www.EasyEngineering.net

(b) $2 \times 10^{-7}\left[\frac{1.6\times10^{-19}\times0.1}{1.38\times10^{-23}\times300}\right]$

(c) $2 \times 10^{-7} \exp\left[\frac{-1.38\times10^{-23}\times300}{1.6\times10^{-19}\times0.1}\right]$

(d) $2 \times 10^{-7}\left[\frac{1.38\times10^{-23}\times300}{1.6\times10^{-19}\times0.1}\right]$ [U.P.S.C. I.E.S. E.E.-I, 2003]

220. Consider a silicon *p-n* junction at room temperature having the following parameters :
Doping on the *n*-side = 1×10^{17}cm^{-3}
Depletion width on the *n*-side = 0.1 μm
Depletion width on the *p*-side = 1.0 μm
Intrinsic carrier concentration = 1.4×10^{10}cm^{-3}
Thermal voltage = 26 mV
Permittivity of free space = 8.85×10^{-14} F-cm^{-1}
Dielectric constant of silicon = 12
The built-in potential of the junction
(a) is 0.70 V. (b) is 0.76 V.
(c) is 0.82 V.
(d) cannot be estimated from the given data. [GATE E.C.E. 2009]

221. Consider the following statements :
E_F^n and E_F^p are the energies of the Fermi levels on the *n* and *p* sides of *p-n* junction diode, respectively. They will vary with applied bias as follows :
1. $E_F^n = E_F^p$ with no bias applied.
2. E_F^n increases and E_F^p decreases with forward bias.
3. E_F^n decreases and E_F^p increases with reverse bias.
4. E_F^n decreases and E_F^p increases with forward bias.
5. E_F^n increases and E_F^p decreases with reverse bias.
Select the correct answer using the codes given below :
(a) 1, 4 and 5 (b) 2 and 3
(c) 4 and 5 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 2003]

222. Which of the following is NOT associated with a *p-n* junction ?
(a) Junction Capacitance. (b) Charge Storage Capacitance.
(c) Depletion Capacitance. (d) Channel Length Modulation.
[GATE E.C.E. 2008]

223. Consider the following statements about *p-n* junctions:
1. *p-n* junction behaves as a capacitor when forward biased.
2. *p-n* junction has *p* and *n* type semiconductors with depletion layer in between.
3. *p-n* junction has a wider depletion layer as compared to a zener diode.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-I, 2008]

224. The junction capacitance of a linearly graded junction varies with applied reverse bias V_r as
(a) V_r^{-1} (b) $V_r^{-1/2}$ (c) $V_r^{-1/3}$ (d) $V_r^{1/2}$
[U.P.S.C. I.E.S. E.E.-II, 2002]

225. The transition capacitance of a reverse-biased *p-n* junction having uniform doping on both sides, varies with junction voltage (V_B) as
(a) $1/V_B$ (b) V_B (c) $V_B^{-1/2}$ (d) V_B^2
[G.B.T.U. Electronics Engineering Even Semester 2010-11]

226. If *w* is the width of the depletion region in a *p-n* junction, the transition capacitance is proportional to
(a) *w* (b) w^2 (c) $1/w$ (d) $1/w^2$
[U.P.S.C. I.E.S. E.E-I, 2011]

227. The diffusion capacitance of a forward biased P$^+$-N junction diode with a steady current I depends on
(a) width of the depletion region. (b) mean lifetime of holes.
(c) mean lifetime of electrons. (d) junction area.
[U.P.S.C. I.E.S. E.E.-II, 2002]

228. In a forward biased P-N diode the diffusion current I and the injected excess minority carrier charge Q stored in the device are related as
(a) $I = Q\tau_p$ (b) $I = Q/V$ (c) $I = Q^2/\tau_p$ (d) $I = Q/\tau_p$

229. A silicon PN junction diode under reverse bias has depletion region of width 10 μm. The relative permittivity of silicon, ε_r = 11.7 and the permittivity of free space $\varepsilon_0 = 8.85 \times 10^{-12}$ F/m. The depletion capacitance of the diode per square meter is
(a) 100 μF (b) 10 μF (c) 1 μF (d) 20 μF
[GATE E.C.E. 2005]

230. In a step-graded *p-n* junction diode, what is the ratio of depletion-region penetration depths into *p* and *n* regions (if the ratio of acceptor to donor impurity atoms densities is 1 : 2) ?
(a) 2 : 1 (b) 4 : 1 (c) 1 : 2 (d) 1 : 4
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

231. Consider an abrupt *p*-junction. Let V_{bi} be the built-in potential of this junction and V_R be the applied reverse bias. If the junction capacitance (C_1) is 1 pF for $V_{bi} + V_R = 1$ V, then for $V_{bi} + V_R$ = 4 V, C_1 will be
(a) 4 pF (b) 2 pF (c) 0.25 pF (d) 0.5 pF
[GATE E.C.E. 2004]

232. In a semiconductor diode schematic symbol arrow head represents
(a) N-type material. (b) P-type material.
(c) both P and N-type materials. (d) none of the above.

233. In forward region of its characteristics, a diode appears as
(a) an ON switch. (b) an OFF switch.
(c) a capacitor. (d) an high resistor.

234. Silicon devices are preferred at high temperature operations in comparison to germanium because
(a) reverse saturation current is less in case of silicon.
(b) silicon is more thermally stable.
(c) silicon can dissipate more power.
(d) none of the above.

235. At the cutin voltage of a diode
(a) the potential barrier is overcome and the current through the junction starts to increase rapidly.
(b) the potential barrier is strong and the current through the junction is blocked.
(c) the diode almost behaves like a short.
(d) (a) and (c) above.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2005]

236. Find the break region (voltage range) over which the dynamic resistance of a diode is multiplied by a factor of 1000. Let this region be contained between v_1 and v_2 then $|v_1 - v_2|$ is given by
(a) $\log_e (1000\ V_T)$ (b) $1000\ V_T$
(c) $(\log_e 10^3)\ V_T$
(d) The value cannot be computed with given data.
[U.P.S.C. I.E.S. E.E.-II, 2005]

237. As the temperature is increased, the voltage across a diode carrying a constant current
(a) increases. (b) decreases.
(c) remains constant.
(d) may increase or decrease depending on the doping levels in the junction. [GATE E.E. 1999]

Answers: **220.** (b), **221.** (d), **222.** (d), **223.** (a), **224.** (c), **225.** (c), **226.** (c), **227.** (b), **228.** (d), **229.** (b), **230.** (a), **231.** (d), **232.** (b), **233.** (a), **234.** (a), **235.** (a), **236.** (c), **237.** (b),

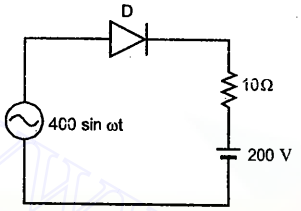
238. A diode whose terminal characteristics are related as $i_0 = I_s e^{V/V_T}$ where I_s is the reverse saturation current, and V_T is the thermal voltage (= 25 mV) is biased at $I_D = 2$ mA. Its dynamic resistance is
(a) 25 Ω (b) 12.5 Ω (c) 50 Ω (d) 100 Ω
[GATE E.E. 2000]

239. What is the reverse recovery time of a diode when switched from forward bias V_F to reverse bias V_R ?
(a) Time taken to remove the stored minority carriers.
(b) Time taken by the diode voltage to attain zero value.
(c) Time to remove stored minority carriers plus the time to bring the diode voltage to reverse bias V_R.
(d) Time taken by the diode current to reverse.
[U.P.S.C. I.E.S. E.E.-II, 2005]

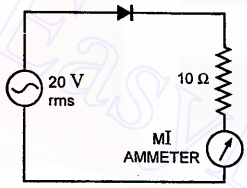
240. Consider a Ge diode operating at 27°C and just beyond the threshold voltage of Ge. What is the valuc of dv/dT?
(a) –1.9 mV/°C (b) – 2.0 mV/°C
(c) – 2.1 mV/°C (d) – 2.3 mV/°C
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

241. The PIV of diode, shown in figure, is



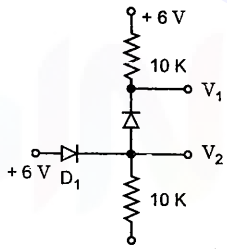
(a) 400 (b) 200 (c) 600 (d) 300
[A.M.I.E. Sec. Power Electronics Summer 2007]

242. Assuming the diode in the circuit given in the fig follows to be ideal, what should be current in 10 Ω resistor if it is measured by a moving iron ammeter.



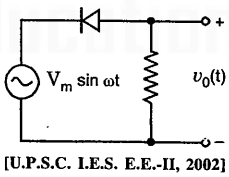
(a) 2.0 A (b) 1.79 A
(c) 1.41 A (d) 0.89 A
[U.P.S.C. I.E.S. E.E.-II, 1994]

243. The voltage at V_1 and V_2 of the arrangement shown in the figure will be respectively



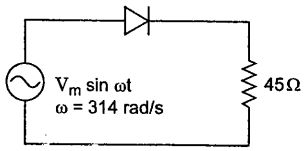
(a) 6 V and 5.4 V
(b) 5.4 V and 6 V
(c) 3 V and 5.4 V
(d) 6 V and 3 V
[U.P.S.C. I.E.S. E.E.-II, 1998]

244. In the circuit shown below the average value of $v_0(t)$ will be



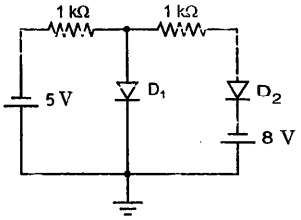
(a) 0. (b) $-V_m/\pi$
(c) $-V_m/\sqrt{2}$
(d) $-V_m$
[U.P.S.C. I.E.S. E.E.-II, 2002]

245. The forward resistance of the diode shown in the circuit is 5 ohms, and the other parameters are same as those of an ideal diode. Then what is the dc component of the source current?



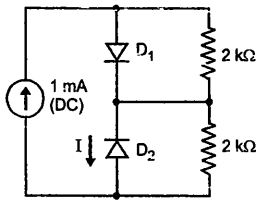
(a) $\frac{V_m}{50\pi}$ (b) $\frac{V_m}{50\pi\sqrt{2}}$ (c) $\frac{V_m}{100\pi\sqrt{2}}$ (d) $\frac{2V_m}{50\pi}$
[U.P.S.C. I.E.S. E.E-II, 2009]

246. Assuming that the diodes are ideal in the figure, the current in diode D_1 is



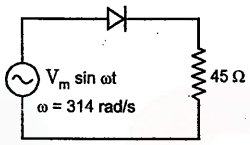
(a) 8 mA. (b) 5 mA.
(c) 0 mA. (d) –3 mA.
[GATE E.E. 2004]

247. Assume that D_1 and D_2 in figure are ideal diodes. The value of current-I is



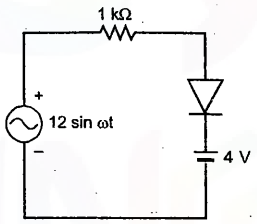
(a) 0 mA (b) 0.5 mA (c) 1 mA (d) 2 mA
[GATE E.E. 2005]

248. The forward resistance of the diode shown in the figure is 5 Ω and the remaining parameters are the same as those of an ideal diode. The dc component of the source current is



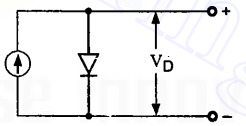
(a) $V_m/50\pi$ (b) $V_m/50\pi\sqrt{2}$
(c) $V_m/100\pi\sqrt{2}$ (d) $2V_m/50\pi$ [GATE E.E. 2002]

249. What is the peak current through the resistor in the circuit given below assuming the diode to be ideal ?



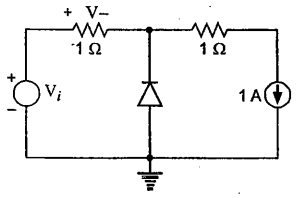
(a) 4 mA (b) 8 mA
(c) 12 mA (d) 16 mA
[U.P.S.C. I.E.S. E.E.-II, 2008]

250. In the figure, silicon diode is carrying a constant current of 1 mA. When the temperature of the diode is 20°C, V_D is found to be 700 mV. If the temperature rises to 40°C, V_D becomes approximately equal to



(a) 740 mV (b) 660 mV
(c) 680 mV (d) 700 mV [GATE E.C.E. 2002]

251. In the circuit below, the diode is ideal. The voltage V is given by



(a) min (V_i, 1) (b) max (V_i, 1)
(c) min (–V_i, 1) (d) max (–V_i, 1)
[GATE E.C.E. 2009]

Answers: **238.** (b), **239.** (a), **240.** (d), **241.** (c), **242.** (d), **243.** (a), **244.** (b), **245.** (a), **246.** (c), **247.** (a), **248.** (a), **249.** (b), **250.** (b), **251.** (a),

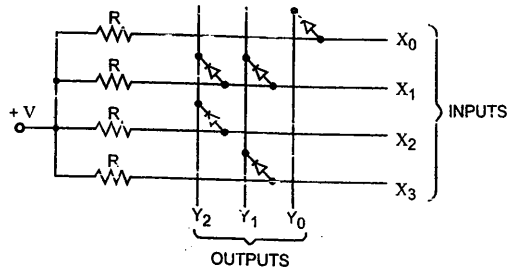
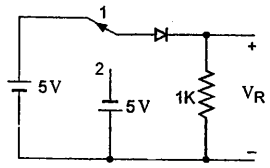
252. For the diode matrix shown in the figure the output Y_i will be



(a) X_0X_2 (b) X_1X_3 (c) $X_1 + X_3$ (d) $X_0 + X_2$

[U.P.S.C. I.E.S. E.E.-II, 1998]

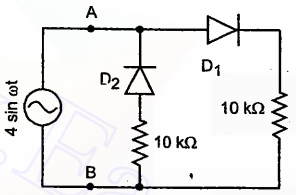
253. In the circuit shown, the switch was connected to position 1 at $t < 0$ and at $t = 0$, it is changed to position 2. Assume that the diode has zero voltage drop and a storage time t_s. For $0 < t \le t_s$, V_R is given by (all in volts)



(a) $V_R = -5$ (b) $V_R = +5$

(c) $0 \le V_R < 5$ (d) $-5 < V_R < 0$ [GATE E.C.E. 2006]

254. A voltage source $V_{AB} = 4 \sin \omega t$, is applied across the terminals A and B of the circuit. The diodes are assumed to be ideal. The impedance offered by the circuit across the terminals A and B in kilo ohm is :

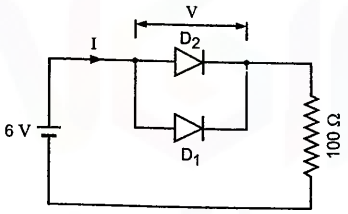


(a) 5 (b) 20

(c) 10 (d) 100

[U.P.S.C. I.E.S. E.E.-II, 1995, 2003]

255. In the given circuit, D_1 is an ideal germanium diode and D_2 is a silicon diode having its cut-in voltage as 0.7 V, forward resistance as 20 Ω and reverse saturation current (I_s) as 10 nA. What are the values of I and V for this circuit, respectively ?

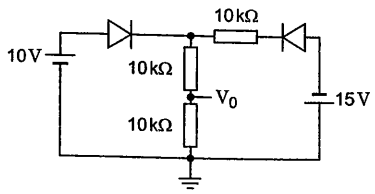


(a) 60 mA and 0 V. (b) 50 mA and 0 V.

(c) 53 mA and 0.7 V. (d) 44 mA and 1.58 V.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

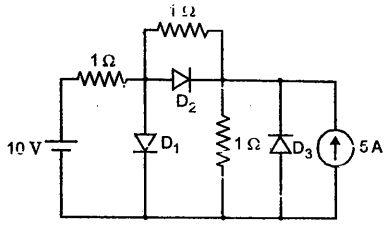
256. Assuming that the diodes in the given circuit are ideal, the voltage V_0 is



(a) 4 V (b) 5 V (c) 7.5 V (d) 12.12 V

[GATE E.E., 2010]

257. What are the states of the three ideal diodes of the circuit shown in figure ?



(a) D_1 ON, D_2 OFF, D_3 OFF.

(b) D_1 OFF, D_2 ON, D_3 OFF.

(c) D_1 ON, D_2 OFF, D_3 ON.

(d) D_1 OFF, D_2 ON, D_3 ON. [GATE E.E. 2006]

258. For the circuit shown in Fig. A, the V-I (voltage-current) characteristic of the circuit using ideal components is given by curve *a* in Fig. B.

Which curve in Fig. B represents the V-I characteristic for the circuit shown in Fig. C?

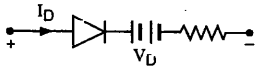


Fig. A

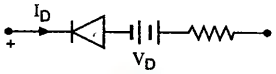

Fig. C

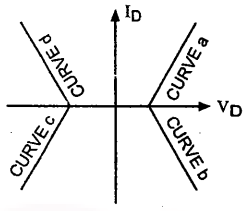

Fig. B

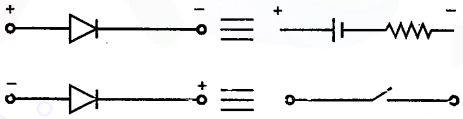
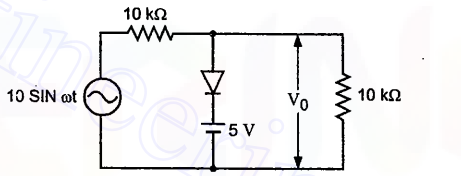
(a) Curve a (b) Curve b (c) Curve c (d) Curve d

[U.P.S.C. I.E.S. E.E.-II, 2008]

259. The equivalent circuits of a diode, during forward biased and reverse biased conditions, are shown in the figure.



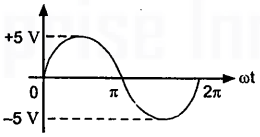
(a)



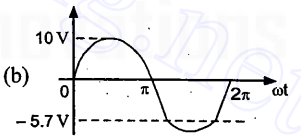
(b)

If such a diode is used in clipper circuit of figure given above, the output voltage (V_0) of the circuit will be

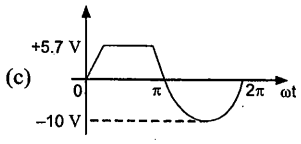
(a)



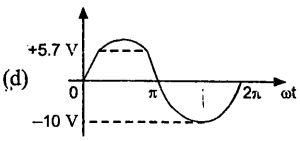
(b)



(c)

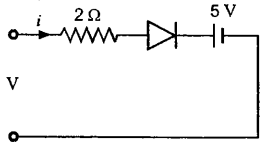


(d)



[GATE E.E., 2008]

260. The figure shows a network in which the diode is an ideal one.



Answers: **252.** (c), **253.** (a), **254.** (c), **255.** (a), **256.** (b), **257.** (a), **258.** (c), **259.** (a), **260.** (c),

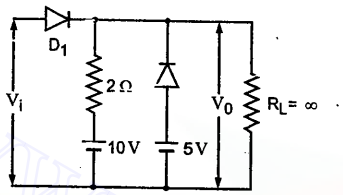
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The terminal *v-i* characteristics of the network is given by

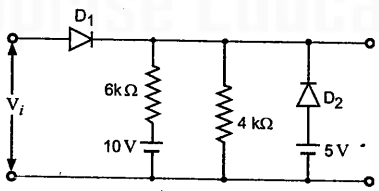
(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2002]

261. Assuming the diodes D_1 and D_2 of the circuit shown in figure to be ideal ones, the transfer characteristics of the circuit will be



(a) 
(b) 
(c) 
(d) 
[GATE E.E.-I, 2006]

262. In the circuit given below, D_1 and D_2 ideal. Which one of the following represents the transfer characteristics the circuit ?



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2007]

263. Avalanche multiplication
(a) disruption of covalent bonds occurs by collision.
(b) direct rupture bonds.
(c) both (a) and (b). (d) none of the above.
[U.P. Technical Univ. 2008-09]

264. Avalanche breakdown is primarily dependent on the phenomenon of
(a) collision. (b) doping.
(c) ionization. (d) recombination.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

265. In P-N junction the avalanche breakdown voltage with semiconductor resistivity
(a) decreases. (b) increases.
(c) both the parameters are independent.
(d) decreases or increases in abrupt P-N junction.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

266. Silicon is preferred for manufacturing zener diodes because it
(a) is relatively cheap. (b) needs lower doping level.
(c) has high temperature and current capacity.
(d) has lower breakdown voltage.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

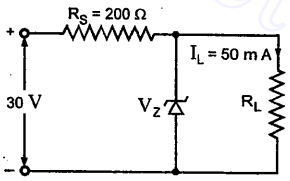
267. For highly doped diode
(a) Zener breakdown is likely to take place.
(b) Avalanche breakdown is likely to take place.
(c) either (a) or (b) will take place.
(d) neither (a) nor (b) will take place.

268. Consider the following statements:
1. A zener diode degrades the input signal at high frequencies due to its transition capacitance.
2. The zener voltage V_Z does not vary with temperature.
3. Regulation of the zener diode is adversely affected at the knee current $I_{Z\,(min)}$ due to limited power dissipation capacity.
4. In a simple zener diode regulated circuit, amplification is not possible.

Which of these statements are correct?
(a) 1, 2, 3 and 4 (b) 3 and 4
(c) 2 and 3 (d) 1 and 4 [U.P.S.C. I.E.S. E.E-I, 2011]

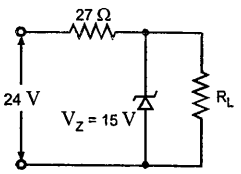
269. Zener diode is used as the main component in dc power supply for
(a) rectification. (b) voltage regulation.
(c) filter action. (d) both (a) and (b).

270. The zener diode shown in the circuit (figure) has a reverse breakdown voltage of 10 V. The power dissipation in R_S would be



(a) 2.0 W (b) 1.5 W
(c) 1.0 W (d) 0.5 W.
[U.P.S.C. I.E.S. E.E.-II 1994]

271. The circuit shown in the figure has a zener regulated dc power supply. Assuming that the zener diode is ideal, the minimum value of R_L down to which the output voltage would remain constant is



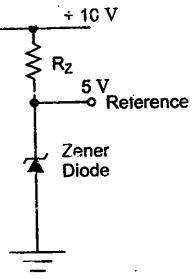
Answers: **261.** (a), **262.** (b), **263.** (a), **264.** (a), **265.** (a), **266.** (c), **267.** (a), **268.** (d), **269.** (b), **270.** (a), **271.** (d),

Downloaded From : www.EasyEngineering.net

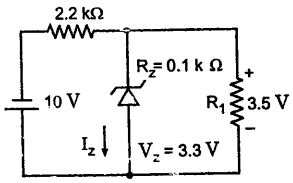
Downloaded From : www.EasyEngineering.net

(a) 15 Ω (b) 24 Ω (c) 27 Ω (d) 45 Ω
[U.P.S.C. I.E.S. E.E.-II, 1997]

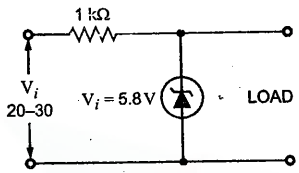
272. A 5 V reference is drawn from the circuit shown in the fig. If the zener diode is of 5 mW, then R_z will be
(a) 50 Ω
(b) 500 Ω
(c) 5,000 Ω
(d) 50,000 Ω
[U.P.S.C. I.E.S. E.E.-II, 1999]



273. The current through the zener diode in figure is
(a) 33 mA
(b) 3.3 mA
(c) 2 mA
(d) 0 mA [GATE E.E. 2004]

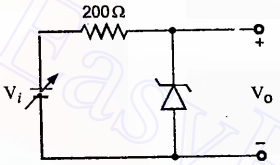


274. The zener diode in the regulator circuit shown in the figure has a Zener voltage of 5.8 volts and a Zener knee current of 0.5 mA. The maximum load current drawn from this circuit ensuring proper functioning over the input voltage range between 20 and 30 volts, is



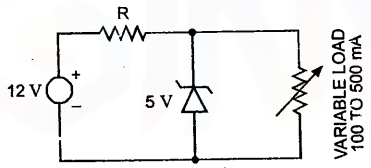
(a) 23.7 mA (b) 14.2 mA (c) 13.7 mA (d) 24.2 mA
[GATE E.C.E. 2005]

275. For the zener diode shown in figure, the zener voltage at knee is 7 V, the knee current is negligible and the zener dynamic resistance is 10 Ω. If the input voltage (V_i) range is from 10 to 16 V, the output voltage (V_0) ranges from



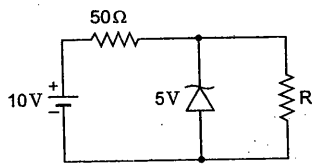
(a) 7.00 to 7.29 V (b) 7.14 to 7.29 V
(c) 7.14 to 7.43 V (d) 7.29 to 7.43 V
[GATE E.C.E. 2007]

276. In the voltage regulator shown in the figure, the load current can vary from 100 mA to 500 mA. Assuming that the Zener diode is ideal (*i.e.*, the zener knee current is negligibly small and Zener resistance is zero in the breakdown region), the value of R is



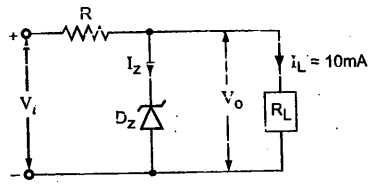
(a) 7 Ω (b) 70 Ω (c) 70/3 Ω (d) 14 Ω
[GATE E.C.E. 2004]

277. The 6 V zener diode as shown in the circuit below, has zero zener resistance and a knee current of 5 mA. Then what is the minimum value of R so that the voltage across it does not fall below 6 V?



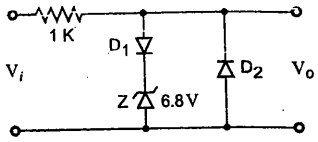
(a) 1,200 ohms. (b) 80 ohms.
(c) 50 ohms. (d) 40 ohms.
[U.P.S.C. I.E.S. E.E-II, 2009]

278. A zener diode regulator in the figure is to be designed to meet the specifications : I_L = 10 mA, V_0 = 10 V and V_{in} varies from 30 to 50 V. The zener diode has V_z = 10 V and I_{zk} (knee current) = 1 mA. For satisfactory operation



(a) $R \le 1800\ \Omega$. (b) $2000\ \Omega \le R \le 2200\ \Omega$.
(c) $3700\ \Omega \le R \le 4000\ \Omega$. (d) $R > 4000\ \Omega$. [GATE E.C.E., 2002]

279. In the following limiter circuit, an input voltage $V_i = 10 \sin 100\pi t$ is applied. Assume that the diode drop is 0.7 V when it is forward biased. The Zener breakdown voltage is 6.8 V. The maximum and minimum values of output voltage respectively are



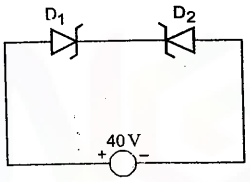
(a) 6.1 V, – 0.7 V. (b) 0.7 V, – 7.5 V.
(c) 7.5 V, – 0.7 V. (d) 7.5 V, – 7.5 V.
[GATE E.C.E. 2008]

280. The cutin voltage of zener diode D_z and diode D shown in the figure below is 0.7 V. Breakdown voltage of D_z is 3.3 V and reverse breakdown voltage of D is 50 V. The other parameters can be assumed to be the same as those of an ideal diode. Then what are the values of the peak output voltage V_o?

	Positive half cycle in V	*Negative half cycle in V*
(a)	3.3	1.4
(b)	4	5
(c)	3.3	3.3
(d)	4	4

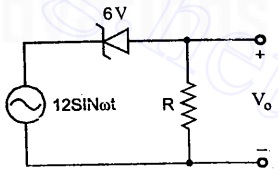
[U.P.S.C. I.E.S. E.E-II, 2009]

281. In the circuit given, the zener diode D_1 has a reverse breakdown voltage of 100 V and reverse saturation current of 25 μA. The corresponding values of D_2 are 50 V and 50 μA. What is the current in the circuit ?

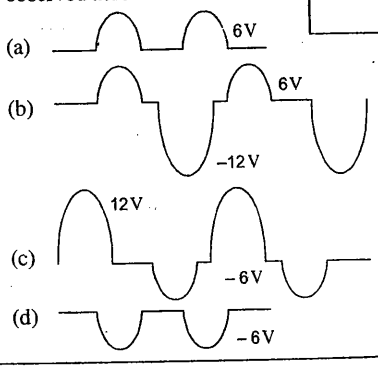


(a) 25 μA anticlockwise.
(b) 25 μA clockwise.
(c) 50 μA anticlockwise. (d) 50 μA clockwise.
[U.P.S.C. I.E.S. E.E.-II, 2008]

282. For the circuit shown below, assume that the zener diode is ideal with a breakdown voltage of 6 volts. The waveform observed across R is



(a)
(b)
(c)
(d)



[GATE E.C.E. 2006]

Answers: **272.** (c), **273.** (c), **274.** (a), **275.** (c), **276.** (d), **277.** (b), **278.** (a), **279.** (c), **280.** (b), **281.** (d), **282.** (b),

283. Tunnel diode
(a) is a power diode. (b) has light doping.
(c) has heavy doping. (d) is a reverse recovery diode.

284. Consider the following statements about a Tunnel diode:
1. Tunnelling takes place at a speed decided by junction temperature.
2. Concentration of impurities is of the order of 1 part in 10^3.
3. Both tunnelling current and normal *pn* junction injection current exist.
4. Tunnel diode exhibits current controlled negative resistance characteristic only.

Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 2.
(c) 2 and 3. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E-II, 2009]

285. Consider the following statements : A tunnel diode is
1. made of Ge or GaAs.
2. an abrupt junction with both sides heavily doped.
3. a hyper abrupt junction with both sides heavily doped.
4. a majority carrier device.

Which of these statements are correct ?
(a) 1 and 2 (b) 3 and 4 (c) 1, 3 and 4 (d) 1, 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 2006]

286. Consider the following statements pertaining to tunnel diodes :
1. Impurity concentration is high.
2. Carrier velocities are low.
3. They have current-controlled V-I characteristic.

Which of the statements given above is / are correct ?
(a) 1 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2008]

287. In a tunnel diode, the width of the depletion layer is of the order of
(a) 0.1 micron (b) 1.0 micron
(c) 0.1 armstrong (d) 100 armstrong
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

288. Choose proper substitutes for X and Y to make the following statement correct. Tunnel diode and Avalanche diode are operated in X bias and Y bias respectively
(a) X : reverse, Y : reverse (b) X : reverse, Y : forward
(c) X : forward, Y : reverse (d) X : forward, Y : forward
[GATE E.C.E. 2003]

289. Negative resistance region of a silicon Esaki diode remains the same even at a temperature of
(a) 50°C (b) 100°C (c) 150°C (d) 200°C
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

290. The main reason why electrons can tunnel through a P-N junction is that
(a) they have high energy. (b) barrier potential is very low.
(c) depletion layer is extremely thin.
(d) impurity level is low.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

291. The I_P/I_V ratio of a tunnel diode is of primary importance in
(a) determining tunneling speed of electrons.
(b) the design of an oscillator.
(c) amplifier designing. (d) computer applications.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

292. Consider the following assertions.
S_1 : For Zener effect to occur, a very abrupt junction is required.
S_2 : For quantum tunneling to occur, a very narrow energy barrier is required.
Which of the following is correct ?
(a) Only S_2 is true
(b) S_1 and S_2 are both true but S_2 is not a reason for S_1
(c) S_1 and S_2 are both true and S_2 is a reason for S_1
(d) Both S_1 and S_2 are false
[GATE E.C.E. 2003]

293. The values of voltage (V_D) across a tunnel-diode corresponding to peak and valley currents are V_P and V_V respectively. The range of tunnel-diode voltage V_D for which the slope of its $I-V_D$ characteristics is negative would be
(a) $V_D < 0$ (b) $0 \le V_D < V_P$
(c) $V_P \le V_D < V_V$ (d) $V_D \le V_V$ [GATE E.C.E. 2006]

294. A structure obtained by lightly doped *n* drift region between the layers of a *pn* junction a PIN diode is obtained. This structure is effective in:
(a) making the diode support large reverse blocking voltages.
(b) making reverse recovery process slow.
(c) making the diode have high on-state voltage drop.
(d) reduction the voltage spike during turn off due to stray inductance.
[U.P.S.C. I.E.S. E.E-II, 2011]

295. Intermediate (I) layer of PIN-diode imparts which one of the following features to a *pn* junction diode ?
(a) High reverse blocking capability.
(b) High forward current rating.
(c) Inverting capability. (d) Poor turn off performance.
[U.P.S.C. I.E.S. E.E.-II, 2007]

296. A PIN diode is frequently used as a
(a) peak clipper. (b) voltage regulator.
(c) harmonic generator.
(d) switching diode for frequencies up to GHz range.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

297. A step-recovery diode
(a) has an extremely short recovery time.
(b) is mainly used as a harmonic generator.
(c) conducts equally well in both directions.
(d) is an ideal rectifier of high frequency signals.

298. Schottky barrier diode can be used
(a) as switching power supplies operating at frequencies of 20 GHz.
(b) in communication receivers and radar units.
(c) in clipping and clamping circuits.
(d) all of the above.

299. Write the incorrect statement. A Schottky diode
(a) has no depletion layer.
(b) has metal semiconductor junctions.
(c) has fast recovery time. (d) is a bipolar device.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

300. For a Schottky-barrier diode which one of the following points is true ?
(a) Speed of operations is low.
(b) I-V characteristics is exactly same as P-N diode.
(c) Current is by means of minority carriers.
(d) There is no P-N junction.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

301. Schottky barrier diode can be used as
(a) low noise amplifier. (b) variable capacitance device.
(c) power supply rectifier. (d) low lever detector.
[U.P.S.C. I.E.S. E.E.-II, 1994]

302. Write the incorrect statement. A varactor diode
(a) has variable capacitance.
(b) utilizes transition capacitance of a junction.
(c) has always a uniform doping profile.
(d) is often used in an automatic frequency control device.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

Answers: **283.** (c), **284.** (c), **285.** (a), **286.** (a), **287.** (d), **288.** (c), **289.** (a), **290.** (c), **291.** (b), **292.** (a), **293.** (c), **294.** (b), **295.** (a), **296.** (d), **297.** (b), **298.** (d), **299.** (d), **300.** (d), **301.** (d), **302.** (c),

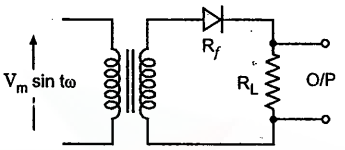
303. A Gunn diode is a negative resistance device, which is used as a source of microwaves. What is the number of p-n junctions ?
(a) 1 (b) 2 (c) 3 (d) 0
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

304. For harmonic generation, the diode that can be used is
(a) Backward diode. (b) P-N junction diode.
(c) Tunnel diode. (d) Varactor diode.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

305. V-I characteristic of a varistor is given by
(a) $i = k e$ (b) $i = k e^2$ (c) $i = k / e^n$ (d) $i = k e^n$
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 1999]

306. Thermistors are essentially semiconductors
(a) well suited to precision measurement of temperature.
(b) widely used in the lower temperature range of –100°C to 300°C.
(c) which behave as resistors with a high negative temperature coefficient of resistance.
(d) all of the above.
[U.P.S.C. I.E.S. E.E.-I, 2005]

307. Given the circuit below where R_f is the diode forward resistance and R_L the load resistance. What is the average rectified current ?



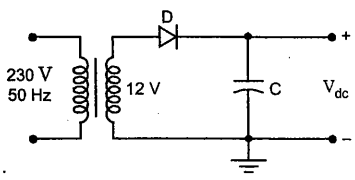
(a) $\frac{V_m}{R_L + R_f}$ (b) $\frac{V_m}{\pi (R_L + R_f)}$
(c) $\frac{2V_m}{\pi}$ (d) $\frac{V_m}{\sqrt{2}(R_L + R_f)}$
[U.P.S.C. I.E.S. E.E.-II, 2006]

308. The average value of a half wave rectified voltage with a peak value of 200 V is
(a) 63.7 V (b) 127.3 V (c) 141 V (d) 200 V
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer 2005-06]

209. A voltage of 200 cos 100 t is applied to a half-wave rectifier with a load resistance of 5 kΩ. The rectifier is represented by an ideal diode with a resistance of 1 kΩ. The maximum value of current, dc component of current and rms value of current will be respectively
(a) 33.33 mA, 10.61 mA, 16.67 mA.
(b) 22.22 mA, 8.61 mA, 12.38 mA.
(c) 28.33 mA, 14.61 mA, 13.33 mA.
(d) 40 mA, 20 mA, 25 mA.
[U.P.S.C. I.E.S. E.E.-II, 1999]

310. For a half-wave rectifier, what is the output dc voltage? (with peak voltage = V_m, dc current = I_{DC} and forward resistance of diode = R_f)
(a) $V_{DC} = \frac{V_m}{\pi} + I_{DC} R_f$ (b) $V_{DC} = \frac{V_m}{\pi}$
(c) $V_{DC} = \frac{V_m}{\pi} - I_{DC} R_f$ (d) $V_{DC} = 0.707 \frac{V_m}{\pi} - I_{DC} R_f$
[U.P.S.C. I.E.S. E.E.-II, 2007]

311. In a rectifier circuit shown below, what should be minimum peak inverse voltage (PIV) rating of a diode ?

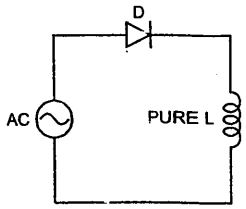


(a) 12 V
(b) $12\sqrt{2}$ V
(c) 24 V (d) $24\sqrt{2}$ V
[U.P.S.C. I.E.S. E.E.-II, 2005]

312. If V_m is peak value of an applied voltage in a half-wave rectifier with a large capacitor across the load, then the peak inverse voltage will be
(a) $V_m/2$ (b) V_m (c) $\sqrt{2}V_m$ (d) $2V_m$
[U.P.S.C. I.E.S. E.E.-II, 2000]

313. A single-phase, 230 V, 50 Hz ac mains fed step down transformer (4 : 1) is supplying power to a half-wave uncontrolled ac-dc converter used for charging a battery (12 V dc) with the series limiting resistor being 19.04 Ω. The charging currents is
(a) 3.43 A (b) 1.65 A (c) 1.22 A (d) 1.0 A
[GATE E.E. 2007]

314. In the circuit of adjacent figure the diode connects the ac source to a pure inductance L.
The diode conducts for
(a) 90° (b) 180°
(c) 270° (d) 360°
[GATE E.E. 2007]



315. For a rectifier circuit, percentage voltage regulation is equal to which one of the following ?
(a) $\frac{V_{\text{no load}} - V_{\text{full load}}}{V_{\text{no load}}} \times 100$ (b) $\frac{V_{\text{no load}} - V_{\text{full load}}}{V_{\text{full load}}} \times 100$
(c) $\frac{V_{\text{no load}} - V_{\text{full load}}}{V_{\text{no load}} + V_{\text{full load}}} \times 100$ (d) $\frac{V_{\text{full load}}}{V_{\text{no load}}} \times 100$
[U.P.S.C. I.E.S. E.E.-II, 2008]

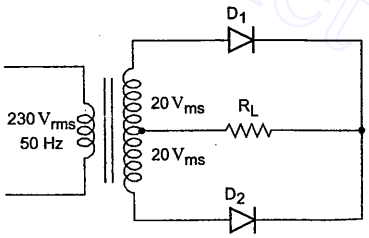
316. A dc power supply has a no-load voltage of 30 V, and a full-load voltage of 25 V at a full-load current of 1 A. Its output resistance and load regulation, respectively, are
(a) 5 Ω and 20% (b) 25 Ω and 20%
(c) 5 Ω and 16.7% (d) 25 Ω and 16.7%
[GATE E.C.E., 1999]

317. Silicon diodes are less suited for low voltage rectifier operation
(a) it cannot withstand high temperature.
(b) its reverse saturation current is low.
(c) its cut-in voltage is high. (d) its breakdown voltage is high.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

318. For constructing a full-wave rectifier
(a) atleast two diodes are needed.
(b) more than two diodes are needed.
(c) atleast four diodes are needed.

319. The dc output polarity from a half-wave rectifier can be reversed by reversing
(a) the diode. (b) the transformer primary.
(c) the transformer secondary. (d) both (b) and (c).

320. For the full-wave rectifier shown in the figure, the rms voltage across each diode will be (assume the diodes and the transformer to be ideal)



(a) 28.28 V.
(b) 20 V.
(c) 17.98 V. (d) 14.12 V.
[U.P.S.C. I.E.S. E.E.-II, 1998]

321. In a full-wave rectifier using two ideal diodes, V_{dc} and V_m are the dc and peak values of the voltage respectively across a resistive load. If PIV is the peak inverse voltage of the diode, then the appropriate relationships for this rectifier are

Answers: **303.** (d), **304.** (d), **305.** (d), **306.** (d), **307.** (b), **308.** (a), **309.** (a), **310.** (c), **311.** (d), **312.** (d), **313.** (d), **314.** (c), **315.** (b), **316.** (b), **317.** (c), **318.** (a), **319.** (a), **320.** (b), **321.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $V_{dc} = \frac{V_m}{\pi}$, $PIV = 2V_m$ (b) $V_{dc} = 2\frac{V_m}{\pi}$, $PIV = 2V_m$

(c) $V_{dc} = 2\frac{V_m}{\pi}$, $PIV = V_m$ (d) $V_{dc} = \frac{V_m}{\pi}$, $PIV = V_m$

[GATE E.C.E. 2004]

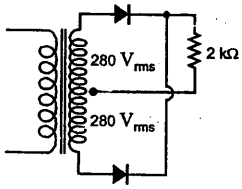
322. Which of the following components are chosen to construct a dc power supply to supply 6 V dc voltage from 230 V ac to operate a tape recorder ?

1. Step down transformer 2. Diodes
3. Resistors and capacitors 4. Three-pin voltage stabilizer

Select the correct answer using the code given below :

(a) 1, 2 and 3 only (b) 1 and 4 only
(c) 3 and 4 only (d) 1, 2, 3 and 4

323. The centre-tap full-wave single phase rectifier circuit uses 2 diodes as shown in the given figure. The rms voltage across each diode is



(a) 790.7 V
(b) 395.3 V
(c) 280 V
(d) 201.3 V

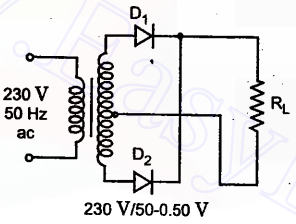
[U.P.S.C. I.E.S. E.E.-II 1995]

324. In a centre tap full wave rectifier, 100 V is the peak voltage between the centre tap and one of the secondary. What is the maximum voltage across the reverse biased diode ?

(a) 200 V (b) 141 V (c) 100 V (d) 86 V

[U.P.S.C. I.E.S. E.E.-II, 2005]

325. The circuit in the figure shows a full wave rectifier. The input voltage is 230 V (rms) single phase ac. The peak inverse voltage across the diodes D_1 and D_2 is



(a) $100\sqrt{2}$ V
(b) 100 V
(c) $50\sqrt{2}$ V
(d) 50 V

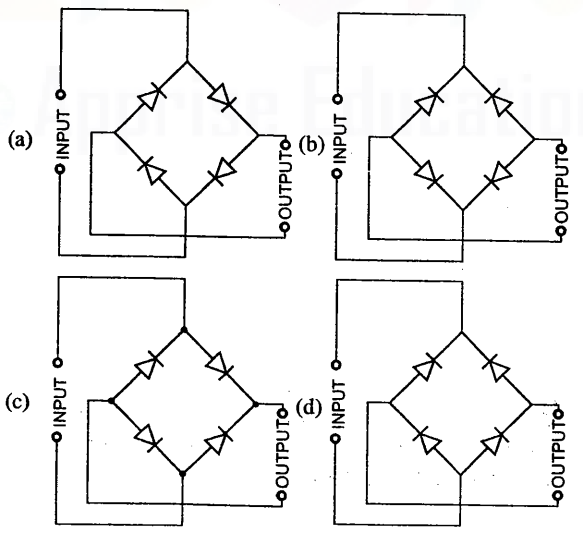
[GATE E.E. 2004]

326. Ripple frequency of the output waveform of a full-wave rectifier when fed with a 50 Hz sine wave is

(a) 25 Hz (b) 50 Hz (c) 100 Hz (d) 200 Hz

[U.P.T.U. Electronics Engineering Even Semester 2009-10]

327. The correct full wave rectifier circuit is



[GATE E.C.E. 2007]

328. Bridge rectifiers are preferred because

(a) they require small transformer.
(b) they have less peak inverse voltage.
(c) they need small transformer and also have less peak inverse voltage.
(d) they have low ripple factor. [U.P.S.C. I.E.S. E.E.-II, 2001]

329. If one the diodes in a full wave bridge rectifier opens, the output is

(a) 0 V.
(b) one-fourth the amplitude of the input voltage.
(c) a half wave rectified voltage.
(d) a 120 Hz voltage.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

330. In a bridge ac to dc converter using P-N diodes, if the input voltage is V sin ωt, what is the peak inverse voltage across any diode ?

(a) V (b) 2 V (c) V/2 (d) $V/\sqrt{2}$

[U.P.S.C. I.E.S. Elec. Engineering II, 2006]

331. The peak inverse voltage rating of a diode in a bridge rectifier is 'X' times larger than that of a full wave rectifier yielding the same dc output voltage, where the value of 'X' is

(a) 0.5 (b) 1.0 (c) $\sqrt{2}$ (d) 2.0

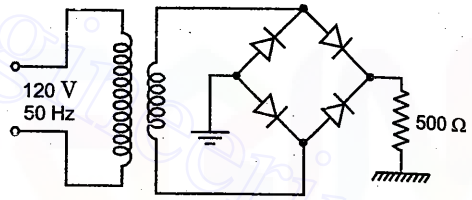
[U.P.S.C. I.E.S. E.E.-II, 2004]

332. The bridge rectifier is preferable to a full wave rectifier with centre tap connections because

(a) it uses four diodes.
(b) its transformer has no centre tap.
(c) it needs much small transformer for the same output.
(d) it has higher safety factor.
(e) both (b) and (c).

[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2007]

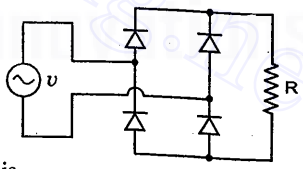
333. In the rectifier circuit shown in the figure, the peak value of the secondary voltage is 68 V. The dc load voltage is



(a) 43.30 V (b) 21.65 V (c) 170 V (d) 27.2 V

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

334. In the single phase diode bridge rectifier shown in the figure, the load resistor is R = 50 Ω. The source voltage is $v = 200 \sin \omega t$, where $\omega = 2\pi \times 50$ radius per second. The power dissipated in the load resistor R is



(a) $\frac{320}{\pi}$ W (b) $\frac{400}{\pi}$ W (c) 400 W (d) 500 W

[GATE E.E. 2002]

335. Ripple frequency of the output waveform of a bridge rectifier when fed with a 50 Hz sine wave is

(a) 100 Hz (b) 25 Hz
(c) 50 Hz (d) none of these.

[A.M.I.E. Sec B. Summer 1995]

336. A single-phase diode bridge rectifier supplies a highly inductive load. The load current can be assumed to be ripple free. The ac supply side current waveform will be

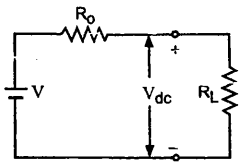
Answers: **322.** (d), **323.** (b), **324.** (a), **325.** (a), **326.** (c), **327.** (c), **328.** (c), **329.** (c), **330.** (a), **331.** (a), **332.** (e), **333.** (a), **334.** (c), **335.** (a), **336.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) sinusoidal. (b) constant dc.
(c) square. (d) triangular. [GATE E.E. 1995]

337. The circuit shown in figure is the Thevenin's equivalent circuit of a centre-tapped full wave rectifier with diode forward resistance $R_f = 100\ \Omega$, transformer secondary coil resistance $R_s = 30\ \Omega$, peak input voltage $V_m = 10$ V.



What are the values of V and R_0, respectively ?
(a) 10 V, 100 Ω. (b) 6.36 V, 130 Ω.
(c) 6.36 V, 115 Ω. (d) 4.54 V, 130 Ω.
[U.P.S.C. I.E.S. E.E.-II, 2006]

338. In a 3-phase half-wave rectifier if the input phase voltage is 200 V, the PIV required for each diode will be
(a) 400 V. (b) 346 V. (c) 370 V. (d) 200 V.
[A.M.I.E. Sec B. Summer 1995]

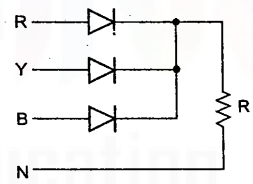
339. In a 3-phase bridge rectifier fed from the star-connected Secondary winding of a transformer, let the voltage to the neutral of the A-phase (phase sequence A-B-C) be $V_m \sin \omega t$. At the instant when the voltage of a phase in maximum, the output voltage at the rectifier terminals will be
(a) $V_m/\sqrt{2}$ (b) V_m. (c) $1.5\ V_m$. (c) $\sqrt{3}\ V_m$.
[U.P.S.C. I.E.S. E.E.-II, 1998]

340. A three phase diode bridge rectifier is fed from a 400 V RMS, 50 Hz, three phase ac source. If the load is purely resistive, then peak instantaneous output voltage is equal to
(a) 400 V. (b) $400\sqrt{2}$ V.
(c) $400\sqrt{\frac{2}{3}}$ V. (d) $\frac{400}{\sqrt{3}}$ V. [GATE E.E. 2005]

341. What is the maximum output voltage of a 3-phase bridge rectifier supplied with line voltage of 440 V ?
(a) 528 V (b) 396 V (c) 594 V (d) 616 V
[U.P.S.C. I.E.S. E.E.-II, 2007]

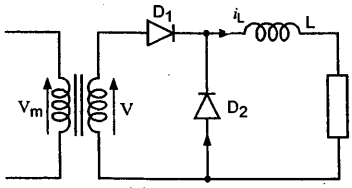
342. In a 3-phase full-wave diode rectifier the peak inverse voltage in terms of average output voltage is
(a) 1.047 (b) 2.094 (c) 1.571 (d) 2.955
[A.M.I.E. Sec. B Power Electronics Winter 2006]

343. The circuit in figure shows a 3-phase half-wave rectifier. The source is a symmetrical, 3-phase four-wire system. The line-to-line voltage of the source is 100 V. The supply frequency is 400 Hz. The ripple frequency at the output is



(a) 400 Hz (b) 800 Hz (c) 1200 Hz (d) 2400 Hz
[GATE E.E. 2004]

344. A single-phase half wave uncontrolled converter circuit is shown in figure. A 2-winding transformer is used at the input for isolation. Assuming the load current to be constant and $v = V_m \sin \omega t$, the current waveform through diode D_2 will be



(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2006]

345. The primary function of a filter is to
(a) minimise ac input variations.
(b) suppress odd harmonics in the rectifier output.
(c) stabilise dc level of the output voltage.
(d) remove ripples from the rectified output.

346. In a rectifier, larger the value of shunt capacitor filter
(a) larger the peak current in the rectifying diode.
(b) smaller the dc voltage across the load.
(c) longer the time that current pulse flows through the diode.
(d) all of the above.

347. Critical value of inductance in choke input filter will be
(a) $R_L/3\omega$ (b) $3\omega R_L$ (c) $3\omega/R_L$ (d) R_L
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 2000]

348. A bleeder resistor in a power supply filter performs which of the following functions ?
1. Protects the rectifier diodes from high voltage transients.
2. Ensures discharge of capacitors when power supply is turned-off.
3. Provides constant output current from the supply when the load is variable.
4. Improves output voltage regulation.

Select the correct answer using the codes given below codes :
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1 and 3. (d) 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1996]

349. The function of bleeder resistor in a power supply is
(a) to ensure a minimum current drain in the circuit.
(b) to increase the output dc voltage.
(c) to increase the output current.
(d) same as that of a load resistor. [U.P.S.C. I.E.S. E.E.-II, 2004]

350. Choke input filter is a
(a) zero detector. (b) average detector.
(c) peak detector. (d) RMS detector.
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2006]

351. If the load resistance of a capacitor filtered full wave rectifier is reduced, the ripple voltage
(a) increases. (b) decreases.
(c) is not affected. (d) has a different frequency.
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer, 2006]

352. If capacitor value increases in a capacitor filter, then the ripple factor
(a) increases. (b) becomes zero.
(c) decreases. (d) none of these.
[G.B.T.U. Elec. Engg. Even Semester 2010-11]

353. A power supply using a full-wave rectifier is to provide 150 mA at 20 V with no more than 1% ripple. The minimum value of smoothening capacitor is
(a) 1100 μF (b) 2200 μF (c) 3300 μF (d) 550 μF
[A.M.I.E. Sec. B. Design of Electronic Devices and Circuits Winter 2005]

354. A low-pass filter with a cut-off frequency of 30 Hz is cascaded with a high-pass filter with a cut-off frequency of 20 Hz. The resultant system of filters will function as
(a) an all-pass filter. (b) an all-stop filter.
(c) a band stop (band-reject) filter.
(d) a band-pass filter. [GATE E.E., 2011]

Answers: **337.** (c), **338.** (b), **339.** (b), **340.** (b), **341.** (c), **342.** (a), **343.** (c), **344.** (d), **345.** (d), **346.** (a), **347.** (a), **348.** (d), **349.** (a), **350.** (b), **351.** (a), **352.** (c), **353.** (c), **354.** (d),

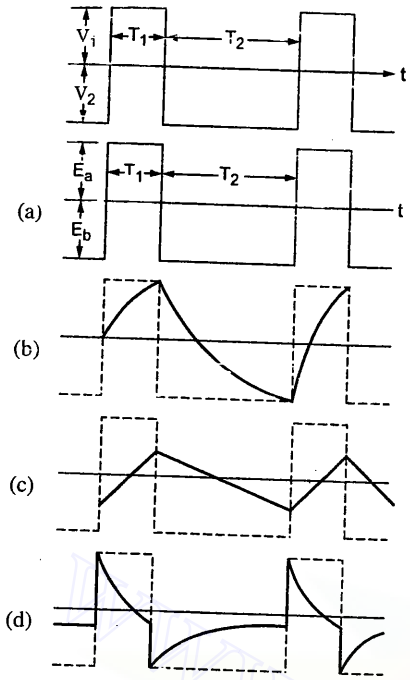
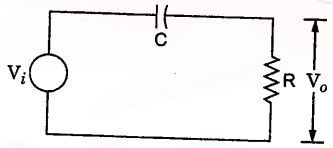
355. For low-pass RC circuit the input waveform is as shown below. What will be the output waveform if the time constant of the circuit is equal to the time period of the input signal ($RC = T_1 + T_2$)?



[U.P.S.C. I.E.S. E.E.-II, 2010]

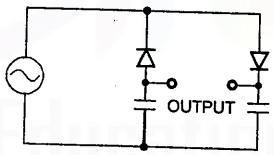
356. In the circuit shown below, under what conditions the output V_o will be proportional to $\frac{dv_i}{dt}$ (with T = time period of input)?



(a) $RC = T$
(b) $RC >> T$
(c) $RC << T$
(d) Both R and C large.

[U.P.S.C. I.E.S. E.E.-II, 2009]

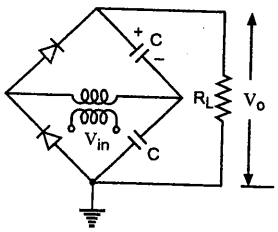
357. The circuit shown in the figure is best described as a



(a) bridge rectifier.
(b) ring modulator.
(c) frequency discriminatory.
(d) voltage doubler.

[GATE E.C.E., 2003]

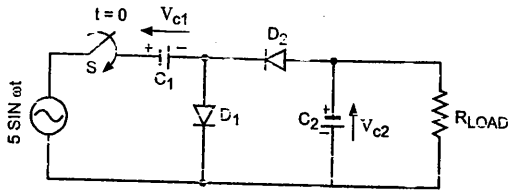
358. The figure shown is a circuit of which one of the following?



(a) Bridge rectifier.
(b) Voltage doubler.
(c) Rectifier with filter.
(d) Comparator.

[U.P.S.C. I.E.S. E.T.E.-II 2008]

359. In the voltage doubler circuit shown in the figure, the switch 'S' is closed at $t = 0$. Assuming diodes D_1 and D_2 to be ideal, load resistance to be infinite and initial capacitor voltages to be zero. The steady state voltage across capacitors C_1 and C_2 will be



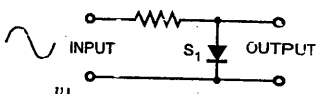
(a) $V_{c1} = 10$ V, $V_{c2} = 5$ V
(b) $V_{c1} = 10$ V, $V_{c2} = -5$ V
(c) $V_{c1} = 5$ V, $V_{c2} = 10$ V
(d) $V_{c1} = 5$ V, $V_{c2} = -10$ V

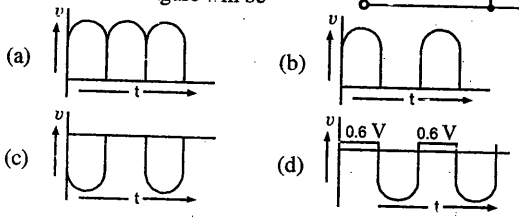
[GATE E.E. 2008]

360. If the input voltage to a voltage trippler has an rms value of 12 V, the dc output voltage is approximately
(a) 36 V (b) 50.9 V (c) 33.9 V (d) 32.4 V

[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer 2005]

361. For the given input, the output waveform across the diode shown in figure will be





[U.P.S.C. I.E.S. E.E.-II, 1997]

362. If an input periodic signal with non-zero dc component is impressed upon a high pass circuit, what will be the dc component in the output waveform ?
(a) zero.
(b) it depends upon the value of capacitor.
(c) it depends upon the value of resistor.
(d) same as the input.

[U.P.S.C. I.E.S. E.E.-II, 2006]

363. For a step input, the output of an integrator is
(a) a pulse. (b) a triangular waveform
(c) a spike. (d) a ramp.

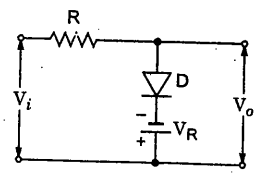
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

364. A rectangular voltage pulse of magnitude V and duration T is applied to a series combination of resistance R and capacitance C. The maximum voltage developed across the capacitor is
(a) $V[1 - e^{-T/RC}]$. (b) VT/RC.
(c) V (d) $Ve^{-T/RC}$

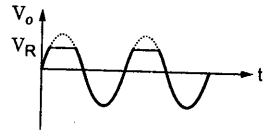
[GATE E.E. 1999]

365. A clipper circuit always
(a) needs a dc source.
(b) clips some part of the input signal.
(c) clips upper portion of input signal.
(d) clips both half cycles of input signal.

366. For a sinusoidal input of peak value V_p, the output waveform V_o will be



(a)



Answers: **355.** (b), **356.** (c), **357.** (d), **358.** (b), **359.** (d), **360.** (a), **361.** (d), **362.** (a), **363.** (d), **364.** (a), **365.** (b), **366.** (d),

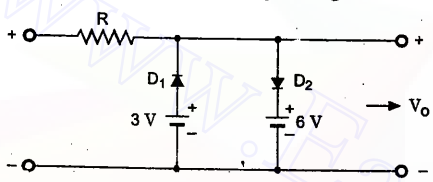
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2010]

367. Without a dc source, a clipper acts like a
(a) clamper. (b) chopper. (c) rectifier. (d) demodulator.

368. The primary function of a clamper circuit is to
(a) introduce a dc level into ac signal.
(b) suppress variations in signal voltage.
(c) raise +ve half cycle of the signal.
(d) lower –ve half cycle of the signal.

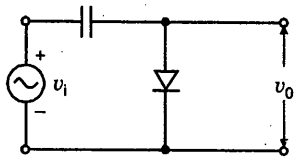
369. A clipping circuit is shown in the given figure.



Its transfer characteristic will be shown in

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 1998]

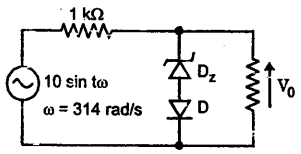
370. Sinusoidal voltage (v_i) of amplitude V_m is applied to the circuit shown in the figure. The dc level of the output waveform is



(a) zero. (b) $+V_m$.
(c) $-V_m$. (d) $-2\,V_m$.

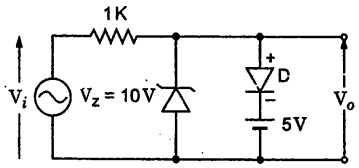
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

371. The cut-in voltage of both zener diode D_Z and diode D shown in the figure is 0.7 V, while breakdown voltage of D_Z is 3.3 V and reverse breakdown voltage of D is 50 V. The other parameters can be assumed to be the same as those of an ideal diode. The values of the peak output voltage (V_o) are



(a) 3.3 V in the positive half cycle and 1.4 V in the negative half cycle.
(b) 4 V in the positive half cycle and 5 V in the negative half cycle.
(c) 3.3 V in both positive and negative half cycles.
(d) 4 V in both positive and negative half cycles. [GATE E.E. 2002]

372. A clipper circuit is shown below.



Assuming forward voltage drops of the diodes to be 0.7 V, the input-output transfer characteristics of the circuit is

(a) 
(b) 
(c) 
(d) 
[GATE E.E., 2011]

Answers: **367.** (c), **368.** (a), **369.** (b), **370.** (c), **371.** (b), **372.** (c),

Downloaded From : www.EasyEngineering.net

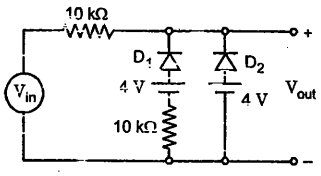
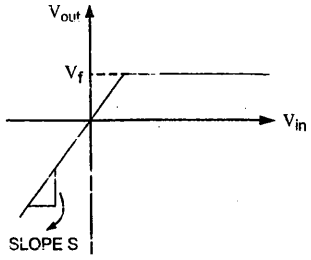
373. A voltage signal 10 sin ωt is applied to the circuit with ideal diodes, as shown in the figure. The maximum and minimum values of the output waveform V_{out} of the circuit are respectively.



(a) +10 V, –10 V
(b) +4 V, –4 V
(c) +7 V, –4 V
(d) +4 V, –7 V [GATE E.E. 2003]

374. The figure shows the transfer characteristics of which one of the following ?



(a) Peak clipper.
(b) Bottom clipper.
(c) Clamper.
(d) Two level clipper.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: 373. (d), **374.** (a).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below.

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): Resistivity of materials is based on deviations from periodicities of the perfect crystal structure.
(R): The mean free path of the electron between two successive collisions of particles is infinite in a perfect crystal with all the nuclei at rest.

2. (A): Energy released when an electron jumps from a higher to a lower level is usually in the form of photons.
(R): Energy released when an electron jumps from a higher to a lower level is absorbed by the nucleus. [U.P.S.C. I.E.S. E.E.-I, 2003]

3. (A): An intrinsic semiconductor has low electrical conductivity. Hence, it is normally not used in the device fabrication without doping.
(R): Its electrical resistivity can be increased by raising its temperature. [U.P.S.C. I.E.S. E.E.-I, 2004]

4. (A): At 0 K, a semiconductor behaves as an insulator.
(R): No free carriers are available in the semiconductor at 0 K. [U.P.S.C. I.E.S. E.E.-II, 2011]

5. (A): Ionic bonds and covalent bonds are higher than metallic bonds.
(R): Ionic and covalent bonds are generally lower than other primary bonds. [U.P.S.C. I.E.S. E.E.-I, 2010]

6. (A): The energy band diagram of a real semiconductor cannot be represented by flat conduction and valence bands.
(R): The presence of energy states in the forbidden energy gap results in carrier trapping, giving rise to finite curvature in the bands. [U.P.S.C. I.E.S. E.E.-II, 2011]

7. (A): The intrinsic carrier concentration of Si at room temperature is more than that of GaAs.
(R): Si is an indirect bandgap semiconductor while GaAs is a direct bandgap semiconductor. [U.P.S.C. I.E.S. E.E.-II, 2002]

8. (A): A *p*-type GaAs sample can be converted to a semi-insulating substrate by doping it with chromium.
(R): Chromium increases the band gap of GaAs. [U.P.S.C. I.E.S. E.E.-I, 2006]

9. (A): The mobility of the conduction electrons is greater than that of holes.
(R): Recombination of electrons and holes obey a logarithmic decay pattern. [U.P.S.C. I.E.S. E.E.-I, 1995]

10. (A): With increasing temperature, the resistivity of an intrinsic semiconductor increases.
(R): With increasing temperature the carrier concentration increases but the mobility of carriers decreases.

11. (A): In intrinsic elemental semiconductors, electrons and holes are created in pairs.
(R): In intrinsic silicon, the electron mobility is 2.81 times greater than the hole mobility. [U.P.S.C. I.E.S. E.E.-I, 1992]

12. (A): Intrinsic germanium does not show N-type behaviour.
(R) : In intrinsic germanium, the number of electrons is less than the number of holes. [U.P.S.C. I.E.S. E.E.-I, 1997]

13. (A): Addition of boron to intrinsic or pure silicon in the proportion of one boron atom to 10^{15} silicon atoms increases the conductivity of pure silicon by a factor of 10^3 at room temperature.
(R): Addition of impurities to intrinsic semiconductors increases carrier mobility. [U.P.S.C. I.E.S. E.E.-I, 1998]

14. (A): A doped semiconductor will behave as a perfect insulator at zero Kelvin but its electrical conductivity will rise if the temperature is slowly increased above zero Kelvin.
(R): The rise in electrical conductivity is mainly due to increased ionization as the temperature is raised above zero Kelvin. [U.P.S.C. I.E.S. E.E.-I, 2002]

15. (A): An *n*-type semiconductor behaves as an intrinsic semiconductor at very high temperatures.
(R): The breaking of the covalent bonds becomes a significant phenomenon at high temperatures. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

16. (A): A heavily doped semiconductor can exhibit positive temperature coefficient of resistance.
(R): The carrier mobility decreases with increase of temperature. [U.P.S.C. I.E.S. E.T.E-I, 2006]

Answers: 1. (c), **2.** (c), **3.** (c), **4.** (a), **5.** (a), **6.** (a), **7.** (b), **8.** (c), **9.** (c), **10.** (d), **11.** (b), **12.** (c), **13.** (c), **14.** (d), **15.** (a), **16.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

17. (A): In a P-type semiconductor, with increase in the level of doping at a fixed temperature, the hole concentration increases but the electron concentration falls.
(R): Law of mass action holds good in case of semiconductors.
[U.P.S.C. I.E.S. E.E.-II, 2011]

18. (A): Intrinsic semiconductors show negative Hall coefficient.
(R): The number of electrons and holes are equal in an intrinsic semiconductor. [U.P.S.C. I.E.S. E.E.-I, 2010]

19. (A): In a semiconductor, Hall field per unit electric current density per unit magnetic flux may be zero.
(R): The Hall coefficient is proportional to $(p\mu_h^2 - n\mu_e^2)$
[U.P.S.C. I.E.S. E.E.-I, 2003]

20. (A): In some semiconductors, the Hall coefficient is positive.
(R): In these semiconductors, the mobility of holes is greater than that of electrons. [U.P.S.C. I.E.S. E.E.-I, 1997]

21. (A): The reverse leakage of silicon junction can be less than that of germanium junction at the same temperature.
(R): More energy is required to ionise silicon atoms when compared to germanium atoms. [U.P.S.C. I.E.S. E.E.-I, 1993]

22. (A): In avalanche breakdown, the reverse current sharply increases with voltage due to field emission.
(R): The field emission requires highly doped p and n regions.
[U.P.S.C. I.E.S. E.E.-II, 2001]

23. (A): If a pn junction has breakdown voltage of less than 6 V, it is due to zener breakdown mechanism.
(R): Heavily doped pn junction have less breakdown voltages.
[U.P.S.C. I.E.S. E.E.-II, 2007]

24. (A): Silicon is preferred for manufacturing zener diodes.
(R): Reverse saturation current is less in case of silicon.

25. (A): A tunnel diode can be used as an oscillator.
(R): Voltage controlled negative resistance is exhibited by a tunnel diode. [U.P.S.C. I.E.S. E.E.-II, 2002]

26. (A): In the work function model of Schottky barrier diode contacts to N-type semiconductor, the metal work function will be higher than the semiconductor work function.
(R): To equalize the Fermi levels on the ferro sides of the contact, electrons from semiconductor surface move to metal side forming a space charge region at the semiconductor surface.
[U.P.S.C. I.E.S. E.E.-II, 2011]

27. (A): The semiconductor material used in making an optical source should be a direct bandgap material.
(R): Carrier recombination time is shorter in a direct bandgap semiconductor. [U.P.S.C. I.E.S. E.E.-I, 2009]

28. (A): In a full-wave rectifier, it is absolutely necessary to use identical diodes having identical characteristics.
(R): In practice, it is never possible to have two diodes having identical characteristics due to technological limitations.
[U.P.S.C. I.E.S. E.E.-II, 2011]

29. (A): Bridge arrangement is preferred over centre-tapped transformer arrangement for full-wave rectification.
(R): The bridge arrangement improves the filtering action.

30. (A): Clipping circuit controls the shape of the waveform by clipping or removing a portion of the applied wave.
(R): It needs minimum three components namely an ordinary diode, a resistor and a capacitor.

31. (A): A clamping network produces an output signal which is a replica of the input signal.
(R): A clamping circuit removes a part of the input signal.
[U.P.S.C. I.E.S. E.E.-II, 2006]

32. (A): A high value of resistor is connected across the diode in a clamper circuit for better performance.
(R): If this resistor is not present, the circuit will respond to sudden decrease in the magnitude of the input pulse train, but the response to sudden increase in the amplitude will cause improper response.

Answers: **17.** (a), **18.** (b), **19.** (c), **20.** (c), **21.** (a), **22.** (d), **23.** (a), **24.** (b), **25.** (a), **26.** (a), **27.** (b), **28.** (b), **29.** (c), **30.** (c), **31.** (c), **32.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Band gap in eV)		List 2 (Material)
A.	0.67	1. GaAs.
B.	1.1.	2. InAs.
C.	1.4.	3. Si.
D.	2.4.	4. Germanium.
		5. Cadmium sulphide.

Codes:	A	B	C	D

List 1 (P-N Junction Devices)		**List 2 (Application)**	
A.	Zener Diode.	1.	First switching circuits.
B.	PIN Diode.	2.	Microwave switches.
C.	Tunnel Diode.	3.	Local oscillators for radars.
D.	Varactor Diode.	4.	Frequency converters.
		5.	Voltage regulators.

Codes :	A	B	C	D
(a)	5	2	1	4
(b)	1	2	5	4
(c)	5	3	1	2
(d)	1	3	5	2

[U.P.S.C. I.E.S. E.E.-I, 2001]

14.

List 1 (Diode)		**List 2 (Application)**	
A.	Gunn diode.	1.	Mixers.
B.	Zener diode.	2.	Microwave oscillators.
C.	Varactor diode.	3.	Frequency modulation.
D.	Schottky diode.	4.	Voltage comparison.

Codes :	A	B	C	D
(a)	2	4	3	1
(b)	3	1	2	4
(c)	2	1	3	4
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

15.

List 1 (Metal-semiconductor Band Diagram Under Equilibrium)		**List 2 (Type of Contact)**	
A.		1.	Rectifier to *n*-type
B.		2.	Ohmic to *n*-type
C.		3.	Rectifier to *p*-type
D.		4.	Ohmic to *p*-type

Codes :	A	B	C	D
(a)	1	4	2	3
(b)	1	4	3	2
(c)	4	1	3	2
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2006]

Answers: **12.** (c), **13.** (a), **14.** (a), **15.** (a).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. An electron device means the device in which the conduction of electrons takes place through vacuum.
2. Electronics has gained much importance because of its numerous applications in various fields but it has no application in the field of power generation on large scale.
3. Wire wound resistors are also sometimes called precision resistors.
4. Few turn air-core coils are used in high frequency systems.
5. An electron volt is the energy required to move an electron between two points which have a pd of one volt.
6. A definite amount of energy is required to be spent in order to remove an electron from its orbit.
7. At ordinary temperature, the energy of free electrons in the metal is more than the work function of the metal.
8. Metals with lower work function will emit electrons at lower temperatures.
9. The amount of energy required for the escape of electrons varies with different materials.
10. The cathode of a thermionic tube is always heated by passing an electric current.
11. Most of the vacuum tubes use oxide-coated cathode because they can be heated to sufficiently high temperature (say, 3000 K) without affecting its physical properties.

Answers: **1.** (F), **2.** (T), **3.** (F), **4.** (T), **5.** (T), **6.** (T), **7.** (F), **8.** (T), **9.** (T), **10.** (T), **11.** (F),

Downloaded From : www.EasyEngineering.net

12. In photoelectric emission the velocity of the emitted electrons increases if the intensity of the incident radiation is increased.
13. The space charge around the cathode in a vacuum tube is negative.
14. An increase in the – ve potential on a control grid of a triode tube increases its plate current.
15. The control grid is nearer to cathode than plate.
16. Out of three inter-electrode capacitances in a triode, the most objectionable is the capacitance between the plate and the control grid.
17. The amplification factor of a typical vacuum triode is of the order of 2,000.
18. The cut-off grid voltage in a vacuum triode depends upon cathode temperature.
19. A triode is said to be cut off when no current flows through its plate circuit, even if the plate has + ve potential on it.
20. The potential of a screen grid in a tetrode is somewhat lower than plate potential.
21. The suppressor grid is provided in a pentode to eliminate the undesirable effects of secondary emission.
22. A gas diode is more efficient than a vaccum diode.
23. A thyratron is widely used as an amplifier.
24. When a thyratron fires, the control grid loses all control over the plate current.
25. A thyratron cannot be used as a switching device.
26. To stop conduction in a thyratron the voltage is to be reduced to zero in the plate circuit.
27. In a conductor the valence band and conduction band do not overlap.
28. The electrons in valence band are known as free electrons.
29. Electrons in valence band have smaller energy than those in conduction band.
30. There is no forbidden energy gap between any two permitted energy levels within an atom.
31. Electrons in an atom can have certain permitted energies only.
32. The greater the energy of an electron, the larger is its orbit.
33. The nearer an electron is to the nucleus, the greater is its velocity.
34. When an electron jumps from lower orbit to a higher orbit, it emits energy.
35. The missing valence electron is called a hole.
36. Covalent bonds are the strongest of all the bonds formed in the solid.
37. Free electrons move in conduction band whereas holes move in valence band.
38. Holes are as mobile as electrons.
39. If given sufficient energy, holes can be lifted from valence band to conduction band.
40. A semiconductor has negative temperature coefficient of resistance.
41. The forces holding the germanium atoms together in a crystal are called the covalent bonds.
42. Germanium and silicon have different characteristics.
43. The number of electrons in the outer most shell of an atom cannot exceed 8.
44. The electrons in the inner orbits are called the bound electrons.
45. The most frequently used semiconductors in electronics and transistor manufacture are silicon and germanium.
46. Silicon has atomic number 14 and has half filled outermost orbit.
47. An intrinsic semiconductor is one in which number of holes produced is equal to the number of conduction electrons.
48. An intrinsic semiconductor at the absolute zero temperature behaves like an insulator.
49. The resistivity of a semiconductor depends upon the atomic structure of the semiconductor.
50. Resistivity of a semiconductor depends upon the shape and length of semiconductor.
51. Mass action law is given by : $n = pn_1^2$. [A.M.I.E. Summer 1993]
52. The product of hole concentration and electron concentration in a semiconductor is constant.
53. When an intrinsic semiconductor is doped with a P-type impurity, each impurity atom will acquire a negative charge.
54. When an intrinsic semiconductor is doped with a trivalent impurity we get P-type semiconductor.
55. Acceptor type impurities are used to make N-type semiconductors.
56. Donor type impurities have three valence electrons.
57. The addition of pentavalent impurity to an intrinsic semiconductor creates electron-hole pairs.
58. The addition of trivalent impurity to an intrinsic semiconductor makes it N-type semiconductor.
59. A pure germanium crystal is an intrinsic semiconductor and a doped conductor is an extrinsic semiconductor.
60. In P-type semiconductors the majority carriers are electrons and minority carriers are holes.
61. A P-type as well as N-type semiconductor is electrically neutral.
62. In a P-type semiconductor the current conduction is by holes.
63. When an intrinsic semiconductor is doped with an acceptor type impurity electrons are generated and the material becomes P-type semiconductor.
64. In an N-type semiconductor, the free electron concentration approximately equals the density of donor atoms.
65. Fermi level is slightly lowered by adding the donor impurity.
66. Conduction electrons move almost twice as fast as the holes.
67. Fermi level is the maximum energy that any electron can have at room temperature.
68. In an intrinsic semiconductor, Fermi level lies midway between the conduction and valence bands.
69. Fermi level is same for all metals.
70. The diffusion current is proportional to concentration gradient of charge carriers.
71. Intrinsic concentration of charge carriers in a semiconductor varies as T^{-2}.
72. The ratio of diffusion constant for electrons D_e to the mobility of electrons μ_e is proportional to T.
73. Hall's effect can be used to measure magnetic field intensity.
74. Hall's effect can be used to measure electric field intensity.
75. When there is no bias, the P-side of a P-N junction acquires a positive charge.
76. A P-N junction becomes forward biased if the N-side is connected to the negative terminal of battery and the P-side is connected to the positive terminal.

Answers: **12.** (F), **13.** (T), **14.** (F), **15.** (T), **16.** (T), **17.** (F), **18.** (F), **19.** (T), **20.** (T), **21.** (T), **22.** (T), **23.** (F), **24.** (T), **25.** (F), **26.** (T), **27.** (F), **28.** (F), **29.** (T), **30.** (F), **31.** (T), **32.** (T), **33.** (T), **34.** (F), **35.** (T), **36.** (F), **37.** (T), **38.** (F), **39.** (F), **40.** (T), **41.** (T), **42.** (T), **43.** (T), **44.** (T), **45.** (T), **46.** (T), **47.** (T), **48.** (T), **49.** (T), **50.** (F), **51.** (F), **52.** (T), **53.** (T), **54.** (T), **55.** (F), **56.** (F), **57.** (F), **58.** (F), **59.** (T), **60.** (F), **61.** (T), **62.** (T), **63.** (F), **64.** (T), **65.** (F), **66.** (T), **67.** (F), **68.** (T), **69.** (F), **70.** (T), **71.** (F), **72.** (T), **73.** (T), **74.** (F), **75.** (F), **76.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

77. The potential barrier in a P-N junction increases with reverse bias and reduces with forward bias.
78. If the reverse-bias voltage of a P-N junction is increased within limits, the reverse saturation current remains unaffected.
79. The depletion region widens as a result of forward bias on a P-N junction.
80. Electrons lose energy as they move from the N-type material to the P-type material.
81. Reverse current is due to movement of majority carriers across the junction.
82. In a forward-biased P-N junction the injected hole current in N-region is proportional to the total charge Q of the injected minority carrier holes.
83. If a P-N junction is heavily doped, breakdown voltage will reduce.
84. Potential barrier decreases at high temperature.
85. Silicon devices are preferred at high temperature operations in comparison to germanium because reverse saturation current is less in case of silicon.
86. Zener diode operates in the reverse biased region. **[A.M.I.E. Summer 1993]**
87. In a zener diode, *p* and *n* materials are heavily doped. **[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]**
88. A zener diode has characteristics similar to that of an ideal current source.
89. A zener diode has sharp breakdown voltage at low reverse voltage. **[U.P. Technical Univ. 2008-09]**
90. A small P-N junction having a very high concentration of impurities in both the P and N sections is called a tunnel diode.
91. The tunnel diode is widely used as a rectifier.
92. The tunnel diode is a high conductivity negative resistance two-terminal device.
93. Schottky diode is a unipolar device because of absence of minority carriers in reverse direction.
94. Point contact diode is composed of three sections a high resistivity intrinsic layer sandwiched between P and N regions.
95. A varactor diode is optimised for its variable capacitance. **[U.P. Technical Univ. 2008-09]**
96. In a full-wave rectifier, the current in each of the diode flows for the whole input signal cycle.
97. A full-wave rectifier cannot be constructed without using a centre-tapped transformer.
98. The maximum reverse voltage, which can be applied before the breakdown point is reached, is called the peak inverse voltage.
99. The ratio of direct or average value of the output to the effective value of ac component present in the rectifier output is called the ripple factor.
100. The filtering action of an inductor depends upon its property of opposing the variation in voltage applied across its terminals.
101. The filtering action of a capacitor depends upon its property of opposing any change in the current flowing through it.
102. Ready availability of low-cost silicon diodes has made bridge circuit arrangement more economical than centre tapped transformer arrangement despite its requirement of four diodes.
103. Bleeder resistor is placed across the filter circuit in order to keep the supply always ON.
104. For clipping circuits at least three components an ideal diode, a resistor and a capacitor are required.
105. The positive clamping circuit shifts the original signal in vertical downward direction.

Answers: **77.** (T), **78.** (T), **79.** (F), **80.** (T), **81.** (F), **82.** (T), **83.** (T), **84.** (T), **85.** (T), **86.** (T), **87.** (T), **88.** (F), **89.** (T), **90.** (T), **91.** (F), **92.** (T), **93.** (T), **94.** (F), **95.** (T), **96.** (F), **97.** (F), **98.** (T), **99.** (F), **100.** (F), **101.** (F), **102.** (T), **103.** (T), **104.** (F), **105.** (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. _____ type resistors are also sometimes called the precision resistors.
2. A choke wound with many turns of fine wire on an iron core made of laminated sheet is used as a _____ choke.
3. Rating on a capacitor are given as 25 F, 12 V. Also a plus sign is written near one of its terminals. The capacitor is _____ type.
4. In a radio receiver we can tune any desired stations by rotating the tuning control. By doing so we vary _____ .
5. A 20 μF capacitor is required for fabricating 500 V electronic circuit. The suitable capacitor will be _____ capacitor.
6. A negatively charged particle present in an atom is _____.
7. The mass of an electron is _____ kg.
8. For determining the number of electrons that can be accommodated in any level shell is given by the formula _____ .
9. Electron volt is the unit of _____ .
10. An electron volt (eV) is equal to _____ .
11. The negative charge on each electron is _____ C.
12. The ratio of e/m for an electron is equal to _____ C/kg.
13. When a normal atom loses an electron, it becomes a _____ ion.
14. The maximum number of electrons that the valence shell of an atom can have is _____.
15. The phenomenon of escaping electrons from the metal surface into the surrounding is called the _____.
16. The process of electron emission from the metal surface into the surrounding space by heating the material is known as _____ emission.
17. The most commonly used type of electron emission in electron tube is _____ emission.
18. _____ temperatures are necessary to cause thermionic emission.
19. The force, which prevents the electrons from leaving the surface is called the _____.
20. The difference between the energy required to move an electron of a metal to an infinitely long distance and the maximum energy an electron can have at 0° absolute, is called the _____ of the metal.
21. The work function of oxide coated surface is _____ eV.
22. The space charge formed around the cathode of a vacuum tube is _____.
23. The internal resistance of a vacuum tube is because of _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

24. A vacuum tube conducts only when the plate is _____ w.r.t. cathode.
25. In a triode the plate current increases when the control grid voltage is made _____ negative. [A.M.I.E. Summer 1994]
26. In a triode, the value of grid voltage, which makes the plate current zero is called the _____ grid voltage.
27. Grid current in a triode is of the order of _____ A
28. The ratio of change in plate voltage to the change in grid voltage so that they may neutralize each other effects on the plate current is called the _____.
29. Typically, the amplification factor of a triode is of the order of _____.
30. The negative resistance characteristic of tetrode is due to _____.
31. The grid to plate capacitance, which usually run 2 to 5 pF in a triode, is thereby reduced to a value as low as _____ pF in a tetrode.
32. The inter-electrode capacitance between the plate and control grid of a pentode is reduced to _____ pF.
33. The grid-to-plate capacitance is _____ in a pentode tube.
34. In a pentode tube, the suppressor grid is provided to suppress _____.
35. The screen and suppressor grids serve to change the _____ of the tube.
36. In a pentode tube, electrons emitted from the plate due to secondary emission are not allowed to reach the screen grid because of _____ potential of suppressor grid w.r.t. plate.
37. The screen grid in a pentode is maintained at a fixed _____ potential while the suppressor grid is maintained at _____ potential w.r.t. plate.
38. The best vacuum tube for amplification is _____.
39. Typically the amplification factor of a pentode tube is approximately _____.
40. A gas tube can conduct _____ current than the equivalent vacuum tube for the same plate voltage.
41. The ionisation voltage in a gas diode depends upon_____.
42. Among the various gas tubes only the _____ and _____ are commonly used.
43. Thyratron tube contains_____ gas. [A.M.I.E. Winter 1993]
44. For stable characteristics and fast operation the inert gas usually used in a thyratron is _____
45. To stop conduction is a thyratron the voltage is to be reduced to zero in _____ circuit.
46. When a thyratron fires, the control grid loses all control over _____ current.
47. Thyratron can be used as_____. [A.M.I.E. Winter 1994]
48. The valence electrons are comparatively_____ bound to the rest of atom.
49. The covalent bond is formed by _____ of electrons between atoms.
50. Silicon has atomic number 14, its outer most orbit is _____ filled.
51. In a conductor the valence band and conduction band are _____.
52. In a semiconductor, the energy gap between valence and conduction band is _____ than 5 V.
53. Electron distribution of a silicon atom is _____.
54. The conduction of electricity, in semiconductors, occurs due to movement of _____.
55. The mobility of an electron in a metal is expressed as _____.
56. An electron rising through a potential of 250 V will acquire an energy of _____ eV.
57. There is a _____ energy gap between any two permitted energy levels within an atom.
58. The electrons in conduction band are known as _____ electrons.
59. Materials having free electrons in conduction band are said to be _____.
60. When the outermost orbit of an atom has exactly 4 electrons, the matter is usually an/a _____.
61. A silicon contains _____ valence electrons.
62. A germanium contains _____ valence electrons.
63. A semiconductor has _____ temperature coefficient of resistance.
64. Semiconductors have _____ bonds.
65. Free electrons move in _____ band whereas holes move in _____ band.
66. A semiconductor has resistivity _____ than that of a conductor and _____ than that of an insulator.
67. Materials having no free electron in the conduction band are said to be _____.
68. Number of free electrons in intrinsic silicon is of the order of _____ /mm^3. ($10^5/10^7/10^{10}/10^{12}$)
69. Number of free electrons in intrinsic germanium at room temperature is _____ /mm^3. (2.5×10^{20}, 2.5×10^4, 2.5×10^7, 2.5×10^{10})
70. The electrons in the _____ shell of an atom determine its electrical and chemical characteristics.
71. Higher the electric field intensity _____ will be the mobility.
72. For N-type semiconductor the doping material is _____.
73. Diffused impurities with five valence electrons are called _____ impurities. [U.P. Technical Univ. 2008-09]
74. In an N-type material the electron is called the _____ and the hole is _____. [U.P. Technical Univ. 2008-09]
75. P-type semiconductor has holes in _____and the free electrons in _____.
76. In the N-type semiconducting material the impurities cause the presence of excess of _____. [A.M.I.E. Winter 1996]
77. An element used in a semiconductor and having 3 valence electrons is a/an _____ element.
78. N-type semiconductor has holes in _____ and the free electrons in _____.
79. Acceptor type impurities are used to make-_____ type semiconductor.
80. In an N-type semiconductor the current conduction is by _____.
81. In P-type semiconductors conduction at room temperature is by _____.
82. If a small amount of antimony is added to silicon there will be _____ free electrons than holes in the semiconductor.
83. The merging of a free electron and a hole is called _____.
84. The generation of free electron-hole pairs is referred to as _____.
85. Fermi level is slightly raised by adding the _____ impurity.
86. The intrinsic concentration of carriers is a function of _____.
87. The Fermi level lies midway between the conduction and valence bands in _____ semiconductors.
88. Fermi level represents the energy level with probability of its occupation of _____ %.
89. When a specimen (metal or semiconductor) carrying a current is placed in a transverse magnetic field, an electric field or a voltage is developed at right angles to both the current and the magnetic field. This phenomenon is called the _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

90. If the amount of impurity, either donor type or acceptor type added to the intrinsic Ge semiconductor is controlled to 1 part in one million, the conductivity of the sample increases by a factor _____.

91. The law of mass action states that $n_p \cdot p_p = p_n n_n =$ _____.

[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

92. The diffusion constant D and mobility μ are related by $\frac{D_p}{\mu_p} = \frac{D_n}{\mu_n} =$ _____.

[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

93. The forward resistance of a semiconductor is _____ than its reverse resistance.

94. The resistance of a reverse biased P-N junction is _____.

95. The depletion or space region in a junction diode contains charges that are fixed donor and acceptor _____. [A.M.I.E. Summer 1995]

96. When the P-N junction is forward biased, width of its depletion layer is _____. [A.M.I.E. Summer 1996]

97. A semiconductor _____ current to flow when it is forward biased. [A.M.I.E. Winter 1995]

98. When P-N junction is biased in the forward direction _____ in each region are injected into the other region.

[U.P. Technical Univ. Second Semester 2009-10]

99. If the applied voltage pushes the conventional current in the direction of arrow, then the diode is _____ biased.

100. Reverse current in a P-N junction is due to movement of _____ carriers across the junction.

101. In a semiconductor the forbidden energy gap is of the order of _____ eV. [A.M.I.E. Summer 1994]

102. Reverse resistance of a diode is of the order of _____ MΩ. [A.M.I.E. Winter 1994]

103. The minimum forward biased voltage required for the conduction of P-N junction is called _____ voltage. [A.M.I.E. Winter 1993]

104. The knee voltage for silicon P-N junction is _____ volt.

105. The forward resistance of crystal is much _____ than its reverse resistance.

106. The maximum permissible voltage occurring across the diode in the reverse direction is known as _____ voltage.

[A.M.I.E. Winter 1997]

107. At room temperature of 25°C, the barrier potential for Si is 0.7 V. Its value at 125°C will be _____ V.

108. Reverse saturation current in a germanium diode practically doubles for every _____ °C rise in temperature.

109. Reverse saturation current in germanium diode is _____ than that in silicon diode.

110. Under normal operating voltage, the reverse saturation current in a silicon diode is of the order of _____ ampere.

111. In the reverse bias region the reverse saturation current of silicon diode doubles for every _____ rise in temperature.

[U.P. Technical Univ. 2008-09]

112. Reverse resistance of a diode is of the order of _____ ohms.

113. The resistance of a reverse-biased ideal diode is _____.

114. Diodes that have breakdown voltage around 5 V have a _____ temperature coefficient.

115. In a forward region of its characteristic a diode appears as _____ switch.

116. A zener diode operates under _____ bias for the application as voltage regulator. [A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]

117. The doping in a zener diode as compared with an ordinary general purpose junction diode is _____. [A.M.I.E. Summer 1996]

118. Zener diodes have _____ temperature coefficient.

119. The voltage across the zener diode after breakdown, is termed as the _____ voltage. [A.M.I.E. Winter 1997]

120. A zener diode is most commonly used in rectifiers/voltage stabilizers.

121. A zener voltage regulator is used for _____ heavy load current/ small load current/medium load current.

122. A tunnel diode is a _____ doped P-N junction.

[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

123. _____ diode is a high conductivity two terminal P-N junction heavily doped, about 1000 times higher than an ordinary diode.

124. In a _____ diode there is a high resistivity intrinsic layer sandwiched between P and N regions.

126. A full-wave rectifier needs at least _____ diodes.

127. In a centre-tap full wave-rectifier, V_m is the peak voltage between the centre tap and one end of the secondary. The PIV of the non-conducting diode is _____ when the filter is not connected.

[U.P. Technical Univ. Second Semester 2009-10]

128. The maximum efficiency of an half wave rectifier is _____ %.

129. The maximum efficiency of a full-wave rectifier is _____ %.

130. If the output voltage of a bridge rectifier is 100 V, the PIV of the diode will be _____ V.

131. In a full-wave rectifier, the current in each of the diode flows for _____ cycle of the input signal.

132. From the point of view of maximum dc power delivered the maximum efficiencyof a full-wave rectifier comes to be _____ percent.

133. A 3-phase ac-to-ac diode bridge rectifier is supplied from a 3-phase, 440-V source. The rectifier supplies a purely resistive load. The average dc voltage across the load will be _____ V.

[GATE E.E. 1995]

134. The PIV of each diode in a bridge rectifier is _____ that of a centre-tap circuit which gives the same output.

[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]

135. The clipper circuits are also called _____.

[G.B. Technical Univ. Even Semester 2010-11]

13 CHAPTER

Analog Electronics

Short Answer Type Questions With Answers

Q. 1. What is the significance of arrow head in the transistor symbol ?

Ans. Arrowhead is always marked on the emitter. The direction indicates the conventional direction of current flow (from emitter-to-base in case of P-N-P transistor and from base-to-emitter in case of N-P-N transistor). Generally, no arrow head is marked for collector since its reverse leakage current is always opposite to the direction of emitter current.

Q. 2. Discuss the need for biasing the transistor.

[A.M.I.E. Sec B. Winter 2005]

Ans. For normal operation, base-emitter junction should be forward-biased and the collector-base junction reverse-biased. The amount of bias required is significant for establishment of the operating or Q-point which is dictated by the mode of operation desired.

In case the transistor is not biased properly, it would (*i*) work inefficiently, (*ii*) produce distortion in the output signal and (*iii*) with the change in transistor parameters or temperature rise, the operating point may shift and the amplifier output will be unstable.

Q. 3. Which of the transistor currents is always the largest ? Which is always the smallest ? Which two currents are relatively close in magnitude ? **[U.P. Technical Univ. 2006-07]**

Ans. The emitter current I_E is always the largest one. The base current I_B is always the smallest. The collector current I_C and emitter current I_E are relatively close in magnitude *i.e.* $I_C \simeq I_E$.

Q. 4. Why silicon type transistors are more often used than germanium type ?

Ans. Because silicon transistor has smaller cut-off current I_{CBO}, small variations in I_{CBO} due to variations in temperature and high operating temperature as compared to those in case of germanium type.

Q. 5. Why collector is made larger than emitter and base ?

Ans. Collector is made physically larger than emitter and base because collector is to dissipate much power.

Q. 6. Why the width of the base region of a transistor is kept very small compared to other regions ?

Ans. Base region of a transistor is kept very small and very lightly doped so as to pass most of the injected charge carriers to the collector.

Q. 7. Why emitter is always forward biased ?

Ans. Emitter is always forward biased w.r.t. base so as to supply majority charge carriers to the base.

Q. 8. Why collector is always reverse-biased w.r.t. base ?

Ans. Collector is always reverse-biased w.r.t. base so as to remove the charge carriers away from the base-collector junction.

Q. 9. Can a transistor be obtained by connecting two semiconductor diodes back-to-back ?

Ans. No. Because in case of two discrete back-to-back connected diodes there are four doped regions instead of three and there is nothing that resembles a thin base region between an emitter and a collector.

Q. 10. Why is there a maximum limit of collector supply voltage for a transistor ?

Ans. Although collector current is practically independent of collector supply voltage over the transistor operating range, but if V_{CB} is increased beyond a certain value collector current I_C eventually increases rapidly and possibly destroys the device.

Q. 11. Explain why $I_{CEO} >> I_{CBO}$? **[U.P.T.U. 2003-04]**

Ans. The collector cut-off current denoted by I_{CEO} is much larger than I_{CBO}. I_{CEO} is given as

$$I_{CEO} = \frac{1}{1-\alpha} I_{CBO}$$

Because α is nearly equal to unity (slightly less than unity), $I_{CEO} >> I_{CBO}$

Q. 12. Why CE configuration is most popular in amplifier circuits ?

Ans. CE configuration is mainly used because its current, voltage and power gains are quite high and the ratio of output impedance and input impedance are quite moderate.

Downloaded From : www.EasyEngineering.net

Q. 13. What are the main purposes for which a CC amplifier may be used. [U.P.S.C. I.E.S. Electrical Engineering II 1997]

Ans. Because of its high input impedance and low output impedance, the common collector circuit finds wide application as a buffer amplifier between a high impedance source and low impedance load. Its other name is emitter follower.

Q. 14. What is Early effect ? [Pb. Technical Univ. 2004-05]

Ans. The modulation of the effective base width by the collector voltage is known as Early effect. An increase in collector voltage increases the space charge width at the output junction diode and thus the effective base width W_b is reduced.

Q. 15. What is punch through effect ?

Ans. When on increasing collector voltage effective base width is reduced to zero the emitter barrier becomes smaller than normal value $V_0 - |V_{EB}|$ because the collector voltage has reached through the base region. This lowering of emitter-junction voltage causes an excessively large emitter current, thus placing an upper limit on the magnitude of collector voltage. This phenomenon is known as punch through.

Q. 16. What do you understand by collector reverse saturation ? In which configuration does it have a greater value ?

Ans. When input current (I_E in case of CB configuration and I_B in case of CE configuration) is zero, collector current I_C is not zero although it is very small. In fact this is the reverse leakage current or collector reverse saturation current (I_{CBO} or simply I_{CO} in CB configuration and I_{CEO} in CE configuration). In case of CE configuration it is much more than that in case of CB configuration.

Q. 17. What do you mean by operating point ? [A.M.I.E. Sec B. Summer 2006]

Ans. The zero signal values of I_C and V_{CE} are known as the operating point. It is called operating point because the variations of I_C and V_{CE} take place about this point when signal is applied. It is also known as quiescent point or Q point.

Q. 18. What is bias stabilization ? [Pb. Univ. Dec. 1993]

Ans. The maintenance of the operating or quiescent point stable (independent of temperature variations or variations in transistor parameters) is known as bias stabilization.

Q. 19. What is meant by midpoint biasing ?

Ans. When an amplifier circuit is so designed that the operating point Q lies at the centre of the dc load line, the amplifier is said to be midpoint biased.

Q. 20. Define stability factor. [PTU December 2004]

Ans. Stability factor is defined as the rate of change of collector current I_C w.r.t. reverse saturation current I_{CO} with V_{BE} and β constant.

Q. 21. What is the significance of stability factor in transistor operation ?

Ans. The stability factor indicates the change in collector current I_C due to change in collector leakage current I_{CO}. Thus a stability factor of high value say 50 means that I_C changes 50 times as much as any change in I_{CO}. In order to achieve greater thermal stability, it is desirable to have as low stability factor as possible. Thus importance of stability factor is with regard to stability of the transistor.

Q. 22. Why a fixed bias circuit is not commonly used ?

Ans. Rise in temperature causes increase in leakage current I_{CO}, increase in current amplification factor β and decrease in base-emitter voltage V_{BE}, so operating point is not stabilized. This is the reason that fixed bias circuit is not commonly used.

Q. 23. Explain why collector-to-base bias circuit is seldom used ? [U.P. Technical Univ. Electronics Engineering December 2004]

Ans. The base resistor R_B not only provides a dc feedback for the stabilization of the operating point, but it also causes an ac feedback in a collector-to-base bias circuit. This is the reason that this circuit is not much used.

Q. 24. Why bias compensation is required ?

Ans. In certain cases loss in signal gain due to negative feedback may be intolerable and so use of compensation techniques, in order to reduce the drift of the operating point, becomes imperative.

Q. 25. Which value of β is to be used in the analysis of a biasing circuit ?

Ans. Normally, the transistor specification sheet lists minimum and maximum values of β (*i.e.* B_{min} and β_{max}). In this case geometric mean of the two values should be used *i.e.* $\beta = \sqrt{\beta_{min} \times \beta_{max}}$. If the transistor data sheet lists only one value of β, that value should be used.

Q. 26. What is an amplifier ?

Ans. The device that amplifies the amplitude of the input signal is called the amplifier. An amplifier may be defined as a device that increases the current, voltage or power of an input signal with the help of a transistor by furnishing the additional power from a separate source of supply.

Q. 27. What is meant by small signal amplifier ?

Ans. When the input signal is quite weak and produces small fluctuations in the output current in comparison to its quiescent value, the amplifier is called the small signal or voltage amplifier.

Q. 28. What is meant by phase reversal ?

Ans. In a CE configuration, the output voltage increases in the negative direction when the input signal voltage increases in the positive direction and vice-versa. This is called the phase reversal and causes a phase difference of 180° between the input signal voltage and output voltage.

Q. 29. What is the effect of removal of emitter bypass capacitor in a CE amplifier circuit ?

Ans. Removal of bypass capacitor in a CE amplifier circuit causes excessive degeneration in the amplifier circuit and therefore reduction in voltage gain.

Q. 30. Why common-collector circuit is known as an emitter follower ?

Ans. The CC circuit amplifier is called an emitter follower because in this circuit the output voltage at the emitter terminal follows the input signal applied to the base terminal.

Q. 31. What are the main purposes for which a common-collector amplifier may be used ? [U.P.S.C. I.E.S. E.E.-II, 1997]

Ans. For a common collector amplifier, current gain is as high as for CE amplifier, voltage gain is less than unity, input resistance is the highest and the output resistance is the lowest of all the three (CE, CC and CB) configurations. This circuit finds wide application as a buffer amplifier between a high impedance source and a low impedance load.

Q. 32. What is meant by distortion in an amplifier ?

Ans. Change in amplified output signal waveform is called the distortion.

Q. 33. Why distortion in amplifier is considered harmful ?

Ans. Because distortion may change the intelligence (useful information) carried by the signal.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 34. What is meant by frequency response of an amplifier ?

Ans. The frequency response is the graph of voltage gain versus input frequency.

Q. 35. What is midband range ?

Ans. The midband range is the region where coupling and bypass capacitors act as short-circuits, and stray and transistor capacitances act as open circuits. In this region, the voltage gain is almost a constant.

Q. 36. What is meant by – 3 dB frequency ?

Ans. – 3 dB frequency, $f_{-3\ dB}$, is one at which the power is reduced to one-half of the maximum magnitude.

Q. 37. Define the term bandwidth of an amplifier.

Ans. The bandwidth (BW) of an amplifier is defined as the difference between the half-power points or –3 dB frequencies.

Q. 38. What is Miller's theorem ? **[Pb. Technical Univ. 2005-06]**

Ans. A feedback impedance from the output to the input of an inverting amplifier is equivalent to two impedances—one impedance across the input terminals and the other across the output terminals. This statement is Miller's theorem.

Q. 39. Explain the effect of bypass capacitor on the voltage gain of an amplifier.

Ans. The bypass capacitor C_E is connected across emitter resistance R_E in a BJT amplifier. At medium and high frequencies the bypass capacitor C_E offers a very low reactance and behaves as a short-circuit and thus R_E is bypassed effectively and bypass capacitor has no effect on voltage gain. But at low frequencies, the reactance of bypass capacitor becomes significant and there is a voltage drop across $R_E - C_E$ combination resulting in reduced output voltage and voltage gain.

Q. 40. How do the internal capacitances of the transistors affect the voltage gain of the amplifier.

Ans. BJT have two internal capacitances (collector-to-base junction capacitance C_{cb} and base-emitter junction capacitance C_{be}) in pF range. These internal capacitances have a very high reactance at low frequencies and so behave as open-circuits. The result is that they have no effect on voltage gain of the amplifier at low frequencies. But at high frequencies their reactances become significantly small.

When the reactance of C_{cb} becomes significantly small, a large portion of output voltage is feedback to the base. This feedback voltage being out of phase with input signal, reduces the effective input to the amplifier resulting in reduced output voltage and voltage gain of the amplifier.

When the reactance of C_{be} becomes significantly small (at high frequencies), a considerable portion of input signal is lost due to low voltage developed across the capacitance C_{be}. The result is that the amplifier output voltage and voltage gain are reduced.

Q. 41. What is Miller capacitance ?

Ans. According to Miller effect, when viewed from input base terminal of a CE-connected transistor the collector-base capacitance C_{cb} appears to be $(1 - A_v)\, C_{cb}$ *i.e.* is amplified by a factor $(1 - A_v)$.

Q. 42. Why is it not possible to use the *h*-parameters at high frequencies and large signals.

Ans. *h*-parameters cannot be used at high frequencies because at high frequencies the internal capacitances offer very low reactance and they are required to be considered in the analysis.

h-parameters cannot be used for large signals because the transistor behaves as a linear device for small signals only.

Q. 43. What are hybrid capacitances ?

Ans. Forward biased P-N junction exhibits a capacitive effect, called the diffusion capacitance. This capacitive effect of the normally forward-biased base-emitter junction of transistor is represented as $C_{b'e}$ or C_e. Similarly a reverse-biased P-N junction has a transition capacitance and it is shown as $C_{b'c}$ or C_c.

Q. 44. What is alpha cutoff frequency ?

Ans. The alpha cutoff frequency (f_α or $-f_{hfb}$) is defined as the frequency at which the current gain α *falls* to $\frac{1}{\sqrt{2}}$ or 0.707 of its low frequency value α_0, corresponding to a 3 dB loss. Thus, at the alpha cutoff frequency (f_α or $-f_{hfb}$) : $\alpha = 0.707\ \alpha_0$ where α_0 is the low frequency value of α listed in the transistor manuals.

Alpha cutoff frequency is found to be (*i*) inversely proportional to the square of the base width and (*ii*) directly proportional to the minority carrier mobility.

Q. 45. Define f_T of a BJT.

Ans. The f_T of a BJT is defined as the frequency at which the short-circuit common emitter current gain β falls to unity. It is equal to βf_β.

Q. 46. Why do you cascade the amplifiers ?

Ans. The voltage/power gain or frequency response obtainable from a single stage amplifier is usually not sufficient to meet the needs of either a composite electronic circuit or load device, so cascading of amplifiers is required to provide greater voltage or current amplification or both.

Q. 47. What is a multistage amplifier circuit ?

Ans. A transistor circuit containing two or more stages of amplification is known as a multistage amplifier.

Q. 48. Why R-C coupling is the most widely used coupling between the two stages of a cascaded amplifier ?

Ans. R-C coupling is the most commonly used coupling between the two stages of a cascaded or multistage amplifier because it is cheaper in cost, very compact circuit and provides excellent frequency response.

Q. 49. Why the overall gain of a multistage amplifier is less than the product of gains of individual stages ?

Ans. The overall gain of a multistage amplifier is less than the product of gains of individual stages because of the loading effects of the following stages.

Q. 50. Why coupling capacitor provided in a self biased CE R-C coupled amplifier is also called the blocking capacitor ?

Ans. In a self biased R-C coupled CE amplifier, coupling capacitor transmits ac signal but blocks the dc voltage of the first stage from reaching the base of the next stage, so it is also called the blocking capacitor.

Q. 51. Why does R-C coupling give constant gain over mid frequency range ?

Ans. In mid-frequency range, the voltage gain of an R-C coupled amplifier remains almost constant. This is because in mid-frequency range, with the increase in frequency, the reactance of the coupling capacitor decreases thereby increasing the gain but at the same time lower capacitive reactance causes higher loading resulting in lower voltage gain. Thus the two effects neutralize each other and uniform gain is obtained in mid frequency range.

Q. 52. What is meant by bandwidth ?

Ans. The difference between the upper cutoff frequency f_2 and lower cutoff frequency f_1 is called the bandwidth.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 53. Why are R-C coupled amplifiers widely used as voltage amplifiers ?

Ans. R-C coupled amplifiers are widely used as voltage amplifiers because of their excellent audio-fidelity over a wide range of frequency.

Q. 54. How do you improve the gain of an R-C coupled amplifier at low frequencies ?

Ans. The voltage gain of an R-C coupled amplifier at low frequencies can be improved by (*i*) selecting very large coupling and bypass capacitors so that their reactance is small (*ii*) making $(R_S + R_B) << (R_C + R_L)$ and (*iii*) selecting transistor with small h_{ie}.

Q. 55. Why a bypass capacitor is used on the bottom of each secondary winding in a transformer coupled amplifier ?

Ans. In a transformer coupled amplifier, bypass capacitor is used on the bottom of each secondary winding to get an ac ground and to prevent the loss of signal power in the biasing resistors.

Q. 56. Why coupling capacitors are not required in a transformer coupled amplifier ?

Ans. No coupling capacitor is required in a transformer coupled amplifier, because dc isolation between the two stages is provided by the transformer itself ?

Q. 57. What type of coupling would you use for amplification of a signal obtained from a thermocouple meant for measuring temperature of a furnace ?

Ans. Direct coupling.

Q. 58. Why direct coupling is not suitable for amplification of high frequency signals ?

Ans. At high frequency, the gain of the direct coupled amplifier falls off due to inter-electrode capacitance of the device and wiring capacitance, so it is not used for amplification of high frequency signals.

Q. 59. What are the main characteristics of cascode amplifier ?

Ans. The main characteristics of cascode amplifier are high input impedance, the same voltage gain as that of a CE amplifier but very low input capacitance so as to provide good high frequency operation.

Q. 60. What is meant by power amplifier ?

Ans. Power amplifier is meant to raise the power level of the input signal and may be defined as a device that converts dc power into ac power and whose action is controlled by the input signal.

Q. 61. Why a power amplifier is always preceded by a voltage amplifier.

Ans. Signal voltage at the input is quite small but a large voltage input signal is necessitated so as to provide large power at the output. So voltage amplifier is required for raising the voltage level of the weak input signal before it is fed to the power amplifier ?

Q. 62. Why power amplifiers are called large-signal amplifiers ?

Ans. Power amplifiers are required to handle large voltage signals so as to deliver large power at the output. That is why power amplifiers are called large-signal amplifiers.

Q. 63. Why a class A power amplifier is cooler in the presence of signal than in the absence of signal ?

Ans. With the zero signal applied at the input of the class A power amplifier, ac power developed across the load reduces to zero and therefore, all the power drawn from collector supply V_{CC} is wasted in the form of heat. Thus, a power transistor dissipates maximum power under zero-signal condition. Thus the device is cooler in the presence of signal than in the absence of signal.

Q. 64. Why a step-down transformer is used in the output circuit of a power amplifier ?

Ans. For transfer of maximum power from amplifier to the output device matching of amplifier output impedance with the impedance of the output device is necessary and this is accomplished by using a step-down transformer of suitable turn-ratio at the output.

Q. 65. What advantages does the transformer provide in a transformer coupled power amplifier ?

Ans. Transformer provide the following advantages in a transformer coupled power amplifier.

1. Power loss in the primary of the transformer, used for coupling the load to the amplifier, is negligible and therefore conversion efficiency is doubled in a transformer coupled-load amplifier compared with a direct coupled resistive load.
2. Output transformer makes the transfer of maximum power to the load through impedance matching.
3. Output transformer prevents a large dc current from flowing in the load, which otherwise could be harmful if the load were a loudspeaker.

Q. 66. Under what conditions would the dc load line in a transformer coupled amplifier not be drawn vertically on the output characteristics ? Which way would it slope ?

Ans. If the resistance of the transformer primary is significant and biasing stabilizing resistance is included, the dc load line will slope slightly to the left.

Q. 67. What equation specify the operating point in terms of the output power delivered to the transformer primary ?

Ans. The operating point of a transformer coupled amplifier is specified by the following equations.

$$I_{CQ} = \frac{2P'_{out(ac)}}{V_{CC}}$$

where $P'_{out(ac)}$ is the power delivered to the transformer primary and $V_{CEQ} = V_{CC}$ and V_{CC} is the collector supply voltage in volts.

Q. 68. What should be the effective ac resistance reflected into the primary of the output transformer in a transformer coupled power amplifier ?

Ans. Effective ac resistance reflected into the primary of the output transformer in a transformer coupled power amplifier is given by

$$R'_L = \frac{V_{CC}^2}{2P'_{out(ac)}}$$

where V_{CC} is the collector supply voltage in volts and $P'_{out(ac)}$ is the power delivered to the transformer primary, in watts.

Q. 69. Why may an amplifier be operated with a load resistance lower than the value that would provide maximum output power ?

Ans. From the power output and distortion-load resistance curves, it is seen that the load providing minimum total harmonic distortion is lower than that the load that provides maximum power output. That is why, an amplifier is operated with a load resistance lower than the value that would provide maximum output power so that output with least distortion is obtained.

Q. 70. Comment on the maximum efficiency of class B operation.

[A.M.I.E. Sec B. Summer 1996]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The maximum possible value of efficiency for class B operation is 78.5%. The efficiency of class B operation exceeds that of class A operation because with zero excitation there is no current in class B operation whereas power is drawn from supply source in class A operation.

Q. 71. What is the use of class C amplifiers ?

Ans. The use of class C amplifiers is limited for a fixed frequency, as occurs in communication circuits.

Q. 72. Why class D power amplifiers are becoming more and more popular ?

Ans. Class D power amplifiers are becoming popular because of their very high efficiency (above 95%).

Q. 73. What is push-pull amplifier ?

Ans. Push-pull amplifier uses two active devices (transistors), needs two input signals having a phase difference of 180°, and usually requires a centre-tapped output transformer.

Q. 74. What is class A push-pull amplifier ?

Ans. Class A push-pull amplifier is that in which current flows in the output of each transistor for the whole of the input cycle.

Q. 75. What is crossover distortion ? How can it be minimized ? **[Pb. Technical Univ. 2005-06]**

Ans. Crossover distortion occurs in class B push-pull amplifiers as a result of one transistor cutting off before the other begins conducting. The distortion introduced is called the crossover distortion because it occurs during the time operation crossover from one transistor to the other in the push-pull amplifier.

For elimination of crossover distortion, it is necessary to add a small amount of forward bias to take the transistors to the average of conduction or slightly beyond. Technically the operation of transistors will lie between class B and class A mode (*i.e.* class AB operation).

Q. 76. The complementary symmetry push-pull amplifiers are called so. Why ?

Ans. The complementary symmetry push-pull amplifier uses two transistors having complementary symmetry (one N-P-N and another P-N-P). The term complementary arises from the fact that one transistor is the N-P-N and the other is P-N-P. They have the symmetry as they are made with the same material and technology and are of same maximum ratings.

Q. 77. What is the maximum collector circuit efficiency of a complementary push-pull class B power amplifier ?

Ans. Maximum collector circuit efficiency of a class B complementary push-pull power amplifier is 78.5%.

Q. 78. What advantage does phase inverter circuit have over a transformer phase splitter ?

Ans. The advantage of phase inverter circuit is elimination of centre-tapped input transformer because collector current from each transistor flows through the load during alternate half cycles of the input signal.

Q. 79. What are the drawbacks of complementary symmetry push-pull class B power amplifier ?

Ans. One obvious drawback of this circuit arrangement is the requirement for two supply voltages. Another drawback of this circuit is difficulty of obtaining matched complementary transistors. If there is an unbalance in the characteristics of the two transistors, even harmonics will no longer be cancelled and considerable distortion will be introduced. Very often negative feedback is used in power amplifiers to reduce nonlinear distortion.

Q. 80. Why the power rating of a power transistor is required to be reduced when it is operated above ambient temperature of 25°C ?

Ans. The heat flow from the transistor junction to the surroundings depends on the difference of junction temperature and the ambient temperature. As the ambient temperature increases, rate of heat flow and so the power rating of the transistor decreases. Thus the power rating of a power transistor is required to be reduced when operated above ambient temperature of 25°C.

Q. 81. What is feedback in amplifiers ?

Ans. The process of combining a fraction of output energy back to the input is called the feedback.

Q. 82. What is the difference between current and voltage feedbacks ?

Ans. Voltage feedback refers to connecting the output voltage as input to the feedback network while current feedback refers to tapping off some output current through the feedback network.

Q. 83. How do series feedback and shunt feedback differ from each other ?

Ans. Series feedback means connecting the feedback signal in series with the input signal voltage while shunt feedback means connecting the feedback signal in parallel with an input current source.

Q. 84. Why voltage-series feedback is most commonly used in cascaded amplifiers ?

Ans. In cascaded amplifiers, high input impedance and low output impedance are usually the main requirements and both of these requirements can be met by voltage series feedback, so it is most commonly used in cascaded amplifiers.

Q. 85. What is the effect of negative feedback on the bandwidth of an amplifier ? **[Pb. Univ. Dec. 1995]**

Ans. Bandwidth of an amplifier is increased, when negative feedback is introduced, by a factor $(1 + \beta A)$, by which its gain is reduced.

Q. 86. Why an emitter follower is called so ?

Ans. In an emitter follower, output and input voltages are approximately equal in magnitude and also in phase *i.e.* emitter output voltage closely follows the input and that is why it is called the emitter follower.

Q. 87. Why an emitter follower is preferred over a transformer for impedance matching ?

Ans. An emitter follower is preferred over a transformer for impedance matching because it is not only more convenient than a transformer but it also provides better frequency response.

Q. 88. What are the main characteristics of a Darlington amplifier ?

Ans. The main characteristics of a Darlington amplifier are high input impedance, low output impedance and high current gain.

Q. 89. What is Darlington pair ?

Ans. Darlington pair may be considered a device providing externally only three terminals (base, emitter and collector) and having a very high current gain and high input resistance.

Q. 90. What is feedback pair ?

Ans. The feedback pair connection is a two transistor circuit that uses a PNP transistor driving an NPN transistor and operates like the Darlington connection and provides a very high current gain.

Q. 91. What is an oscillator ?

Ans. Oscillator may be defined as a circuit which generates an ac output signal of very high frequency without requiring any

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

externally applied input signal or it may be defined as an electronic source of alternating current (or voltage) having sinusoidal or non-sinusoidal (square, sawtooth or pulse) waveshape. It can also be defined as a circuit that converts dc energy into very high frequency ac energy.

Q. 92. Give Barkhausen conditions required in order for sinusoidal oscillations to be sustained. **[Pb. Technical Univ. 2005-06]**

or

What is Barkhausen criterion for oscillator ?

[U.P. Technical Univ. 2006-07]

Ans. Barkhausen conditions for sustained oscillations are : (*i*) the loop gain of the circuit must be ≥ 1 and (*ii*) the phase shift around the circuit must be zero.

Q. 93. Explain why positive feedback and not negative feedback is necessary to produce oscillations. **[U.P. Technical Univ. 2005-06]**

Ans. With negative feedback feedback factor $A\beta$ becomes less than unity, $A\beta V_{in}$ less than V_{in} and therefore output signal will die out while with positive feedback $A\beta$ exceeds unity, $A\beta V_{in}$ exceeds V_{in} and oscillations are produced. That is why positive feedback is necessary to produce oscillations.

Q. 94. Every electronic oscillator can be considered to be an amplifier with infinite gain. Explain where you get the starting signal voltage from. **[U.P. Technical Univ. 2005-06]**

Ans. Due to the thermal energy, electrons are at random vibrations. These vibrations give rise to small potentials. All oscillators use positive feedback. The small voltage due to movement of electrons due to thermal energy is repeatedly amplified in the oscillator circuit and potential build up occurs. This results in oscillations. To make these oscillations, dc biasing voltage is essential.

Q. 95. Why is L-C oscillator not used at audio frequency ?

[A.M.I.E. Sec B. Electronic Circuits Summer 2005]

Ans. L-C resonant circuits are impractical at audio-frequencies because components required in their construction for low-frequency operation are too bulky and heavy and expensive.

Q. 96. Why are R-C oscillators not used at RF frequencies ?

[A.M.I.E. Sec B. Electronic Circuits Summer 2006]

Ans. R-C oscillators, when used at R-F frequencies, will require bulky and expensive low-value capacitors for phase shift circuits which is not practical and therefore not used.

Q. 97. How does Clapp oscillator circuit differ from Colpitt's oscillator circuit in construction ?

Ans. Clapp oscillator circuit is a refinement of the Colpitt's oscillator circuit. The only difference is that the single inductor found in the tank circuit of the Colpitt's oscillator is replaced by a series L-C combination (inductor L in series with capacitor C).

Q. 98. Why Clapp oscillator is preferred over the Colpitt's oscillator ?

Ans. In a Colpitt's oscillator, the resonant frequency is affected by the transistor and stray capacitances but in a Clapp oscillator, the transistor and stray capacitances have no effect on the oscillation frequency. Thus in Clapp oscillator the effect of transistor parameters on the operation of the circuit is eliminated and the frequency stability is improved. That is why, Clapp oscillator is preferred over Colpitt's oscillator.

Q. 99. How does Hartley oscillator differ from Colpitt's oscillator in construction ?

Ans. Hartley oscillator circuit is similar to Colpitt's oscillator except that phase-shift network consists of two inductors and one capacitor instead of two capacitors and one inductor.

Q. 100. Why is the Armstrong oscillator less common than the Colpitts, Clapp and Hartley oscillators ? **[A.M.I.E. Sec. B Summer 2006]**

Ans. Armstrong oscillators use transformers which occupy large space and are bulky and costly. Hence Armstrong oscillators are less common than other oscillators (Colpitts, Clapp or Hartley oscillators).

Q. 101. Why is crystal oscillator used in communication transmitters and receivers ?

Ans. Crystal oscillators are used in communication transmitters and receivers because of their greater frequency stability.

Q. 102. Why we use two transistors in a Wien bridge oscillator ?

Ans. Wien bridge oscillator employs two transistors so as to obtain 360° or 0° phase shift between output and input voltages.

Q. 103. Sometimes a lamp is used in one of the resistance arms of a Wien bridge oscillator. Why ?

Ans. A lamp is used in one of the resistance arms of a Wien bridge oscillator so as to provide a negative feedback, in proportion to the output current, in the circuit and thus ensure constant output over a range of frequencies.

Q. 104. Explain why BJTs are called bipolar devices while FETs are called unipolar devices. **[A.M.I.E. Sec B. Summer 2005]**

Ans. In ordinary transistors, current conduction is by both majority carriers and minority carriers (both by holes as well as electrons) and, therefore, these are called bipolar transistors. In field-effect transistors current conduction is by only one type of majority carriers (either by electrons or by holes) and, therefore, these are called unipolar transistors.

Q. 105. Define "current-controlled device" and "voltage-controlled device".

Ans. A current controlled device is one in which a current defines the operating conditions of the device, whereas a voltage-controlled device is one in which a particular voltage defines the operating conditions.

Q. 106. Why the channel of a JFET is never completely closed at the drain end ?

Ans. If the channel is completely closed in JFET, then there will be no drain current, so there will be no voltage drop along the channel length and amount of reverse bias will become uniform and wedge-shaped depletion region will become rectangular one.

Q. 107. No current flows through the channel of a JFET when $V_{GS} = 0$ and $V_{DS} = 0$, though channel is fully-open. Why ?

Ans. When drain-source voltage is zero, there is no attracting potential at the drain, so no current flows inspite of the fact that the channel is fully open.

Q. 108. Define pinch-off voltage for a JFET **[U.P.S.C. I.E.S. 2002]**

Ans. The value of drain-source voltage at which channel is pinched-off (*i.e.* all the free charges from the channel get removed) is called the pinch-off voltage.

Q. 109. What are the parameters that control the pinch-off voltage of JFET ?

Ans. Parameters that control the pinch-off voltage of JFET are electron charge, donor/acceptor concentration density, permittivity of channel material and half width of channel bar.

Q. 110. Why FET is called a voltage controlled device ?

[Pb. Univ. April 1993]

Ans. In a FET, drain current is controlled by the effect of the extension of the field associated with the depletion region developed by the reverse bias on the gate, so it is called a voltage controlled device.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 111. How does the FET behave (*i*) for small values of $|V_{DS}|$ and (*ii*) for large values of $|V_{DS}|$?

[Pb. Univ. May 1994; U.P. Technical Univ. 2005-06]

Ans. (*i*) FET behaves as an ordinary resistor for small value of $|V_{DS}|$ *i.e.* in ohmic region.

(*ii*) FET behaves as a constant current source for large values of $|V_{DS}|$ till breakdown occurs.

Q. 112. How does the current vary with the gate voltage in the saturation region ? [Pb. Univ. May 1994]

Ans. Drain current decreases with the increase in gate-source bias $|V_{GS}|$. When $V_{GS} = 0$; drain current $I_D = I_{DSS}$, drain-source saturation current and when $V_{GS} = V_P$; drain current $I_D = 0$.

Q. 113. How does the transconductance vary with drain current ?

[Pb. Univ. May 1994]

Ans. Transconductance g_m of a FET varies with the drain current I_D as given by the following equation

$$g_m = \frac{2}{|V_P|}\sqrt{I_{DS} \cdot I_{DSS}}$$

Q. 114. Explain how the mutual conductance of a FET varies with I_D and V_G. [U.P. Technical Univ. 2006-07]

Ans. Mutual conductance g_m of a FET is determined by the ratio of the change in drain current ΔI_D associated with a particular change in gate-to-source voltage ΔV_{GS} in the region of interest. The steeper the slope of the I_D versus V_{GS} curve, the greater is the value of g_m. The quantity gm increases as V_{GS} approaches zero.

Q. 115. What is meant by gate-source cut-off voltage ?

Ans. The gate-source bias voltage required to reduce the drain current to zero is designated the gate-source cut-off voltage $V_{GS(OFF)}$. It is equal to pinch-off voltage V_P.

Q. 116. How do the junction FETs have a very high input impedance ? [P.T.U. December 2004]

Ans. FET has very high input impedance because its input circuit (gate-to-source) is reverse biased and the input gate current is very small (of the order of few nanoamperes).

Q. 117. What is meant by transconductance with reference to JFET ?

Ans. The control that gate-source voltage has over the drain current is measured by the transconductance of a JFET. It may be defined as the ratio of change in drain current to the change in gate-source voltage for a given value of drain-source voltage *i.e.*

$$g_m = \frac{\Delta I_D}{\Delta V_{GS}} \text{ at constant } V_{DS}.$$

Q. 118. What is meant by gate-to-source threshold voltage in E-MOSFET ?

Ans. The minimum value of gate-to-source voltage V_{GS} that is required to form the inversion layer is termed the gate-to-source threshold voltage V_{GST}.

Q. 119. How is threshold voltage of the MOS transistor adjusted ?

Ans. Threshold voltage of a MOS transistor can be adjusted by the following three methods.

1. If the silicon crystal orientation is < 111 >, it results in high threshold voltage. If the crystal has orientation of < 100 >, the value of threshold will go to half as compared to the previous one.
2. Instead of SiO_2, a layer of Si_3N_4 and SiO_2 is used. It makes the dielectric constant twice as that of SiO_2 alone. This causes V_{GST} to come down to half.
3. Instead of aluminium as gate electrode polycrystalline silicon doped with boron is used as the gate electrode. This causes reduction in contact potential between gate electrode and gate dielectric resulting in reduction of V_{GST}.

Q. 120. Why MOSFETs are never connected or disconnected in the circuit when power is ON ?

Ans. If a MOSFET is connected or disconnected in circuit while the power is ON, transient voltages caused by inductive kickback and other effects may exceed $V_{GS\,(max)}$ and thus wipe out the MOSFET.

Q. 121. Name the factors which make the JFET superior to BJT ?

Ans. The high input impedance, low output impedance and low noise level make JFET far superior to the BJT.

Q. 122. In communication electronics, why JFET RF amplifier is used in a receiver instead of BJT amplifier ?

Ans. The reasons for using JFET RF amplifier in receiver instead of BJT amplifier are :

1. The noise level of JFET is very low.
2. The antenna of the receiver receives a very weak signal that has an extremely low amount of current. Since JFET is a voltage controlled device, it will respond to low current signal provided by the antenna.

Q. 123. What are the advantages of ICs over discrete component circuits ? [Bharathiyar Univ. April 1996]

Ans. The advantages of IC's over discrete component circuits are extremely small size, very small weight, very low cost, lower power consumption, more reliability, easy replacement, increased operating speed, close matching, improved functional performance, suitability for small signal operation etc.

Q. 124. What are the important IC Technologies used ?

[Bharathiyar Univ. April 1996]

Ans. IC technologies used are monolithic, thin- and thick-film, and hybrid or multichip.

Q. 125. Why is the diffusion technique of formation of resistors most widely used ?

Ans. The diffused resistors can be processed while diffusing transistors, so the diffusion technique is the cheapest and, therefore, is most widely used.

Q. 126. Why is the plastic DIP IC package most widely used ?

Ans. The plastic dual-in-line package is much cheaper than other types of packages and is, therefore, most widely used.

Q. 127. Draw the equivalent circuit of an ideal op-amp.

Ans. Equivalent circuit of an ideal op-amp is shown in Fig. 1.

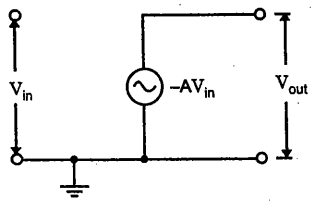

Fig. 1

Q. 128. What are differential gain and common-mode gain of a differential amplifier ?

Ans. When the difference of the two inputs applied to the two terminals of a differential amplifier is amplified, the resultant gain is

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

termed as differential gain. But when the two input terminals are connected to the same input source then the gain established by the differential amplifier is called the common mode gain.

Q. 129. Why does an op-amp have high CMRR ?

Ans. High CMRR ensures that the common mode signals such as noise are rejected successfully and the output voltage is proportional only to the differential input voltage.

Q. 130. Define offset voltage as applied to an op-amp. [Manonmanian Univ. April 1996]

Ans. Input offset voltage may be defined as that voltage which is to be applied between the input terminals to balance the amplifier.

Q. 131. Define slew rate. [Bharathiyar Univ. April 1997]

Ans. Slew rate of an op-amp is defined as the maximum rate of change of output voltage per unit time and is expressed in V/μs.

Q. 132. What is a voltage follower ? [Bharathiyar Univ. Nov. 1995]

Ans. Voltage follower is an electronic circuit in which output voltage tracks the input voltage both in sign and magnitude.

Q. 133. What are the advantages of using a voltage follower amplifier ? [Manonmanian Univ. April 1996]

Ans. Voltage follower has three unique characteristics viz. extremely high input impedance, extremely low output impedance and unity transmission gain and is, therefore, an ideal circuit device for use as a buffer amplifier.

Q. 134. What is an inverting amplifier ? [Bharathiyar Univ. Nov. 1995]

Ans. In an inverting amplifier, the input is connected to the minus or inverting terminal of op-amp.

Q. 135. What are the applications of an inverting amplifier ? [Bharathiyar Univ. April 1996]

Ans. Inverting amplifier is a very versatile component and can be used for performing number of mathematical stimulation such as analog inverter, paraphase amplifier, phase shifter, adder, integrator, differentiator.

Q. 136. Give the examples of linear circuits.

Ans. Adder, subtractor, differentiator, integrator, voltage-to-current converter, current-to-voltage converter, instrumentation amplifier fall under the category of linear circuits.

Q. 137. Op-amp is used mostly as an integrator than a differentiator. Why ?

Ans. Op-amp is mostly used as an integrator rather as a differentiator, because in differentiator at high frequency, gain is high and so high frequency noise is also amplified which absolutely abstract the differentiated signal.

Q. 138. What is difference between positive scalar and voltage-to-current converter ?

Ans. The circuit of voltage-to-current converter is similar to that of a positive scalar except that feedback resistor R_f is replaced by load resistor R_L.

Q. 139. What is a VCO ? Give two applications that require VCO. [P.T.U. 2006-07]

Ans. The oscillator whose output frequency is controlled by varying the magnitude of the input voltage is called a voltage-controlled oscillator (VCO). Applications requiring VCO are frequency modulation (FM) and frequency shift keying (FSK).

Q. 140. What is a precision rectifier ?

Ans. Precision rectifier is a small signal rectifier which is capable of rectifying signals of very small peaks (of the order of millivolts).

Q. 141. What is a comparator and where is it used ?

Ans. A comparator is essentially an op-amp operated in open-loop configuration. The output signal is either a high or low saturated voltage. It is used in digital interfacing, Schmitt triggers, analog-to-digital converters, oscillators etc.

Q. 142. What is zero-crossing detector ?

Ans. A comparator with a reference voltage of zero volt is called a zero-crossing detector. Diode clampers are often used to protect the comparator against excessively large input voltages.

Q. 143. What is Schmitt trigger ?

Ans. A Schmitt trigger uses a comparator with a positive feedback and converts an irregular waveform to a square or pulse waveform. In the Schmitt trigger, the input voltage triggers the output every time, it exceeds certain voltage levels known as upper threshold and lower threshold voltages.

Q. 144. Why hysteresis is desirable in a Schmitt trigger ?

Ans. Hysteresis is desirable in a Schmitt trigger because it prevents noise from causing false triggering.

Q. 145. What is 555 timer ?

Ans. The 555 timer is a highly stable IC that can produce accurate and highly stable time delays or oscillation. The frequency of oscillation and duty cycle are accurately controlled by only two external resistors and a capacitor.

Q. 146. Why normally control terminal of 555 timer is connected to ground through a 0.01 μF bypass capacitor ?

Ans. Normally control terminal (pin 5) of timer is connected to ground through a 0.01 μF bypass capacitor so as to prevent noise coupled onto this pin from causing false triggering.

Q. 147. What are the two basic modes in which the 555 timer operates ?

Ans. The 555 timer basically operates in one of the two modes—either as monostable or as an astable multivibrator.

Q. 148. What are the commonly used filters ? [Bharathiyar Univ, Nov. 1996]

Ans. The most commonly used filters are low-pass, high-pass, band-pass, band-reject and all-pass filters.

Q. 149. What is the difference between active and passive filters ? [Bharathidhasan Univ. Nov. 1995]

Ans. A passive filter is formed with passive components, such as resistors, inductors and capacitors while active filters make use of transistors or op-amps in addition to resistors and capacitors.

Q. 150. Why are active filters preferred ? [Bharathiyar Univ. Nov. 1996]

Ans. Active filters are preferred over passive filters because they provide gain and frequency adjustment flexibility. They pose no loading problem because of high input impedance and low output impedance and they are comparatively less expensive.

Q. 151. What is a low-pass filter ? [Bharathiyar Univ. Nov. 1995]

Ans. A filter that provides a constant output from dc up to a cutoff frequency f_C and then passes no signal above that frequency is called a low-pass filter.

Q. 152. What is a high-pass filter ?

Ans. A filter that provides or passes signals above a cutoff frequency f_C is called a high-pass filter. It has a zero gain starting from zero to a frequency f_C and above this frequency the gain is constant.

Q. 153. Why do we use higher order filters ? [Bharathiyar Univ Nov. 1995; April 1997]

Ans. Higher order filters are used to obtain stopband response of the filter approaching ideal stopband characteristics.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 154. What is the wide band-pass filter ?

[Madurai Kamaraj Univ. Nov. 1995; April 1996]

Ans. A wide band-pass filter has a wide passband between two cutoff frequencies f_H and f_L where $f_H >> f_L$ and two stopbands at $0 < f < f_L$ and $f > f_H$.

Q. 155. What is a notch filter ? [Madras Univ. October 1995; Bharathiyar Univ Nov. 1995; Madurai Kamaraj Univ. Nov. 1996]

Ans. Notch filter is a narrow band-stop filter. It notches out or blocks frequencies near centre frequency f_c, also called a notch-out frequency.

Q. 156. What is PLL ? [Madurai Kamaraj Univ. Nov. 1996]

Ans. PLL is basically an electronic circuit that consists of a phase detector, a low-pass filter, a dc amplifier and a voltage controlled oscillator connected.

Q. 157. What is the need for a low-pass filter in a PLL ?

[M.S. Univ. April 1996]

Ans. While the loop is trying to achieve lock, the output of the phase detector contains frequency components at the sum and difference of the signals compared. A low-pass filter is provided in a PLL to pass only the low-frequency component of the signal so that the loop can obtain lock between input and VCO signals. Low-pass filter also removes high frequency noise.

Q. 158. What is the role served by the VCO in a PLL chip ?

[M.S. Univ. Nov. 1995]

Ans. The role of the VCO in a PLL is to provide an oscillating output signal (typically of square or triangular waveform), whose frequency can be adjusted over a range controlled by a dc voltage.

Q. 159. In a PLL system define the locked state.

Ans. Before the application of the input, the PLL circuit is in the free-running state. When the input is applied, the VCO output frequency tries to capture the input frequency, so, it is in the capture mode. Once the two frequencies (input signal frequency and VCO output frequency) have matched, the PLL is in the phase-locked state.

Q. 160. Define 'capture range' of a PLL. [Bharathiyar Univ. April 1997]

Ans. The range of frequencies over which the output signal frequency of the VCO will be able to lock with the input signal frequency is called the capture range. The capture range is always smaller than lock range.

Q. 161. A PLL frequency translator has a centre frequency f_o and the input frequency is f_i. *What* will be the output frequency ?

[Madras Univ. April 1996]

Ans. Output frequency, $f_{out} = f_i \simeq f_o$

Q. 162. Why do we use higher order filters ?

[Bharathiyar Univ. April 1997]

Ans. Higher order filters are used to achieve faster filter response or characteristic closer to the ideal characteristic.

Q. 163. What is a VCO ? [Madurai Kamaraj Univ. Nov. 1996]

Ans. A VCO is a circuit that provides an oscillating output signal (typically of square or triangular waveform), whose frequency can be controlled by means of an input voltage, called the control voltage.

Q. 164. Give the advantages and limitations of PLL synthesizer.

Ans. The PLL synthesizer solves several of the problems associated with purely analog techniques. It is accurate, easily controlled digitally and exhibits good long-term stability.

However, it suffers from limitations of its analog components. The loop must remain locked for reliable performance. Short-term drift is caused by variation in filter and VCO component values. We are to wait for the loop to stabilize when changing frequencies. Frequency is determined by an analog voltage or current. Any noise injected into this point in the circuit will cause jitter.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The emitter of a transistor is generally doped the heaviest because it
(a) has to dissipate maximum power.
(b) has to supply the charge carriers.
(c) is the first region of the transistor.
(d) must posses low resistance.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

2. An emitter in a bipolar junction transistor is doped much more heavily than the base as it increases the
(a) emitter efficiency. (b) base transport factor.
(c) forward current gain. (d) all the three given above.
[U.P.S.C. I.E.S. E.E.-II, 2005]

3. Which of the following statements is correct ?
(a) Base region is of low resistivity material and heavily doped.
(b) Collector region is of higher conductivity than emitter.
(c) Emitter region is of high resistivity material and lightly doped.
(d) Emitter region is of high resistivity and heavily doped.

4. The impurity commonly used for realizing the base region of a silicon *n-p-n* transistor is
(a) Gallium. (b) Indium. (c) Boron.
(d) Phosphorus. [GATE E.C.E. 2004]

5. Consider the following statements S_1 and S_2
S_1 : The β of a bipolar transistor reduces if the base width is increased.
S_2 : The β of a bipolar transistor increases if the doping concentration in the base is increased.
Which one of the following is correct ?
(a) S_1 is False and S_2 is True. (b) Both S_1 and S_2 are True.
(c) Both S_1 and S_2 are False.
(d) S_1 and True and S_2 is False. [GATE E.C.E. 2004]

6. In a properly biased N-P-N transistor, most of the electrons from the emitter
(a) pass to the collector through the base.
(b) recombine with holes in base.
(c) recombine with holes in emitter itself.
(d) are stopped by the function barrier.

7. For an *npn* bipolar transistor, what is the main stream of current in the base region ?
(a) Drift of holes. (b) Diffusion of holes.
(c) Drift of electrons. (d) Diffusion of electrons.
[U.P.S.C. I.E.S: E.T.E.-I, 2007]

8. The current I_{CBO} flows in the
(a) emitter and base leads. (b) collector and base leads.
(c) emitter and collector leads.
(d) none of these. [U.P. Technical Univ. 2008-09]

9. For correct working of an N-P-N bipolar junction transistor, the different electrodes should have the following polarities with respect to an emitter
(a) collector +ve, base –ve. (b) collector –ve, base +ve.
(c) collector –ve, base –ve. (d) collector +ve, base +ve.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

10. For a given emitter current, the collector current can be increased by
(a) reducing the recombination rate in the base region.
(b) doping the emitter region lightly.
(c) reducing the minority carrier mobility in the base region.
(d) making the base region more wider.

11. In saturation region in an N-P-N transistor
(a) V_{CB} is – ve and V_{BE} +ve.
(b) V_{CB} is + ve and V_{BE} –ve.
(c) Both V_{CB} and V_{BE} are +ve.
(d) Both V_{CB} and V_{BE} are –ve.

12. If I_E is zero (base is open but collector junction is having usual bias), then I_C is equal to
(a) $I_B - I_{CO}$ (b) zero (c) I_B (d) I_{CO}

13. Two P-N junction diodes are connected back to back to make a transistor. Which one of the following is correct ?
(a) the current gain of such a transistor will be high.
(b) the current gain of such a transistor will be moderate.
(c) it cannot be used as a transistor due to large base width.
(d) it can be used only for PNP transistor.
[U.P.S.C. I.E.S. E.E.-II, 2005]

14. The dc current gain (β) of BJT is 50. Assuming that the emitter injection efficiency is 0.995, the base transport factor is
(a) 0.980 (b) 0.985 (c) 0.990 (d) 0.995
[GATE E.C.E. 2007]

15. The alpha (α) and beta (β) of a transistor are related to each other as
(a) $\alpha = \frac{\beta}{\beta+1}$ (b) $\beta = \frac{\alpha}{1+\alpha}$
(c) $\beta = \frac{1+\alpha}{\alpha}$ (d) $\alpha = \frac{1+\beta}{\beta}$
[U.P. Technical Univ. 2008-09]

16. $V_{BE\,sat}$ for Ge and Si P-N-P transistor is of the order of
(a) 0.1 V and 0.4 V. (b) 0.3 V and 0.7 V.
(c) – 0.3 V and – 0.7 V. (d) – 0.1 V and 0.2 V.

17. If for a silicon *n-p-n* transistor, the base-to-emitter voltage (V_{BE}) is 0.7 V and the collector-to-base voltage (V_{CB}) is 0.2 V, then the transistor is operating in the
(a) normal active mode. (b) saturation mode.
(c) inverse active mode. (d) cutoff mode. [GATE E.C.E. 2004]

18. I_{CBO} in a transistor can be reduced by reducing
(a) I_B (b) V_{CC} (c) I_E (d) temperature.

19. If α_F and α_R denote the forward and inverted mode current gains of a BJT, which one of the following is correct ?
(a) $\alpha_F = \alpha_R$ (b) $\alpha_F < \alpha_R$ (c) $\alpha_F \geq \alpha_R$ (d) $\alpha_F >> \alpha_R$
[U.P.S.C. I.E.S. E.E.-II, 2007]

20. Ebers-Model of a transistor represents two diodes
(a) in series. (b) in parallel.
(c) back to back. (d) none of the above.
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 2000]

Answers: **1.** (b), **2.** (d), **3.** (d), **4.** (c), **5.** (d), **6.** (a), **7.** (b), **8.** (b), **9.** (d), **10.** (a), **11.** (a), **12.** (d), **13.** (c), **14.** (b), **15.** (a), **16.** (c), **17.** (a), **18.** (d), **19.** (d), **20.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

21. In an N-P-N transistor, the leakage current is due to
(a) flow of minority carriers from collector to emitter.
(b) flow of holes from base to emitter.
(c) flow of electrons from collector to base.
(d) flow of holes from collector to base.

22. In a transistor, the reverse saturation current I_{CO}
(a) doubles for every 10°C rise in temperature.
(b) doubles for every 1°C rise in temperature.
(c) increases linearly with temperature.
(d) decreases linearly with temperature.
[U.P.S.C. I.E.S. E.E.-II, 2004]

23. Silicon is preferred over germanium for use in semiconductor devices. The reasons is/are:
(a) silicon crystal has fewer electrons than germanium crystal at room temperature. So silicon has much smaller collector cut-off current (I_{CBO}) than that of germanium.
(b) I_{CBO} approximately doubles with each 6°C rise of temperature in germanium while it doubles with each 10°C rise of temperature for silicon.
(c) The normal operating temperature of germanium is approximately 70° C while it is 150°C in case of silicon.
(d) all the above three.

24. The phenomenon known as "Early Effect" in a bipolar transistor refers to a reduction of the effective base-width caused by
(a) electron-hole recombination at the base.
(b) the reverse biasing of the base-collector junction.
(c) the forward biasing of emitter-base junction.
(d) the early removal of stored base charge during saturation-to-cutoff switching.
[GATE E.C.E. 2006]

25. The maximum junction temperature of a transistor is 150°C and the ambient temperature is 25°C. If the total thermal impedance is 1°C/W, what is the maximum power dissipation ?
(a) $\frac{1}{175\text{ W}}$ (b) 175 W (c) 125 W (d) $\frac{1}{125}$ W
[U.P.S.C. I.E.S. E.E.-II, 2008]

26. A transistor has a maximum power dissipation limit of 300 mW for ambient temperature up to 25°C. If the maximum allowable junction temperature is 175°C, then what is the limit of the device in an ambient temperature of 55°C?
(a) 120 mW (b) 240 mW
(c) 300 mW (d) 360 mW
[U.P.S.C. I.E.S. E.E.-II, 2009]

27. Which one of the following specifications is not correct for a common collector amplifier ?
(a) High input impedance. (b) Low output impedance.
(c) High voltage gain. (d) High current gain.
[U.P.S.C. I.E.S. E.E.-II, 1993]

28. In a common collector amplifier the voltage gain is
(a) constant. (b) less than 1.
(c) varies with input voltage. (d) varies with load impedance.
[U.P.S.C. I.E.S. E.E.-II, 2011]

29. The transistor configuration which provides highest output impedance is:
(a) Common Base. (b) Common Emitter.
(c) Common Collector. (d) None of the above.
[U.P.T.U. Elec. Engg. Even Semester 2009-10]

30. Which one of following statements is correct ?
In a transistor.
(a) I_{CBO} is greater than I_{CEO} and does not depend upon temperature.
(b) I_{CBO} is greater than I_{CO} and doubles for every 10 degrees rise in temperature.
(c) I_{CBO} is equal to I_{CO} and doubles for every 10 degrees rise in temperature.
(d) I_{CEO} is equal to I_{CO} and doubles for every 10 degrees rise in temperature.
[U.P.S.C. I.E.S. E.E.-II, 2005]

31. In cutoff region in an N-P-N transistor
(a) V_{CB} is + ve and V_{BE} is – ve.
(b) V_{CB} is – ve and V_{BE} is + ve.
(c) Both V_{CB} and V_{BE} are positive.
(d) Both V_{CB} and V_{BE} are negative.

32. What is the phase shift between the input and output voltage in a common-base small signal amplifier (assuming ideal coupling and bypass capacitors) ?
(a) 180° (b) – 180°
(c) 0° (d) none of these above
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

33. For a CE amplifier, dc load line is which one of the following plots ?
(a) I_C versus V_{CE} for a given value of $(R_C + R_E)$ and V_{CC}
(b) I_B versus V_{BE} for a given value of $(R_C + R_E)$ and V_{CC}
(c) I_B versus V_{CE} for a given value of I_B
(d) I_C versus V_{CB} for a given value of I_E
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

34. Which of the following are true for h-parameters of transistors ?
1. They are real numbers at audio frequencies.
2. They are easy to measure.
3. They vary widely with temperature.
Select the correct answer using the code given below:
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

35. Consider the following parameters of a hybrid-π equivalent circuit of BJT:
1. Transconductance (g_m) 2. h_{fe} 3. h_{ie}
Which of the above parameters vary with temperature in similar manner (all of them decrease or all of them increase) ? Select the correct answer using the code given below :
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

36. Which of the following statement is not correct regarding h-parameters of transistor ?
(a) values of h-parameter cannot be obtained from transistor characteristics.
(b) values depend on transistor configuration.
(c) values depend on operating point.
(d) they are four in number.
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

37. Consider the following statements:
The *h*-parameters of a BJT:
1. Represent the input resistance, output conductance, current gain etc.
2. Can be easily measured in the laboratory.
3. Can be used in circuit analysis over a wide range of frequencies.
4. Constitute a simple small signal model for easy circuit analysis at low frequencies where junction capacitances can be neglected.
Which of these statements are correct?
(a) 1, 2, 3 and 4. (b) 1, 2 and 4.
(c) 1, 3 and 4. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

38. A CE-amplifier has $R_L = 10\text{ k}\Omega$. Given $h_{ie} = 1\text{ k}\Omega$, $h_{fe} = 50$, $h_{re} = 0$ and $1/h_{oe} = 40\text{ k}\Omega$. What is the voltage gain ?
(a) – 500 (b) – 400 (c) – 50 (d) – 40
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

Answers: **21.** (d), **22.** (a), **23.** (d), **24.** (b), **25.** (c), **26.** (b), **27.** (c), **28.** (b), **29,** (a), **30.** (c), **31.** (a), **32.** (c), **33.** (a), **34.** (d), **35.** (b), **36.** (a), **37.** (b) **38.** (b),

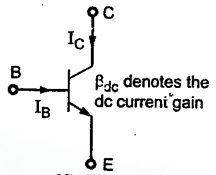
39. Consider the following statements in respect of a CC amplifier:
1. It performs a resistance transformation from low to high resistance.
2. Its current gain is close to unity.
3. Its voltage gain is close to unity.
4. Its frequency range is higher than that of a CE-stage.

Which of the statements is given above are correct ?
(a) 1, 2 and 4. (b) 1 and 3.
(c) Only 2 and 4. (d) 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

40. While using a bipolar junction transistor as an amplifier, the collector and emitter terminals got interchanged mistakenly. Assuming that the amplifier is a common emitter amplifier and the biasing is suitably adjusted, the interchange of terminals will result into which one of the following ?
(a) Zero gain. (b) Infinite gain.
(c) Reduced gain. (d) No change in gain at all.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

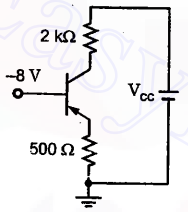
41. If the transistor in the figure is in saturation, then
(a) I_C is always equal to $\beta_{dc} I_B$.
(b) I_C is always equal to $-\beta_{dc} I_B$.
(c) I_C is greater than or equal to $\beta_{dc} I_B$.
(d) I_C is less than or equal to $\beta_{dc} I_B$.



[GATE E.C.E. 2002]

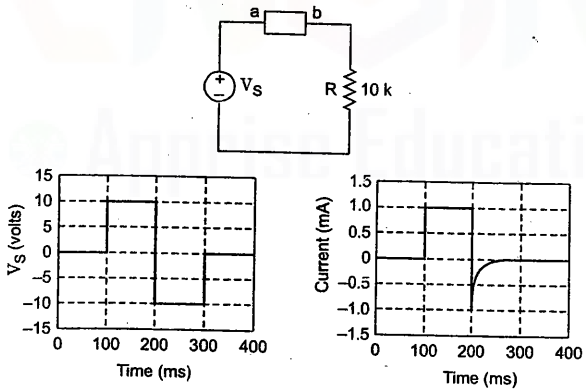
42. Transistor is in saturation when
(a) $I_B = I_C$ (b) $I_B > I_C/\beta_{dc}$
(c) $I_B = 0$ (d) $I_B < I_C/\beta_{dc}$
[G.B.T.U. Elec. Engg. Even Semester 2010-11]

43. The transistor circuit shown in the figure given above is to function as an amplifier. If I_{CQ} = 3 mA, what is the value of V_{CC} (approximate) ?
(a) 15 V
(b) – 15 V
(c) – 10 V
(d) – 13.5 V



[U.P.S.C. I.E.S. E.T.E.-II, 2006]

44. The following circuit has a source voltage V_s as shown in the graph. The current through the circuit is also shown.



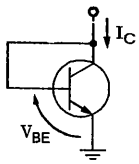
The element connected between *a* and *b* could be

(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2009]

45. Which one of the following statements is not correct ?
(a) Reverse saturation current in a BJT approximately doubles for every 10°C rise in temperature.
(b) The reverse resistance of a junction diode increases with increase in temperature.
(c) Reverse saturation current of a silicon diode is much smaller than that of a germanium diode.
(d) The cut-in voltage of silicon diode is larger than that of germanium.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

46. The neutral base-width of a bipolar transistor, biased in the active region, is 0.5 μm. The maximum electron concentration and the diffusion constant in the base are $10^{14}/cm^3$ and $D_n = 25\ cm^2/sec$ respectively. Assuming negligible recombination in the base, the collector current density is (the electron charge is 1.6×10^{-19} coulomb)
(a) 800 A/cm^2. (b) 8 A/cm^2.
(c) 200 A/cm^2. (d) 2 A/cm^2. [GATE E.C.E. 2004]

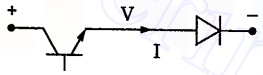
47. For an *npn* transistor connected as shown in the figure, V_{BE} = 0.7 volt.
Given that reverse saturation current of the junction at room temperature 300 K is 10^{-13} A, the emitter current is
(a) 30 mA. (b) 39 mA.
(c) 49 mA. (d) 20 mA. [GATE E.C.E. 2005]



48. When a transistor is used in switching mode then what is the turn-on time?
(a) Sum of delay time and rise time.
(b) Sum of rise time and storage time.
(c) Sum of delay time and storage time.
(d) Sum of rise time and fall time. [U.P.S.C. I.E.S. E.E.-II, 2009]

49. For a transistor, turn-off time is:
(a) Sum of storage time and fall time.
(b) Maximum value of storage time.
(c) Maximum value of fall time.
(d) Sum of rise time and fall time. [U.P.S.C. I.E.S. E.E.-II, 2011]

50. Figure shows a composite switch consisting of a power transistor (BJT) in series with a diode. Assuming that the transistor switch and the diode are ideal, the I-V characteristic of the composite switch is



(a)

(b)

(c)

(d)

[GATE E.E., 2010]

51. Consider the following statements:
The basic purpose of bias stabilization in a transistor circuit is to
1. increase the voltage and current gain of the amplifier.
2. make the operating point of the transistor independent of temperature variation of the transistor.
3. make the operating point independent of the replacement of the same type, Ge or Si.

Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

Answers: **39.** (d), **40.** (c), **41.** (d), **42.** (b), **43.** (d), **44.** (a), **45.** (b), **46.** (b), **47.** (c), **48,** (a), **49.** (a), **50.** (c), **51.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

52. Consider the following statements:
Bias stabilization in a BJT circuit is very important, because it
1. provides high voltage and current gain.
2. ensures large bandwidth of the amplifier.
3. keeps the operating point unchanged with change of temperature.
Which of the statements given above is / are correct ?
(a) 1 and 2 (b) 2 and 3 (c) 3 only (d) 1 and 3
[U.P.S.C. I.E.S. E.T.E.-II, 2003]

53. What is the most noticeable effect of a small increase in temperature in the common emitter connected BJT ?
(a) Increase in I_{CEO}. (b) Increase in output resistance.
(c) Decrease in forward current gain.
(d) Increase in forward current gain. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

54. A biasing circuit has a stability factor of 40. If due to temperature change, I_{CO} changes by 1 μA, then I_C will change by
(a) 20 μA (b) 40 μA (c) 80 μA (d) none of these
[U.P. Technical Univ. 2008-09]

55. In the case of BJT amplifier, bias stability is achieved by
(a) keeping the base current constant.
(b) changing the base current in order to keep I_C and V_{CE} constant.
(c) keeping the temperature constant.
(d) keeping the temperature and base current constant.
[U.P.S.C. I.E.S. E.E.-II, 1998]

56. The voltage divider bias circuit is used in amplifiers quite often because it
(a) limits the ac signal going to the base.
(b) makes the operating point almost independent of β.
(c) reduces the dc base current.
(d) reduces the cost of the circuit.
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

57. A transistor circuit employing base bias with collector feedback has greater stability than the one without feedback. It is because of
(a) reduction of I_C in magnitude. (b) reduction of V_{BE}.
(c) I_C becoming independent of β.
(d) negative feedback effect.

58. The Q-point in a voltage amplifier is selected in the middle of the active region so that
(a) it may give distortionless output.
(b) it may need a small dc voltage.
(c) the operating point becomes very stable.
(d) less number of resistors is required.

59. The emitter resistor R_E is bypassed by a capacitor in order to
(a) stabilize the Q-point. (b) cause thermal run away.
(c) increase the voltage gain. (d) reduce the voltage gain.

60. For a given spread ratio in value of β
(a) low β transistor circuit will be more stable.
(b) high β transistor circuit will be more stable.
(c) both (a) and (b) will be stable.
(d) none of (a) or (b) will be stable.

61. If in a transistor circuit I_B remains constant but β increases
(a) operating point will go down.
(b) operating point will go up.
(c) operating point will not change its position.
(d) operating point will shift as per value of base current I_B.

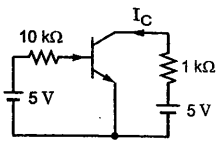
62. Introducing a resistor in the emitter of a common amplifier stabilizes the dc operating point against variations in
(a) only the temperature. (b) only the β of the transistor.
(c) both temperature and β. (d) none of the above.
[GATE E.C.E. 1999]

63. What is the thermal runaway in a bipolar junction transistor biased in the active region due to ?
(a) heating of the transistor emitter region.
(b) changes in β which increases with temperature.
(c) base emitter voltage V_{BE} which decreases with rise in temperature.
(d) increase in reverse collector-base saturation current due to rise in internal device temperature. [U.P.S.C. I.E.S. E.E.-II, 2006]

64. An ideal amplifier
(a) has + ve feedback.
(b) gives uniform frequency response.
(c) has infinite voltage gain.
(d) responds only to signals at its input terminals.

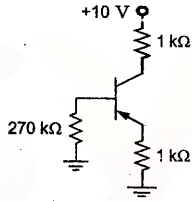
65. In voltage amplifiers the load resistance should be
(a) as large as possible. (b) as small as possible.
(c) equal to output impedance. (d) equal to input impedance.

66. In the *pnp* transistor circuit shown in the given figure, the transistor is in saturation with values of $V_{be} = 0.7$ V, $V_{ce(sat)} = 0.3$ V and $\beta_{min} = 20$. The value of I_C will be



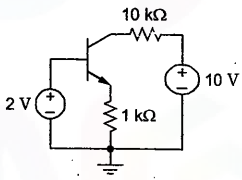
(a) 4.7 mA (b) 5.3 mA
(c) 8.6 mA (d) 10 mA [U.P.S.C. I.E.S. E.E.-II, 2000]

67. The common emitter forward current gain of the transistor shown is $\beta_F = 100$.
The transistor is operating in



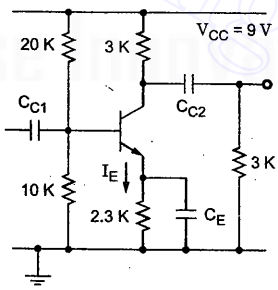
(a) Saturation region.
(b) Cutoff region.
(c) Reverse active region.
(d) Forward active region. [GATE E.E.E., 2007]

68. For the BJT circuit shown, assume that the β of the transistor is very large and $V_{BE} = 0.7$ V. The mode of operation of the BJT is



(a) cutoff.
(b) saturation.
(c) normal active.
(d) reverse active. [GATE E.C.E. 2007]

Statement for linked Answer Questions 69 and 70.
In the following transistor circuit, $V_{BE} = 0.7$ V, $r_e = 25$ mV/I_E, and β and all the capacitances are very large.



69. The value of dc current I_E is
(a) 1 mA (b) 2 mA (c) 5 mA (d) 10 mA
[GATE E.C.E. 2008]

70. The midband voltage gain of the amplifier is approximately
(a) – 180 (b) – 120 (c) – 90 (d) – 60
[GATE E.C.E. 2008]

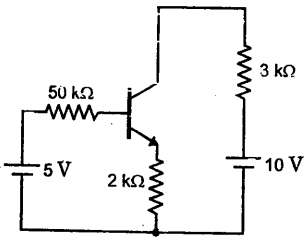
Answers: **52.** (c), **53.** (a), **54.** (b), **55.** (b), **56.** (b), **57.** (d), **58.** (a), **59.** (a), **60.** (b), **61.** (b), **62.** (c), **63.** (d), **64.** (d), **65.** (a), **66.** (a), **67.** (d), **68.** (b), **69.** (a), **70.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

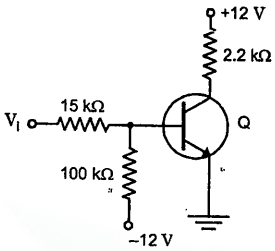
71. Operating point shift can occur in an amplifier due to which one of the following ?
(a) input frequency variation.
(b) Noise at the input.
(c) Parasitic capacitances.
(d) Power supply fluctuation.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

72. For the circuit shown in figure given below, assume $\beta = h_{FE} = 100$. The transistor is in
(a) active region and $V_{CE} = 5$ V.
(b) saturation region.
(c) active region and $V_{CE} = 1.42$ V.
(d) cutoff region.



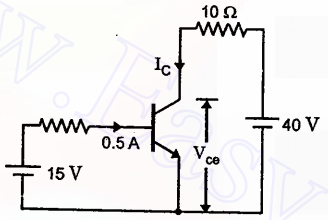
[U.P.S.C. I.E.S. E.E.-II, 2005]

73. Consider the circuit shown in figure. If the β of the transistor is 30 and I_{CBO} is 20 nA and the input voltage is +5 V, the transistor would be operating in
(a) saturation region.
(b) active region.
(c) breakdown region.
(d) cutoff region.



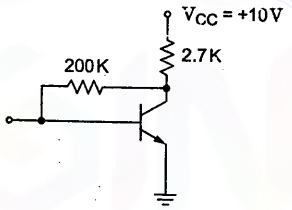
[GATE E.E. 2006]

74. In the circuit shown in the figure, the current gain (β) of the ideal transistor is 10. The operating point of the transistor (V_{ce}, I_c) is
(a) (40 V, 4 A)
(b) (40 V, 5 A)
(c) (0 V, 4 A)
(d) (15 V, 4 A)



[GATE E.E. 2003]

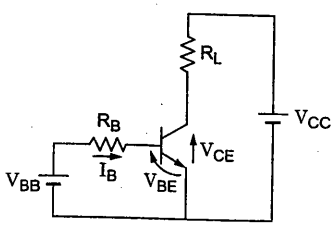
75. In the circuit as shown β = 99, $V_{BE} = 0.6$ V, then what are the values of V_C and I_C corresponding to the operating point?
(a) 4.6 V and 1.98 mA
(b) 4.7 V and 2.00 mA
(c) 5.4 V and 1.56 mA
(d) 4.2 V and 2.1 mA



[U.P.S.C. I.E.S. E.E.-II, 2009]

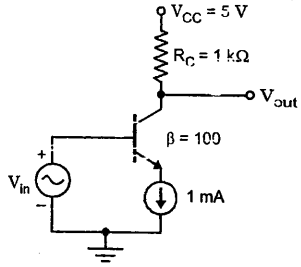
76. In a certain self biased Si npn transistor the dc base voltage is 3.2 V then what is the dc emitter voltage? (Assume the transistor is in linear active mode)
(a) 0.7 V
(b) 2.5 V
(c) 3.2 V
(d) 3.9 V
[U.P.S.C. I.E.S. E.E.-II, 2009]

77. β of a BJT varies from 15 to 65. $R_L = 10\ \Omega$, $V_{CC} = 120$ V and $V_{BB} = 8$ V. If $V_{CE(Sat)} = 1.5$ V and $V_{BE(Sat)} = 1.75$ V, then what is the value of R_B that will result in saturation with an overdrive factor of 10?

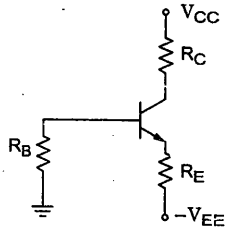


(a) 7.9 Ω
(b) 0.79 Ω
(c) 79 Ω
(d) 7.9 kΩ
[U.P.S.C. I.E.S. E.E.-II, 2009]

78. The common emitter amplifier shown in figure is biased using a 1 mA ideal current source. The approximate base current value is
(a) 0 μA
(b) 10 μA
(c) 100 μA
(d) 1,000 μA [GATE E.E. 2005]

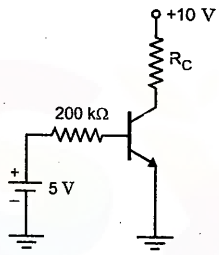


79. The Si transistor as shown in the circuit has β = 50 and negligible leakage current. If $V_{CC} = 18$ V, $V_{EE} = 4$ V, $R_E = 200\ \Omega$, $R_C = 4$ kΩ, $R_B = 72$ kΩ, what is the value of the quiescent collector current I_{CQ}?
(a) 1.1 mA
(b) 2 mA
(c) 5 mA
(d) 3.6 mA

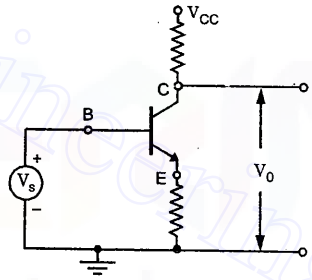


[U.P.S.C. I.E.S. E.E.-II, 2009]

80. A silicon transistor with $V_{BE\,sat} = 0.8$ V, $\beta_{dc} = 100$ and $V_{CE\,sat} = 0.2$ V is used in the circuit shown in given figure. What is the minimum value of R_C for which transistor is in saturation ?
(a) 4286 Ω (b) 4667 Ω
(c) 500 Ω (d) 1000 Ω
[U.P.S.C. I.E.S. E.E.-II, 2004]

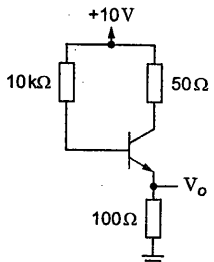


81. In the circuit given below, if the output is taken from point E instead of node C, what will be the result?



(a) an increase in the output impedance.
(b) a reduction in the output impedance.
(c) an increase in the input impedance.
(d) a reduction in the input impedance. [U.P.S.C. I.E.S. E.E.-III, 2006]

82. The transistor circuit shown uses a silicon transistor with $V_{BE} = 0.7$ V, $I_C \approx I_E$ and a dc current gain of 100. The value of V_o is



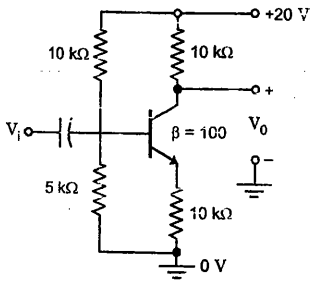
(a) 4.65 V
(b) 5 V
(c) 6.3 V
(d) 7.32 V
[GATE E.E., 2010]

Answers: **71.** (d), **72.** (b), **73.** (b), **74.** (c), **75.** (a), **76.** (b), **77.** (b), **78.** (b), **79.** (b), **80.** (b), **81.** (b), **82.** (a),

Downloaded From : www.EasyEngineering.net

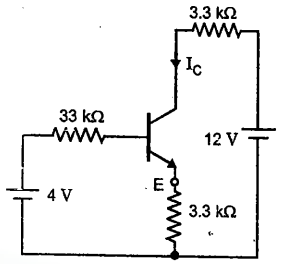
Downloaded From : www.EasyEngineering.net

83. Consider a silicon transistor connected as a common emitter amplifier as shown below.



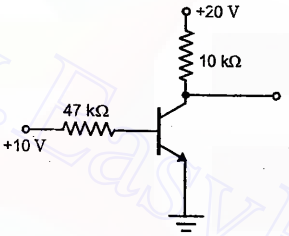
The quiescent collector voltage of the circuit is approximately
(a) 6.67 V
(b) 10 V
(c) 14 V
(d) 20 V
[U.P.S.C. I.E.S. E.E.-II, 2003]

84. In the circuit of figure shown below, assume that the transistor has $h_{FE} = 99$ and $V_{BE} = 0.7$ V. The value of collector current. I_C of the transistor is approximately.



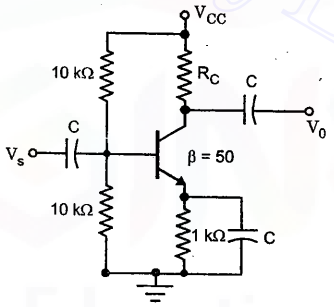
(a) [3.3/3.3] mA
(b) [3.3/(3.3 + 0.33)] mA
(c) [3.3/33] mA
(d) [3.3/(33 + 3.3)] mA
[GATE E.E. 2003]

85. In the transistor circuit shown below, the collector-to-ground voltage is +20 V. The possible condition is



(a) collector-emitter terminal shorted.
(b) emitter-to-ground connection open.
(c) 10 kΩ resistor open.
(d) collector-base terminals shorted.
[U.P.S.C. I.E.S. E.E.-II, 2003]

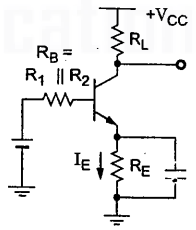
86. The transconductance g_m of the transistor shown in the figure is 10 mS. The value of input resistance R_{in} is



(a) 10.0 kΩ
(b) 8.3 kΩ
(c) 5.0 kΩ
(d) 2.5 kΩ [GATE E.E 2004]

87. Fixed biasing of CE configuration is shown in the figure. The current stabilization factor for

$$R_B << \beta R_E \text{ is } S_i = 1 + \frac{R_B}{R_E}$$



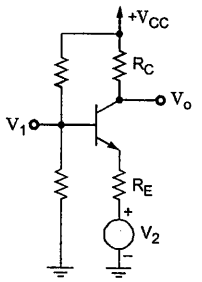
For $R_B << R_E$. What is the voltage stabilization factor S_V ?

(a) $= \dfrac{R_E}{R_B + R_E}$ (b) $= \dfrac{R_B}{R_E}$

(c) $\simeq -\dfrac{1}{R_E}$ (d) $\simeq -\dfrac{R_E}{R_B + R_E}$

[U.P.S.C. I.E.S. E.E.-II, 2007]

88. In the circuit as shown above, the ratio of V_0 to $(V_2 - V_1)$ would approximately (neglecting constant due to V_{CC}) be

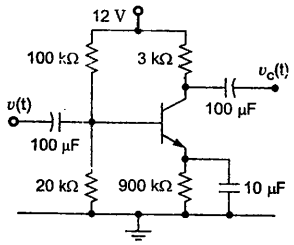


(a) $\dfrac{R_C}{R_E}$ (b) $\dfrac{R_E}{R_C}$

(c) $\dfrac{-R_C}{R_E}$ (d) $\dfrac{-R_E}{R_C}$

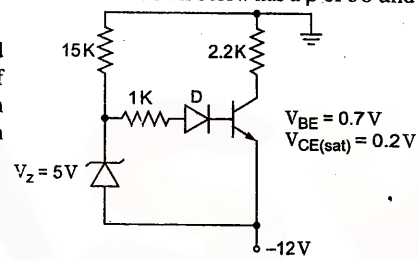
[U.P.S.C. I.E.S. E.E.-II, 2003]

89. A small signal source $v_i(t) = A \cos 20t + B \sin 10^6 t$ is applied to a transistor amplifier as shown in figure. The transistor has $\beta = 150$ and $h_{ie} = 3$ kΩ. Which expression best approximates $v_o(t)$?



(a) $v_o(t) = -1500(A \cos 20t + B \sin 10^6 t)$
(b) $v_o(t) = -150(A \cos 20t + B \sin 10^6 t)$
(c) $v_o(t) = -1500\ B \sin 10^6 t$
(d) $v_o(t) = -150\ B \sin 10^6 t$
[GATE E.C.E. 2009]

90. The transistor used in the circuit shown below has a β of 30 and I_{CBO} is negligible.

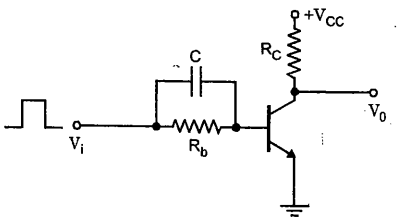


If the forward voltage drop of diode is 0.7 V, then the current through collector will be
(a) 168 mA
(b) 108 mA
(c) 20.54 mA
(d) 5.36 mA
[GATE E.E., 2011]

91. When used for amplification, the output port side of a BJT behaves as controlled current source. According to the above, the variation of which one of the following does not change the output current of an ideal BJT ? (The BJT is being used in a common emitter amplifier circuit)
(a) Load resistance. (b) Collector to base bias voltage.
(c) Both load resistance and collector to base bias voltage.
(d) Base-emitter bias voltage. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

92. Which one of the following statements is correct in respect of a BJT ?
(a) Avalanche multiplication starts when the reverse biased collector base voltage V_{CB} equals the avalanche breakdown voltage BV_{CBO}.
(b) The Early effect starts as soon as punch through occurs in a transistor.
(c) The small signal current gain h_{fe} = large signal current gain h_{FE} when $\partial h_{FE}/\partial_{I_C} = 0$.
(d) In the CE mode, a transistor can be cutoff by reducing I_B to zero. [U.P.S.C. I.E.S. E.E.-II, 2006]

93. In the circuit shown in the figure, the function of the capacitor C connected in parallel with R_b is to



Answers: **83.** (c), **84.** (b), **85.** (b), **86.** (c), **87.** (c), **88.** (c), **89.** (b), **90.** (d), **91.** (c), **92.** (d), **93.** (d),

(a) keep the transistor into saturation.
(b) keep the transistor into cut-off.
(c) reduce the switching time while the transistor makes a transition from ON to OFF state.
(d) reduce the switching time while the transistor makes a transition from ON to OFF state and vice versa.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

94. When $f = f_\beta$, A_i is equal to
(a) $\frac{1}{2}$ of low frequency value of h_{fe}.
(b) $\frac{1}{\sqrt{2}}$ of low frequency value of h_{fe}.
(c) twice of low frequency value of h_{fe}.
(d) low frequency value of h_{fe}.

95. Which one of the following is the available noise power produced by a noisy resistor R? [k = Boltzmann Constant, T = Temperature and B = Bandwidth]
(a) kTB (b) 4 kTB (c) 4 kTBR (d) 2 kTBR
[U.P.S.C. I.E.S. E.E.-II, 2006]

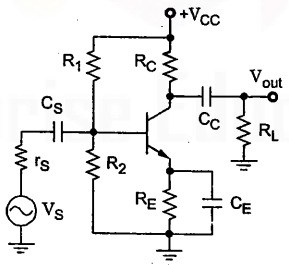
96. In a transconductance amplifier, it is desirable to have
(a) a large input resistance and a large output resistance
(b) a large input resistance and a small output resistance
(c) a small input resistance and a large output resistance
(d) a small input resistance and a small output resistance
[GATE E.C.E. 2007]

97. For a transconductance amplifier, input and output resistances are respectively
(a) ∞ and 0 (b) 0 and ∞
(c) 0 and 0 (d) ∞ and ∞
[U.P.S.C. I.E.S. E.E.-II, 2011]

98. An amplifier has a power gain of 200. What is its gain in dB? ($\log_{10}2 \approx 0.30$)
(a) 14 dB (b) 17 dB (c) 20 dD (d) 23 dB
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

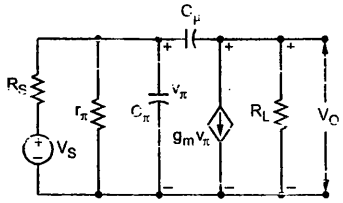
99. In an amplifier, the increase in gain is 12 dB if the frequency doubled. If the frequency is increased by 10 times, then the increase in gain will be
(a) 2.4 dB (b) 20 dB (c) 40 dB (d) 60 dB
[U.P.S.C. I.E.S. E.E.-II, 2000]

100. For the amplifier shown in the figure, the lower cut-off frequency depends on which of the following ?



(a) C_S, C_E, internal junction capacitances of transistor.
(b) Stray wiring capacitance (C_W), C_C.
(c) C_S, C_E, C_C.
(d) C_S, C_E only.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

101. Consider the following statements :
The circuit in the figure is the high frequency equivalent of a CE amplifier. If the upper cutoff frequency $\omega_H = 1/T$ where T = RC, then
1. $R = R_s + r_\pi$ 2. $R = R_s \| r_\pi$
3. $C = C_\pi + C_\mu$ 4. $C = C_\pi + C_\mu(1 + g_m R_1)$



Which of these statements are correct ?
(a) 1 and 3 (b) 1 and 4 (c) 2 and 3 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 1999]

102. A resistance R_f is connected across the collector and base of a BJT amplifier of gain – A(A > 0). The input impedance of the amplifier will consist of transistor internal resistance $r_{b'e}$ shunted by which one of the following ?
(a) $R_f(1 + A)$ (b) $R_f(1 - A)$
(c) $\frac{R_f}{(1+A)}$ (d) $\frac{R_f}{(1-A)}$
[U.P.S.C. I.E.S. E.E.-II, 2008]

103. Following transistor parameters were measured at $I_c = 5$ mA, $V_{CE} = 10$ V, $h_{fe} = 100$, $[A_I] = 10$ at 10 M rad/s. What is the value for $(C_e + C_c)$, if the unity-gain frequency $\omega_T = \frac{g_m}{C_e + C_c}$?
(a) 20 nF (b) 2 nF (c) 5 pF (d) 5 nF
[U.P.S.C. I.E.S. E.E.-II, 2007]

104. The current gain of a BJT is
(a) $g_m r_o$ (b) $\frac{g_m}{r_o}$ (c) $g_m r_\pi$ (d) $\frac{g_m}{r_\pi}$
[GATE E.C.E. 2001]

105. Generally, the gain of a transistor amplifier falls at high frequencies due to the
(a) internal capacitances of the device.
(b) coupling capacitor at the input.
(c) skin effect.
(d) coupling capacitor at the output.
[GATE E.C.E. 2003]

106. In the hybrid-π model for the transistor in CE configuration $r_{bb'}$ is used to account for the
(a) increased recombination base current.
(b) broad frequency reaction.
(c) bias resistance.
(d) ohmic base-spreading resistance.
[A.M.I.E. Sec B. Electronics Circuits Summer 2006]

107. The widths of the base in a GaAs transistor and in a Si transistor (both *n-p-n* type) are equal. GaAs transistor works at higher frequency.
Which one of the following is the correct statement ?
(a) The band gap of GaAs is higher than that of Si.
(b) The base transit time is lower in GaAs.
(c) The negative differential mobility in GaAs favours operation at very high frequency.
(d) Si transistor works at higher frequency compared to GaAs transistor.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

108. The action of a JFET in its equivalent circuit can best be represented as a
(a) Current Controlled Current Source
(b) Current Controlled Voltage Source
(c) Voltage Controlled Voltage Source
(d) Voltage Controlled Current Source
[GATE E.C.E. 2003]

Answers: **94.** (b), **95.** (c), **96.** (a), **97.** (d), **98.** (d), **99.** (c), **100.** (c), **101.** (d), **102.** (c), **103.** (c), **104.** (c), **105.** (a), **106.** (d), **107.** (a), **108.** (d),

109. Consider the following statements :
FETs when compared to BJTs have
1. high input impedance.
2. current flow due to majority carriers.
3. low input impedance.
4. current flow due to minority carriers.
Which of the statements given above are correct ?
(a) 1 and 4 (b) 2 and 3 (c) 3 and 4 (d) 1 and 2
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

110. Compared to the bipolar junction transistor, a JFET:
1. Has a larger gain bandwidth production.
2. Is less noisy.
3. Has less input resistance.
4. Has current flow due to only majority carriers.
(a) 1, 2, 3 and 4 are correct. (b) 1 and 2 are correct.
(c) 2 and 4 are correct. (d) 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 2011]

111. A FET
(a) incorporates a forward-biased junction.
(b) uses a high-concentration emitter junction.
(c) depends on the variation of a magnetic field for its operation.
(d) depends on the variation of the depletion layer width with reverse voltage for its operation.

112. An N-type FET is never operated with positive gate voltage w.r.t. the source because
(a) gate to source current is to be avoided.
(b) drain current becomes very high.
(c) drain current does not increase.

113. Mobility of electrons in N-channel JFET and mobility of holes is P-channel JFET are
(a) large, poor. (b) poor, large.
(c) large, large. (d) poor, poor.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

114. When the positive voltage on the gate of a *p*-channel JFET is increased, its drain current:
(a) increases. (b) decreases.
(c) remains the same. (d) none of the above.
[U.P.T.U. Elec. Engg. Even Semester 2009-10]

115. The small value of drain-to-source voltage, JFET behaves like a
(a) resistor. (b) constant current source.
(c) constant voltage source. (d) negative resistance.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

116. N-channel FETs are superior to P-channel FETs because they have
(a) lower switching time. (b) lower pinch-off voltage.
(c) higher input impedance.
(d) mobility of electrons in N-channel is greater than mobility of holes in P-channel.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

117. The drain-source voltage at which drain current becomes nearly constant, is called
(a) barrier voltage. (b) breakdown voltage.
(c) pick-off voltage. (d) pinch-off voltage.
[U.P.S.C. I.E.S. E.E.-II, 1998]

118. In a JFET drain current is maximum when V_{GS} is
(a) zero. (b) negative. (c) positive. (d) equal to V_P.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

119. The shape of the transfer characteristic of JFET is very nearly a
(a) hyperbola. (b) straight line.
(c) parabola. (d) none of the above.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2005]

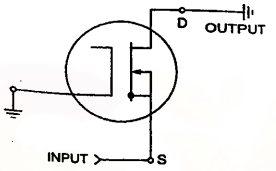
120. The pinch-off voltage $V_P = +6$ V for a P-channel JFET. If $V_{GS} = +2$ V, what is the value of V_{DS} at which it will enter into saturation region ?
(a) –6 (b) –4 V (c) +8 V (d) + 4 V
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

121. An *n*-channel JFET has $I_{DSS} = 2$ mA, $V_p = -4$ V. Its transconductance g_m (in mA/V) for an applied gate to source voltage V_{GS} of –2 V is
(a) 0.25 (b) 0.5 (c) 0.76 (d) 1.0
[GATE E.C.E. 1999]

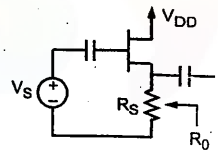
122. An N-channel JFET, having a pinch-off voltage (V_P) of –5 V, shows a transconductance (g_m) of 1 mA/V when the applied gate-to-source voltage (V_{GS}) is –3 V. Its maximum transconductance (in mA/V) is
(a) 1.5 (b) 2.0 (c) 2.5 (d) 3.0
[GATE E.E. 2001]

123. The data sheet for a certain JFET (Junction Field Effect Transistor) indicates that I_{DSS} (drain to source current with gate shorted) = 15 mA and V_{GS}(off) (cut-off value of gate to source voltage) = – 5 V. What is the drain current for $V_{GS} = -2$ V ?
(a) 58.8 mA (b) 29.4 mA (c) 9.6 mA (d) 5.4 mA
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

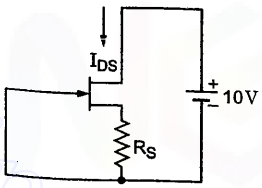
124. The FET shown is a
(a) Common drain.
(b) Common gate.
(c) Common source.
(d) Common source follower.
[U.P.S.C. I.E.S. E.E.-II, 2010]



125. For the circuit shown in figure, if $g_m = 3 \times 10^{-3}$ and $R_S = 3000\ \Omega$, then what is the value of R_o ?
(a) 3000 Ω (b) 1000/3 Ω
(c) 300 Ω (d) 100 Ω
[U.P.S.C. I.E.S. E.T.E.-II, 2006]



126. The JFET in the circuit shown has an $I_{DSS} = 10$ mA, $V_P = 5$ V. The value of the resistance R_S for a drain current of $I_{DS} = 6.4$ mA is
(a) 1.06 kΩ
(b) 560 Ω
(c) 470 Ω
(d) 156 Ω [U.P.S.C. I.E.S. E.E.-II, 2010]



127. In a JFET, drain current is primarily controlled by
(a) size of depletion region. (b) channel resistance.
(c) gate reverse bias. (d) voltage drop across channel.

128. In a JFET, increase in applied external bias to the gate causes
(a) decrease in size of depletion regions.
(b) increase in drain current.
(c) decrease in channel resistance.
(d) decrease in drain current to achieve pinch-off voltage.

129. JFET has main drawback of
(a) having low input impedance.
(b) having high output impedance.
(c) being noisy.
(d) having small gain-bandwidth product.

130. Thermal runaway is not encountered in FETs because
(a) I_{DS} has a zero temperature coefficient.
(b) I_{DS} has a negative temperature coefficient.
(c) I_{DS} has a positive temperature coefficient.
(d) the mobility of the carriers increases with increase in temperature.
[U.P.S.C. I.E.S. E.E.-II, 2010]

Answers: **109.** (d), **110.** (c), **111.** (d), **112.** (a), **113.** (c), **114.** (b), **115.** (a), **116.** (d), **117.** (d), **118.** (a), **119.** (a), **120.** (c), **121.** (b), **122.** (c), **123.** (d), **124.** (b), **125.** (c), **126.** (d), **127.** (c), **128.** (d), **129.** (d), **130.** (a),

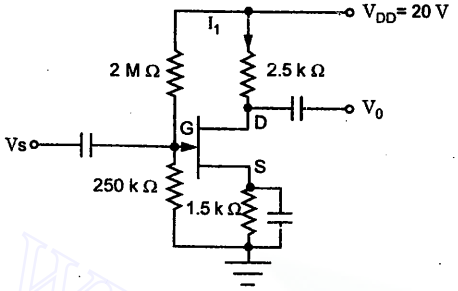
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

131. How is an N-channel junction field effect transistor operated as an amplifier ?
(a) With a forward bias gate-source junction.
(b) With a reverse bias gate-source junction.
(c) With an open gate-source junction.
(d) With a shorted gate-source junction. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

132. What is the main advantage of a JFET cascade amplifier ?
(a) High voltage gain. (b) Low output impedance.
(c) Very low input capacitance.
(d) High input impedance. [U.P.S.C. I.E.S. E.T.E.-II, 2005]

133. FET voltage divider bias circuit is shown in the given figure. If $I_D = 4$ mA, then V_{GS} and V_{DS} will be respectively



(a) – 3.78 V and 4 V. (b) 4 V and – 3.78 V.
(c) – 3.78 V and – 4 V. (d) – 4 V and – 3.78 V.
[U.P.S.C. I.E.S. E.E.-II, 2000]

134. A JFET is set up as a follower, with $\mu = 200$, $r_d = 100$ K and source load resistor $R_L = 1$ K. The output resistance R_o is
(a) 1,000 Ω (b) 500 Ω
(c) 333 Ω (d) 666 Ω
[U.P.S.C. I.E.S. E.E.-II, 2010]

135. In a CS amplifier, $V_{ds} = 4.2\ V_{rms}$ and $V_{gs} = 140\ mV_{rms}$, the voltage gain is
(a) 4.2 (b) 42
(c) 30 (d) 3
[G.B.T.U. Elec. Engg. Even Semester 2010-11]

136. A source follower using a FET usually has a voltage gain which is
(a) greater than +100.
(b) slightly less than unity but positive.
(c) exactly unity but negative.
(d) about –10. [U.P.S.C. I.E.S. E.E.-II, 1994]

137. In an FET common-source high frequency amplifier, which one of the following is the correct expression for input capacitance C_i?
(a) $C_i = C_{gs} + (1 - A_v)C_{gd}$ (b) $C_i = C_{gs} + (1 - 1/A_v)C_{gd}$
(c) $C_i = C_{gd} + (1 - A_v)C_{gs}$ (d) $C_i = C_{gd} + (1 - 1/A_v)C_{gs}$
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

138. The drain gate capacitance of a junction FET is 2 pF. Assuming a common source voltage gain of 20, what is the input capacitance due to Miller effect ?
(a) 21 pF (b) 40 pF (c) 42 pF (d) 10 pF
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

139. The unity gain bandwidth f_T of FET is given by
(a) $g_m/2\ pC_{sg}$ (b) $C_{sg}/2p\ g_m$
(c) $g_m/2\ pf\ C_{sg}$ (d) $C_{sg}/2\ pf\ g_m$
[a.m.i.e. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

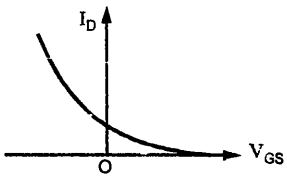
140. For the operation of N-channel E-MOSFET it is necessary that gate voltage is
(a) highly negative. (b) highly positive.
(c) low positive. (d) zero.

141. The extremely high input impedance of a MOSFET is primarily because of
(a) absence of its channel. (b) depletion of current carriers.
(c) extremely small leakage current of its gate capacitor.
(d) – ve V_{GS}.

142. Which one of the following statements is NOT correct for a MOSFET?
(a) Are easy to parallel for higher current.
(b) Leakage current is relatively high.
(c) Have more linear characteristic.
(d) Overload and peak current handling capability are high.
[U.P.S.C. I.E.S. E.E.-II, 2011]

143. MOSFET can be used as a
(a) current controlled capacitor.
(b) voltage controlled capacitor.
(c) current controlled inductor.
(d) voltage controlled inductor. [GATE E.C.E. 2001]

144. The variation of drain current with gate-to-source voltage ($I_D - V_{GS}$) characteristic of a MOSFET is shown in the figure. The MOSFET is



(a) an *n*-channel depletion mode device.
(b) an *n*-channel enhancement mode device.
(c) a *p*-channel depletion mode device.
(d) a *p*-channel enhancement mode device. [GATE E.E. 2003]

145. What is the main difference between MOSFETs and BJTs in terms of their I-V characteristics ?
(a) Current is quadratic with V_{GS} for MOSFETs and linear with V_{BE} for BJTs.
(b) Current is linear with V_{GS} for MOSFETs and exponential with V_{BE} for BJTs.
(c) Current is exponential with V_{GS}/V_{BE} in both these devices but rise is faster in MOSFETs.
(d) Current is quadratic with V_{GS} for MOSFETs and exponential with V_{BE} for BJTs. [U.P.S.C. I.E.S. E.E.-II, 2006]

146. Consider the following statements :
1. BJT is a current controlled device with a high input impedance and high gain bandwidth.
2. FET is a voltage controlled device with high input impedance and low gain bandwidth.
3. UJT is a negative resistance device and can be used as an oscillator.
4. BJT, FET and UJT can all be used for amplification.
Which of the statements given above are correct ?
(a) 1 and 2 (b) 2 and 3 (c) 3 and 4 (d) 1 and 4
[U.P.S.C. I.E.S. E.E.-II, 2005]

147. Which one of the following has the highest input resistance?
(a) NPN transistor in CB configuration.
(b) PNP transistor is CE configuration.
(c) N type channel JFET. (d) P type channel MOSFET.
[U.P. Technical Univ. 2008-09]

148. The lower turn off time of MOSFET when compared to BJT can be attributed to which one of the following ?
(a) Input impedance.
(b) Positive temperature coefficient.
(c) Absence of minority carriers.
(d) On-state resistance. [U.P.S.C. I.E.S. E.E.-II, 2007]

149. The effective channel length of a MOSFET in saturation decreases with increase in
(a) gate voltage. (b) drain voltage.
(c) source voltage. (d) body voltage.
[GATE E.C.E. 2001]

Answers: **131.** (b), **132.** (a), **133.** (a), **134.** (c), **135.** (b), **136.** (b), **137.** (a), **138.** (c), **139.** (d), **140.** (b), **141.** (c), **142.** (b), **143.** (b), **144.** (c), **145.** (d), **146.** (b), **147.** (d), **148.** (c), **149.** (b),

150. In a MOSFET, the transfer characteristics can be used to determine which of the following device parameters ?
(a) Threshold voltage and output resistance.
(b) Transconductance and output resistance.
(c) Threshold voltage and transconductance.
(d) Transconductance and channel length modulation parameters.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

151. In *n*-channel enhancement MOSFET, at a fixed drain voltage
(a) the drain current is maximum at zero gate voltage and it decreases with applied negative gate voltage.
(b) the drain current has a finite value at zero gate voltage and it increases or decreases with the applied voltage of proper polarity.
(c) the drain current is zero at zero gate voltage and it increases with the positive applied gate voltage.
(d) the drain current is zero for negative bias voltage to gate and it increases at the negative gate bias is decreased in magnitude.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

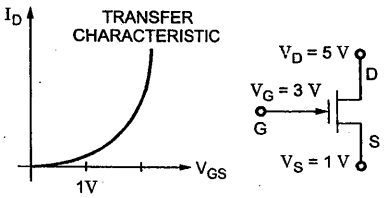
152. Which one of the following gain equations is correct for a MOSFET common-source amplifier ? (g_m is mutual conductance, and R_D is load resistance at the drain)
(a) $A_V = g_m/R_D$ (b) $A_V = g_m R_D$
(c) $A_V = g_m/(1 + R_D)$ (d) $A_V = R_D/g_m$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

153. The drain current of a MOSFET in saturation is given by $I_D = K(V_{GS} - V_T)^2$ where K is a constant. The magnitude of the transconductance g_m is
(a) $\dfrac{K(V_{GS} - V_T)^2}{V_{DS}}$ (b) $2K(V_{GS} - V_T)$
(c) $\dfrac{I_D}{V_{GS} - V_{DS}}$ (d) $\dfrac{K(V_{GS} - V_T)^2}{V_{GS}}$
[GATE E.C.E. 2008]

154. For an *n*-channel enhancement type MOSFET, if the source is connected at a higher potential than that of the bulk (i.e. $V_{SB} > 0$), the threshold voltage V_T of the MOSFET will
(a) remain unchanged. (b) decrease.
(c) change polarity. (d) increase. [GATE E.C.E. 2003]

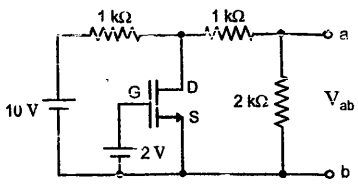
155. Consider the following two statements about the internal conditions in an n-channel MOSFET operating in the active region.
S_1 : The inversion charge decreases from source to drain.
S_2 : The channel potential increases from source to drain .
Which of the following is correct ?
(a) Only S_2 is true. (b) Both S_1 and S_2 are false.
(c) Both S_1 and S_2 are true, but S_2 is not a reason for S_1.
(d) Both S_1 and S_2 are true, and S_2 is a reason for S_1.
[GATE E.C.E. 2009]

156. For an *n*-channel MOSFET and its transfer curve shown in the figure, the threshold voltage is



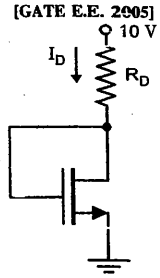
(a) 1 V and the device is in active region.
(b) –1 V and the device is in saturation region.
(c) 1 V and the device is in saturation region.
(d) –1 V and the device is in active region. [GATE E.C.E. 2005]

157. Assume that the N-channel MOSFET shown in the figure is ideal and that its threshold voltage is +1.0 V. The voltage V_{ab} between nodes *a* and *b* is



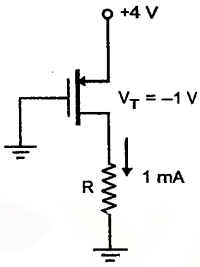
(a) 5 V (b) 2 V (c) 1 V (d) 0 V
[GATE E.E. 2005]

158. For the N-channel enhancement mode shown in the figure, the threshold voltage $V_{Th} = 2$ V. The drain current I_D of the MOSFET is 4 mA when the drain resistance R_D is 1 kΩ. If the value of R_D is increased to 4 kΩ, drain current I_D will become



(a) 2.8 mA
(b) 2.0 mA
(c) 1.4 mA
(d) 1.0 mA [GATE E.E. 2003]

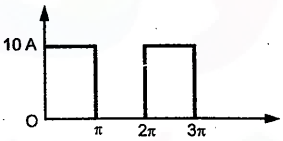
159. The value of R for which the PMOS transistor in the figure will be biased in linear region is



(a) 220 Ω (b) 470 Ω
(c) 680 Ω (d) 1200 Ω
[GATE E.E. 2004]

160. The conduction loss versus device current characteristic of a power MOSFET is best approximated by
(a) a parabola. (b) a straight line.
(c) a rectangular hyperbola.
(d) an exponentially decaying function. [GATE E.E. 2005]

161. A MOSFET rated for 15 A, carries a periodic current as shown in the figure. The ON state resistance of the MOSFET is 0.15 Ω. The average ON state loss in the MOSFET is



(a) 33.8 W (b) 15 W (c) 7.5 W (d) 3.8 W
[GATE E.E. 2004]

162. For frequency around 100 GHz MESFETs generally are
(a) Si (b) Ge (c) GaAs (d) AlGaP
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

163. A MOS capacitor made using *p* type substrate is in the accumulation mode. The dominant charge in the channel is due to the presence of
(a) holes. (b) electrons.
(c) positively charged ions. (d) negatively charged ions.
[GATE E.C.E. 2005]

164. Consider the following statements S_1 and S_2
S_1 : The threshold voltage (V_T) of a MOS capacitor decreases with increase in gate oxide thickness.
S_2 : The threshold voltage (V_T) of a MOS capacitor decreases with increase in substrate doping concentration.
Which one of the following is correct ?
(a) S_1 is FALSE and S_2 is TRUE.
(b) Both S_1 and S_2 are TRUE.
(c) Both S_1 and S_2 are FALSE.
(d) S_1 is TRUE and S_2 is FALSE. [GATE E.C.E. 2004]

165. The modified work function of an *n*-channel MOSFET is –0.85 V. If the interface charge is 3×10^{-4} C/m^2 and the oxide capacitance is 300 μF/m^2, the flat band voltage is
(a) –1.85 V (b) –0.15 V (c) +0.15 V (d) +1.85 V
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **150.** (c), **151.** (c), **152.** (b), **153.** (b), **154.** (d), **155.** (d), **156.** (c), **157.** (d), **158.** (c), **159.** (d), **160.** (a), **161.** (c), **162.** (c), **163.** (a), **164.** (d), **165.** (d),

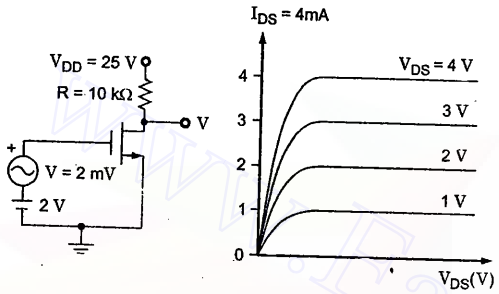
166. An n-channel depletion MOSFET has following two points on its $I_D - V_{GS}$ curve :
(i) $V_{GS} = 0$ at $I_D = 12$ mA and (ii) $V_{GS} = -6$ Volts at $Z_0 = \infty$
Which of the following Q-points will give the highest trans-conductance gain for small signals ?
(a) $V_{GS} = -6$ Volts. (b) $V_{GS} = -3$ Volts.
(c) $V_{GS} = 0$ Volts. (d) $V_{GS} = 3$ Volts.
[GATE E.C.E. 2006]

167. The drain of an n-channel MOSFET is shorted to the gate so that $V_{GS} = V_{DS}$. The threshold voltage (V_T) of MOSFET is 1 V. If the drain current (I_D) is 1 mA for $V_{GS} = 2$ V, then for $V_{GS} = 3$ V, I_D is
(a) 2 mA (b) 3 mA (c) 9 mA (d) 4 mA
[GATE E.C.E. 2004]

Data for Q. 168 and Q. 169 are given below. Solve the problems and choose the correct answers.
Assume that the threshold voltage of the N-channel MOSFET shown in figure is +0.75 V. The output characteristics of the MOSFET are also shown



168. The transconductance of the MOSFET is
(a) 0.75 mS (b) 1 mS (c) 2 mS (d) 10 mS
[GATE E.E. 2005]

169. The voltage gain of the amplifier is
(a) +5 (b) –7.5 (c) +10 (d) –10
[GATE E.E. 2005]

170. The cascode amplifier is a multistage configuration of
(a) CC-CB (b) CE-CB (c) CB-CC (d) CE-CC
[GATE E.C.E. 2005]

171. Two MOSFETs M_1 and M_2 are connected in parallel to carry a total current of 20 A. The drain to source voltage of M_1 is 2.5 V and that of M_2 is 3 V. What are the drain currents of M_1 and M_2 when the current sharing series resistances are each of 0.5 Ω?
(a) 10.5 A and 9.5 A (b) 9.5 A and 10.5 A
(c) 10.5 A and 10.5 A (d) 9.5 A and 9.5 A
[U.P.S.C. I.E.S. E.E.-II, 2009]

172. If the amplification of a single stage is not sufficient or the input or output impedance is not of the correct magnitude for the intended application how may two stages be connected to achieve desired result?
(a) Cascode connection.
(b) Complementary symmetry connection.
(c) Cascade connection.
(d) Totem pole connection.
[U.P.S.C. I.E.S. E.E.-II, 2009]

173. What is the effect of cascading the amplifier stages ?
(a) To increase the voltage gain and increase the bandwidth.
(b) To increase the voltage gain and reduce the bandwidth.
(c) To decrease the voltage gain and increase the bandwidth.
(d) To decrease the voltage gain and reduce the bandwidth.
[A.M.I.E. Sec B. Electronic Circuits Summer 2006; U.P.S.C. I.E.S. E.E.-II, 2008]

174. Power gain in decibels is equal to voltage gain in decibels only when
(a) input impedance is zero. (b) output impedance is zero.
(c) never.
(d) input impedance is equal to output impedance.

175. In an amplifier, the coupling capacitors are employed for
(a) limiting the bandwidth. (b) matching the impedances.
(c) controlling the output.
(d) preventing of dc mixing with input or output.

176. The amplifier gain varies with frequency. This happens mainly due to
(a) Miller effect.
(b) logarithmic increase in its output power.
(c) interstage transformers.
(d) presence of external and internal capacitances.

177. The bandwidth of an amplifier may be increased by
(a) reducing the stray capacitances to the minimum possible.
(b) cascading it.
(c) reducing the capacitance of bypass capacitors.
(d) increasing input signal frequency.

178. Three identical amplifiers with each one having a voltage gain of 50, input resistance of 1 kΩ and output resistance of 250 Ω, are cascaded. The open circuit voltage gain of the combined amplifier is
(a) 49 dB (b) 51 dB (c) 98 dB (d) 102 dB
[GATE E.C.E. 2003]

179. An amplifier circuit has an overall current gain of – 100 and an input resistance of 10 kΩ with a load resistance of 1 kΩ. The overall voltage gain of the amplifier is
(a) 5 dB (b) 10 dB (c) 20 dB (d) 40 dB
[U.P.S.C. I.E.S. E.E.-II, 2000]

180. When two amplifiers each of bandwidth, $f_H = 10$ kHz are cascaded, the overall bandwidth becomes
(a) 10 kHz (b) 6.4 kHz (c) 5 kHz (d) 20 kHz
[U.P.S.C. I.E.S. E.E.-II, 2006]

181. The two stages of a cascade amplifier have individual upper cut-off frequencies $f_1 = 5$ MHz and $f_2 = 3.33$ MHz. What is the best approximation for the upper cutoff frequency of the cascade combination ?
(a) 4.16 MHz (b) 3.33 MHz
(c) 2.5 MHz (d) 5.00 MHz
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

182. Consider the following statements :
In frequency response of n-stage amplifiers,
1. upper cutoff frequency is $(2^{1/n} - 1)$ times that of a single stage.
2. lower cutoff frequency is $(2^{1/n} - 1)$ times that of a single stage.
3. lower cutoff frequency is $(2^{1/n} - 1) - 1$ times that of a single stage.
4. upper cutoff frequency is $(2^{1/n} - 1) - 1$ times that of a single stage.
Which of the statements given above are correct ?
(a) 1 and 2 (b) 1 and 3 (c) 2 and 4 (d) 3 and 4
[U.P.S.C. I.E.S. E.E.-II, 2006]

183. If two stages with noise figures F_1 and F_2 and gains G_1 and G_2 are cascaded, the resultant noise figure F will be
(a) $F_1 + \frac{F_2 - 1}{G_1}$ (b) $F_1 + \frac{F_2 - 1}{G_2}$
(c) $\frac{F_1 - 1}{G_2} + F_2$ (d) $\frac{F_1 - 1}{G_1} + F_2$
[U.P.S.C. I.E.S. E.E.-II, 1999]

Answers: **166.** (d), **167.** (d), **168.** (b), **169.** (d), **170.** (b), **171.** (a), **172.** (c), **173.** (b), **174.** (d), **175.** (d), **176.** (d), **177.** (a), **178.** (c), **179.** (c), **180.** (b), **181.** (c), **182.** (b), **183.** (a),

184. R-C coupling is proper in low-level AF amplifier because it
(a) is inexpensive and needs no adjustment.
(b) has better low frequency response.
(c) needs low voltage battery.
(d) provides an output signal in phase with input signal.

185. Harmonic distortion of the signal is produced in an R-C coupled transistor amplifier. The probable component responsible for it is
(a) power supply V_{CC}. (b) coupling capacitor C_C.
(c) transistor itself. (d) biasing resistors R_1 and R_2.

186. In an R-C coupled amplifier, the voltage gain
(a) remains almost constant over a range of frequency.
(b) always increases with frequency.
(c) always decreases with frequency.

187. Which of the following components control the high frequency response of the R-C coupled amplifier ?
1. Parasitic capacitances of the transistors.
2. Coupling capacitance.
3. Stray capacitances. 4. Wiring capacitance.
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 3 and 4 only. (d) 1, 3, and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

188. In a single stage R-C coupled amplifier stage, what are the phase shifts introduced at lower and upper 3 dB frequencies, respectively?
(a) 45°, 225° (b) 45°, 135°
(c) 90°, 180° (d) 45°, 180°
[U.P.S.C. I.E.S. E.E.-II, 2005]

189. In an R-C coupled common emitter amplifier
(a) coupling capacitance affects the high frequency response and bypass capacitance affects the low frequency response.
(b) both coupling and bypass capacitances affect the *hf* response only.
(c) both coupling and bypass capacitances affect the *lf* response only.
(d) coupling capacitance affects the *lf* response and the bypass capacitance affects the *hf* response. [U.P.S.C. I.E.S. E.E.-II, 2003]

190. In an RC coupled amplifier, the gain decreases in the frequency response due to the
(a) coupling capacitor at low frequency and bypass capacitor at high frequency.
(b) coupling capacitor at high frequency and bypass capacitor at low frequency.
(c) coupling junction capacitance at low frequency and coupling capacitor at high frequency.
(d) device junction capacitor at high frequency and coupling capacitor at low frequency. [U.P.S.C. I.E.S. E.E.-II, 2001]

191. A transistorised transformer coupled class-A amplifier supplies 0.94 W to a 4 kΩ load. The zero signal dc collector current is 31 mA, and the dc collector current with the signal is 34 mA. What is the percent-second-harmonic distortion ?
(a) ~50% (b) 0% (c) ~20%
(d) Cannot be computed with the available information.
[U.P.S.C. I.E.S. E.E.-II, 2007]

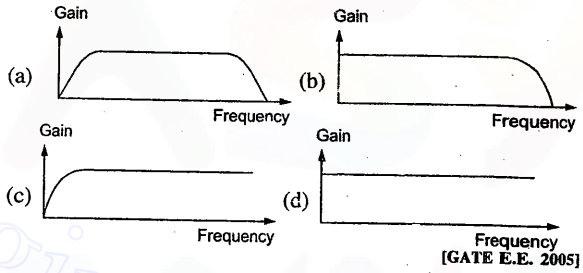
192. Consider the following statements :
Transformer coupling is preferable to R-C coupling because it
1. can also be made to match input and output impedances.
2. results in better frequency response.
3. reduces the amplitude distortion.
4. reduces the number of stages for achieving same power gain as compared to R-C coupled stages.
Of these statements :
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1996]

193. A signal may have frequency components which lie in the range of 0.001 Hz to 10 Hz. Which one of the following types of couplings should be chosen in a multistage amplifier designed to amplify the signal ?
(a) R-C coupling. (b) Transformer coupling.
(c) Direct coupling.
(d) Double tuned transformer coupling.
[U.P.S.C. I.E.S. E.E.-II, 1996]

194. The major advantages of dc amplifiers is that it
(a) uses less number of components.
(b) has very good temperature stability.
(c) does not use frequency sensitive components.
(d) can amplify direct current and low frequency signals.
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

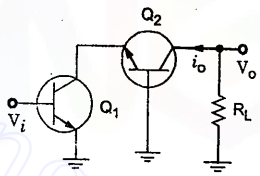
195. Which one of the following is NOT true of direct coupled amplifiers?
(a) Low cost.
(b) Can amplify high frequency signals.
(c) Can amplify low frequency signals.
(d) Operating point shifts with temperature variations.
[U.P.S.C. I.E.S. E.E.-II, 2011]

196. The typical frequency response of a two-stage direct coupled voltage amplifier is as shown in



[GATE E.E. 2005]

197. In the cascade amplifier shown in the figure, if the common-emitter stage (Q_1) has a transconductance g_{m1}, and the common base stage (Q_2) has a transconductance g_{m2}, then overall transconductance $g(=(i_0/v_i)$ of the cascade amplifier is



(a) g_{m1} (b) g_{m2} (c) $\frac{g_{m1}}{2}$ (d) $\frac{g_{m2}}{2}$
[GATE E.C.E. 1999]

198. Two identical RC coupled amplifiers each having an upper cut-off frequency f_u, are cascaded with negligible loading. What is the upper cut-off frequency of the overall amplifier ?
(a) $\frac{f_u}{\sqrt{\sqrt{2}-1}}$ (b) $f_u\sqrt{\sqrt{2}-1}$ (c) $\frac{f_u}{2}$ (d) $2f_u$
[U.P.S.C. I.E.S. E.E.-II, 2004]

199. Two identical RC coupled amplifiers, each having a lower cut-off frequency f_l, are cascaded with negligible loading. What is lower cut-off frequency of the overall amplifier ?
(a) $\frac{f_l}{\sqrt{\sqrt{2}-1}}$ (b) $f_l\sqrt{\sqrt{2}-1}$
(c) $\frac{f_l}{2}$ (d) $2f_l$ [U.P.S.C. I.E.S. E.E.-II, 2004]

Answers: **184.** (a), **185.** (c), **186.** (a), **187.** (d), **188.** (a), **189.** (c), **190.** (d), **191.** (b), **192.** (d), **193.** (c), **194.** (d), **195.** (b), **196.** (b), **197.** (a), **198.** (b), **199.** (a),

200. What is the purpose of impedance matching between the output of previous stage and input of next stage in a cascaded amplifier?
(a) To achieve high efficiency.
(b) To achieve maximum power transfer.
(c) To achieve reduced distortion.
(d) To achieve reduced noise. [U.P.S.C. I.E.S. E.E.-II, 2006]

201. An amplifier having an output resistance of 4 Ω gives an open-circuit output voltage of 6 V (rms). The maximum power that it can deliver to a load is
(a) 1.5 W (b) 2.25 W (c) 2.4 W (d) 9 W
[U.P.S.C. I.E.S. E.E.-II, 2001]

202. The output power of a power amplifier is several times its input power. This is possible due to the fact that
(a) step up transformer is used in the circuit.
(b) there is a positive feedback in the circuit.
(c) a negative resistance is introduced.
(d) power amplifier converts a part of the input dc power into ac power.

203. In a class A amplifier, there will be a worst condition when
(a) signal input is zero. (b) signal input is maximum.
(c) load resistance is high.
(d) there is a transformer coupling.

204. The circuit efficiency of a class A amplifier can be increased with
(a) direct-coupled load. (b) low dc power input.
(c) transformer coupled load. (d) low rating resistor.

205. In class A amplifier, conduction extends over 360° because Q-point is
(a) located on load line. (b) located at or near cutoff point.
(c) located near saturation point.
(d) centred on load line.

206. In a class A amplifier, $V_{CE(max)} = 15$ V and $V_{CE(min)} = 1$ V. The conversion efficiency for a series fed load will be equal to
(a) 25% (b) 23.33% (c) 12.5% (d) 11.67%
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

207. Where does the operating point of a class-B power amplifier lie?
(a) At the middle of ac load line.
(b) Approximately at collector cutoff on both the dc and ac load lines.
(c) Inside the collector cutoff region on ac load line.
(d) At the middle point dc load line. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

208. The type of power amplifier which exhibits crossover distortion in its output is
(a) class A. (b) class B. (c) class AB. (d) class C.
[GATE E.E. 2000]

209. In a class C amplifier
(a) efficiency and distortion both are maximum.
(b) efficiency maximum but distortion minimum.
(c) efficiency minimum but distortion maximum.
[A.M.I.E. Sec B. Electronic Circuits Summer 2005]

210. The most preferred high power output stage for hi-fi AF amplifier is of the
(a) class B push-pull type (b) class B single ended type.
(c) class A type. (d) class C type.
[U.P.S.C. I.E.S. E.E.-II, 1993]

211. In push-pull amplifiers there occurs cancellation
(a) of even order harmonics. (b) of all odd order harmonics.
(c) as small as possible (d) none of these.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 1995]

212. What is the main source of distortion in a push-pull amplifier?
(a) Fundamental component. (b) Second harmonic.
(c) Third harmonic. (d) All even harmonics.
[U.P.S.C. I.E.S. E.E.-II, 2009]

213. Consider the following statements:
1. Only even harmonics are present in the output.
2. Provides more output per device for a given amount of distortion.
3. Core saturation of transformer is avoided.
4. Power supply hum is absent in the output.
Which of the above statements is/are correct for a push-pull amplifier?
(a) 1 only. (b) 1 and 2 only.
(c) 1, 2 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2009]

214. High power efficiency of the push-pull amplifier is due to the fact that
(a) each transistor conducts on different cycles of the input.
(b) transistors are placed in CE configuration.
(c) there is no quiescent collector current.
(d) low forward biasing voltage is required.
[U.P.S.C. I.E.S. E.E.-II, 2001]

215. Which one of the following statements is correct ?
The efficiency of class B push-pull amplifiers is much higher than that of class-A amplifiers primarily because
(a) the distortion is kept within acceptable limits.
(b) one half of the input signal is amplified using one transistor and the other half is phase inverted and fed to the other transistor.
(c) matched pair transistors are used in the class B push-pull operation.
(d) the quiescent dc current is avoided. [U.P.S.C. I.E.S. E.E.-II, 2004]

216. The maximum theoretical efficiency of a class B push-pull transistor amplifier is approximately
(a) 25% (b) 50% (c) 70.7% (d) 78.5%
[U.P.S.C. I.E.S. E.E.-II, 1993]

217. The efficiency of a class B amplifier is 72% when the supply voltage is 24 V. The peak to peak output voltage is
(a) 20 V (b) 22 V
(c) 25 V (d) 16 V
[U.P.S.C. I.E.S. E.E.-II, 2010]

218. Which one of the following parameters is used for distinguishing between a small signal and a large-signal amplifier ?
(a) Voltage gain. (b) Frequency response.
(c) Harmonic distortion. (d) Input/output impedances.
[U.P.S.C. I.E.S. E.E.-II, 1993]

219. Class AB operation is often used in power (large signal) amplifiers in order to
(a) get maximum efficiency. (b) remove even harmonics.
(c) overcome crossover distortion.
(d) reduce collector dissipation. [U.P.S.C. I.E.S. E.E.-II, 1996]

220. Which of the following are the main advantages of class-B push-pull power amplifier (using BJTs) ?
1. Even harmonics tend to cancel out at the output.
2. More power output per transistor.
3. Conversion efficiency can be as high as 78%.
4. Absence of crossover distortion.
Select the correct answer using the code given below :
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) 1, 3 and 4. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2007]

221. Which of the following characteristics are possessed by a transformer coupled class B push-pull power amplifier ?
1. It eliminates even harmonic distortion.
2. It suffers from crossover distortion.

Answers: **200.** (b), **201.** (b), **202.** (d), **203.** (a), **204.** (c), **205.** (d), **206.** (b), **207.** (b), **208.** (b), **209.** (a), **210.** (d), **211.** (a), **212.** (c), **213.** (d), **214.** (c), **215.** (d), **216.** (d), **217.** (b), **218.** (d), **219.** (c), **220.** (a), **221.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

3. its device ratings are higher than those of class-A power amplifier.
4. Its collector circuit efficiency is more than that of class-C power amplifier.

Select the correct answer using the code given below :
(a) 1, 3 and 4. (b) 2 and 4.
(c) 1 and 2. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2007]

222. In respect of the block diagram shown in the figure, the input power is 1 mW. The output power P_0 will be

(a) 2 mW (b) 1 mW (c) 0.5 mW (d) zero
[U.P.S.C. I.E.S. E.E.-II, 1998]

223. Heat sink is used in the power amplifier circuit
(a) to increase the output power.
(b) to reduce the heat loss in a transistor.
(c) to increase the voltage gain of the power amplifier.
(d) to increase the collector dissipation ratings of the transistor.

224. Consider the following statements:
1. Amplitude distortion arises due to different frequency components being amplified differently.
2. White noise gives the same noise per unit bandwidth across the entire frequency spectrum.
3. If an amplifier has two poles such that $p_2 = 4p_1$, then the dominant pole is p_2.
4. The self-biasing emitter resistance of an amplifier is by-passed by a large capacitance to reduce degeneration at higher frequencies.

Which of these statements are correct?
(a) 1, 2, 3 and 4. (b) 2 and 4.
(c) 2 and 3. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

225. The input resistance R_i and output resistance R_o of an ideal current amplifier, in ohms are
(a) 0 and 0. (b) 0 and ∞.
(c) ∞ and 0. (d) ∞ and ∞.
[U.P.S.C. I.E.S. E.E.-II, 2010]

226. In a feedback amplifier, the feedback improves the signal to noise ratio for noise signal
(a) present with the amplifier. (b) present at the output.
(c) internally generated in the amplifier.
(d) both internally generated and present with the input.

227. Feedback in amplifier always helps in
(a) controlling its output. (b) increasing its gain.
(c) reducing its input impedance. (d) stabilizes its gain.

228. A large sacrifice factor in a negative feedback amplifier leads to
(a) precise control over output. (b) reduced input impedance.
(c) increased output impedance.
(d) characteristics which cannot be achieved without feedback.

229. Negative feedback in an amplifier leads to which one of the following?
(a) Decrease in bandwidth. (b) Increases in current gain.
(c) Increases in voltage gain. (d) Decrease in voltage gain.
[U.P.S.C. I.E.S. E.E.-II, 2007]

230. Consider the following statements:
Negative feedback in amplifier results in
1. reduced voltage gain.
2. reduced bandwidth.
3. increased signal to noise ratio.
4. reduced distortion.

Of these statements
(a) 1 and 2 are correct. (b) 1, 3 and 4 are correct.
(c) 2, 3 and 4 are correct (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1994]

231. An amplifier without feedback has a gain of 1000. What is the gain with a negative feedback of 0.009 ?
(a) 900 (b) 125 (c) 100 (d) 10
[U.P.S.C. I.E.S. E.E.-II, 2007]

232. An amplifier has an open loop gain of 1000 ± 10. Negative feedback is provided such that the gain variation remains within 0.1%. What is the amount of feedback β_F ?
(a) 1/10 (b) 1/9 (c) 9/100 (d) 9/1000
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

233. An amplifier without feedback, when fed with a 1 V, 50 Hz input signal gives an output of 30 V, 50 Hz with a 5% 2nd order distortion. When 10% of the output is fed back what is the 2nd order distortion?
(a) 0.375 V (b) 1.3 V
(c) 0.75 V (d) 3 V [U.P.S.C. I.E.S. E.E.-II, 2009]

234. In the shunt series feedback amplifier, the basic amplifier and the feedback network are parallel connected at the input and series connected at the output. The signal sampled and the summing down will be respectively
(a) current and current (b) current and voltage
(c) voltage and current (d) voltage and voltage
[U.P.S.C. I.E.S. E.E.-II, 1999]

235. Voltage series feedback (also called series-shunt feedback) results in
(a) increases in both input and output impedances.
(b) decrease in both input and output impedances.
(c) increases in input impedance and decrease in output impedance.
(d) decrease in input impedance and increase in output impedance.
[GATE E.C.E. 2004]

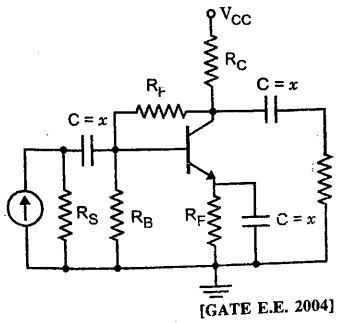
236. The effect of current shunt feedback in an amplifier is to
(a) increase the input resistance and decrease the output resistance.
(b) increase both input and output resistances.
(c) decrease both input and output resistances.
(d) decrease the input resistance and increase the output resistance.
[GATE E.C.E. 2005]

237. In a common emitter amplifier, the unbypassed emitter resistance provides
(a) voltage shunt feedback. (b) current series feedback.
(c) negative voltage feedback. (d) positive current feedback.
[U.P.S.C. I.E.S. E.E.-II, 1996; GATE 1992]

238. Consider the following with reference to a CE transistor amplifier
1. The use of negative feedback.
2. The conversion of dc power to ac.
3. High voltage and current gains.
4. The use of step-up transformer.

The power gain is due to
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2003]

239. The feedback used in the circuit shown in the figure can be classified as
(a) shunt series feedback.
(b) shunt-shunt feedback.
(c) series-shunt feedback.
(d) series-series feedback.



[GATE E.E. 2004]

Answers: **222.** (b), **223.** (d), **224.** (b), **225.** (b), **226.** (c), **227.** (a), **228.** (d), **229.** (d), **230.** (d), **231.** (c), **232.** (d), **233.** (a), **234.** (d), **235.** (c), **236.** (d), **237.** (b), **238.** (c), **239.** (b),

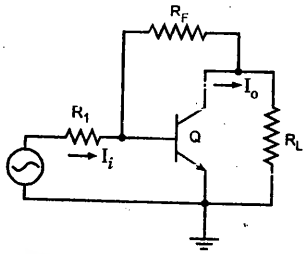
240. The open-loop voltage gain of an amplifier is 240. The noise level in the output without feedback is 100 mV. If a negative feedback with $\beta = 1/60$ is used, the noise level in the output will be
(a) 1.66 mV (b) 2.4 mV (c) 4.0 mV (d) 20 mV
[U.P.S.C. I.E.S. E.E.-II, 2003]

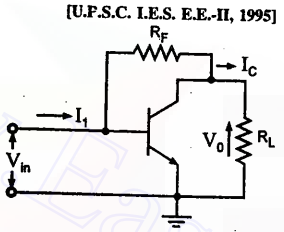
241. An amplifier has an open-loop gain of 1000. lower 3 dB cutoff frequency of 100 Hz and upper 3 dB cutoff frequency of 1 MHz. If a negative feedback of 60 dB is provided to this amplifier, the lower 3 dB and upper 3 dB cutoff frequencies with feedback will be respectively
(a) 33 Hz and 1 MHz. (b) 50 Hz and 1 MHz.
(c) 50 Hz and 2 MHz. (d) 33 Hz and 2 MHz.
[U.P.S.C. I.E.S E.E.-II, 1993]

242. The given figure represents the ac equivalent circuit of a parallel voltage feedback amplifier stage. h_{fe}, h_{fc} are h-parameters in CE and CC operations respectively of Q. The current gain (I_0/I_i) of this stage is



(a) R_F/R_L (b) h_{fe}
(c) R_L/R_F (d) h_{fc}
[U.P.S.C. I.E.S. E.E.-II, 1995]

243. The circuit shown in the figure below represents a feedback amplifier. For this circuit, the current and voltage gains would respectively be



(a) h_{fe}, $h_{fe}\,R_L/h_{ie}$
(b) R_F/R_L, $h_{fe}\,R_L/h_{ie}$
(c) h_{fe}, R_L/R_F
(d) R_F/R_L, R_L/R_F
[U.P.S.C. I.E.S. E.E.-II, 1993]

244. A negative feedback amplifier with open-loop gain $\dfrac{-A_0}{1+j\dfrac{\omega}{\omega_0}}$

$A_0 > 0$ and feedback factor $\beta(> 0)$ will have a 3 dB cutoff at what frequency ?
(a) $\omega_0 A_0 \beta$ (b) $\omega_0(1 + A_0\beta)$
(c) $\dfrac{\omega_0}{(1+A_0\beta)}$ (d) $\omega_0(1 - A_0\beta)$
[U.P.S.C. I.E.S. E.E.-II, 2008]

245. An amplifier has an open-loop gain of 100, an input impedance of 1 kΩ, and an output impedance of 100 Ω. A feedback network with a feedback factor of 0.99 is connected to the amplifier in a voltage series feedback mode. The new input and output impedances, respectively, are
(a) 10 Ω and 1 Ω (b) 10 Ω and 10 Ω
(c) 100 kΩ and 1 Ω (d) 100 kΩ and 1 kΩ
[GATE E.C.E. 1999]

246. An amplifier without feedback has a voltage gain of 50, input resistance of 1 kΩ and output resistance of 2.5 kΩ. The input resistance of the current-shunt negative feedback amplifier using the above amplifier with a feedback factor of 0.2 is
(a) 1/11 kΩ (b) 1/5 kΩ (c) 5 kΩ (d) 11 kΩ
[GATE E.C.E. 2003]

247. Consider the following features regarding an amplifier:
1. Voltage gain being less than unity.
2. High input impedance.
3. High output impedance. 4. High current gain.

Which of these are the characteristic features of an emitter follower amplifier ?
(a) 1, 2 and 4. (b) 1, 2 and 3.
(c) 1 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2000]

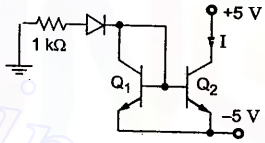
248. Transformer and emitter follower can both be used for impedance matching at the output of an audio amplifier. The basic relationship between the input power P_{in} and output power P_{out} in both the cases is
(a) $P_{in} = P_{out}$ for both transformer and emitter follower.
(b) $P_{in} > P_{out}$ for both transformer and emitter follower.
(c) $P_{in} < P_{out}$ for transformer and $P_{in} = P_{out}$ for emitter follower.
(d) $P_{in} = P_{out}$ for transformer and $P_{in} < P_{out}$ for emitter follower.
[GATE E.E., 2009]

249. Cascode amplifiers when compared with a simple common-emitter amplifier provide which of the following ?
(a) Higher voltage gain and same bandwidth.
(b) Same voltage gain but higher bandwidth.
(c) No change in either voltage gain or bandwidth.
(d) Voltage gain less than one but bandwidth to f_T.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

250. Transformer and emitter follower can both be used for impedance matching at the output of an audio amplifier. The basic relationship between the input power P_{in} and output power P_{out} in both the cases is
(a) $P_{in} = P_{out}$ for both transformer and emitter follower.
(b) $P_{in} > P_{out}$ for both transformer and emitter follower.
(c) $P_{in} < P_{out}$ for transformer and $P_{in} = P_{out}$ for emitter follower.
(d) $P_{in} = P_{out}$ for transformer and $P_{in} < P_{out}$ for emitter follower.
[GATE E.E. 2009]

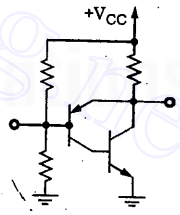
251. In a source follower, consider the following statements :
1. The voltage gain of a source follower is always less than one.
2. It has some current gain and power gain.
3. Its output resistance can be made low.
Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

252. Two perfectly matched silicon transistors are connected as shown in the figure Assuming the β of the transistors to be very high and the forward voltage drop in diodes to be 0.7 V, the value of current I is



(a) 0 mA (b) 3.6 mA
(c) 4.3 mA (d) 5.7 mA [GATE E.E. 2008]

253. What is the transistor combination shown in the figure given ?



(a) A Darlington pair.
(b) A complementary pair.
(c) It effectively acts as a single *p-n-p* transistor.
(d) It effectively acts as a single *n-p-n* transistor.
[U.P.S.C. I.E.S. E.E.-II, 2008]

254. Which of the following features are offered by a bipolar junction transistor amplifier in Darlington connection ?
1. High voltage gain. 2. High input impedance.
3. High current gain.
Select the correct answer using the code given below ?
Codes :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

Answers: **240.** (d), **241.** (c), **242.** (c), **243.** (a), **244.** (b), **245.** (c), **246.** (a), **247.** (a), **248.** (d), **249.** (b), **250.** (d), **251.** (c), **252.** (c), **253.** (b), **254.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

255. A Darlington amplifier has a
(a) large current gain and high input resistance.
(b) large voltage gain and low output resistance.
(c) small voltage gain and low input resistance.
(d) small current gain and high output resistance.
[U.P.S.C. I.E.S. E.E.-II, 2005]

256. The Darlington pair is mainly used for
(a) impedance matching.
(b) wideband voltage amplification
(c) power amplification. (d) reducing distortion.
[U.P.S.C. I.E.S. E.E.-II, 2002]

257. The Darlington pair has a current gain of approximately β^2, the voltage gain A_v, the input resistance R_i and the output resistance R_o. When the Darlington pair is used in the emitter follower configuration, A_v, R_i and R_o are respectively,
(a) very large, very large and very small.
(b) unity, very large and very small.
(c) unity, very small and very large.
(d) very large, very small and very large.
[U.P.S.C. I.E.S. E.E.-II, 2001]

258. Consider the following statements:
When Darlington circuit and normal single stage emitter followers are compared
1. Both have near unity voltage gain.
2. Both have equal current gain.
3. Darlington circuit has higher output resistance.
4. Emitter follower has lower input resistance.
Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 4 only.
(c) 2 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2010]

259. Cascaded amplifiers are used as
(a) video amplifiers. (b) voltage amplifiers.
(c) power amplifiers. (d) tuned amplifier design.
[U.P.S.C. I.E.S. E.E.-II, 1992]

260. The BJT amplifier which offers highest input impedance and least voltage gain is
(a) CE (b) CB
(c) CC (d) Cascode amplifier.
[A.M.I.E. Sec B. Electronic Circuits Summer 2006]

261. Consider the following statements :
1. In amplifiers, a complementary symmetry amplifier has 1 PNP and 1 NPN transistor.
2. A bootstrap incorporates emitter follower.
3. The main function of transformer used in the output of a power amplifier is to increase its voltage gain.
4. The harmonic distortion of the signal produced in a R-C coupled transistor amplifier is due to transistor itself.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 2, 3 and 2.
(c) 1, 3, 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2005]

262. Consider the following statements :
Tuned amplifiers
1. are wideband amplifiers.
2. are used in radio transmitters and receivers.
3. performance is determined by Q of the circuit.
Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

263. The bandwidth of an RF tuned amplifier is dependent on
(a) Q-factor of the tuned output circuit.
(b) Q-factor of the tuned input circuit.
(c) Quiescent operating point.
(d) Q-factors of the output and input circuits as well as the quiescent operating point. [U.P.S.C. I.E.S. E.E.-II, 1995]

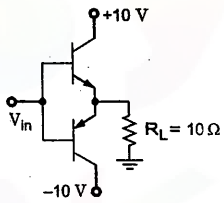
264. A narrowband amplifier is one that has a passband
(a) approximately 10% of its central frequency.
(b) limited to 3 kHz.
(c) limited to AF range only.
(d) somewhat in the region near the cutoff region of the active device employed.

265. For tuned radio-frequency we use
(a) class A amplifier. (b) class B amplifier.
(c) class AB amplifier. (d) class C amplifier.

266. A tuned amplifier has peak output at 2 MHz and quality factor 50. The bandwidth and 3 dB frequencies shall be at what values respectively ?
(a) 40 kHz, 2.02 MHz, 1.98 MHz
(b) 40 kHz, 2.04 MHz, 1.96 MHz
(c) 80 kHz, 2.04 MHz, 1.96 MHz
(d) 80 kHz, 2.08 MHz, 1.92 MHz [U.P.S.C. I.E.S. E.E.-II, 2007]

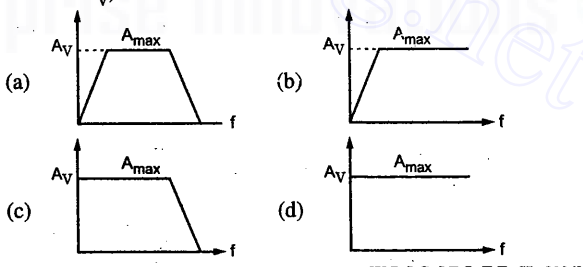
267. A sinusoidal signal of 100 Hz is applied to an amplifier. The output current is
$i_0 = 20 \sin(628t) + 2 \sin(1256t) + 1 \sin(2512t)$
What is the approximate percentage increase in power due to distortion ?
(a) 1.15 (b) 1.25 (c) 1.30 (d) 1.50
[U.P.S.C. I.E.S. E.E.-II, 2008]

268. The input signal V_{in} shown in the figure is a 1 kHz square wave voltage that alternates between +7 V and –7 V with a 50% duty cycle. Both transistors have the same current gain which is large. The circuit delivers power to the load resistor R_L. What is the efficiency of this circuit for the given input? Choose the closest answer.



(a) 46% (b) 55% (c) 63% (d) 92%
[GATE E.E. 2007]

269. If the coupling capacitors of a CE transistor amplifier is shorted, which one of the following graphs will represent the frequency response curve of the amplifier ?
(A_V = voltage gain, f = frequency in Hertz, A_{max} = maximum value of A_V)



[U.P.S.C. I.E.S. E.E.-II, 2004]

270. In high frequency region, amplifier will behave like
(a) band pass filter. (b) high pass filter.
(c) low pass filter. (d) none of the above.

271. Signal generator is generally used for generating the following waveform :

Answers: **255.** (a), **256.** (a), **257.** (b), **258.** (b), **259.** (c), **260.** (c), **261.** (a), **262.** (b), **263.** (a), **264.** (a), **265.** (d), **266.** (a), **267.** (b), **268.** (d), **269.** (b), **270.** (c), **271.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Sawtooth waveform. (b) Square waveform.
(c) A periodical waveform. (d) Sinusoidal waveform.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

272. In signal generators
(a) energy is created. (b) energy is generated.
(c) energy is converted from a simple dc source into ac energy at some specific frequency.
(d) all of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2000]

273. The maximum output power obtainable from a general purpose audio-signal generator is usually
(a) quite low, of the order of μW.
(b) fairly low, of the order of mW.
(c) low, of the order of W.(d) high of the order of kW.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2003]

274. The frequency band from 30 MHz to 300 MHz is of
(a) audio-frequency oscillator. (b) radio-frequency oscillator.
(c) video-frequency oscillator.
(d) very high frequency oscillator.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

275. The basic condition(s) for generating sinusoidal voltage in a feedback type oscillator is (are)
(a) total loop gain should be '1'.
(b) total phase shift should be '360°'.
(c) either (a) or (b). (d) both (a) and (b).
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

276. The Barkhausen criterion for sustained oscillations is given by
(a) $A\beta = 1$ (b) $|A\beta| \geq 1$
(c) $|A\beta| < 1$ (d) $\angle A\beta = 180°$
[U.P.S.C. I.E.S. E.E.-II, 2000]

277. Oscillators use following feedback.
(a) Negative. (b) Positive
(c) Both negative and positive.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]

278. In a certain oscillator $A_v = 50$. The attenuation of the feedback circuit must be
(a) 1 (b) 0.01 (c) 10 (d) 0.02
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

279. Consider the following statements :
1. A Hartley oscillator circuit uses a tapped inductor for inductive feedback.
2. Oscillator circuit can be operated in class A condition for better waveshape.
3. Frequency stabilization is obtained by the use of automatic biasing.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2005]

280. The resonance frequency of a quartz crystal oscillator shows least variation with temperature when the orientation of the crystal is chosen to have
(a) X-cut (b) Y-cut (c) NT-cut (d) AT-cut
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

281. In highly stable oscillator circuits, AT cut quartz crystals are generally employed. What is the reason for using this particular orientation ?
(a) Quartz crystals have a natural growth along this plane.
(b) The corresponding quality factor is largest for this orientation.
(c) There is minimal temperature variation of frequency.
(d) AT cut crystals can be used over a wide frequency range.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

282. Crystal oscillators are superior to tuned LC oscillators mainly because of their.
(a) high degree of frequency stability.
(b) size of crystal.
(c) high value of Q. (d) availability crystal.
[A.M.I.E. Sec B. Electronic Circuits Winter, 2006]

283. The highest frequency stability is achieved by using an oscillator of the type:
(a) Colpitts. (b) Crystal controlled.
(c) Hartley. (d) RC oscillator.
[U.P.S.C. I.E.S. E.E.-II, 2011]

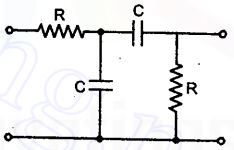
284. In a piezoelectric crystal oscillator, the oscillation or tuning frequency is linearly proportional to the
(a) mass of the crystal.
(b) square root of the mass of the crystal.
(c) square of the mass of the crystal.
(d) inverse of the square root of the mass of the crystal.
[U.P.S.C. I.E.S. E.E.-II, 1993]

285. In an R-C phase shift oscillator, the minimum number of R-C networks to be connected in cascade will be
(a) one. (b) two. (c) three. (d) four.
[U.P.S.C. I.E.S. E.E.-III, 1993]

286. Consider the following statements regarding an R-C phase-shift oscillator.
1. The amplifier gain is positive.
2. The amplifier gain is negative.
3. The phase shift introduced by the feedback network is 180°.
4. The phase shift introduced by the feedback network is 360°.
Of these statements
(a) 1 and 3 are correct. (b) 2 and 3 are correct.
(c) 2 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1997]

287. An R-C phase shift oscillator will not produce any oscillation until and unless the voltage gain of its internal amplifier is
(a) unity. (b) less than unity.
(c) around 3. (d) more than 29.
[A.M.I.E. Sec B. Electronic Circuits Winter 2005]

288. A FET oscillator uses the given phase shift network as shown below. The minimum gain required for oscillation is



(a) –29 (b) 1
(c) 3 (d) 29
[U.P.S.C. I.E.S. E.E.-II, 2003]

289. In a Wien bridge oscillator, the positive feedback attenuation is
(a) 1/3 (b) 1/29 (c) –29 (d) 3
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

290. In a Wien bridge oscillator, if the resistances in the positive feedback circuit are decreased the frequency
(a) decreases. (b) increases.
(c) remains the same.
(d) fluctuates in an erratic fashion.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

291. Consider the following statements :
1. Wien bridge oscillator is suitable for generating 1 kHz.
2. Colpitts oscillator is suitable for generating 1 MHz.

Answers: **272.** (c), **273.** (b), **274.** (d), **275.** (d), **276.** (b), **277.** (b), **278.** (d), **279.** (b), **280.** (d), **281.** (c), **282.** (a), **283.** (b), **284.** (d), **285.** (c), **286.** (a), **287.** (d), **288.** (c), **289.** (a), **290.** (b), **291.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Which of the statements given above is / are correct ?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.E.-II, 2008]

292. Which one of the following statements is correct of phase-shift type and Wein bridge type R-C oscillators ?
(a) Both use positive feedback.
(b) The former uses positive feedback while the latter uses both positive and negative feedback.
(c) The former uses both positive and negative feedback while the latter uses positive feedback only
(d) Both use negative feedback [U.P.S.C. I.E.S. E.E.-I, 2007]

293. A beat frequency oscillator uses
(a) two RF oscillators. (b) two AF oscillators.
(c) one RF oscillator. (d) one AF oscillator.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

294. A triangular wave can be generated by
(a) integrating a square wave. (b) differentiating a square wave.
(c) integrating a sine wave. (d) differentiating a sine wave.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

295. In a laboratory type function generator, the sinusoidal signal is obtained
(a) from a Wien bridge oscillator. (b) from a Hartley oscillator.
(c) by integrating a cosine signal.
(d) by using a sine shaping circuit with a triangular wave generator.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1999]

296. A relaxation oscillator is one which
(a) relaxes indefinitely. (b) produces sinusoidal waves.
(c) produces non-sinusoidal waves.
(d) oscillates continuously.

297. In a sweep frequency generator the master oscillator frequency is fixed at 10.0 MHz and the variable frequency is varied between 10.01 MHz and 35 MHz. The mixer will give sinusoidal output whose frequency is swept
(a) from 10 kHz to 45 MHz. (b) from 10 kHz to 25 MHz.
(c) from 20.01 MHz to 45 MHz.
(d) from 20.01 MHz to 25 MHz.

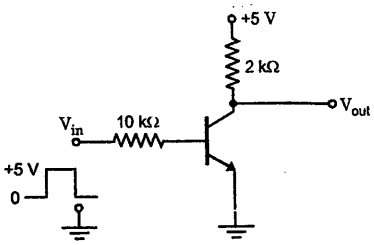
298. CE configuration is the most preferred transistor configuration when used as a switch, because
(a) It requires only one power supply.
(b) It requires low voltage or current for operating the switch.
(c) It is easily understood by every one.
(d) It has small I_{CEO}. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

299. For faster switching action of a transistor,
(a) a capacitor may be connected across the base resistance.
(b) a capacitor may be connected in series with the base resistance.
(c) a capacitor may be connected across R_E.
(d) the value of the coupling capacitor may be increased.

300. The primary switching delay in an over-driven bipolar junction transistor is contributed by which one of the following characteristics of the transistor ?
(a) Storage time. (b) Fall time.
(c) Rise time. (d) Charging time.
[U.P.S.C. I.E.S. E.E.-II, 1993]

301. A bipolar junction transistor (BJT) is used as a power control switch by biasing it in the cut-off region (OFF state) or in the saturation region ON state). In the ON state for BJT.
(a) both the base-emitter and base-collector junctions are reverse biased.
(b) the base-emitter junction is reverse biased, and the base-collector junction is forward biased.
(c) the base-emitter junction is forward biased and base collector junction is reverse biased.
(d) both the base-emitter and base collector junctions are forward biased. [GATE E.E. 2004]

302. A switch circuit using the transistor is shown in the figure. Assume $h_{FE(min)} = 20$ and $f_t = 100$ MHz. The most dominant speed limitation is brought by



(a) rise time.
(b) fall time.
(c) storage time. (d) delay time. [U.P.S.C. I.E.S. E.E.-II, 2001]

303. The output time period of a transistorised monostable multivibrator using base resistor R_b and coupling capacitor C_b for the output transistor is given by
(a) R_bC_b (b) $0.69\ R_bC_b$
(c) $2\ R_bC_b$ (d) $1.38\ R_bC_b$
[U.P.S.C. I.E.S. E.E.-II, 1996]

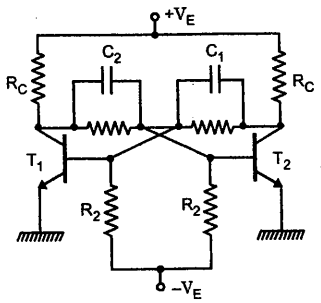
304. One shot multivibrator, with a pulse input gives an output:
(a) A single triangular pulse.
(b) A square pulse.
(c) An impulse. (d) A single sinusoid pulse.
[U.P.S.C. I.E.S. E.E.-II, 2011]

305. Trigger pulses are essential for the operation of a bistable multivibrator because
(a) there are no R-C timing circuits.
(b) the circuit cannot switch between its two states automatically.
(c) transistor operation is controlled by the triggering pulses.
(d) all of the above.

306. The multivibrator circuit which possesses one stable state and one quasi-stable is
(a) astable. (b) monostable.
(c) bistable. (d) Schmitt trigger circuit.
[A.M.I.E. Sec B. Electronics Circuits Summer 2006]

307. It is required to stretch a 5 μs pulse to a duration of 5 ms. An appropriate circuit to be used for this is
(a) astable multivibrator. (b) monostable multivibrator.
(c) schmitt trigger. (d) bistable multivibrator.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

308. Consider the following bistable multivibrator circuit. Which one of the following statements is correct ?
In the above circuit, condensers C_1 and C_2 are used



(a) for passing the noise.
(b) to compensate the collector-emitter capacitance.

Answers: **292.** (b), **293.** (a), **294.** (a), **295.** (b), **296.** (c), **297.** (b), **298.** (b), **299.** (a), **300.** (a), **301.** (d), **302.** (a), **303.** (b), **304.** (b), **305.** (d), **306.** (b), **307.** (b), **308.** (c),

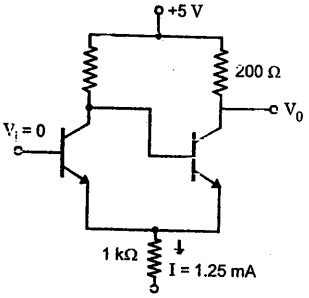
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) to speed up the switching action.
(d) to provide negative feedback path.

[U.P.S.C. I.E.S. E.E.-II, 2004]

309. In the Schmitt trigger circuit shown in the figure, if $V_{CE(sat)} = 0.1$ V, the output logic low level (V_{OL}) is



(a) 1.25 V. (b) 1.35 V.
(c) 2.50 V. (d) 5.00 V.

[GATE E.E. 2004]

310. A blocking oscillator
(a) is a triggered oscillator.
(b) generates sinusoidal waves.
(c) is an amplifier with a negative feedback.
(d) produces very sharp and narrow pulses.

311. Consider the following two statements :
Statement 1: Astable multivibrator can be used for generating square wave.
Statement 2: Bistable multivibrator can be used for storing binary information.
(a) Only statement 1 is correct. (b) Only statement 2 is correct.
(c) Both the statements 1 and 2 are correct.
(d) Both the statement 1 and 2 are incorrect. [GATE E.C.E, 2001]

312. The type of multivibrator used for generation of clock pulses is
(a) monostable multivibrator. (b) astable multivibrator.
(c) bistable multivibrator. (d) none of the above.

313. Schmitt trigger is basically
(a) an astable multivibrator. (b) a monostable multivibrator.
(c) a bistable multivibrator. (d) an oscillator.

314. A Schmitt trigger converts slowly varying waveform into
(a) sinewave. (b) sawtooth wave.
(c) triangular wave. (d) square wave.

[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2007]

315. Narrow pulses with adjustable mark to space ratio can be obtained from square wave input signal by using which of the following ?
1. Schmitt trigger 2. Monostable multivibrator
3. Clippers
Select the correct answer using the code given below :
(a) Only 1 (b) Only 2 (c) 1 and 2 (d) 2 and 3

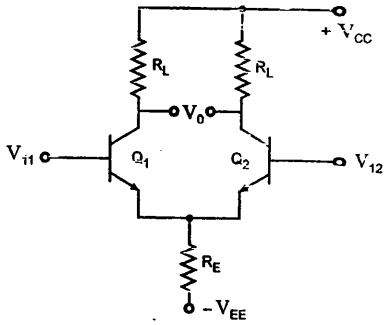
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

316. Consider the following statements.
From a sine wave one can obtain square wave by using.
1. Schmitt trigger circuit. 2. Zero crossing detector.
3. clippers and amplifiers.
Of these statements
(a) 1 and 2 are correct. (b) 1 and 3 are correct.
(c) 2 and 3 are correct. (d) 1, 2 and 3 are correct.

[U.P.S.C. I.E.S. E.E.-II, 1996]

317. Square-wave generator is a special type of
(a) variable frequency oscillator.
(b) sweep frequency generator.
(c) function generator.
(d) pulse generator. (e) both (c) and (d).

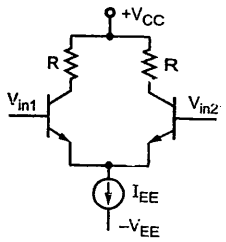
318. The differential mode voltage gain of the amplifier $= \left[\frac{V_0}{V_{11} - V_{12}}\right]$ given in the figure is



(a) $h_{fe} R_L/h_{ie}$.
(b) $R_L/2R_E$.
(c) R_L/R_E.
(d) $h_{fe} R_L/R_E$.

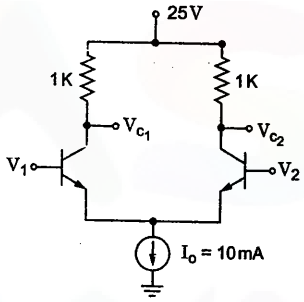
[U.P.S.C. I.E.S. E.E.-II, 1995]

319. In the differential amplifier of the figure, if the source resistance of the current source I_{EE} is infinite, then the common-mode gain is



(a) zero.
(b) infinite.
(c) indeterminate.
(d) $\frac{V_{in1} + V_{in2}}{2V_T}$. [GATE E.C.E. 2000]

320. In the difference amplifier as shown below, the differential output $\left(V_{C_2} - V_{C_1}\right)$ for $V_1 = +5$ V, $V_2 = 0$ V is



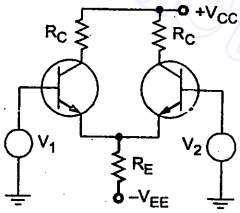
(a) 0 V (b) 5 V (c) 10 V (d) 15 V

[U.P.S.C. I.E.S. E.E.-II, 2010]

321. Active load is used in the collector of the differential amplifier of an op-amp to
(a) increase the output resistance.
(b) increase the differential gain A_d.
(c) increase maximum peak to peak output voltage.
(d) eliminate load resistance from the circuit.

[U.P.S.C. I.E.S. E.E.-II, 2001]

322. In an ideal differential amplifier shown in the figure, a large value of (R_E).



(a) increases both the differential and common-mode gains.
(b) increases the common-mode gain only.
(c) decreases the differential-mode gain only.
(d) decreases the common-mode gain only.

[GATE E.C.E. 2005]

323. Most important advantage of an IC is its
(a) very low cost. (b) extremely high reliability.
(c) extremely small size. (d) very small weight.

324. Why is the term 'planar technology' for fabrication of devices in ICs used ?

Answers: **309.** (b), **310.** (d), **311.** (c), **312.** (a), **313.** (c), **314.** (d), **315.** (b), **316.** (b), **317.** (e), **318.** (a), **319.** (a), **320.** (c), **321.** (c), **322.** (d), **323.** (b), **324.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) The variety of manufacturing processes by which devices are fabricated, takes place through a single plane.
(b) The aluminium contacts to the collector, base and emitter regions of the transistors in the ICs are laid in the same plane.
(c) The collector, base and emitter regions of the transistors in ICs are laid in the same plane.
(d) The device looks like a thin plane wafer.
[U.P.S.C. I.E.S. E.T.E. I, 2008]

325. The most significant factor in the relative manufacturing cost of IC components is
(a) the shape of the component.
(b) number of electrode connections.
(c) the area occupied by the component.
(d) the position of the component on the slice.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

326. Ultraviolet radiation is used in IC fabrication process for
(a) diffusion. (b) masking.
(c) isolation. (d) metalization.
[U.P.S.C. I.E.S. E.E.-II, 1994]

327. In the context of IC fabrication, metallisation means
(a) covering with a metal cap. (b) depositing SiO_2 layer.
(c) connecting metal wires.
(d) forming interconnecting conduction pattern and bonding pads.

328. Why is silicon dioxide (SiO_2) layer used in ICs ?
(a) To protect the surface of the chip from external contaminants and to allow for selective formation of the n and p regions by diffusion.
(b) Because it facilitates the penetration of the desired impurity by diffusion.
(c) To control the concentration of the diffused impurities.
(d) Because of its high heat conduction. [U.P.S.C. I.E.S. E.T.E. II, 2008]

329. In integrated circuits, the design of electronic circuits is based on the approach of use of
(a) maximum number of resistors in the circuit.
(b) large sized capacitor.
(c) minimum chip area irrespective of the type of components in the design.
(d) use of only bipolar transistors. [U.P.S.C. I.E.S. E.T.E. I, 2006]

330. Which of the following capacitors are made use of widely for a capacitance application in monolithic ICs ?
1. MOS capacitor. 2. Collector-Substrate capacitor.
3. Collector-Base capacitor. 4. Base-Emitter capacitor.
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 3 and 4 only. (d) 1 and 4 only.
[U.P.S.C. I.E.S. E.T.E. I, 2008]

331. The process of extension of a single-crystal surface by growing a film in such a way that the added atoms form a continuation of the single-crystal structure is called
(a) ion implantation. (b) chemical vapour depiction.
(c) electroplating. (d) Epitaxy.
[U.P.S.C. I.E.S. E.T.E. II, 2009]

332. Op-amps have become very popular because
(a) they are very cheap.
(b) they are extremely small in size.
(c) their external characteristics can be altered to suit any application.
(d) they are available in different packages.

333. An operational amplifier is basically a
(a) Low gain ac amplifier. (b) High gain dc amplifier.
(c) High gain RC coupled amplifier.
(d) Low gain transformer-coupled amplifier.
[U.P.S.C. I.E.S. E.E.-II, 2007]

334. An ideal op-amp is an ideal
(a) voltage controlled current source.
(b) voltage controlled voltage source.
(c) current controlled current source.
(d) current controlled voltage source. [GATE E.C.E. 2004]

335. The ideal op-amp has the following characteristics.
(a) $R_i = \infty, A = \infty, R_0 = 0$ (b) $R_i = 0, A = \infty, R_0 = 0$
(c) $R_i = \infty, A = \infty, R_0 = \infty$ (d) $R_i = 0, A = \infty, R_0 = \infty$
[GATE E.C.E. 2001]

336. The common mode rejection ratio (CMRR) of a differential amplifier (where A_d = differential gain, A_C = common mode gain) is defined as
(a) $\frac{A_d}{A_C}$ (b) $\frac{A_d - A_C}{A_d}$.
(c) $20 \log_{10} \frac{A_d}{A_C}$. (d) $20 \log_e \frac{A_d}{A_C}$.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

337. In an ideal op-amp, the voltage gain for the common mode signal is
(a) 0 (b) 0.5 (c) 2.0 (d) ∞
[U.P.S.C. I.E.S. E.E.-II, 2002]

338. An op-amp has a common mode gain of 0.01 and a differential mode gain of 10^5. Its CMRR would be
(a) 10^{-7} (b) 10^{-3} (c) 10^3 (d) 10^7
[U.P.S.C. I.E.S. E.E.-II, 2000]

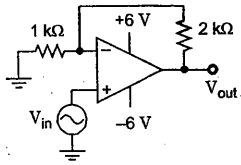
339. If the differential voltage gain and the common mode voltage gain of a differential amplifier are 48 dB and 2 dB respectively, then its common mode rejection ratio is
(a) 23 dB (b) 25 dB (c) 46 dB (d) 50 dB
[GATE E.C.E. 2003]

340. An IC operational amplifier has a typical open loop gain of 1,200 and the common mode rejection of 55 dB. What is the common mode rejection ratio (CMRR) ?
(a) 550 (b) 560 (c) 570 (d) 580
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

341. An op-amp has a differential gain of 10^3 and a CMRR of 100. The output voltage of the op-amp with inputs of 120 μV and 80 μV will be
(a) 26 mV. (b) 41 mV. (c) 100 mV. (d) 200 mV.
[U.P.S.C. I.E.S. E.E.-II, 2003]

342. A differential amplifier has inputs, $V_1 = 1050$ μV and $V_2 = 950$ μV with CMRR = 1000. What is the error in the differential output?
(a) 10% (b) 1% (c) 0.1% (d) 0.01%
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

343. The nature of feedback in the op-amp circuit shown is



(a) Current – Current feedback.
(b) Voltage – Voltage feedback.
(c) Current – Voltage feedback.
(d) Voltage – Current feedback.
[GATE E.E. 2009]

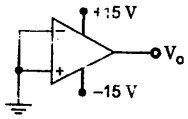
344. The voltage follower is commonly used as
(a) Switch. (b) Isolator.
(c) Regulator. (d) None of these.
[G.B.T.U. Elec. Engg. Even Semester 2010-11]

Answers: **325.** (c), **326.** (b), **327.** (d), **328.** (a), **329.** (c), **330.** (a), **331.** (d), **332.** (c), **333.** (b), **334.** (b), **335.** (a), **336.** (a), **337.** (a), **338.** (d), **339.** (c), **340.** (c), **341.** (b), **342.** (b), **343.** (b), **344.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

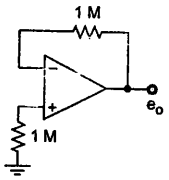
345. If the op-amp in the figure has an input offset voltage of 5 mV and an open-loop voltage gain of 10,000, then V_0 will be



(a) 0 V (b) 5 mV
(c) +15 V or –15 V
(d) +50 V or –50 V

[GATE E.C.E. 2000]

346. The voltage e_0 indicated in the figure has been measured by an ideal voltmeter. Which of the following can be calculated ?



(a) Bias current of the inverting input only.
(b) Bias current of the inverting and non-inverting inputs only.
(c) Input offset current only.
(d) Both the bias currents and the input offset current.

[GATE E.C.E. 2005]

347. Which one of the following causes phase shift through an op-amp?
(a) Internal RC circuits. (b) External RC circuits.
(c) Gain roll off of the internal transistor.
(d) Negative feedback. [U.P.S.C. I.E.S. E.T.E., I, 2007]

348. Consider the following statements :
1. Stray capacitance at the input terminal of an op-amp effectively introduces an additional phase lag network in feedback loop.
2. Stray capacitance depends upon the value of resistor used in feedback.
3. Low value of resistance has higher effects on stray capacitance.
4. High value of resistances has higher effects on stray capacitance.

Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 4.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

349. The purpose of phase lag compensation is to
(a) make the op-amp stable at very high values of gain.
(b) make the op-amp stable at very low values of gain.
(c) reduce the unity gain frequency.
(d) increase the bandwidth.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

350. Consider the following statements :
Dominant-pole frequency compensation in an op-amp
1. increases the slew-rate of the op-amp.
2. increases the stability of the op-amp.
3. reduces the bandwidth of the op-amp.
4. reduces the CMRR of the op-amp.

Which of the statements given above are correct ?
(a) 1 and 3 only. (b) 1, 2 and 4 only.
(c) 1 and 2 only. (d) 2 and 3 only.

[U.P.S.C. I.E.S. E.T.E.-II, 2008]

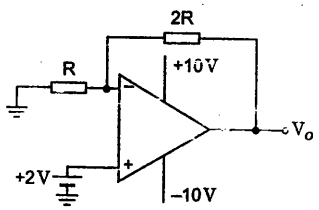
351. An ideal OP-AMP is used to make an inverting amplifier. The two input terminals of the OP-AMP are at the same potential because
(a) the two input terminals are directly shorted internally.
(b) the input impedance of the OP-AMP is infinity.
(c) the open loop gain of the OP-AMP is infinity.
(d) CMRR is infinity. (e) both (c) and (d).

[GATE E.E. 1992]

352. An op-amp has an open-loop gain of 10^5 and an open-loop upper cut-off frequency is 10 Hz. If this op-amp is connected as an amplifier with a closed loop gain of 100, then the new upper cut-off frequency is
(a) 10 Hz (b) 100 Hz (c) 10 kHz (d) 100 kHz

[GATE E.E. 2001]

353. Give that the op-amp is ideal, the output voltage V_o is



(a) 4 V (b) 6 V (c) 7.5 V (d) 12.12 V

[GATE E.E., 2010]

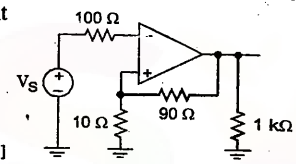
354. If a certain op-amp has a closed-loop gain 20 and an upper critical frequency of 10 MHz, the gain-bandwidth product is
(a) 200 MHz (b) 10 MHz
(c) the unity gain frequency. (d) only (a) and (c) above.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

355. A certain inverting amplifier has a closed loop gain of 25. The op-amp has an open-loop gain of 100,000. If another op-amp with an open-loop gain of 200,000 is substituted in the configuration, the closed loop gain
(a) doubles. (b) drops to 12.5
(c) remains at 25 (d) increases slightly.

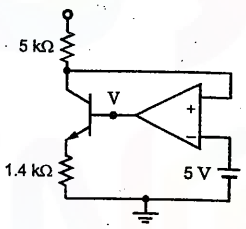
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

356. The feedback factor for the circuit shown in the figure is



(a) 9/100
(b) 9/10
(c) 1/9
(d) 1/10 [GATE E.E. 2000]

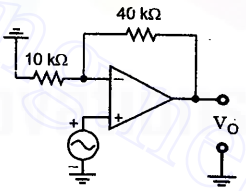
357. In the circuit shown in the figure, the op-amp is ideal, the transistor has V_{BE} = 0.6 V and β = 150. Decide whether the feedback in the circuit is positive or negative and determine the voltage V at the output of the op-amp.



(a) Positive feedback, V = 10 V.
(b) Positive feedback, V = 0 V.
(c) Negative feedback, V = 5 V.
(d) Negative feedback, V = 2 V.

[GATE E.C.E. 2009]

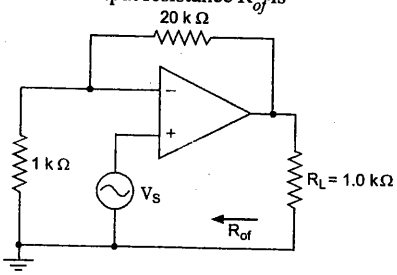
358. The op-amp is the above circuit shown a unity-gain bandwidth of 1 MHz and a dominant pole at 10 Hz. The bandwidth of the non-inverting amplifier will be



(a) 10 MHz (b) 1 MHz
(c) 250 kHz (d) 200 kHz

[U.P.S.C. I.E.S. E.E.-II, 1999]

359. An op-amp with open-loop gain of 10,000, R_{in} = 2 kΩ and R_o = 500 Ω is used in the noninverting configuration as shown in the figure. The output resistance R_{of} is



Answers: **345.** (c), **346.** (c), **347.** (c), **348.** (d), **349.** (c), **350.** (c), **351.** (e), **352.** (c), **353.** (b), **354.** (a), **355.** (d), **356.** (d), **357.** (d), **358.** (d), **359.** (d),

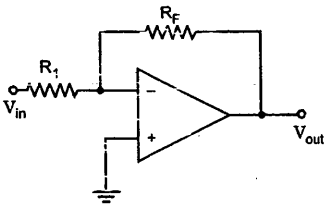
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 2505 Ω (b) 21 Ω (c) 2 Ω (d) 0.998 Ω

[U.P.S.C. I.E.S. E.E.-II, 1999]

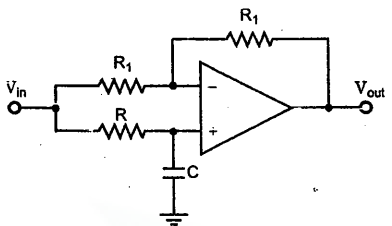
360. Consider the inverting amplifier, using an ideal operational amplifier shown in the figure. The designer wishes to realize the input resistance seen by the small-signal source to be as large as possible while keeping the voltage gain between –10 and –25. The upper limit of R_F is 1 MΩ. The value of R_1 should be



(a) infinity. (b) 1 MΩ. (c) 100 kΩ. (d) 40 kΩ.

[GATE E.E. 2005]

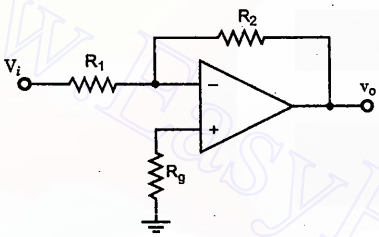
361. For the circuit shown in the figure with an ideal op-amp, the maximum phase shift of the output V_{out} with reference to the input V_{in} is



(a) 0° (b) –90° (b) + 90° (d) ± 180°

[GATE E.E. 2003]

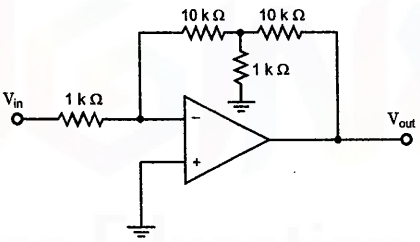
362. In the inverting op-amp circuit shown in the figure, the resistance R_g is chosen as $R_1 \| R_2$ in order to



(a) increase gain.
(b) reduce offset voltage.
(c) reduce offset current. (d) increase CMRR.

[U.P.S.C. I.E.S. E.E.-II, 2002]

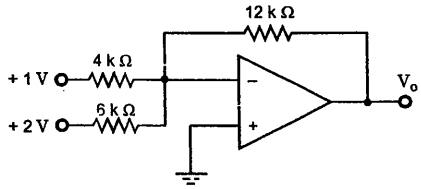
363. Assuming the op-amp to be ideal, the gain V_{out}/V_{in} for the circuit shown in the figure



(a) – 1
(b) – 20
(c) – 100 (d) – 120

[GATE E.E. 2003]

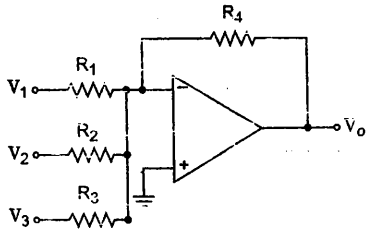
364. In the circuit shown in the figure, the value of output 'V_0' is



(a) + 3 V (b) – 3 V (c) – 7 V (d) + 7 V

[U.P.S.C. I.E.S. E.E.-II, 1999]

365. In the given circuit, the magnitude of the output voltage $|V_o| = 3V_1 + 2V_2 + 7V_3$, then the values of R_1, R_2, R_3 and R_4 are:



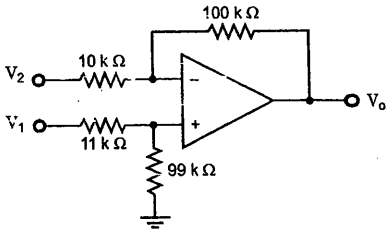
(a) 3 kΩ, 2 kΩ, 7 kΩ and 1 kΩ.

(b) $\frac{1}{4}$ kΩ, 6 kΩ, $\frac{7}{12}$ kΩ and 12 kΩ.

(c) 4 kΩ, 6 kΩ, $\frac{12}{7}$ kΩ and 12 kΩ.

(d) $\frac{1}{3}$ kΩ, $6\frac{1}{2}$ kΩ, $\frac{1}{7}$ kΩ and 12 kΩ. [U.P.S.C. I.E.S. E.E.-II, 2011]

366. The expression for the output voltage V_0 in terms of the input voltages V_1 and V_2 in the circuit shown in the figure, assuming the op-amp to be ideal is



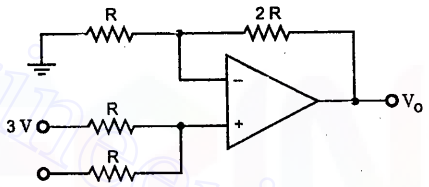
$V_0 = A_1V_1 + A_2V_2$

The values of A_1 and A_2 would be respectively

(a) 9 and –10 (b) 9.9 and –10
(c) –9 and 10 (d) –9.9 and 10

[U.P.S.C. I.E.S. E.E.-II, 1997]

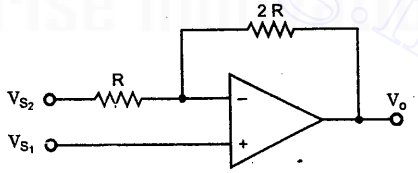
367. A noninverting op-amp summer is shown in figure. The output voltage V_0 is



(a) sin 100 t (b) 3/2 sin 100 t
(c) 2 sin 100 t (d) 3 sin 100 t

[U.P.S.C. I.E.S. E.E.-II, 1997]

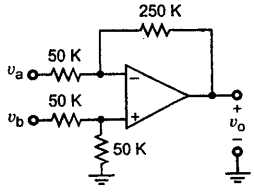
368. A circuit with op-amp is shown in figure. The voltage V_0 is



(a) $3V_{s1} - 6V_{s2}$ (b) $2V_{s1} - 3V_{s2}$
(c) $2V_{s1} - 2V_{s2}$ (d) $3V_{s1} - 2V_{s2}$

[U.P.S.C. I.E.S. E.E.-II, 2001]

369. What is the output voltage v_0 of the given circuit ?



(a) $-5v_a + 2.5v_b$
(b) $-5v_a + 3v_b$
(c) $-2.5v_a + 2.5v_b$
(d) $-2.5v_a + 3v_b$

[U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: **360.** (d), **361.** (d), **362.** (c), **363.** (d), **364.** (c), **365.** (c), **366.** (b), **367.** (b), **368.** (d), **369.** (b),

Downloaded From : www.EasyEngineering.net

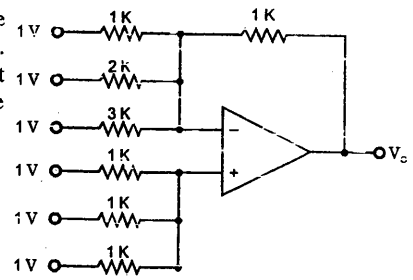
370. Consider the following circuit. What is the output voltage V_0 in the circuit ?



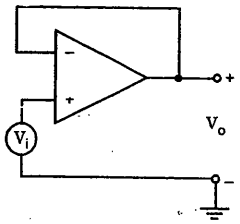
(a) 9.5 V
(b) 3 V
(c) 32.2 V
(d) 1 V

[U.P.S.C. I.E.S. E.E.-II, 2004]

371. The voltage gain of an ideal voltage follower is
(a) 1 (b) < 1 (c) 0 (d) infinity

[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

372. Consider the following statements with reference to an ideal voltage follower circuit as shown below :



1. Unity gain and no phase shift.
2. Infinite gain and 180° phase shift.
3. Very high input impedance and very low output impedance.
4. It is a buffer amplifier.

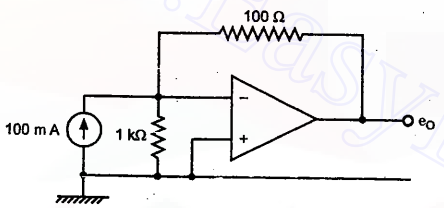
Which of these statements is correct ?
(a) 1 and 3. (b) 2 and 4.
(c) 1, 3 and 4 (d) 1, 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-II, 2003]

373. A averaging amplifier has five inputs. The ratio R_f / R_i must be
(a) 10 (b) 5 (c) 1 (d) 0.2

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

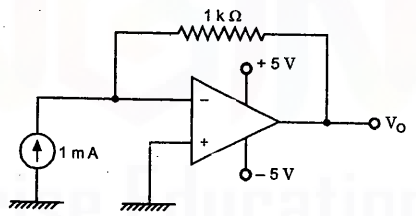
374. In the circuit shown in the given figure, the output voltage will be



(a) 9 V
(b) 10 V
(c) 11 V
(d) 12 V

[U.P.S.C. I.E.S. E.E.-II, 1998]

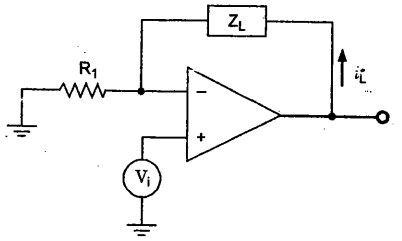
375. The circuit shown in the figure uses an ideal op-amp working with + 5 V and – 5 V power supplies. The output voltage V_0 is equal to



(a) + 5 V (b) – 5 V (c) + 5 V (d) – 1 V

[GATE E.E. 2000]

376. In the op-amp circuit as shown, the current i_L is



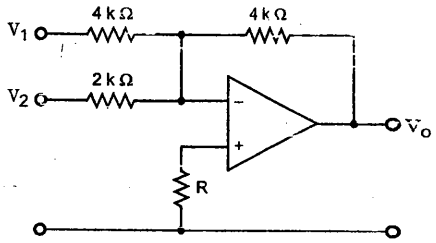
(a) $\frac{V_i}{Z_L}$

(b) $\frac{V_i}{Z_L \| R_1}$

(c) $\frac{V_i}{R_1}$ (d) $V_i (R_1 + Z_L)$

[U.P.S.C. I.E.S. E.E.-II, 2003]

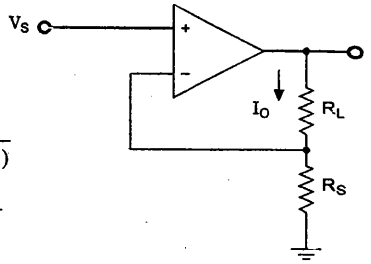
377. The most appropriate value of 'R' in the circuit shown is



(a) 0
(b) 1 kΩ
(c) 2 kΩ
(d) 4 kΩ

[U.P.S.C. I.E.S. E.E.-II, 2004]

378. An op-amp is used in the circuit as shown in the figure. Current I_0 is



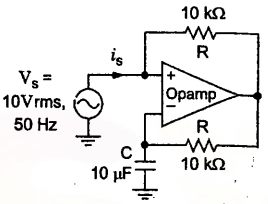
(a) $V_S \times \frac{R_L}{R_S (R_L + R_S)}$

(b) $\frac{V_S}{R_S}$ (c) $\frac{V_S}{R_L}$

(d) $V_S \left(\frac{1}{R_S} + \frac{1}{R_L} \right)$

[U.P.S.C. I.E.S. E.E.-II, 2004]

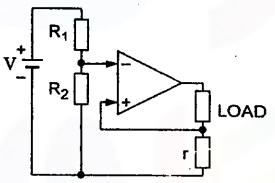
379. The following circuit has R = 10 kΩ, C = 10 μF. The input voltage is a sinusoid at 50 Hz with an rms value of 10 V. Under ideal conditions, the current i_s from the source is



(a) 10 πmA leading by 90°.
(b) 20 πmA leading by 90°.
(c) 10 πmA leading by 90°.
(d) 10 πmA leading by 90°.

[GATE E.E. 2000]

380. The circuit shown in the figure is



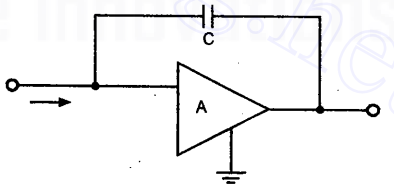
(a) a voltage source with voltage $\frac{rV}{R_1 \| R_2}$

(b) a voltage source with voltage $\frac{r \| R_2}{R_1} V$

(c) a current source with current $\frac{r \| R_2}{R_1 + R_2} \cdot \frac{V}{r}$

(d) a current source with current $\frac{R_2}{R_1 + R_2} \cdot \frac{V}{r}$. [GATE E.E. 2007]

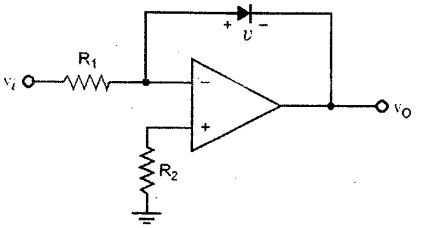
381. An amplifier of gain A is bridged by a capacitance C as shown below.



The effective input capacitance is
(a) C/A
(b) C(1 – A) (c) C(1 + A) (d) C × A

[U.P.S.C. I.E.S. E.E.-II, 2002]

382. In the op-amp circuit shown below, $v_i > 0$ and $i = I_0 a^{kv}$. The output v_0 will be proportional to



Answers: **370.** (d), **371.** (a), **372.** (c), **373.** (d), **374.** (b), **375.** (d), **376.** (c), **377.** (a), **378.** (b), **379.** (a), **380.** (d), **381.** (b), **382.** (d),

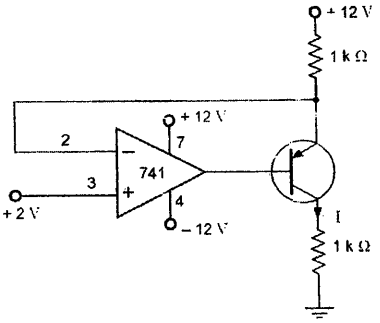
(a) $\sqrt{v_i}$ (b) v_i

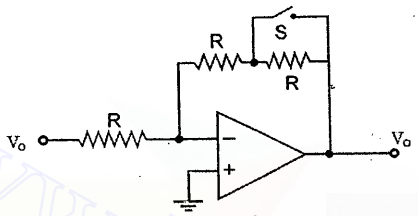
(c) e^{kvi} (d) $\log (kv_i)$ [U.P.S.C. I.E.S. E.E.-II, 2002]

383. An op-amp circuit is shown in the given figure. The current I is



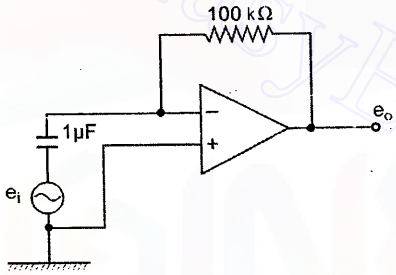
(a) zero (b) 6 mA (c) 10 mA (d) 12 mA
[U.P.S.C. I.E.S. E.E.-II, 2000]

384. Let the magnitude of the gain in the inverting op-amp amplifier circuit shown in figure be x with switch S_1 open. When the switch S_1 is closed, the magnitude of gain becomes



(a) $x/2$ (b) $-x$ (c) $2x$ (d) $-2x$
[GATE E.E. 1996]

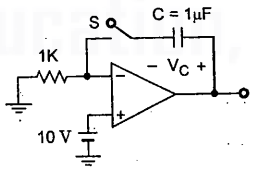
385. If the input signal e_1, applied to the op-amp of the circuit shown in the given fig is sinusoidal of maximum value 1 mV and of 1 kHz frequency, then the magnitude of the peak value of the output voltage waveform would be



(a) 1.59 mV (b) 6.28 mV
(c) 159 mV (d) 628 mV
[U.P.S.C. I.E.S. E.E.-II, 1996]

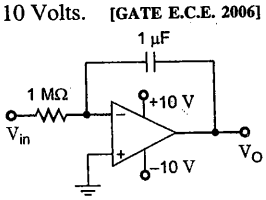
386. For the circuit shown in the figure, the capacitor C is initially uncharged. At $t = 0$, the switch S is closed. The voltage V_C across the capacitor at $t = 1$ millisecond is

In the figure shown above, the op-amp is supplied with ±15 V.



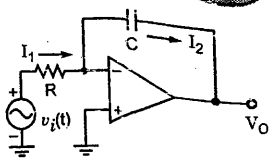
(a) 0 Volt. (b) 6.3 Volts.
(c) 9.45 Volts. (d) 10 Volts. [GATE E.C.E. 2006]

387. A unit positive step is applied at the input of the circuit shown in the figure. After 20 seconds, the output V_0 will be



(a) +20 V (b) +10 V
(c) –10 V (d) –20 V
[U.P.S.C. I.E.S. E.E.-II, 1998]

388. For the circuit shown in figure, given by the output voltage V_0 is

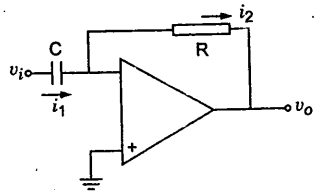


(a) $V_0 = -\frac{1}{RC}\int_0^t V_i(t)dt$

(b) $V_0 = -RC\int_0^t V_i(t)dt$

(c) $V_0 = -RC\frac{d}{dt}V_i(t)$ (d) $V_0 = -\frac{1}{RC}\int\frac{d}{dt}V_i(t)$
[U.P. Technical Univ. 2008-09]

389. For the circuit shown in figure, the output voltage v_o is given by:



(a) $v_o = -\frac{1}{RC}\frac{dv_i(t)}{dt}$ (b) $v_o = -\frac{1}{RC}\int_0^t v_i(t)\,dt$

(c) $v_o = -RC\frac{dv_i(t)}{dt}$ (d) $v_o = -RC\int_0^t v_i(t)\,dt$
[U.P.T.U. Even Semester 2009-10]

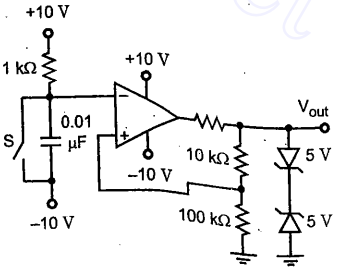
390. When you apply a triangular waveform to the input of a differentiator, the output is
(a) a dc level.
(b) an inverted triangular waveform.
(c) square waveform.
(d) the first harmonic of the triangular wave.
[A.M.I.E. Sec. B Design of Electronic Devices and Circuits Summer 2007]

391. The output of a particular op-amp increases 8 V in 12 μs. The slew rate is
(a) 96 V/μs (b) 0.67 V/μs
(c) 1.5 V/μs (d) none of the above.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summe- 2005]

392. The slew rate of an op-amp is 0.5 V/μs. The maximum frequency of a sinusoidal input of 2V rms that can be handled without excessive distortion is
(a) 3 kHz (b) 30 kHz (c) 200 kHz (d) 2 MHz
[U.P.S.C. I.E.S. E.E.-II, 2001]

393. An op-amp having a slew rate of 62.8 V/μs, is connected in a voltage follower configuration. If the maximum amplitude of the input sinusoid is 10 V, then the minimum frequency at which the slew rate limited distortion would set in at the output is
(a) 1.0 MHz (b) 6.28 MHz
(c) 10.0 MHz (d) 62.8 MHz [GATE E.E. 2001]

394. The switch S in the circuit of the figure is initially closed, it is opened at time $t = 0$. You may neglect the zener diode forward voltage drops. What is the behaviour of V_{OUT} for $t > 0$?



(a) It makes a transition from –5 V to +5 at $t = 12.98$ μs.
(b) It makes a transition from –5 V to +5 V at $t = 2.57$ μs.
(c) It makes a transition from +5 V to –5 V at $t = 12.98$ μs.
(d) It makes a transition from +5 V to –5 V at $t = 2.57$ μs.
[GATE E.E. 2007]

Answers: **383.** (c), **384.** (a), **385.** (d), **386.** (d), **387.** (d), **388.** (a), **389.** (c), **390.** (c), **391.** (b), **392.** (b), **393.** (a), **394.** (d),

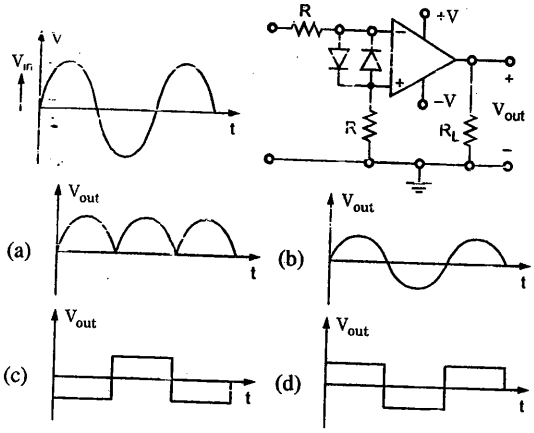
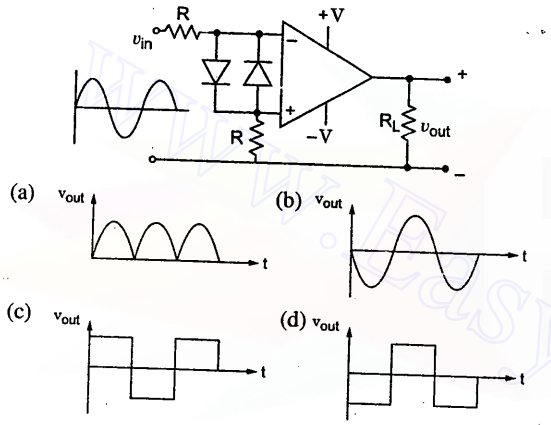
395. In the given figure, if the input is a sinusoidal signal, the output will appear as shown in



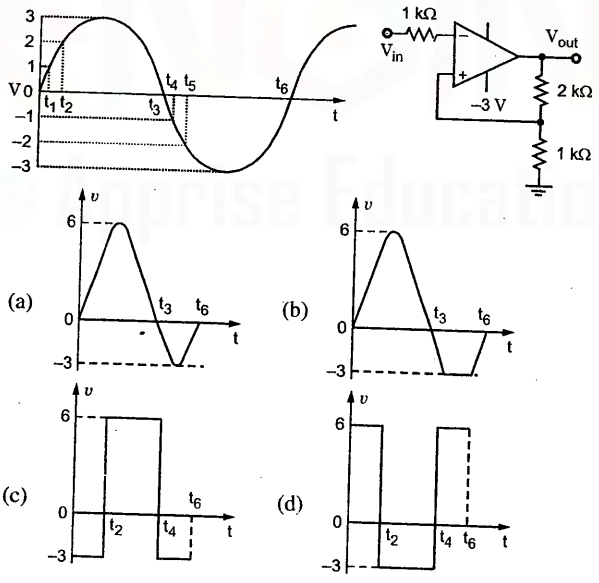
[GATE E.E. 2005]

396. For the circuit given below what will be the output for the sinusoidal input shown at the input terminal?



[U.P.S.C. I.E.S. E.E.-II, 2009]

397. An ideal opamp circuit and its input waveform are shown in the figures. The output waveform of this circuit will be



[GATE E.E. 2009]

398. Typically an instrumentation amplifier has an external resistor used for

(a) establishing the input impedance.
(b) setting the voltage gain.
(c) setting the current gain. (d) interfacing with an instrument.

[A.M.I.E. Sec. B Design of Electronic Devices and Circuits Summer 2007]

399. Instrumentation amplifiers are used primarily in

(a) high noise environment. (b) medical equipment.
(c) test instruments. (d) filter circuits.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

400. The main advantage in using a three OP-AMP instrumentation amplifier over a single OP-AMP differential amplifier lies in

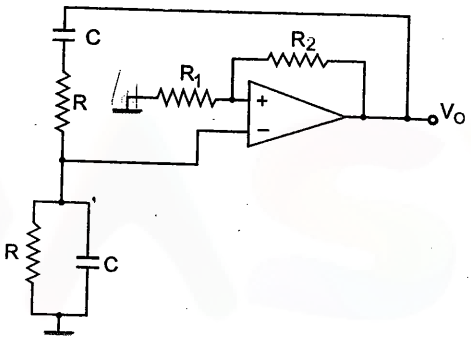
(a) higher values of CMRR. (b) lower noise figure.
(c) elimination of the need for accurate matching of resistors.
(d) simplicity of gain adjustment. [U.P.S.C. I.E.S. Elec. Engg. I, 1993]

401. An instrumentation amplifier uses

(a) 1 op-amp. (b) 2 op-amps.
(c) 4 op-amps. (d) 3 op-amps.

[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

402. A Wien bridge oscillator is shown in the figure. Which of the following statements is not true, if f is the frequency of oscillation ?



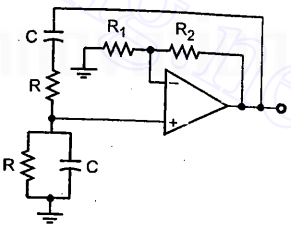
(a) For R = 1k, $C = \frac{1}{2\pi}$ μF, f = 1 kHz.

(b) For R = 3 k, $C = \frac{1}{18\pi}$ μF, f = 3 kHz.

(c) The gain of the op-amp stage should be less than two for proper operation.

(d) The gain of the op-amp stage should be three for proper operation.

403. Consider the following statements in respect of the Wien bridge oscillator shown in the figure :



1. For R = 1 kilo ohm

$C = \left(\frac{1}{2\pi}\right)$ μF, f = 1 kHz

2. For R = 3 kilo ohms

$C = \left(\frac{1}{18\pi}\right)$ μF, f = 3 kHz

Which of the statements given above is / are correct ?

(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 and 2.

[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **395.** (c), **396.** (d), **397.** (d), **398.** (b), **399.** (c), **400.** (c), **401.** (d), **402.** (c), **403.** (c),

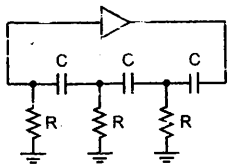
404. The oscillator circuit shown in the figure has an ideal inverting amplifier. Its frequency of oscillation (in Hz) is

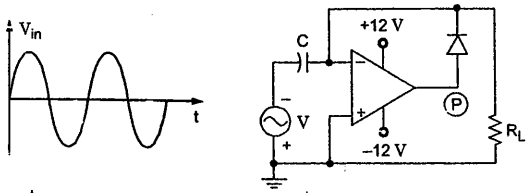


(a) $\frac{1}{(2\pi\sqrt{6}RC)}$ (b) $\frac{1}{(2\pi RC)}$

(c) $\frac{1}{(\sqrt{6}RC)}$ (d) $\frac{1}{\sqrt{6}(2\pi RC)}$

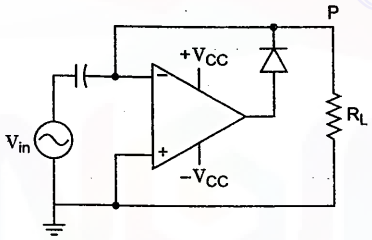
[GATE E.C.E. 2003]

405. For a given sinusoidal input voltage, the voltage waveform at point P of the clamper circuit shown in figure will be



(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2006]

406. For the given sinusoidal input to the circuit as shown below, the voltage waveform at point 'P' of the clamper circuit is



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2010]

407. A sinusoidal waveform can be converted to a square waveform by using a

(a) two stage transistorised overdriven amplifier.
(b) two stage diode detector circuit.
(c) voltage comparator based on op-amp.
(d) regenerative voltage comparator circuit.

[U.P.S.C. I.E.S. E.E.-II, 2001]

408. A comparator with hysteresis

(a) has one trigger point. (b) has two trigger points.
(c) has a variable trigger point.
(d) is like a magnetic circuit.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005-06]

409. Noise on the input of the comparator can cause the output to

(a) hang-up in one state. (b) go to zero.
(c) change erratically between two states.
(d) produce the amplified noise signal.

[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer 2007]

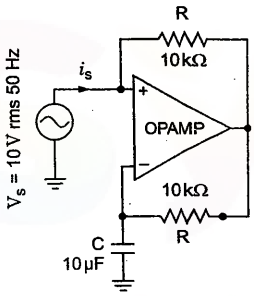
410. An operational amplifier can be connected as a non-inverting voltage comparator as shown in

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 1998]

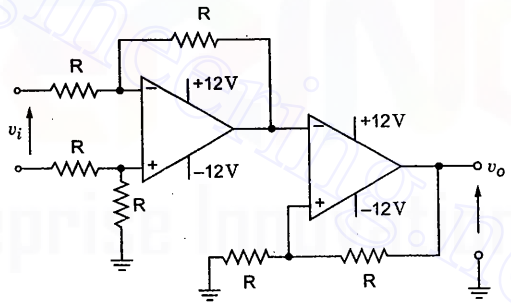
411. The following circuit has R = 10 kΩ, C = 10 μF. The input voltage is a sinusoid at 50 Hz with an rms value of 10 V. Under ideal conditions, the current i_s from the source is

(a) 10 π mA leading by 90°
(b) 20 π mA leading by 90°.
(c) 10 mA leading by 90°.
(d) 10 π mA lagging by 90°.

[GATE E.E., 2009]



412. For the circuit shown below:



the CORRECT transfer characteristic is

(a) 
Answers: **404.** (a), **405.** (d), **406.** (d), **407.** (c), **408.** (b), **409.** (c), **410.** (b), **411.** (d), **412.** (d),

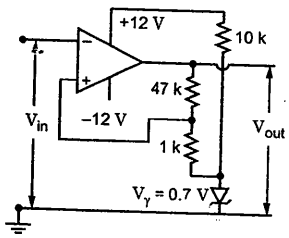
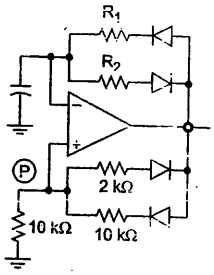
413. The zero level detector is one application of a
(a) differentiator. (b) integrator.
(c) summing amplifier. (d) comparator.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005-06]

414. Consider the following statements.
From a sine wave one can obtain square wave by using.
1. Schmitt trigger circuit. 2. Zero crossing detector.
3. clippers and amplifiers.
Of these statements
(a) 1 and 2 are correct (b) 1 and 3 are correct.
(c) 2 and 3 are correct (d) 1, 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1996]

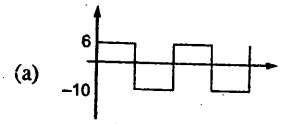
415. The Schmitt trigger circuit is shown in the figure. If $V_{sat} = \pm 10$ V, the tripping point for the increasing input voltage will be
(a) 1 V
(b) 0.893 V
(c) 0.477 V
(d) 0.416 V
[U.P.S.C. I.E.S. E.E.-II, 2001]



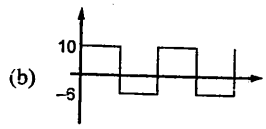
416. A relaxation oscillator is made using OPAMP as shown in figure. The supply voltages of the op-amp are ± 12 V. The voltage waveform at point P will be



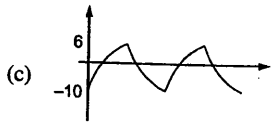
(a)



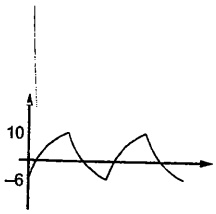
(b)



(c)

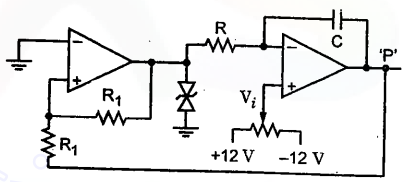


(d)

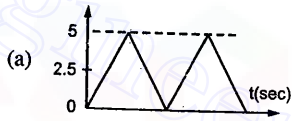


[GATE E.E. 2006]

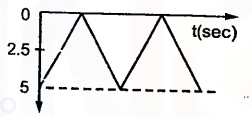
417. A waveform generator circuit using op-amp is shown in the figure. It produces a triangular wave at point 'P' with a peak to peak voltage of 5 V for $V_i = 0$ V.
If the voltage V_i is made +2.5 V, the voltage waveform at point 'P' will become



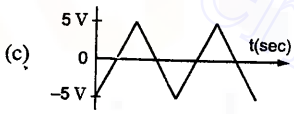
(a)



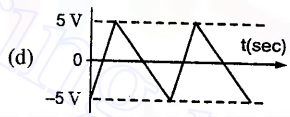
(b)



(c)

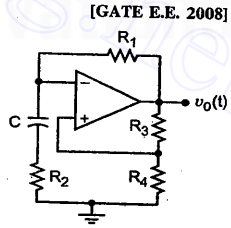


(d)



[GATE E.E. 2008]

418. In the following a stable multivibrator circuit, which properties of $V_0(t)$ depend on R_2?
(a) Only the frequency.
(b) Only the amplitude.
(c) Both the amplitude and the frequency.
(d) Neither the amplitude nor the frequency.



[GATE E.C.E. 2009]

419. The control signal for a sample and hold circuit is applied to the following device.
(a) diode (b) SCR (c) MOS (d) Triac
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2005]

420. The most commonly used amplifier in sample and hold circuits is
(a) a unity gain inverting amplifier.
(b) a unity gain non-inverting amplifier.

Answers: **413.** (d), **414.** (b), **415.** (b), **416.** (c), **417.** (a), **418.** (a), **419.** (c), **420.** (b),

(c) an inverting amplifier with a gain of 10.
(d) an inverting amplifier with a gain of 100. [GATE E.C.E. 1999]

421. IC 555 in the adjacent figure is configured as an astable multivibrator. It is enabled to oscillate at $t = 0$ by applying a high input to pin 4. The pin description is : 1 and 8 – supply; 2-trigger, 4-reset; 6-threshold; 7-discharge. The waveform appearing across the capacitor starting from $t = 0$, as observed on a storage CRO is

(a) (b) (c) (d) 
[GATE E.E. 2007]

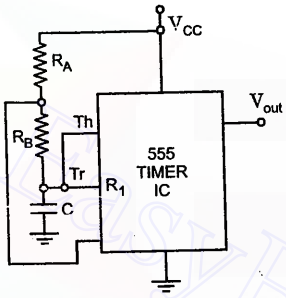
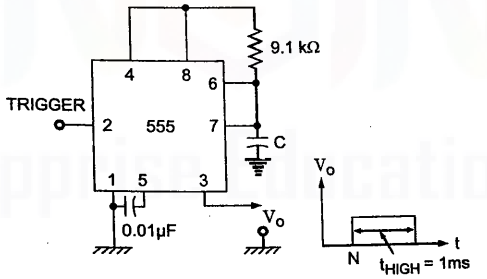
422. The circuit of the figure shows a 555 timer IC connected as an astable multivibrator. The value of the capacitor C is 10 nF. The values of resistors R_A and R_B for a frequency of 10 kHz and a duty cycle of 0.75 for the output voltage waveform are



(a) $R_A = 3.62\ k\Omega$, $R_B = 3.62\ k\Omega$
(b) $R_A = 3.62\ k\Omega$, $R_B = 7.25\ k\Omega$
(c) $R_A = 7.25\ k\Omega$, $R_B = 3.62\ k\Omega$
(d) $R_A = 7.25\ k\Omega$, $R_B = 7.25\ k\Omega$ [GATE E.E. 2003]

423. A monostable multivibrator circuit is shown in the figure. The value of C would be nearly



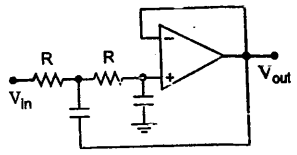
(a) 0.001 μF (b) 0.01 μF (c) 0.1 μF (d) 1 μF
[U.P.S.C. I.E.S. E.E.-II, 2000]

424. The ideal dc output voltage of a comparator filter is equal to
(a) peak value of rectified voltage.
(b) average value of rectified voltage.
(c) rms of rectified voltage.
(d) average value of rectified current.
[A.M.I.E. Sec. B. Design of Electronic Devices and Circuits Summer 2007]

425. The lowest frequency of a low-pass filter is
(a) 1 Hz (b) 0 Hz
(c) 10 Hz (d) depends on f_c
[A.M.I.E. Sec. B. Design of Electronic Devices and Circuits Summer 2007]

426. A major advantage of active filters is that they can be realized without using
(a) op-amps. (b) inductors. (c) resistors. (d) capacitors.
[GATE E.E. 1997]

427. The circuit in the figure is a
(a) low-pass filter.
(b) high-pass filter.
(c) band-pass filter.
(d) band-reject filter.
[GATE E.C.E. 2004]

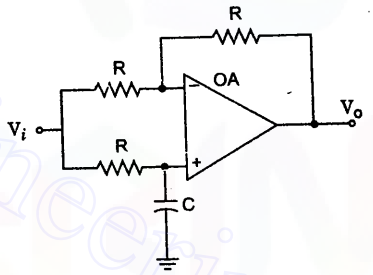


428. A first order low-pass filter is given with $R = 50\ \Omega$ and $C = 5\ \mu F$. What is the frequency at which the gain of the voltage transfer function of the filter is 0.25 ?
(a) 4.92 kHz (b) 0.49 kHz
(c) 2.46 kHz (d) 24.6 kHz [GATE E.E. 2002]

429. The waveform of the output of a low-pass filter to a step input will be as in

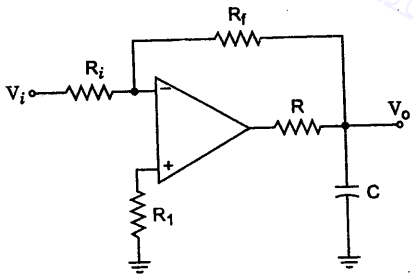
(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 1997]

430. The circuit shown is:



(a) A low pass filter. (b) A high pass filter.
(c) A comparator. (d) An all-pass filter.
[U.P.S.C. I.E.S. E.E.-II, 2011]

431. The circuit shown is:



(a) A low pass filter. (b) A clamper.
(c) A lag compensated inverting amplifier.
(d) A narrow band video amplifier. [U.P.S.C. I.E.S. E.E.-II, 2011]

Answers: **421.** (a), **422.** (c), **423.** (c), **424.** (b), **425.** (b), **426.** (b), **427.** (a), **428.** (c), **429.** (c), **430.** (d), **431.** (a),

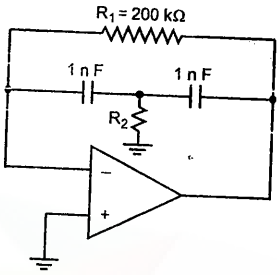
432. Which one of the following correctly depicts the output of a low-pass filter to a pulse input ?

(a) 
(b)

(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 1998]

433. In the active filter circuit shown in the figure, if Q = 1, a pair of poles will be realized with ω_0 equal to



(a) 1000 rad/s.
(b) 100 rad/s.
(c) 10 rad/s.
(d) 1 rad/s. [GATE E.E. 2004]

434. The damping factor of a second order active low pass filter to give butterworth response is

(a) 1.732 (b) 1.414
(c) 0.707 (d) none of the above

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2005]

435. If an input periodic signal with non-zero dc component is impressed upon a high pass circuit, what will be the dc component in the output waveform ?

(a) zero.
(b) it depends upon the value of capacitor.
(c) it depends upon the value of resistor.
(d) same as the input. [U.P.S.C. I.E.S. E.E.-II, 2006]

436. For a step input, the output of an integrator is

(a) a pulse. (b) a triangular waveform
(c) a spike. (d) a ramp.

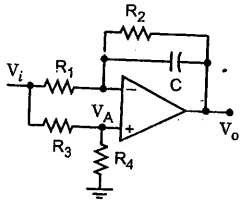
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

437. A rectangular voltage pulse of magnitude V and duration T is applied to a series combination of resistance R and capacitance C. The maximum voltage developed across the capacitor is

(a) $V\,[1 - e^{-T/RC}]$ (b) VT/RC
(c) V (d) $Ve^{-T/RC}$ [GATE 1999]

Statement for Linked Answer Questions 438 and 439.

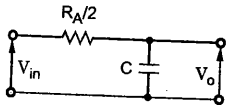
A general filter circuit is shown in the figure :



438. If $R_1 = R_2 = R_A$ and $R_3 = R_4 = R_B$, the circuit acts as a

(a) all pass filter.
(b) band pass filter.
(c) high pass filter.
(d) low pass filter. [GATE E.E. 2008]

439. The output of the filter in Q 438 is given to the circuit shown in figure. The gain vs frequency characteristic of the output (V_o) will be

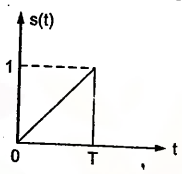


(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2008]

440. Which one of the following is the output of the high pass filter to a step input ?

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2001]

441. Which one of the following is the impulse response of a matched filter for a signal s(t) of the type shown in figure ?



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2006]

442. The integrated circuit chip NE/SE 566 is a

(a) Schmitt trigger (b) power amplifier
(c) video amplifier. (d) voltage controlled oscillator.
(e) IF amplifier.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2006]

443. An oscillator whose frequency is changed by a variable dc voltage, is known as

(a) a crystal oscillator. (b) a VCO.
(c) an Armstrong oscillator. (d) a piezoelectric device.

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

444. The control voltage is V_{CONT}. The VCO output frequency is directly proportional to

(a) V^2_{CONT} (b) V_{CONT}
(c) $\sqrt{V_{CONT}}$ (d) $\dfrac{1}{V_{CONT}}$

[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

445. Which of the following is not a component of PLL ?

(a) Frequency multiplier. (b) Phase detector.
(c) VCO. (d) Loop filter.

[U.P.S.C. I.E.S. E.E.-II, 2005]

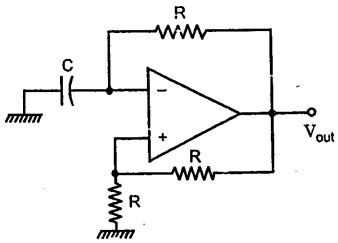
446. FSK demodulation is an application of
(a) PLL (b) timer.
(c) BPF (d) none of the above.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

447. A frequency multiplier usually operates in
(a) push-pull. (b) class A.
(c) class B. (d) class C.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

448. For the oscillator circuit shown in the figure, the expression for the time period of oscillation can be given by (where $\tau = RC$)
(a) $\tau \log 3$
(b) $2\tau \log 3$
(c) $\tau \log 2$
(d) $2\tau \log 2$



[GATE E.E. 2001]

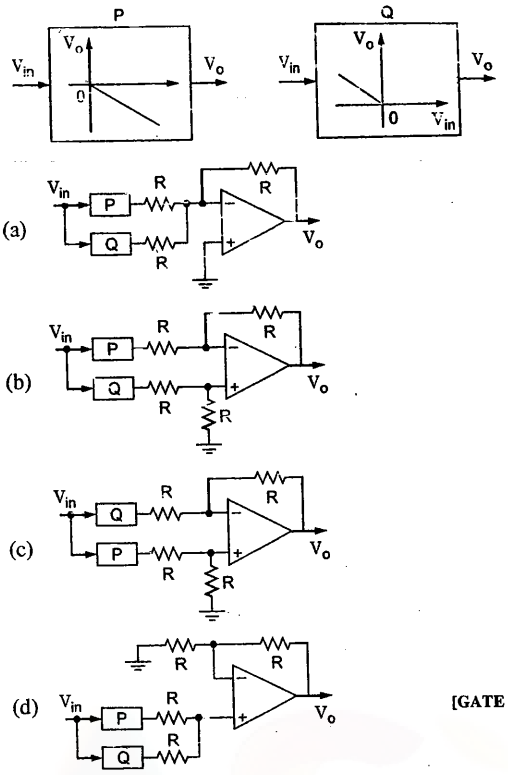
449. A multiplier is derived using two logarithmic amplifiers and an antilog amplifier. One more section required is
(a) multiplier (b) adder.
(c) subtractor. (d) divider.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Winter 2005]

450. If the input to an antilog amplifier is x, the output is proportional to
(a) $e^{\ln x}$ (b) e^{x} (c) $\ln x$ (d) e^{-x}
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

451. If the input to a log amplifier is x, the output is proportional to
(a) $2.3 \log_{10} x$ (b) $\log x$
(c) $\log_{10} x$ (d) $\log x$ and $2.3 \log_{10} x$
[A.M.I.E. Sec. B. Design of Electronic Devices and Circuit Summer 2007]

452. A multiplier which can accept input voltages of either polarity and can produce output voltage of both polarities is called
(a) biquadrant multiplier (b) four quadrant multiplier
(c) Two quadrant multiplier (d) one quadrant multiplier
[A.M.I.E. Sec. B. Design of Electronic Devices and Circuit Summer 2007]

453. The block diagrams of two of half wave rectifiers are shown in the figure. The transfer characteristics of the rectifiers are also
It is desired to make full wave rectifier using above two half-wave rectifiers. The resultant circuit will be



[GATE E.E. 2008]

454. The filter which exhibits ac equiripple in the passband and monotonic characteristic in stop band is
(a) Butterworth. (b) Chebyshev.
(c) Bessel. (d) Elliptic.
[A.M.I.E. Sec. B. Circuit Theory and Control Summer 2005]

455. Notch filter is also called as
(a) band-pass filter. (b) low-pass filter.
(c) high-pass filter. (d) narrowband reject filter.
[A.M.I.E. Sec. B. Circuit Theory and Control Summer 2007]

Answers: **446.** (a), **447.** (d), **448.** (b), **449.** (b), **450.** (a), **451.** (b), **452.** (c), **453.** (b), **454.** (a), **455.** (d).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): In a bipolar junction transistor, the emitter region width (in comparison to base region width) is immaterial in the design so long as the base doping is kept lower than the emitter doping.
(R): The emitter injection efficiency is also dependent on both emitter and base region width and their relative dopings.
[U.P.S.C. I.E.S. E.E.-II, 2000]

2. (A): A bipolar junction transistor (BJT) has collector-base junction forward biased and emitter base junction reverse biased.
(R): BJT acts as a current amplifying device.
[U.P.S.C. I.E.S. Elec. Engg-I, 1992]

3. (A): The operating point in a transistor amplifier shifts with changes in temperature.

Answers: **1.** (d), **2.** (d), **3.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): Reverse saturation current approximately doubles for every 10 °C increase in temperature. [U.P.S.C. I.E.S. E.E.-II, 2011]

4. (A): Transistor h-parameter equivalent circuit can be used for the analysis irrespective of the configuration (CE, CB or CC) of the transistor used.
(R): The values of h-parameter remain unchanged with transistor configuration. [U.P.S.C. I.E.S. E.E.-II, 2003]

5. (A): The small signal analysis of a transistor amplifier is done to obtain the current gain, voltage gain and conversion efficiency of an amplifier.
(R): The small signal analysis of a transistor amplifier uses the small signal parameters of the transistors. [U.P.S.C. I.E.S. E.E.-II, 2009]

6. (A): The collector current in a BJT in common base mode increases slightly with increase in collector base voltage.
(R): Increased collector-base bias causes avalanche breakdown to increase the current. [U.P.S.C. I.E.S. E.E.-II, 2011]

7. (A): When a transistor is taken from hard saturation state to OFF, the storage time plays a significant role in deciding the turn OFF time of the transistor.
(R): The excess minority carrier concentration in the base region should die down by recombination process which mostly contributes to the storage time during the turn OFF process of the transistor. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

8. (A): The three electrodes, Source, Drain and Gate of FET correspond to Emitter, Base and Collector of a junction transistor respectively. Input signal is generally applied to the gate and gate voltage V_G controls the electric field in the channel.
(R): In the input circuit, the gate and the channel act like two plates of a capacitor. A charge of one polarity on the gate induces an equal and opposite charge in the channel. As a result the conductivity of the channel can be increased or decreased by V_G. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

9. (A): FET is a unipolar device.
(R): The current carriers in a FET are either holes or electrons. [U.P.S.C. I.E.S. E.E.-II, 1996]

10. (A): In JFET, the phenomenon of thermal runaway is not observed around room temperature.
(R): The heat dissipation in the semiconductor increases its temperature which increases the carrier mobility with temperature. [U.P.S.C. I.E.S. E.E.-II, 2006]

11. (A): A MOSFET amplifier offers very high input impedance irrespectively of its circuit configuration.
(R): MOSFET has extremely low gate current. [U.P.S.C. I.E.S. E.E.-II, 2000]

12. (A): MOSFETs perform very well in parallel operation.
(R): MOSFET has smaller turn-off time. [U.P.S.C. I.E.S. E.E.-II, 2007]

13. (A): It is easy to parallel power MOSFETs for increased current handling capability.
(R): The ON state resistance of a power MOSFET has a positive temperature coefficient. [U.P.S.C. I.E.S. E.E.-II, 2000]

14. (A): The input resistance of a silicon JFET is of the order of tens or hundreds of mega ohms.
(R): The gate-source junction of JFET is a reverse biased silicon diode and hence only a very small leakage current flows through the gate. [U.P.S.C. I.E.S. E.E.-II, 1999]

15. (A): A fixed bias circuit exhibit better performance as compared to a self bias BJT circuit.
(R): A fixed bias BJT circuit uses less components as compared to a self bias BJT circuit. [U.P.S.C. I.E.S. E.T.E.-II, 2009]

16. (A): The universal bias stabilization is most popular.
(R): Collector current I_C is independent of transistor characteristics.

17. (A): CB amplifier has very low input resistance.
(R): Low emitter ac resistance r'_e shunts all other resistances.

18. (A): As the temperature of a transistor increases, the base spreading resistance r'_{bb} in the hybrid-π model at high frequencies decreases.
(R): The mobility of the carriers decreases as temperature increases. [U.P.S.C. I.E.S. E.E.-II, 1996]

19. (A): The gain of an RC coupled CE amplifier falls off at low frequencies.
(R): The low frequency response depends on the transistor junction capacitance. [U.P.S.C. I.E.S. E.E.-II, 1998]

20. (A): In a typical RC coupled amplifier, the gain falls at high frequencies.
(R): The amplifier has to use coupling capacitors in the input and output side for isolating dc biasing circuit and ac signal. [U.P.S.C. I.E.S. E.E.-II, 2009]

21. (A): In small-signal R-C coupled amplifiers the gain falls in the high frequency range.
(R): The decline in gain with frequency is due to the reactance of the coupling capacitor. [U.P.S.C. I.E.S. E.E.-II, 2009]

22. (A): Design of dc amplifiers is difficult and involves a complex procedure.
(R): Drift problem is associated with dc amplifiers. [U.P.S.C. I.E.S. E.E.-II, 1996]

23. (A): Direct coupled class A power amplifier is not preferred.
(R): The collector circuit efficiency of direct-coupled class A power amplifier is only 25%. [U.P.S.C. I.E.S. E.E.-II, 1994]

24. (A): In small signal class 'A' amplifier, the output is magnified replica of the input without any change in frequency.
(R): The dc operating point is fixed in class 'A' position. [U.P.S.C. I.E.S. E.E.-II, 2001]

25. (A): If the output voltage waveform in a transistor amplifier is a true replica of the input waveform, then it is said to be operated in class A mode. The Q point cannot be fixed near $I_C = 0$.
(R): The positive half cycle of the input will be clipped off in the output due to transistor being driven into cut-off from active region. [U.P.S.C. I.E.S. E.E.-II, 2011]

26. (A): For class A operation of CE transistor amplifier, the operating point cannot be fixed near $V_{CE} = 0$ point.
(R): During the positive half of the input cycle, the transistor may be driven from 'active' region to 'saturation' region, thus loosing the class A waveshape in the output. [U.P.S.C. I.E.S. E.E.-II, 2011]

27. (A): Complementary transistors are used for class B push-pull power amplifiers.
(R): We don't need transformers if we use complementary transistors in class B push pull power amplifiers. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

28. (A): An emitter follower is widely used in electronic instruments.
(R): The voltage gain of emitter follower is very high.

29. (A): High power RF amplifiers are operated as class C amplifiers.
(R): The flywheel effect of the output circuit tuned coil and capacitor restores the sine wave shape to the output signal. [U.P.S.C. I.E.S. E.E.-II, 1996]

Answers: **4.** (c), **5.** (d), **6.** (b), **7.** (a), **8.** (a), **9.** (a), **10.** (c), **11.** (a), **12.** (b), **13.** (b), **14.** (a), **15.** (d), **16.** (a), **17.** (a), **18.** (b), **19.** (c), **20.** (b), **21.** (c), **22.** (a), **23.** (b), **24.** (b), **25.** (a), **26.** (a), **27.** (b), **28.** (c), **29.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

30. (A): An FET operated crystal oscillator operates on the concept of feedback.
(R): The feedback is provided by the drain-to-gate capacitance C_{dg}. [U.P.S.C. I.E.S. E.E.-II, 2005]

31. (A): Emitter coupled oscillator is capable of high frequency operation.
(R): It consists of saturating NPN BJTs. [U.P.S.C. I.E.S. E.E.-II, 2005]

32. (A): All practical R-C phase shift oscillators generate sinusoidal oscillation with some amount of amplitude distortion which cannot be avoided.
(R): The amplitude oscillation of a sinusoidal oscillator is controlled by the onset of non-linearity of the amplifying device. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

33. (A): A four-arm 'Wien' bridge network is sometimes used in feedback circuit of tuned amplifier.
(R): The balance equation of such a Wien bridge contains 'frequency' term along with arm parameters. [U.P.S.C. I.E.S. E.E.-I, 2002]

34. (A): An IC is more reliable as compared to its discrete circuit equivalent.
(R): All the joints in an IC are soldered simultaneously. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

35. (A): The resistors and capacitors fabricated using IC technology have poor tolerances with respect to their absolute values.
(R): As all the components of the IC are fabricated simultaneously, their ratio of tolerances is very low. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

36. (A): The op-amp is known for its very high voltage gain and broad bandwidth.
(R): The op-amp has high R_{in} and CMRR. [U.P.S.C. I.E.S. E.E.-II, 2000]

37. (A): Operational amplifiers invariably possess high common mode rejection.
(R): Operational amplifiers are designed to have excellent matching of their input transistors. [U.P.S.C. I.E.S. E.E.-I-II, 1993]

38. (A): It is not possible to design a current source using operational amplifier.
(R): Operational amplifier is a voltage controlled voltage source. [U.P.S.C. I.E.S. E.E.-II, 2008]

39. (A): In normal operation, the noninverting and inverting input terminals of an operational amplifier are at almost same potential.
(R): The two terminals are connected together. [U.P.S.C. I.E.S. E.E.-II, 2010]

40. (A): The capture range of a PLL is always less than or equal to the lock range and is related to the cutoff frequency of the low-pass filter in the loop.
(R): The capture range is range of frequencies, the VCO can produce. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

Answers: **30.** (a), **31.** (c), **32.** (a), **33.** (a), **34.** (a), **35.** (a), **36.** (b), **37.** (a), **38.** (d), **39.** (a), **40.** (c).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Hybrid Parameter)	List 2 (Units/Definitions)
A. h_{ie}	1. Forward Current transfer ratio
B. h_{fe}	2. Ohms
C. h_{re}	3. Siemens
D. h_{oe}	4. Reverse Voltage transfer ratio

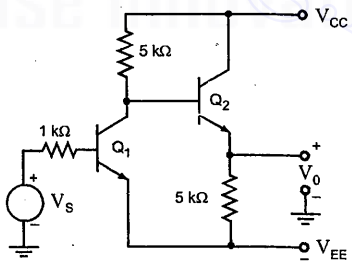
Codes :	A	B	C	D
(a)	2	1	3	4
(b)	1	2	4	3
(c)	1	2	3	4
(d)	2	1	4	3 [U.P.S.C. I.E.S. E.E.-II, 2001]

2.

List 1 (Amplifier configuration)	List 2 (Application)
A. CE amplifier.	1. Low bandwidth with high input impedance amplifier.
B. CB amplifier.	2. Audio-frequency amplifier.
C. JFET amplifier.	3. Radio frequency amplifier.
D. CC amplifier.	4. Microwave amplifier.
	5. Buffer amplifier.

Codes:	A	B	C	D
(a)	2	1	5	4
(b)	4	3	1	5
(c)	2	3	1	5
(d)	5	4	3	2 [U.P.S.C. I.E.S. E.E.-II, 1994]

3. In a given circuit, gain of stage I is G_1, gain of stage II is G_2 and overall gain is $G_{1\text{-}2}$. The gains have the values of 0.991 (*A*), – 116.61 (B) and – 115.55 (*C*). Choose the correct answer by using the codes given below :



Codes:	G_1	G_2	$G_{1\text{-}2}$
(a)	A	B	C
(b)	C	B	A
(c)	C	A	B
(d)	B	A	C [U.P.S.C. I.E.S. E.E.-II, 1995]

Answers: **1.** (d), **2.** (c), **3.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

4. An NPN silicon transistor is meant for low current audio-amplification. Match its following characteristics against their values

List 1 (Characteristics)	List 2 (Value)
A. V_{EB} max.	P 0.7 V.
B. V_{CB} max.	Q 0.2V.
C. V_{CE} sat.	R 6 V.
	S 50V. [GATE E.E. 1998]

Codes:	A	B	C
(a)	P	R	Q
(b)	P	S	R
(c)	R	P	S
(d)	S	R	P

5.

List 1 (Device)	List 2 (Application)
A. *p-n* junction diode	1. Microwave generator
B. Tunnel diode	2. Low frequency rectifier
C. JFET	3. High frequency rectifier
D. Schottky barrier	4. Voltage variable resistor

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	2	1	4	3
(d)	4	3	2	1 [U.P.S.C. I.E.S. E.E.-II, 2005]

6.

List 1 (Type of Amplifier/ Configuration)	List 2 (Characteristics Property)
A. Common emitter amplifier.	1. Very low output resistance.
B. Emitter follower.	2. Current gain ≃ 1.
C. Common base amplifier.	3. Beta multiplication.
D. Darlington pair.	4. Very high power gain.

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	2	3	4	1
(c)	4	3	2	1
(d)	2	1	4	3 [U.P.S.C. I.E.S. E.E.-II, 2006]

7.

List 1 (Electronic Circuit)	List 2 (Characteristic)
A. CE	1. The circuit introduces a phase inversion of 180°.
B. CB	2. The circuit is rarely used.
C. CC	3. The name, emitter. follower is also used for the circuit.
D. Darlington Pair	4. The circuit consists of two circuits connected in cascade.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	1	3	4
(c)	2	1	4	3
(d)	1	2	4	3 [U.P.S.C. I.E.S. E.T.E.-II, 2007]

8.

List 1	List 2
A. Class A amplifier.	1. Hi Fidelity.
B. Class B amplifier.	2. Tuned amplifier.
C. Class C amplifier.	3. Power amplifier.
D. Class AB amplifier.	4. Low distortion power amplifier.

Codes :	A	B	C	D
(a)	4	3	2	1
(b)	1	2	3	4
(c)	4	2	3	1
(d)	1	3	2	4 [U.P.S.C. I.E.S. E.E.-II, 1998]

9.

List 1 (Amplifier's Mode of Operation)	List 2 (Properties/Characteristics)
A. Class A	1. Clips off half a cycle.
B. Class B	2. Leads to most stable biasing circuit.
C. Class C	3. Transistor acts as a switch.
D. Class D	4. Amplification of the resonant frequency only.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	1	4	3
(c)	1	2	4	3
(d)	2	1	3	4 [U.P.S.C. I.E.S. E.E.-II, 2002]

10.

List 1 (Type of Feedback)	List 2 (Effect on Rin and Rout)
A. Voltage series	1. R_{in} increases and R_{out} decreases.
B. Voltage shunt	2. R_{in} and R_{out} decrease.
C. Current series	3. R_{in} and R_{out} increase.
D. Current shunt	4. R_{in} decreases and R_{out} increases.

Codes :	A	B	C	D
(a)	1	4	3	2
(b)	3	2	1	4
(c)	3	4	1	2
(d)	1	2	3	4 [U.P.S.C. I.E.S. E.T.E.-II, 2008]

11.

List 1	List 2
A. R-C phase shift oscillator.	1. R F oscillator.
B. UJT oscillator.	2. Higher frequency stability
C. LC oscillator.	3. A F oscillator
D. Crystal oscillator	4. Relaxation oscillator

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	2	1	3	4
(c)	2	3	1	4
(d)	3	4	1	2 [U.P.S.C. I.E.S. E.E.-II, 1994]

12.

List 1 (Type of Oscillator)	List 2 (Properties)
A. Wien bridge.	1. Stable amplitude and frequency.
B. Phase-shift.	2. 1:10 frequency coverage in a single range common.
C. Hartley.	3. Minimum three R-C sections required.
D. Crystal.	4. 1 : 3 frequency coverage in a single range common.

Codes :	A	B	C	D
(a)	3	2	4	1
(b)	2	3	4	1
(c)	3	2	1	4
(d)	2	3	1	4 [U.P.S.C. I.E.S. E.E.-II, 1993]

13.

List 1	List 2
A. Wien bridge oscillator.	1. Low output impedance.
B. Voltage shunt feedback amplifier.	2. RF frequency range.
C. Crystal oscillator.	3. Audio frequency range.
D. Current shunt feedback amplifier.	4. High input impedance.
	5. High output impedance.

Codes :	A	B	C	D
(a)	2	1	3	5
(b)	3	4	2	1

Answers: **4.** (a), **5.** (c), **6.** (a), **7.** (a), **8.** (d), **9.** (b), **10.** (d), **11.** (d), **12.** (b), **13.** (d),

(c)	5	4	2	1
(d)	3	1	2	5

[U.P.S.C. I.E.S. E.E.-ii, 2000]

14.

List 1 (Device)	List 2 (Applications)
A. Diode	1. Amplifier
B. Transistor	2. Oscillator
C. Tunnel Diode	3. Rectifier
D. Zener Diode	4. Voltage Regulator

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	3	2	1	4
(c)	4	2	1	3
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-II, 2006]

15.

List 1	List 2
A. A stable multivibrator.	1. Counter.
B. Schmitt trigger.	2. Sweep generator.
C. Bistable multivibrator.	3. Voltage to frequency converter.
	4. Comparator.

Codes :	A	B	C
(a)	3	4	1
(b)	3	2	1
(c)	1	4	3
(d)	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2000]

16.

List 1 (Circuit)	List 2 (Application)
A. Monostable multivibrator.	1. Comparator.
B. Bistable multivibrator.	2. DC level translator.
C. Clamping circuit.	3. Delay.
D. Schmitt trigger.	4. Voltage controlled oscillator.
	5. Counter.

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	3	5	2	1
(c)	4	5	2	1
(d)	5	4	1	2

[U.P.S.C. I.E.S. E.E.-II, 2004]

17.

Circuit		Function
(A)		(P) High-pass filter
(B)		(Q) Amplifier
(C)		(R) Comparator
		(S) Low-pass filter

[GATE E.E. 1998]

Ans. A-R, B-S, C-P

18.

List 1 (Circuits)	List 2 (Characteristics/Applications)
A. High-pass RC circuit	1. Comparator
B. Low-pass RC circuit	2. DC Restorer
C. Clamping circuit	3. Integrator
D. Clipping circuit	4. Differentiator
	5. Compensated Attenuator

Codes :	A	B	C	D
(a)	5	4	2	1
(b)	4	3	1	2
(c)	5	4	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2003]

Answers: **14.** (d), **15.** (a), **16.** (b), **17.** A-R, B-S, C-P, **18.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F).

1. The arrowhead on a transistor symbol always show the direction of flow of conventional current.
2. The emitter of a transistor is a doped moderately.

[U.P. Technical Univ. 2008-09]

3. I_{CO} in a transistor consists of majority carriers.

[U.P. Technical Univ. 2008-09]

4. An ordinary transistor is called 'bipolar junction transistor' because it has two poles—one positive and the other negative.

[U.P. Technical Univ. First, Second Semester 2009-10]

5. For proper operation of a transistor base-emitter junction should be forward biased and collector-base junction reverse biased.
6. Bipolar junction transistor is a current controlled current device.

[A.M.I.E. Summer 1993]

7. Alpha of a transistor can exceed 1.

[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]

8. For a given emitter current, the collector current can be increased by reducing the recombination rate in the base region.
9. In an N-P-N transistor, I_C is approximately equal to 0.95 I_E.
10. In a P-N-P transistor with normal bias, the collector junction is of low resistance.
11. In a transistor with normal bias the emitter junction is of high resistance.
12. The main current crossing the collector junction in a normally biased N-P-N transistor is a drift current.
13. A small increase in collector reverse bias will cause very small change in collector reverse saturation current.

Answers: **1.** (T), **2.** (F), **3.** (F), **4.** (F), **5.** (T), **6.** (T), **7.** (F), **8.** (T), **9.** (T), **10.** (F), **11.** (F), **12.** (T), **13.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

14. The symbol I_{CBO} signifies the current that flows when some dc voltage is applied in the reverse direction to the collector junction with the emitter open-circuited.
15. P-N-P and N-P-N transistors can be interchanged with each other.
16. Transistor should not be checked when it is connected in the circuit.
17. In a properly biased transistor, in CE mode, collector current is not zero even when base current is zero.
18. In a shorted out transistor, in CE mode, V_{CE} is not zero.
19. In a CE connected transistor V_{CE} will be equal to V_{CC} when base current is zero.
20. CE configuration is preferred when main criterion is both voltage gain and current gain.
21. The most commonly used transistor circuit arrangement is common collector. **[U.P. Technical Univ. 2008-09]**
22. The circuit arrangement of a transistor used as a buffer is CC.
23. The reciprocal of the slope of the output characteristic of a common base connected transistor gives its input resistance.
24. α is a small signal current gain of a CB transistor.
25. The current I_{CEO} is the collector current in the CE connected transistor with zero base current.
26. The locus of operating point on the output characteristics of a transistor is called the load line.
27. DC load line is steeper than ac loadline.
28. The operation of a JFET involves flow of minority carriers.
29. A FET is characterized by transconductance.
30. The noise level in FET is less than that in an ordinary transistor.
31. The drain and source terminals of a FET are not interchangeable.
32. FET can be used as a variable capacitor.
33. A FET is more sensitive to variations in input voltage in comparison to an ordinary transistor.
34. A FET is essentially a voltage driven constant current device.
35. Input impedance of MOSFET is less than that of JFET.
36. The input gate current of a FET is negligible.
37. In enhancement N-channel MOSFET an induced N-type channel can be produced between the source and drain if V_{gs} is negative. **[Mahamaya Technical Univ. Second Semester 2010-11]**
38. For determination of hybrid parameters h_{re} and h_{oe} of a transistor, input is ac open-circuited.
39. The parameters h_r and h_o are called reverse parameters of a transistor and for an ideal transistor both are zero.
40. The values of h-parameters of a transistor in CE mode are different from those in CB mode.
41. The h-parameters of two transistors of the same batch are generally the same.
42. Improper biasing of a transistor results in the distortion of the output signal.
43. Bias stabilization is used to prevent thermal runaway. **[U.P. Technical Univ. 2008-09]**
44. A transistor is said to be in a quiescent stage when no signal is applied to the input.
45. Stabilization means making operating point independent of temperature variations or variations of transistor parameters.
46. Change in operating point results in unfaithful amplification.
47. Self-bias is superior to the fixed bias from the consideration of stability of operating point in the CE amplifier.
48. In a transistor circuit, thermal stability leads to bias stability.
49. The ideal value of stability factor is 10. **[U.P. Technical Univ. 2008-09]**
50. The transistor is biased in order to obtain a certain dc collector current at a certain dc collector voltage.
51. In a certain biasing circuit, V_{CC} and V_{EE} are equal. This is because of heavy transistor conduction.
52. Negative dc feedback through R_E is responsible for the stabilization of the operating point in a potential divider bias circuit.
53. In a dc equivalent circuit of a transistor amplifier, the capacitors are considered short.
54. The dc collector current in a transistor circuit is limited by the junction capacitance.
55. The voltage gain of a transistor amplifier increases with the increase in load resistance.
56. In voltage amplifiers the load resistance should be as small as possible.
57. Noise is defined as any kind of unwanted signal in the output and is not related to the input signal.
58. An ideal amplifier has noise figure of 0 dB.
59. The output impedance of a transistor amplifier is constant irrespective of its configuration.
60. The phase reversal between output and input takes place only for voltage waves and not for current waves, in a transistor amplifier in CE mode.
61. Phase distortion is not objectionable in audio amplifier.
62. Amplifiers are coupled to increase gain.
63. The decibel gain of a cascaded amplifier is equal to the product of individual stage gains.
64. Fidelity represents true reproduction of signal.
65. The decibel gain is important because it tallies with human ear response.
66. The gain of R-C coupled amplifier may increase or decrease when the signal frequency is increased.
67. The coupling capacitors mainly affect the lower cutoff frequency of an amplifier.
68. A transformer coupling is generally employed when load resistance is large.
69. At extremely low frequencies, the electrical size of coupling devices becomes very large.
70. Transformer coupling is mostly used for voltage amplification.
71. Direct coupling is used for amplification of extremely low frequency signals.
72. Class A operation gives more efficiency than class B operation. **[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]**
73. In class C amplifiers, the bias voltage is beyond the cutoff voltage.
74. The collector current in quiescent condition is zero when the amplifier is working in class A operation.
75. In a power amplifier, the load resistance should be equal to output impedance.
76. The output of a class B amplifier is distortion free.

Answers: **14.** (T), **15.** (F), **16.** (T), **17.** (T), **18.** (F), **19.** (T), **20.** (T), **21.** (F), **22.** (T), **23.** (F), **24.** (T), **25.** (T), **26.** (T), **27.** (F), **28.** (F), **29.** (T), **30.** (T), **31.** (F), **32.** (T), **33.** (F), **34.** (T), **35.** (F), **36.** (T), **37.** (F), **38.** (T), **39.** (T), **40.** (T), **41.** (F), **42.** (T), **43.** (T), **44.** (T), **45.** (T), **46.** (T), **47.** (T), **48.** (T), **49.** (F), **50.** (T), **51.** (F), **52.** (T), **53.** (F), **54.** (F), **55.** (T), **56.** (F), **57.** (T), **58.** (F), **59.** (F), **60.** (T), **61.** (T), **62.** (T), **63.** (F), **64.** (T), **65.** (T), **66.** (T), **67.** (T), **68.** (F), **69.** (T), **70.** (F), **71.** (T), **72.** (F), **73.** (T), **74.** (F), **75.** (T), **76.** (F),

77. A class B push-pull amplifier has the main advantage of being free from even order harmonic distortion.
78. The output stage usually employs push-pull power amplifier.
79. Negative feedback in amplifier reduces the gain but increases stability.
80 An amplifier with positive feedback produces instability but still it is useful.
81 Negative feedback reduces the amplifier output impedance but increases the input impedance.
82. In a public address system, voltage amplifiers with unbypassed emitter resistors are used.
83. The current gain of an emitter follower is less than unity.
84. Negative feedback increases the gain of amplifier.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]
85. A narrowband amplifier is one that has a passband approximately 10% of its central frequency.
86. A voltage amplifier is designed to have small β.
87. A power amplifier is designed to have high β.
88. Output transformer is always step-up.
89. The main consideration in the output stage is maximum power output.
90. A power transistor differs in size from other transistors.
91. In a power transistor, maximum power dissipation occurs under zero signal conditions.
92. The h-parameter approach in the design of transistor amplifier provides accurate results.
93. Positive feedback is essential for the operation of an oscillator.
94. For increasing the frequency of oscillation, the value of capacitance in the tuned circuit of an oscillator is to be increased.
95. In a transistor Hartley oscillator, inductive feedback is used.
96. A practical R-C sinusoidal oscillator is built using a positive feedback amplifier with a closed loop gain slightly less than unity.
[GATE E.E. 1994]
97. The gain of an R-C phase shift oscillator can be 28.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]
98. To avoid saturation in a transistor switch, a diode is connected between the base and collector terminals of the transistor.
99. In an astable multivibrator $\beta = 1$.
100. Transistors used in multivibrators operate either in saturation or in cut-off region.
101. An astable multivibrator always generates symmetrical square waves.
102. In a monostable multivibrator there is no energy storage elements.
103. A bistable multivibrator switches automatically from one state to the other state.
104. Conventional bistable multivibrators are preferred over Schmitt triggers in applications that require the circuit to be triggered back and forth between the two stable states.
105. Hybrid ICs are most widely used.
106. SiO_2 layer in an IC acts as an insulating layer
107. The most popular form of IC package is flatpack.
108. Op-amp is a current controlled voltage device.
[A.M.I.E. Summer 1993]
109. An ideal op-amp has infinite input resistance and zero gain.
[Bharathithasan Univ. April 1996]
110. Operational amplifiers cannot be used as an integrator.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]
111. Operational amplifier can be used as a differentiator.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]
112. Inverting amplifier gain is independent of source resistance.
[Mahamaya Technical Univ. Second Semester 2010-11]
113. FM can be done using PLL. [Bharathithasan Univ. Nov. 1996]
114. First order active LPF can also act as an integrator.
[Bharathithasan Univ. Nov. 1996]
115. An op-amp is used in IC regulators as an error amplifier.
116. PSRR of an op-amp should be as small as possible.

Answers: **77.** (T), **78.** (T), **79.** (T), **80.** (T), **81.** (T), **82.** (T), **83.** (F), **84.** (F), **85.** (T), **86.** (F), **87.** (F), **88.** (F), **89.** (T), **90.** (T), **91.** (T), **92.** (T), **93.** (T), **94.** (F), **95.** (T), **96.** (F), **97.** (F), **98.** (T), **99.** (T), **100.** (T), **101.** (F), **102.** (F), **103.** (F), **104.** (T), **105.** (F), **106.** (T), **107.** (F), **108.** (F), **109.** (F), **110.** (F), **111.** (T), **112.** (T), **113.** (T), **114.** (F), **115.** (T), **116.** (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. The input controlling variable for a BJT is _____.
[U.P. Technical Univ. 2008-09]
2. A bipolar transistor has _____ P-N junctions and _____ terminals.
3. The most heavily doped region in a BJT is _____.
4. The thinnest region in a BJT is _____.
5. The main current crossing the collector junction in a normally biased N-P-N transistor is a _____ current.
[A.M.I.E. Summer 1995]
6. In a transistor, if electrons flow into the emitter, _____ flow out of collector. (electrons/holes)
7. In a symbol of a transistor, the sign of arrow indicates _____. (emitter/base/collector)
8. The current I_{CBO} _____ with an increase in temperature. (increases/decreases)
9. In the dc mode the levels of I_C and I_B are related by a quantity called _____. [U.P. Technical Univ. 2008-09]
10. The quantity β provides an important relationship between base and collector currents, and is usually between _____.
[U.P. Technical Univ. 2008-09]
11. For faithfull amplification, the transistor must operate in the _____ region of the output characteristics.
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]
12. When a bipolar transistor goes into saturation, both base-emitter and collector-base junctions are _____ biased.
[A.M.I.E. Sec B. Electronic Devices and Circuits Winter 1999]
13. For a transistor to operate as an amplifier the collector-base junction should be _____ biased. [A.M.I.E. Summer 1994]
14. Under saturated conditions collector current is _____.
15. When a transistor is used in the grounded base configuration, the base-collector junction is _____ biased. [A.M.I.E. Winter 1996]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

16. _____ configuration has the highest voltage gain.
[A.M.I.E. Summer 1994]

17. For a transistor having $I_C = 4.85$ mA and $I_E = 5$ mA, the α will be _____ and β will be _____.
[G.B. Technical Univ. Odd Semester 2010-11]

18. The α and β of a transistor are 0.99 and 99 respectively. If its I_{CBO} is 0.1 A, then its I_{CEO} will be _____.
[U.P. Technical Univ. First Semester 2009-10]

19. Common collector configuration of a transistor is used when _____ is required.

20. In a CE amplifier, a positive going input signal produces a _____ going output signal.

21. For matching high impedance source to low impedance load we use _____ configuration.

22. If the I_{CO} entering the collector is taken positive, then in case of N-P-N transistor I_C will be _____.

23. For a CE configuration, typical values of Z_{in} are in the range of _____.
[U.P. Technical Univ. 2008-09]

24. Given $\beta = 150$ and $I_E = 3.2$ mA for a common emitter configuration with $r_0 = \infty\ \Omega$, the value of Z_i is _____ kΩ.
[U.P. Technical Univ. Second Semester 2008-09]

25. To get maximum undistorted output from a CE amplifier with V_{CC} = 10 V, V_{CE} (G) should be of the order _____ V.

26. A small increase in temperature in the CE transistor amplifier will effectively _____ the I_{CEO}. (increase/decrease)

27. In a transistor circuit, the dc load line is a _____ line and has a _____ slope.

28. A common emitter transistor amplifier has a gain of 150. The output voltage is measured as 2 V ac, the input voltage will be _____.
[U.P. Technical Univ. First Semester 2009-10]

29. In an amplifier circuit of voltage gain 100, if 2 V is the output voltage, the input voltage applied is _____.
[Mahamaya Technical Univ. Even Semester 2010-11]

30. If collector supply voltage is 10 V, then collector cutoff voltage under dc conditions is _____ V.

31. In approximate analysis _____ and _____ *h*-parameters are neglected.
[G.B. Technical Univ. Even Semester 2010-11]

32. The dc load seen by the transistor amplifier is _____.

33. DC load line gives the locus of V_{CE} and I_C under _____ conditions.

34. The intersection of the dc load line with the given base current curve is the _____.

35. In a JFET gate is _____ biased relative to source.

36. JFET is a _____ controlled _____device.

37. An N-type channel FET is superior to P-type channel FET because _____ of electrons is greater than that of holes.
[U.P. Technical Univ. 2008-09]

38. The input impedance of all commonly available FETs is _____.
[U.P. Technical Univ. 2008-09]

39. JFET amplifiers have _____ input impedance.
[G.B. Technical Univ. Even Semester 2010-11]

40. With the increase in reverse gate-source bias, drain current _____ until at $V_{GS(OFF)}$ the drain current is _____.

41. The maximum safe drain current I_{DSS} is obtained when the _____ is shorted to source.

42. The maximum drain voltage at which a JFET can be operated, when $V_{GS} = 0$, is designated as _____ voltage.

43. In a field-effect transistor (FET) the gate to source voltage that gives zero drain current is called the _____.
[U.P. Technical Univ. Second Semester 2009-10]

44. In a JFET, drain current will be maximum when gate-source voltage is _____.

45. The polarity of V_{GS} for E-MOSFET is _____. (negative/positive)

46. A MOSFET uses the electric field of a _____ for controlling the channel current.

47. The gate of an N-channel E-MOSFET must be biased _____ relative to the source in order to have flow of drain current.

48. For faithful amplification, minimum V_{BE} for Si transistor should be _____ V.

49. In the universal bias stabilization circuit, voltage and current values are almost independent of _____.

50. In order to achieve good stabilization in potential divider method, current through R_1 and R_2 should be at least _____ times base current. (3, 5, 10, 20)

51. The zero signal I_C, in the initial stages of a transistor amplifier is usually _____ mA. (0.25, 1.0, 2.0, 5.0)

52. Increase in temperature reduces _____. ($\beta/I_{CO}/V_{BE}$)

53. The input resistance of an ideal voltage amplifier is _____.

54. The purpose of dc conditions in the transistor amplifier is to _____.

55. The voltage gain of emitter follower is approximately _____.
[A.M.I.E. Summer 1993]

56. The transition frequency f_T of a BJT is the frequency at which the short-circuit current gain of a CE stage is _____.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

57. _____ is the logarithmic unit of gain.

58. If a 2-stage amplifier has individual stage gains of 10 dB and 5 dB, the total gain is _____ dB.

59. When CE amplifier stages are cascaded, they provide _____ gain and _____ bandwidth.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

60. If the current gain of the amplifier is *x*, its voltage gain is *y*, then its power gain will be _____.

61. R-C coupled amplifier has a very _____ frequency response curve.

62. The main component responsible for the fall of gain of an R-C coupled amplifier in low frequency range is _____.
[A.M.I.E. Summer 1995]

63. The best frequency response is of _____ coupling.

64. The frequency response of transformer coupling is _____.

65. _____ coupling is used in initial stages of a practical amplifier.

66. _____ coupling is used in final stage of an amplifier.

67. Push-pull operation needs two transistors of the same type with _____ characteristics.

68. The maximum theoretical collector circuit efficiency of class A power amplifier is _____.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

69. Push-pull amplifiers have the advantage of eliminating _____ harmonics. [A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

70. Class C power amplifiers are invariably employed in _____ power amplifiers.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

71. Negative feedback in amplifiers reduces the gain but _____ bandwidth.

72. Feedback does not change the gain bandwidth _____.

73. Positive feedback is employed in_____.

74. Feedback circuit is essentially a potential _____.

75. The value of feed fraction is _____ than unity.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

76. An emitter follower may be used as a buffer stage because it possesses _____.
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]

77. Tuned amplifiers are used for _____ amplification.
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]

78. A high Q circuit has _____ selectivity.

79. The bandwidth of a tuned circuit _____ with the decrease in the value of its Q.

80. The voltage gain of a tuned amplifier is _____ at resonant frequency.

81. The resonance curve will be _____ with loose coupling.

82. Tuned amplifiers are used for _____ frequency amplification.

83. In high frequency region, amplifier will behave like a _____ pass filter.

84. For tuned radio-frequency we use _____ amplifier.

85. The driver stage uses _____ power amplifier.

86. Signal generator is usually used for generating _____ waveform.

87. Oscillators use _____ feedback. [A.M.I.E. Sec B. Summer 1996]

88. The audio-frequency oscillators have frequency band _____ Hz to _____ kHz.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

89. Audio-frequency oscillators usually possess output impedances _____. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

90. To produce sustained oscillations the positive feedback should be such that loop gain is at least _____.
[A.M.I.E. Sec B. Electronic Devices & Circuits Winter 1999]

91. The frequency stability of any tuned oscillator is directly proportional to the _____ of the tank circuit employed.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2000]

92. The frequency stability of L-C oscillators is _____ than R-C oscillators.

93. In a phase-shift oscillator, the frequency determining elements are _____ and _____.

94. The frequency of a crystal oscillator is very stable due _____ of the crystal.

95. The frequency band from 30 MHz to 300 MHz is of _____ frequency oscillator. (audio/radio/video/very high)

96. The cut-off frequency of an op-amp for unity-gain frequency 1 MHz and open-loop voltage gain 200 V/mV will be _____.
[G.B. Technical Univ. Odd Semester 2010-11]

97. The output voltage of op-amp differentiator with input voltage V_i is given by _____ when R = 1 kΩ and C = 1 pF.
[Mahamaya Technical Univ. Even Semester 2010-11]

98. When you apply a triangular wave to the input of a differentiator, the output is _____.

99. The output of a particular op-amp increases 8 V in 12 μs. The slew rate is _____.

100. Instrumentation amplifier uses (1/2/3/4) op-amps.

ANSWERS

1. current **2.** 2; 3 **3.** emitter **4.** base
5. drift **6.** electrons **7.** emitter **8.** increases
9. current gain or transport factor β **10.** 50 and 400 **11.** active
12. forward **13.** reverse **14.** maximum **15.** reverse
16. CE **17.** 0.97; 32.33 **18.** 10 A **19.** impedance matching
20. negative **21.** CC **22.** positive **23.** 1 to 2 kΩ
24. 1.172 **25.** 5 **26.** increase **27.** straight, negative
28. 13.33 mV **29.** 20 mV **30.** 10 **31.** h_r, h_o
32. collector resistance **33.** dc **34.** operating point **35.** reverse
36. voltage; current **37.** mobility **38.** about 100 MΩ **39.** high
40. reduces, cut-off **41.** gate **42.** pinch-off **43.** Pinch-off voltage, V_p
44. zero **45.** negative **46.** capacitor **47.** positive
48. 0.7 **49.** β **50.** 10 **51.** 1.0
52. V_{BE} **53.** infinite **54.** fix biasing **55.** unity
56. unity **57.** dB **58.** 15 **59.** high, same
60. ∞ **61.** flat **62.** C_C **63.** direct
64. poor **65.** R-C **66.** Transformer **67.** matching
68. 50% **69.** of even order **70.** RF **71.** increases
72. product **73.** oscillators **74.** divider **75.** less
76. $A_v = 1$, high input impedance, low output impedance **77.** narrow band **78.** better
79. increases **80.** maximum **81.** sharp **82.** radio
83. low **84.** class C **85.** Class A **86.** sinusoidal
87. positive **88.** 20; 20 **89.** 75 Ω and 600 Ω **90.** unity
91. Q **92.** poorer **93.** R; C
94. little effect of temperature on parameters (R-L-C) **95.** very high **96.** 5 Hz
97. $-1 \times 10^{-9} \frac{dV_i}{dt}$ **98.** square wave **99.** 0.67 V/μs **100.** 3

CHAPTER 14

Industrial and Power Electronics

Short Answer Type Questions With Answers

Q. 1. What is power electronics ?

[A.M.I.E. Sec B. Power Electronics Summer 2008]

Ans. Power electronics is a subject that concerns the application of electronic principles into situations that are rated at power level rather than signal level. Alternatively, it may also be defined as a subject that deals with the apparatus and equipment operating on the principle of electronics but rated at power level rather than signal level.

Q. 2. Give the broad classification of power semiconductor devices.

Ans. Power semiconductor devices can be broadly classified into three categories viz. power diodes, thyristors and transistors.

Q. 3. What is a thyristor ? Why is it named so ?

[A.M.I.E. Sec B. Power Electronics Summer 2008]

Ans. Thyristor is a solid state device like a transistor and has the characteristics similar to a thyratron tube. The thyristor structure consists of four layers of semiconductor material of alternative conductive type PN-PN all formed in a single crystal.

The term thyristor is derived from thyratron and transistor because the device combines the rectification action of thyratron and control action of transistor. Thyristor stands for THYRatron transISTOR.

Q. 4. Which are the members of "thyristor family" ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. The member of thyristor family are SCR, diac, triac, Shockley diode, SCS, SBS, SUS, CSCR, LASCR, LAS, LASCS, GCS, GTO, etc.

Q. 5. How is current limited in conducting state of an SCR ?

Ans. The current in conducting state of an SCR is controlled by external impedance.

Q. 6. What is the effect of negative gate current on a normal SCR ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. Negative gate current will increase the holding current of the SCR.

Q. 7. What is false triggering ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. False triggering is unintended turn-on of an SCR either through gate due to noise pick-up or excessive anode voltage.

Q. 8. What do you mean by commutation in thyristor power converters ?

A.M.I.E. Sec B. Power Electronics Summer 2008]

Ans. The method of switching *off* a thyristor is known as commutation of thyristor. The thyristor can be turned *off* by reducing the forward current below its holding current level or by applying a large reverse voltage across it.

Q. 9. What are the factors on which 'turn-off time' of an SCR depends ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. Turn-of time of an SCR depends upon doping densities, recombination time, junction temperature, on-state current, rate of decay of on-state current.

Q. 10. How the forced turn-off of an SCR is different from natural turn-off ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. In forced turn-off of an SCR current is brought below the holding current by an additional circuit employing energy storage elements while in natural turn-off, it is the natural voltage/ current variation.

Q. 11. Why 'pulse triggering' is preferred and when does it fail ?

[A.M.I.E. Sec B. Power Electronics Winter 1996]

Ans. Pulse triggering is preferred as it is effective to turn-on an SCR keeping the device gate dissipation low and ensures a fast turn-on keeping the $\frac{di}{dt}$ stress on the device low.

Pulse triggering shall fail if the pulse is of short duration and the load circuit contains large inductance. With highly inductive load, the device current builds up slowly. If the pulse duration is small and the anode current in not able to build up to latching current, I_L, the device turns off on removal of gate pulse.

Q. 12. Why is it necessary to keep supply voltage much less than breakover voltage of an SCR ?

Ans. The supply voltage is kept much less than breakover voltage of an SCR otherwise the device will get damaged.

Q. 13. What is meant by breakover voltage of an SCR ?

Ans. The minimum forward voltage, with gate open, at which SCR starts conducting heavily (*i.e.* turns on) is called the breakover voltage.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 14. What is maximum on-state voltage in reference to an SCR ?

Ans. Maximum on-state voltage is the maximum value of the voltage appearing across the SCR during conduction.

Q. 15. What is meant by forward current rating of an SCR ?

Ans. The maximum value of anode current, that an SCR can handle safely (without any damage) is called the forward current rating of the SCR.

Q. 16. What is holding current in an SCR ?

Ans. Holding current is the minimum on-state current required to keep the SCR in conducting state without any gate drive.

Q. 17. Define latch current of an SCR. **[A.M.I.E. Sec B. Summer 1998]**

Ans. Latching current is the minimum device current, which must be attained by the device, before the gate drive is removed.

Q. 18. Give the typical values of current ratings of SCR.

[A.M.I.E. Sec B. Summer 1997]

Ans. Forward breakover current—less than a few hundred micro-amperes.

Peak forward current 30 A to over 100 A.

Holding current—a few mA to few hundred milliamperes.

Q.19. What are bilateral devices ?

Ans. Bilateral devices are those devices which switch symmetrically with forward and reverse bias. Triac and diac fall under this category.

Q. 20. What is triac ?

Ans. The triac is a three terminal, four layer bidirectional semiconductor device. It incorporates two SCRs connected in inverse parallel with a common gate terminal in a single chip. Triac is an abbreviation for a triode ac switch.

Q. 21. What are the differences between an SCR and a TRIAC ?

[A.M.I.E. Sec B. Power Electronics Summer 2008]

Ans. An SCR is a unidirectional device as it can conduct from anode to cathode only and not from cathode to anode. But a TRIAC can, however, conduct in both directions. A TRIAC is thus a bidirectional thyristor with three terminals.

TRIAC incorporates two SCRs connected in inverse parallel with a common gate terminal in a single chip.

Q. 22. Why force commutation cannot be applied to triac ?

Ans. Because the triac is a bidirectional device *i.e.* it can conduct in either direction, forced commutation by reverse-biasing cannot be applied.

Q. 23. What is diac ?

Ans. A diac is a P-N-P-N structured four-layer, two-terminal semiconductor device. This is just like a triac but without gate terminal. Diac is an abbreviation for a diode ac switch.

Q. 24. How Shockley diode is switched on ?

Ans. Shockley diode has no trigger inputs, the only way to switch the device on is to increase the anode-to-cathode voltage to the switching voltage equivalent to SCR forward breakover voltage.

Q. 25. What is silicon controlled switch ? **[A.M.I.E. Sec B. Summer 1997]**

Ans. Silicon controlled switch (SCS), like an SCR, is a unilateral, four-layer, three junction P-N-P-N silicon device with four electrodes namely cathode, cathode gate, anode gate and anode.

Q. 26. What is GTO ?

Ans. Gate turn-off switch (GTO), like an SCR, is a four-layer, three junction semiconductor device with three external terminals (anode, cathode and gate).

Q. 27. How GTO can be turned on and turned off ?

Ans. GTO can be turned on and turned off by applying positive pulse and negative pulse respectively to the gate terminal.

Q. 28. What is SITH ?

Ans. A static induction thyristor (SITH) is a self controlled GTO-like on-off device.

Q. 29. What are the advantages of MCT ?

Ans. MCT has the advantages of (*i*) low switching losses (*ii*) high gate input impedance (*iii*) low forward voltage drop during conduction (*iv*) low reverse voltage blocking capability and (*v*) fast turn-on and turn-off times. However, it is incapable of withstanding a high reverse voltage.

Q. 30. What are the types of BJTs ?

Ans. The power transistors can be classified broadly in four categories: BJTs, MOSFETs, SITs, IGBTs.

Q. 31. What is second breakdown effect in power BJTs ?

Ans. Slight non-uniformities in current density develop local regions of increased heating that reduces the resistance of the semiconductor material, which in turn enhances the current in those regions. This effect results in positive feedback, and the current continues to rise, causing a further increase in temperature, until the semiconductor material may actually melt, creating a short-circuit between the collector and emitter and causing a permanent failure. This phenomenon is known as second breakdown and occurs in BJT operating at high voltage and large current.

Q. 32. Why Darlington pair configuration is used in BJTs ?

Ans. For achieving high current gain.

Q. 33. What is SIT ?

Ans. SIT stands for static induction transistor and it is a solid state version of vacuum triode valve which is used for high frequency and high power applications.

Q. 34. What is IGBT ?

Ans. IGBT (insulated gate bipolar junction transistor) is a new high conductance MOS controlled power switch and incorporates some of the best features of power MOSFETs and power transistors.

Q. 35. Give the applications of IGBTs.

Ans. IGBTs are finding increasing applications in medium power applications such as dc and ac motor drives, power supplies, solid-state relays, and contractors.

Q. 36. What is unijunction transistor ?

Ans. Unijunction transistor (UJT) is a two-layer, three-terminal solid-state (silicon) switching device.

Q. 37. What are freewheeling diodes ? **[Bharathiyar Univ. April 1997]**

Ans. Freewheeling diode is a bypass or commutating diode. It is connected across motor terminals to allow for dissipation of energy stored in motor inductance and to provide for continuity of motor current when the thyristors are blocked. It also provides protection against transient overvoltages.

Q. 38. What is the relationship of V_{dc} and V_{ac} in terms of firing angle α for half-controlled and full-controlled converters ?

[Madurai Kamaraj Univ. Nov. 1996]

Ans. For half-controlled converter,

$$V_{dc} = \frac{\sqrt{2}\, V_{ac}}{\pi} (1 + \cos \alpha) \text{ for } 0 \le \alpha \le \pi.$$

For full-controlled converter,

$$V_{dc} = \frac{2\sqrt{2}\, V_{ac}}{\pi} \cos \alpha \text{ for } 0 \le \alpha \le \pi.$$

Q. 39. What are the drawbacks of half-wave rectifier circuits ?

[Bharathiyar Univ. April 1997]

Ans. The output voltage wave of a half-wave rectifier is not a perfect dc. It is a discontinuous current and contains various harmonics. So half-wave converter drives have poor performance and their use is limited to small drives (rating up to 500 W).

Q. 40. What is the necessity of dc choke coil and freewheeling diode in a converter circuit ? **[Madurai Kamaraj Univ. Nov. 1996]**

Ans. Freewheeling diode allows for dissipation of energy stored in the motor inductance and dc choke coil reduces the rate of decay of current during the freewheeling operation when thyristors are blocked and thus motor current is made continuous. Discontinuous armature current results in deterioration of motor performance.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 41. Why three-phase half-wave drives are generally not employed in industrial applications ?

Ans. Because of presence of dc component in supply currents.

Q. 42. Semiconverter system is preferred for dc series motor drive. Why ?

Ans. The semiconverter system, because of its freewheeling action helps in maintaining continuous current and thus provides better performance to dc series motors in comparison to full converter system.

Q. 43. Why are ac regulators preferred over conventional methods of providing ac variable voltage of constant frequency for ac motor drives ?

Ans. AC regulators using thyristors are becoming popular because of high efficiency, fast control and compact size.

Q. 44. What is difference between on-off control and phase control in the case of ac voltage controller ? **[Madras Univ. October 1996]**

Ans. In on-off control, also known as integral cycle control, the thyristors are used to connect the motor to the supply source for a certain number of cycles and then to disconnect it for another certain number of cycles; each of the on and off times consist of an integral number of cycles. On the other hand in phase control, the thyristors are employed as switches for connecting the motor to the supply for a certain portion of each cycle of the supply voltage.

Q. 45. Mention any two drawbacks of cycloconverters. **[Bharathiyar Univ. April 1997]**

Ans. The two drawbacks of cycloconverters are :

1. It needs more power semiconductors than an inverter.
2. They can produce only a sub-frequency output.

Q. 46. Give some applications of cycloconverter. **[Madurai Kamaraj Univ. Nov. 1996]**

Ans. Cycloconverter drives are normally used for large sized motors. They have also been employed in gearless cement mill or ball mill drives.

Q. 47. What is a dc chopper ? **[A.M.I.E. Sec B. Power Electronics Summer 2008]**

Ans. A chopper is a static device to provide variable dc voltage from a source of constant dc voltage. Thus a chopper may be thought of a dc equivalent of an ac transformer.

Q. 48. Where is a dc chopper normally employed ? **[A.M.I.E. Sec B. Power Electronics Summer 2008]**

Ans. DC choppers are widely used for traction motor control in electric traction, trolley cars, marine hoists, wire travellers, mine haulers, forklift trucks, electric braking and for power factor improvement of ac/dc thyristor converters. Choppers provide smooth control, high efficiency and fast dynamic response and regeneration.

Q. 49. What is meant by duty ratio of a dc chopper ? **[Madras Univ. April 1997]**

Ans. The ratio of on-period to the time period is known as duty ratio, *i.e.*,

$$\text{Duty ratio, } \alpha = \frac{T_{on}}{T} \text{ or } T_{on} \times \text{frequency or } \frac{T_{on}}{T_{on} + T_{off}}$$

Q. 50. What are the advantages of chopper fed drive over converter fed drive ?

Ans. The advantages of chopper fed drive over converter fed drive are:

1. The ripple in the output of chopper is much less than that in the output of a converter. Lesser ripple means lesser losses.
2. The chances of discontinuous operation in chopper drive are lesser than that in converter drive. So speed regulation and transient response of chopper drive are better than that in converter drive.

Q. 51. Enumerate the control strategies used in dc choppers.

Ans. There are two types of control strategies for operating the switches that can be used in dc choppers. These control strategies are time ratio control (TRC) and current limit control.

Q. 52. What is TRC ? In how many ways can it be affected ?

Ans. TRC (time-ratio control) is a control strategy in which the value of $\frac{T_{on}}{T}$ is varied. This is affected in two ways namely variable frequency control (FM control) and constant frequency control (PWM).

Q. 53. What quantity is varied in PWM and frequency modulation ?

Ans. In pulse width modulation (PWM), the chopping period T is kept constant but the pulse width T_{on} is varied to control the output.

In frequency modulation the chopping frequency is varied and for this purpose either T_{on} or T_{off} is varied.

Q. 54. What is a step-up chopper ?

Ans. A step-up chopper, like a step-up transformer, raises the level of input dc voltage.

Q. 55. On what principle does a step-up chopper operate ?

Ans. A step-up chopper operates on the principle of storing energy in an inductance to provide output voltage higher than source voltage.

Q. 56. What is steady-state ripple ?

Ans. When chopper feeds R-L or R-L-E_b load, the current varies between I_{max} and I_{min}. The difference of I_{max} and I_{min} is known as steady-state ripple.

Q. 57. When is steady-state ripple maximum.

Ans. When $\alpha = 0.5$, steady-state ripple is maximum.

Q. 58. What factors can make the current discontinuous in a chopper feeding an R-L-E_b load ?

Ans. Higher L/R ratio, low duty cycle and higher back emf can make the current discontinuous.

Q. 59. What is an inverter ? Is it used in small power applications or high power applications or both ?

Ans. A device that converts dc power into ac power of desired output voltage and frequency is known as an inverter. It is used in both of small as well as high power applications.

Q. 60. What are feedback diodes ? **[A.M.I.E. Sec B. Power Electronics Summer 2008]**

Ans. A diode which provides a return path for the current back to the supply is known as feedback diode. These diodes also help in preventing the load voltage from increasing towards no load.

Q. 61. Where are feedback diodes used ?

Ans. Feedback diodes are used in inverters to feedback load reactive energy. The feedback diodes conduct when the voltage and current are of opposite polarity.

Q. 62. Why the feedback diodes are connected in antiparallel with thyristors in inverter circuits ? How do these diodes come into play ? **[U.P.S.C. I.E.S. Electrical Engineering-II, 2001]**

Ans. When in an inverter circuit, load is other than resistive, the load current i_{out} is not in phase with load voltage V_{out}. For such loads, feedback diodes are connected in antiparallel with thyristors to permit the flow of current when the main thyristors are turned *off*.

Q. 63. What way feedback diodes are different from freewheeling diodes ?

Ans. Freewheeling diode is a bypass or commutating diode while feedback diodes are used in inverters to feedback load reactive energy. Thus the freewheeling diodes and feedback diodes are quite different in functions.

Q. 64. Enlist a few industrial applications of inverters.

Ans. Some industrial applications of inverters are for adjustable-speed ac drives, induction heating, standby air-craft power supplies. One of the biggest applications of inverters is in HVDC power transmission.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 65. Give the classification of inverters.

Ans. Inverters are classified as single-phase or three-phase, voltage source or current source and series or parallel or bridge inverters.

Q. 66. Why bridge circuits are very popular for inverter operation ?

Ans. Bridge circuits are very popular for inverter operation because bridge circuits do not require output transformer and can be easily extended for multi-phase operation.

Q. 67. What is the difference between single-phase half-bridge circuits and full-bridge circuits ?

Ans. Single-phase half-bridge inverter circuit needs two thyristors and two diodes while full-bridge inverter circuit needs four thyristors and four diodes. The main drawback of half-bridge inverter is that it requires 3-wire dc supply which is overcome in full-bridge rectifier.

Q. 68. For providing adjustable-frequency power to industrial applications, three-phase inverters are more common than single phase inverters. Why ?

Ans. Three single-phase inverters connected in parallel provides a 3-phase operation. The gating signals for the three inverters have a phase difference of 120°. This arrangement requires 3 single phase transformers, 12 thyristors and 12 diodes (*i.e.* 1 transformer, 4 thyristors and 4 diodes for each phase) while a 3-phase inverter needs only 6 thyristors and 6 diodes. This is the reason that three-phase inverters are more common than single phase inverters for providing adjustable frequency power to industrial applications.

Q. 69. What are the two modes of operation of 3-phase inverters ?

Ans. Two modes of operation of 3-phase inverters are 120° conduction mode and 180° conduction mode. In 120° conduction mode, each thyristor conducts for 120° while in 180° conduction mode, each thyristor conducts for 180°. But in both modes of operation gating signals are applied and removed at 60° intervals of the output voltage waveform.

Q. 70. Compare the two modes of operation of 3-phase inverters.

Ans. Two modes of operation of 3-phase inverters are 120° conduction mode and 180° conduction mode. 120° conduction mode is more reliable and the possibility of two series thyristors conducting simultaneously is very much reduced but 180° conduction scheme has utilisation factor more than that with 120° conduction.

Q. 71. What is the need for controlling the output voltage of an inverter ?

Ans. The variation and control of output voltage is required for the following reasons :

(*a*) To compensate for change in input dc voltage.

(*b*) To compensate for voltage drop in the thyristors, diodes and other components of inverter circuit.

(*c*) To run variable speed drives. The variation in speed is achieved by variation of voltage.

Q. 72. What is pulse-width modulation ?

Ans. PWM (pulse-width modulation) techniques are characterized by constant amplitude pulses. Output voltage control is obtained by varying the width of pulses.

Q. 73. What are the advantages of pulse-width modulation (PWM) technique of voltage control used in inverters ?

Ans. The PWM technique of voltage control has the following advantages :

(*i*) The output voltage control can be obtained without any additional component.

(*ii*) With this type of control, lower order harmonics can be eliminated or minimized along with its output voltage control. The filtering needs are minimized as higher order harmonics can be filtered easily.

Q. 74. What is single-pulse width modulation ? What is its main disadvantages ?

Ans. In single-pulse width modulation, there is only one pulse per half cycle of output voltage and width of this pulse is varied for controlling the output voltage of inverter. This technique has the disadvantage that the harmonic content in the output is high.

Q. 75. What is multiple-pulse width modulation ? Give its advantage and disadvantages.

Ans. Multiple-pulse width modulation is an extension of single-pulse width modulation. In this method of output voltage control of inverter, several equidistant pulses per half-cycle are used. With this technique, since voltage control is obtained with a simultaneous reduction of lower order harmonics, this scheme is comparatively advantageous over single-pulse width modulation. However, larger number of pulses per half cycle needs frequent turning-on and turning-off thyristors resulting in increased switching losses. Also, this scheme needs inverter-grade thyristors which are costly.

Q. 76. What is sinusoidal-pulse width modulation ?

Ans. In sinusoidal-pulse width modulation, several pulses per half cycle are used as in case of multiple-pulse width modulation. But in this method of modulation, instead of maintaining the width of all pulses the same (as in case of multiple-pulse width modulation), the width of the pulse is varied in proportion to the amplitude of sinusoidal wave evaluated at the centre of the same pulse.

Q. 77. What are photonic devices ?

Ans. Photonic devices are those in which the basic particle of light (the photon) plays an important role. Photodetectors, solar cells and LASERS etc. are photonic devices.

Q. 78. What is photoelectric effect ?

Ans. Photoelectric effect is the relationship between collection of light energy and reflection of electrons from a metal.

Q. 79. How wavelength and energy of a photon are related ?

Ans. Wavelength, $\lambda = \dfrac{1.24}{\text{Energy, E}}$ in micrometre.

Q. 80. What is luminescence ?

Ans. The general property of light emission is called luminescence.

Q. 81. What is electroluminescence ?

Ans. When excitation occurs due to introduction of current into the sample, the resulting luminescence is called electroluminescence.

Q. 82. What is photoluminescence ?

Ans. When carriers are excited by photon absorption, the radiation resulting from the recombination of the excited carriers is called photoluminescence.

Q. 83. What is photoconductivity ?

Ans. When the excess carriers are generated in a semiconductor by optical luminescence, the resulting conductivity is called photoconductivity.

Q. 84. What are photodetectors ?

Ans. Photodetectors are the semiconductor devices that can detect optical signals through electronic processes.

Q. 85. Enlist the three electronic processes involved in photodetection.

Ans. Three electronic processes involved in photodetection are (*i*) carrier generation by incident light (*ii*) carrier transport and/or multiplication and (*iii*) interaction of current with the external circuit to give the output signal.

Q. 86. Name some devices used for photodetection.

Ans. The best known devices used for photodetection are LDRs, photodiodes and phototransistors.

Q. 87. What is photodiode ?

Ans. Photodiode is a two-terminal semiconductor P-N junction device and is designed to operate with reverse bias.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 88. How the current is reduced to zero in a photodiode ?

Ans. The reverse saturation current I_0 flowing through a photodiode is reduced to zero by applying a forward bias voltage of magnitude equal to barrier potential.

Q. 89. Photodiode is a photovoltaic device or a photoconductive device or both ?

Ans. Photodiode is a photovoltaic device as well as photoconductive device. When it is operated with a reverse bias, it is photoconductive device and when operated without the reverse bias, it is a photovoltaic device.

Q. 90. What is PIN photodiode ?

Ans. PIN photodiode consists of a P-region and N-region separated by an intrinsic region where width of intrinsic region is much larger than the space charge width of an ordinary PN junction.

Q. 91. How does avalanche photodiode differ from PIN photodiode ?

Ans. The avalanche photodiode is similar to PIN photodiode except that it is operated at high reverse-bias voltages so that impact ionization occurs.

Q. 92. How does a phototransistor differ from an ordinary BJT ?

Ans. Phototransistor is similar to an ordinary BJT except that no base terminal is provided. Instead of a base current, the input to the transistor is in the form of light.

Q. 93. What are photovoltaic or solar cells ?

Ans. Photovoltaic or solar cells are semiconductor junction devices used to convert radiation energy into electrical energy. These cells generate a voltage proportional to electromagnetic radiation intensity and are called the photovoltaic cells because of their voltage generating capability.

Q. 94. How the main drawback of low sensitivity of vacuum type photocells has been overcome in gas filled photocells.

Ans. The main drawback of low sensitivity of vacuum type photocells has been overcome to some extent by increasing the number of electrons produced at the cathode by a gas discharge.

Q. 95. What is disadvantage of multiplier phototubes ?

Ans. The disadvantage of multiplier phototubes is that they are large in size and expensive in cost and require high voltage (between 500 V and 5,000 V) for their operation.

Q. 96. What is the main drawback of the photoconductive cells ?

Ans. The major drawback of the photoconductive cells is that temperature variations cause substantial variation in resistance for a particular light intensity.

Q. 97. What is meant by LED ?

Ans. LED stands for light-emitting diode.

Q. 98. What precautions are required to be observed in the use of LEDs ?

Ans. LEDs should neither be reverse-biased nor operated near their maximum current rating. The leads of a LED should never be bent closer than about 2 mm from the encapsulation.

Q. 99. Why LCDs are not operated from ac supply of frequency lower than 25 Hz and higher than 50 Hz ?

Ans. If the frequency of supply to LCDs is lower than 25 Hz, a visible flicker would be produced and if it exceeds 50 Hz, the current drawn will be more.

Q. 100. What are the advantages of LCDs over LEDs ?

Ans. The LCDs have the distinct advantage of having low power consumption than the LEDs. It is typically of the order of microwatts for the display in comparison to the some order of mW for LEDs. Other advantages are lower cost and good contrast.

Q. 101. What are the drawbacks of LCDs ?

Ans. The main drawbacks of LCDs are additional requirement of light source, limited temperature range of operation (0–60°C), poor reliability, short operating life, poor visibility in low ambient lighting, slow speed and the need for an ac drive.

Q. 102. What is an optocoupler ?

Ans. Optocoupler is a device that contains an infrared LED and a photodetector (such as a photodiode, phototransistor, Darlington pair, SCR or Triac) combined in a package.

Q. 103. How an optocoupling efficiency of an optocoupler device is expressed ?

Ans. The optocoupling efficiency of an optocoupler may be specified by the output-to-input current transfer ratio (CTR). It may also be expressed as a ratio of output current I_C (measured at the collector terminal of the phototransistor), to the input current I_F flowing into the LED *i.e.*, CTR = I_C/I_F.

Q. 104. Nixie tube display is based on what principle ? **[P.T.U. December 2004]**

Ans. The working principle of Nixie tube is based on the fact that when an electric current is passed through a gas, it breaks down and produces a glow at that location. When negative voltage is applied to any cathode, the glow is produced and the corresponding numeral is displayed. The colour of display depends upon the gas used.

Q. 105. Where is Nixie tube used ? **[P.T.U. December 2005]**

Ans. Indicators, small, medium and large displays, small group viewing.

Q. 106. What are the display devices used in digital instruments ? **[P.T.U. December 2005]**

Ans. LEDs and LCDs.

Q. 107. What is an ordinary power supply ?

Ans. The combination of a transformer, a rectifier and a filter constitutes an ordinary dc power supply, also called an unregulated power supply.

Q. 108. What is a regulated power supply ? **[Bharathiyar Univ. April 1996]**

Ans. A regulated power supply is an electronic circuit designed to provide constant dc voltage of predetermined value across load terminals, which is independent of variations in load current, ac mains voltage and temperature.

Q. 109. Why unregulated power supply is not good enough for many of the applications in electronics ?

Ans. Since the output voltage available from an unregulated power supply varies with the variations in load current, ac mains voltage and temperature and variations in dc output voltage may cause inaccurate or erratic operation or malfunctioning of many electronic circuits. Unregulated power supply is not considered suitable for many of the applications in electronics.

Q. 110. What is a regulated power supply and what are its parts ? **[Bharathiyar Univ. Nov. 1996]**

Ans. A transformer, a rectifier circuit, a filter circuit, a voltage regulator along with some current limiting arrangement constitute a regulated voltage supply.

Q. 111. What do you mean by the parameter 'load regulation' ? **[Bharathiyar Univ. April 1997]**

Ans. The load regulation is the change in regulated output voltage when the load current changes from minimum to maximum value *i.e.*

Load regulation, LR = No-load voltage, V_{NL} – Full-load voltage V_{FL}.

It is usually expressed in percentage and is given as

$$\% \text{ LR} = \frac{V_{NL} - V_{FL}}{V_{FL}} \times 100$$

Q. 112. What is a voltage regulator ? **[Madurai Kamarajar Univ. Nov. 1996]**

Ans. A voltage regulator is a circuit that supplies a constant voltage regardless of variations in load current and ac mains voltage.

Q. 113. What is the need for voltage regulators ? **[Bharathidhasan Univ. April 1996]**

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Voltage regulator is provided in regulated power supply to keep output voltage constant against variations in load current and in ac mains voltage.

Q. 114. What is the function of a voltage regulator ?

[Bharathiyar Univ. April 1997]

Ans. The primary function of a voltage regulator is to maintain a dc output voltage constant regardless of variations in load current or ac mains voltage.

Q. 115. What are the limitations of a regulator using zener diodes ?

[A.M.I.E. Sec B. Winter 2006]

Ans. The efficiency of zener regulated power supply becomes very low when the load current is high. The other drawback is the shift in breakdown voltage due to change in temperature unless suitable compensation techniques are not used, the reference voltage level will shift according to temperature and this may affect the voltage regulation.

Q. 116. Define the three coefficients used to specify a regulated power supply.

Ans. The three coefficient used to specify a regulated power supply are :

1. Input regulation factor, $SR = \left.\frac{\Delta V_{out}}{\Delta V_{in}}\right|_{\substack{\Delta I_L = 0 \\ \Delta T = 0}}$

2. Output resistance, $R_{out} = \left.\frac{\Delta V_{out}}{\Delta I_L}\right|_{\substack{\Delta V_{in} = 0 \\ \Delta T = 0}}$

3. Temperature coefficient, $ST = \left.\frac{\Delta V_{out}}{\Delta T}\right|_{\substack{\Delta V_{in} = 0 \\ \Delta I_L = 0}}$

Q. 117. Why pass-transistor is so called ?

Ans. Collector and emitter terminals of a transistor connected in a transistor series voltage regulator are in series with the load and whole load current pass through it, so it is called a pass-transistor.

Q. 118. Why emitter follower regulator is better than zener regulator ?

Ans. The advantage of an emitter follower regulator is that the changes in zener current are reduced by a factor β and thus the effect of zener effect is largely reduced and much more stabilised output is obtained.

Q. 119. What is the need of foldback current limiting ?

Ans. A problem with the simple current limiting, provided for protection against overload/short-circuit, is that a large amount of power is dissipated in the series-pass resistor while the regulator remains short-circuited. The foldback current limiting is the solution of this problem.

Q. 120. What is meant by 'dropout' voltage of an IC voltage regulator ?

[Madurai Kamarajar Univ. April 1996]

Ans. The drop-out voltage, typically 2V, is the minimum amount of voltage across the input-output terminals that is required to be maintained if the IC is to operate as a regulator.

Q. 121. What is the function of error amplifier in IC voltage regulator ?

Ans. An error amplifier is essentially an op-amp with extremely high open-loop voltage gain. Because of high gain of an op-amp, the error voltage between the two input terminals approaches zero.

Q. 122. Why are series regulators called linear voltage regulators ?

[Bharathidhasan Univ. Nov. 1995]

Ans. Series regulators are called linear voltage regulators because the pass-transistor used in such regulators operate in the active region (linear portion of its output characteristic).

Q. 123. What is the categorisation of series regulator : linear or switching ? [Madras Univ. April 1996]

Ans. Linear.

Q. 124. What are the limitations of linear voltage regulators ?

[Bharathiyar Univ. April 1996]

Ans. The main drawback of linear voltage regulator is the power dissipation in the pass-transistor which is operated in its linear mode. Other drawbacks of linear voltage regulators are that regulated power supplies using these regulators require a stepdown transformer (most expensive and bulky component of the power supply) and large sized filter capacitors to reduce the ripple.

Q. 125. What is switching regulator ? List the four major components of the switching regulator.

[P.T.U. 2006-07]

Ans. A switching regulator can be thought of as a similar to a linear regulator, but with the series-pass transistor operating as a switch that is either *off* or switched-*on* (in a saturated state). The output voltage from the switch is in a pulse waveform which is smoothed into a dc voltage by the action of an LC filter.

A basic switching regulator consists of four major components—voltage source, transistor (or thyristor) switch, pulse generator and a filter. The block diagram of a basic switching regulator is shown in Fig. 1.

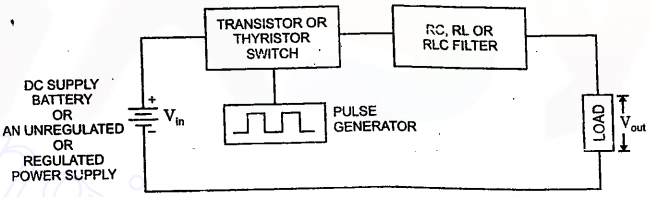

Fig. 1 *Pulse Generator Produces an Asymmetrical Square*

Pulse generator produces an symmetrical square-wave varying in either frequency or pulse width known as frequency modulation (FM) or pulse width modulation PWM) respectively. The pulse generator output alternately turns the switch *on* and *off*. Filter converts the pulse waveform from the output of the switch into a dc voltage. The basic filters are RC, RL or RLC, the RLC filter is the most commonly used.

Q. 126. What is an UPS ? [A.M.I.E. Sec B. Power Electronics Summer 2008]

Ans. An interruptible power supply (UPS) is just an alternative source of supply. It generally consists of a rectifier, battery charger, a battery bank and inverter circuit which converts the commercial ac input into dc suitable for input to the battery bank and the inverter. The rectifier should have its input protected and should be capable of supplying power to the inverter when the commercial supply voltage is either slightly below the normal voltage or slightly above.

Q. 127. The demand for on-line UPS system is less than for off-line UPS system. Why ?

Ans. The demand for on-line UPS system is less than for off-line UPS system because the former is costlier one.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Consider the following devices:
1. SCR 2. GTO
3. BJT 4. MOSFET
5. IGBT

Which of these devices do not belong to the family of transistors?
(a) 1 and 2 only. (b) 1, 2 and 3 only.
(c) 2, 3 and 5 only. (d) 1, 2, 3, 4 and 5.
[U.P.S.C. I.E.S. E.E.-II, 2010]

2. Consider the following statements with respect to the power transistors used in inverters:
1. Maximum collector-emitter voltage V_{CEO}.
2. Maximum collector current.
3. Maximum power dissipation.
4. Maximum current gain at minimum load current.
5. Maximum current gain at maximum load current.

Which of the above statements is/are correct?
(a) 1 only. (b) 1, 2, 3 and 5.
(c) 2 and 3 only. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2009]

3. A field-effect transistor with an anti-parallel body diode blocks:
(a) Bidirectional voltage and passes unidirectional current.
(b) Bidirectional voltage and passes bidirectional current.
(c) Unidirectional voltage and passes unidirectional current.
(d) Unidirectional voltage and passes bidirectional current.
[U.P.S.C. I.E.S. E.E.-II, 2011]

4. Which one of the following statements is not correct ?
(a) Power MOSFETs are so constructed as to avoid punch through.
(b) In a power MOSFET, the channel length is relatively large and channel width is relatively small.
(c) Power MOSFETs do not experience any minority carrier storage.
(d) Power MOSFETs can be put in parallel to handle large currents.
[U.P.S.C. I.E.S. E.E.-II, 2005]

5. A power diode is in the forward conduction mode and the forward current is now decreased. The reverse recovery time of the diode is t_r and the rate of fall of the diode current is di/dt. What is the stored charge ?
(a) $\left(\frac{di}{dt}\right).t_r$ (b) $\frac{1}{2}.\left(\frac{di}{dt}\right).t_r^2$
(c) $\left(\frac{di}{dt}\right).t_r^2$ (d) $\frac{1}{2}.\left(\frac{di}{dt}\right).t_r$.
[U.P.S.C. I.E.S. E.E.-II 2004]

6. Which one of the following is not a power MOSFET type ?
(a) Lateral construction (LMOSFET).
(b) Lateral double diffusion construction (LDMOSFET).
(c) T construction (TMOSFET).
(d) Enhancement mode construction (EMOSFET).
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

7. Consider the following statements :
1. BJT has lower power losses than MOSFETs.
2. MOSFETs have lower power losses than IGBTs.
3. SCRs have lower power losses than MOSFETs.

Which of these statements are correct ?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2000]

8. The correct sequence of given devices in the decreasing order of their speeds of operation is
(a) power BJT, power MOSFET, IGBT, SCR.
(b) IGBT, power MOSFET, power BJT, SCR.
(c) SCR, power BJT, IGBT, MOSFET.
(d) MOSFET, IGBT, power BJT, SCR.
[U.P.S.C. I.E.S. E.E.-II, 1999]

9. Which one is most suitable power device for high frequency (> 100 kHz) switching application ?
(a) Power MOSFET. (b) BJT.
(c) Schottky diode. (d) Microwave transistor.
[U.P.S.C. I.E.S. E.E.-II, 2006]

10. A modern power semiconductor device that combines the characteristics of BJT and MOSFET is
(a) GTO. (b) FCT.
(c) IGBT. (d) MCT.
[U.P.S.C. I.E.S. E.E.-II, 2008]

11. The peak reverse blocking voltage of an IGBT is nearly
(a) the same as its peak forward blocking voltage.
(b) 0.7 V.
(c) a few hundred volts. (d) a few volts.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

12. The main advantage of IGBT over SCR in power electronics is
(a) reduced weight. (b) self commutating capability.
(c) very high reliability. (d) self cooling property.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

13. Consider the following statements in respect of IGBT :
1. It combines the attributes of MOSFET and BJT.
2. It has low forward voltage drop.
3. Its switching speed is very much lower than that of MOSFET.
4. It has high input impedance.

Which of the statements given above are correct ?
(a) 1, 2, 3 and 4. (b) 1, 2 and 4 only.
(c) 1, 2 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2007]

14. Conductivity modulation is a phenomenon which occurs in
(a) power MOSFET. (b) GTO thyristor.
(c) IGBT (d) power bipolar transistor.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

15. Which semiconductor power device, out of the following, is not a current triggered device ?
(a) Thyristor. (b) GTO.
(c) TRIAC. (d) MOSFET.
[A.M.I.E. Sec B. Power Electronics Summer 2008; GATE E.E. 1996]

16. Power electronic device with poor turn-off gain is
(a) A symmetrical thyristor. (b) A conventional thyristor.

Answers: **1.** (a), **2.** (b), **3.** (d), **4.** (a), **5.** (b), **6.** (d), **7.** (c), **8.** (d), **9.** (a), **10.** (c), **11.** (b), **12.** (c), **13.** (a), **14.** (c), **15.** (d), **16.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Power bipolar junction transistor.
(d) Gate turn-off thyristor. [U.P.S.C. I.E.S. E.E.-II, 2005]

17. Thyristor is nothing but a
(a) controlled switch. (b) controlled transistor.
(c) amplifier with large current rating.
(d) amplifier with higher gain.
[A.M.I.E. Fundamentals of Electronics & Instrumentation Winter 1994]

18. A thyristor can be termed as
(a) dc switch. (b) ac switch.
(c) either (a) or (b). (d) square-wave switch.
[A.M.I.E. Sec B. Power Electronics Summer 2008]

19. Consider the following statements:
1. A thyristor requires turn-off circuit while transistor does not.
2. The voltage drop of a thyristor is less than that of a transistor.
3. A thyristor requires a continuous gate current.
4. A transistor draws continuous base current.
Which of these statements are correct?
(a) 1, 2, 3 and 4. (b) 1 and 2.
(c) 2 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

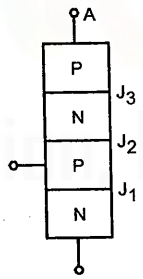
20. An SCR is considered to be a semicontrolled device because
(a) it can be turned OFF but not ON with a gate pulse.
(b) it conducts only during one half-cycle of an alternating current wave.
(c) it can be turned ON but not OFF with a gate pulse.
(d) it can be turned ON only during one half-cycle of an alternating voltage wave. [GATE E.E. 2009]

21. A thyristor equivalent of a thyratron tube is
(a) SCR. (b) UJT. (c) Diac. (d) Triac.
[U.P.S.C. I.E.S. E.E.-II, 1992]

22. Thyristors are not made using germanium, because
(a) it is a stable semiconductor.
(b) group V elements cannot be doped with it.
(c) its current handling capacity is less than silicon.
(d) it has high leakage current.

23. Thyristor is a semiconductor switch which is
(a) unilateral and astable. (b) bilateral and astable.
(c) unilateral and bistable. (d) bilateral and bistable.
[A.M.I.E. Winter 1996]

24. Figure shows a thyristor with the standard terminations of anode (A) cathode (k), gate (G) and the different junctions J_1, J_2 and J_3. When the thyristor is turned on and conducting



(a) J_1 and J_2 are forward biased and J_3 is reverse biased.
(b) J_1 and J_3 are forward biased and J_2 is reverse biased.
(c) J_1 is forward biased and J_2 and J_3 are reverse biased.
(d) J_1, J_2 and J_3 are all forward biased. [GATE E.E. 2003]

25. When cathode of a thyristor is made more positive than its anode
(a) all the junctions are reverse biased.
(b) outer junctions are reverse biased and central one is forward biased.
(c) outer junctions are forward biased and central one is reverse biased.
(d) all the junctions are forward biased.
[U.P.S.C. I.E.S. E.E.-II, 2002]

26. Turn-on of a thyristor takes place when
(a) anode to cathode voltages is positive.
(b) anode to cathode voltage is negative.
(c) there is a positive current pulse at the gate.
(d) the anode to cathode voltage is positive and there is a positive current pulse at the gate. [U.P.S.C. I.E.S. E.E.-II, 2006]

27. A thyristor can be switched from a non-conducting state to a conducting state by applying:
1. Voltage more than forward breakover voltage.
2. A voltage with high $\frac{dv}{dt}$.
3. Positive gate current with positive anode voltage.
4. Negative gate current with positive anode voltage.
(a) 1, 2, 3 and 4 are correct. (b) 1, 2 and 4 are correct.
(c) 1, 2 and 3 are correct. (d) 2, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 2011]

28. In a conventional reverse blocking thyristor
(a) external layers are lightly doped and internal layers are heavily doped.
(b) external layers are heavily doped and internal layers are lightly doped.
(c) the *p*-layers are heavily doped and the *n*-layers are lightly doped.
(d) the *p*-layers are lightly doped and the *n*-layers are heavily doped. [U.P.S.C. I.E.S. E.E.-II, 1998]

29. When a thyristor is in ON state, its gate drive be
(a) removed to save power.
(b) removed or may not be removed.
(c) not removed as it will turn off the thyristor.
(d) removed to avoid increased losses and higher junction temperature.

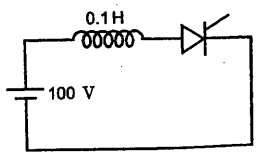
30. After firing an SCR, the gate pulse is removed. The current in the SCR will
(a) remain the same. (b) immediately fall to zero.
(c) rise up. (d) rise a little and then fall to zero.
[A.M.I.E. Sec B. Power Electronics Summer 2007]

31. The anode current through a conducting SCR is 10 A. If its gate current is made one-fourth, then what will be the anode current?
(a) 0 A (b) 5 A (c) 10 A (d) 20 A
[U.P.S.C. I.E.S. E.E.-II, 2009]

32. With gate open, if the supply voltage exceeds the breakover voltage of SCR, then SCR will conduct
(a) false. (b) true.
(c) for dc only. (d) for ac only.
[A.M.I.E. Sec B. Power Electronics Summer 2006]

33. In a thyristor, the holding current I_H is
(a) more than latching current I_L.
(b) less than I_L. (c) equal to I_L. (d) equal to zero.
[U.P.S.C. I.E.S. E.E.-II, 2004]

34. The latching current in the given circuit is 4 mA. The minimum width of the gate pulse required to properly turn on the thyristor is



(a) 6 μs. (b) 4 μs.
(c) 2 μs. (d) 1 μs.
[U.P.S.C. I.E.S. E.E.-II, 2001]

35. Turn-on and turn-off times of transistor depend on
(a) static characteristics. (b) junction capacitances.
(c) current gain. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-II, 2003]

Answers: **17.** (a), **18.** (a), **19.** (d), **20.** (c), **21.** (a), **22.** (d), **23.** (c), **24.** (b), **25.** (b), **26.** (d), **27.** (c), **28.** (a), **29.** (d), **30.** (a), **31.** (c), **32.** (c), **33.** (b), **34.** (b), **35.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

36. Turn-off time of a thyristor
(a) depends upon junction temperature and forward current.
(b) is a constant. (c) depends on load.
[A.M.I.E. Sec B. Power Electronics Summer, 1996]

37. Latching current of an SCR is
(a) below 10% (b) 10-20 %
(c) 20-25% (d) 25-30 % of rated current.
[A.M.I.E. Sec B. Power Electronics Summer, 1994]

38. When two identical SCRs are placed back to back in series with a load and if each is fired at 90°, the voltage across the load will be
(a) $\frac{2}{\pi}$ × peak voltage. (b) zero.
(c) $\frac{1}{\pi}$ × peak voltage. (d) $\frac{1}{\sqrt{2}}$ × peak voltage.

39. Carrier frequency gate drive is used for turn-on of a thyristor to reduce
(a) *di/dt*. (b) Turn-on time.
(c) *dv/dt*. (d) size of pulse transformer.
[U.P.S.C. I.E.S. E.E.-II, 2005]

40. Current in SCR to turn on transient can be reduced by
(a) connecting a small inductor in series with the anode.
(b) connecting a small inductor in parallel with the anode.
(c) connecting a capacitor in series with the anode.
(d) connecting a capacitor in parallel with the anode.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

41. It is preferable to use a train of pulse of high frequency for gate triggering of SCR in order to reduce
(a) *dv/dt* problem. (b) *di/dt* problem.
(c) the size of the pulse transformer.
(d) the complexity of the firing circuit.
[U.P.S.C. I.E.S. E.E.-II, 2001]

42. The main reason for connecting a pulse transformer at the output stage of a thyristor triggering circuit is to
(a) amplify the power of the triggering pulse.
(b) provide electrical isolation.
(c) reduce the turn on time of the thyristor.
(d) avoid spurious triggering of the thyristor due to noise.
[A.M.I.E. Sec B. Power Electronics Summer 2008; Gate E.E. 2001]

43. The drawback of R-firing circuit for SCR is
(a) high power loss. (b) reduced response time.
(c) requirement of high *on*-time SCRs.
(d) firing angle limitation to $\pi/2$.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

44. For thyristors, pulse triggering is preferred to dc triggering because
(a) gate dissipation is low. (b) pulse system is simple.
(c) triggering signal is required for very short duration.
(d) all of the above. [A.M.I.E. Sec B. Power Electronics Winter 2007]

45. High frequency modulation of the gate pulse is normally done in triggering an SCR in order to
(a) reduce the power dissipation in the SCR.
(b) minimize the saturation of pulse transformer core.
(c) reduce the turn on time of SCR.
(d) reduce the turn off time of SCR.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

46. An SCR can be turned off by
(a) interrupting its anode current.
(b) reversing the polarity of its anode-cathode voltage.
(c) low-current drop out. (d) all of the above.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

47. What are the different methods followed to take $p-n-p-n$ device from its conducting state to the non-conducting state ?
1. Reducing the anode current below the holding value.
2. Reducing the gate current to zero.
3. Reducing the gate voltage to zero.
4. Reducing anode voltage below the holding value.
Select the correct answer using the code given below:
(a) 1 and 2 (b) 2 and 3 (c) 1 and 4 (d) 3 and 4
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

48. An SCR is in conducting state, a reverse voltage is applied between anode and cathode, but it fails to turn off. What could be the reason?
(a) Positive voltage is applied to the gate.
(b) The reverse voltage is small.
(c) The anode current is more than the holding current.
(d) Turn off time of SCR is large. [U.P.S.C. I.E.S. E.E.-II, 2011]

49. To turn-off or commutate a thyristor
(a) gate current is made zero.
(b) forced commutation is used.
(c) reverse blocking voltage is applied.
[A.M.I.E. Sec B. Power Electronics Summer, 1996]

50. Most SCRs can be turned-off by voltage reversal during negative half cycle of the ac supply for
(a) all frequencies. (b) frequencies up to 300 Hz.
(c) up to 30 kHz. (d) upto 300 kHz.
[A.M.I.E. Sec B. Summer 1995]

51. *Circuit turn-off time* of an SCR is defined as the time
(a) taken by the SCR to turn off.
(b) required for the SCR current to become zero.
(c) for which the SCR is reverse biased by the commutation circuit.
(d) for which the SCR is reverse biased to reduce its current below the holding current. [GATE E.E., 2011]

52. Which one of the following statements is correct ?
The turn-off time of converter grade SCRs are normally in the range of
(a) 1 to 2 μs. (b) 50 to 200 μs.
(c) 500 to 1000 μs. (d) 1 to 2 ms.
[U.P.S.C. I.E.S. E.E.-II, 2004]

53. If a diode is connected in antiparallel with a thyristor, then
(a) both turn-off power loss and turn-off time decreases.
(b) turn-off power loss decreases but turn-off time increases.
(c) turn-off power loss increases but turn-off time decreases.
[GATE E.E. 1997]

54. Which of the following does not cause permanent damage to an SCR ?
(a) High current. (b) High rate of rise of current.
(c) High temperature rise.
(d) High rate of rise of voltage.
[A.M.I.E. Sec B. Power Electronics Summer 2007; Gate E.E. 1996]

55. In a commutation circuit employed to turn-off an SCR, satisfactory turn-off is obtained when
(a) circuit turn-off time < device turn-off time
(b) circuit turn-off time > device turn-off time
(c) circuit time constant > device turn-off time
(d) circuit time constant < device turn-off time [GATE E.E. 1998]

56. Thyristors are classified as inverter grade or converter grade based on
(a) turn-off time. (b) turn on time.
(c) forward breakover voltage.
(d) holding current. [A.M.I.E. Sec B. Power Electronics Winter 2005]

Answers: **36.** (a), **37.** (a), **38.** (b), **39.** (d), **40.** (a), **41.** (c), **42.** (b), **43.** (a), **44.** (d), **45.** (b), **46.** (a), **47.** (c), **48.** (c), **49.** (b), **50.** (b), **51.** (c), **52.** (b), **53.** (b), **54.** (a), **55.** (b), **56.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

57. When compared to those of a symmetrical thyristor, the turn-off time and reverse blocking voltage of an asymmetrical thyristor are respectively
(a) large and large. (b) large and small.
(c) small and large. (d) small and small.
[U.P.S.C. I.E.S. E.E.-II, 2000]

58. The turn-on time of as SCR is 5 microsecond. Its trigger pulse should have which one of the following ?
(a) Short rise time with pulse width = 2.5 μs
(b) Long rise time with pulse width = 3 μs
(c) Short rise time with pulse width = 6 μs
(d) Short rise time with pulse width = 5 μs
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

59. If the amplitude of the gate pulse to thyristor is increased, then
(a) both delay time and rise time would increase.
(b) the delay time would increase but the rise time would decrease.
(c) the delay time would decrease but the rise time would increases.
(d) the delay time would decrease while the rise time remains unaffected. **[U.P.S.C. I.E.S. E.E.-II, 1998]**

60. Use of reverse conducting thyristor in place of antiparallel combination of thyristor and feedback diode in an inverter
(a) effectively minimizes the peak commutating current.
(b) decreases the operating frequency of operation.
(c) minimizes the effects of lead inductances on the commutation performance.
(d) causes deterioration in the commutation performance.
[U.P.S.C. I.E.S. E.E.-II, 1998]

61. The duration of reverse recovery transient affects the following aspect in a power diode.
(a) peak inverse voltage. (b) forward threshold voltage.
(c) speed of response. (d) average current.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

62. During the turn-off process of a thyristor, the current flow does not stop at the instant when the current reaches zero but continues to flow to a peak value in the reverse direction. This is due to
(a) commutation failure. (b) hole storage effect.
(c) presence of reverse voltage across the thyristor.
(d) protective inductance in series with the thyristor.
[U.P.S.C. I.E.S. E.E.-II, 2000]

63. An SCR has half cycle surge current rating of 3,000 A for 50 Hz supply. One cycle surge current rating will be
(a) 1,500 A (b) 2,121.32 A
(c) 4,242.64 A (d) 6,000 A
[U.P.S.C. I.E.S. E.E.-II, 1999]

64. Surge current rating of an SCR specifies the maximum
(a) repetitive current with rectangular wave.
(b) non-repetitive current with sine wave.
(c) non-repetitive current with rectangular wave.
(d) repetitive current with sine wave.
[A.M.I.E. Sec B. Power Electronics Winter 2006]

65. The *dv/dt* effect in SCR can result in
(a) low capacitive charging current.
(b) false triggering.
(c) increased junction capacitance.
(d) high rate of rise of anode voltage.

66. In an LC series circuit connected to a dc supply of E volts via a thyristor when it turns off, the voltage that appears across the thyristor is
(a) +E (b) +2E (c) −E (d) −2E
[U.P.S.C. I.E.S. E.E.-II, 2010]

67. For an SCR, the gate cathode characteristic has a straight line slope of 140. For trigger source voltage of 20 V and allowable gate power dissipation of 0.5 watts, what is the gate source resistance?
(a) 200 Ω (b) 255 Ω (c) 195 Ω (d) 185 Ω
[U.P.S.C. I.E.S. E.E.-II, 2009]

68. How many SCRs are to be connected in series with 800 V rating to be used for a 3 kV circuit using derating factor of 15% ?
(a) 3. (b) 4. (c) 5. (d) 6.
[A.M.I.E. Sec B. Power Electronics Summer, 1995]

69. In a power circuit of 3 kV, four thyristors each of rating 800 V are connected in series. What is the percentage series derating factor?
(a) 50 (b) 25 (c) 12.5 (d) 6.25
[U.P.S.C. I.E.S. E.E.-II, 2009]

70. An SCR is rated for 650 V PIV. What is the voltage for which the device can be operated if the voltage safety factor is 2?
(a) 325 V rms (b) 230 V rms
(c) 459 V rms (d) 650 V rms
[U.P.S.C. I.E.S. E.E.-II, 2009]

71. Number of thyristors, each with a rating of 500 V, 75 A, required in each branch of a series-parallel combination for a circuit with a total voltage and current ratings of 7.5 kV and 1 kA respectively. If the device derating factor is 14%, then what is the number of thyristors in series and parallel branch respectively?

	No. of thyristors in series branch	*No. of thyristors in parallel branch*
(a)	18	16
(b)	15	14
(c)	12	12
(d)	16	18

[U.P.S.C. I.E.S. E.E.-II, 2009]

72. A resistor connected across the gate and cathode of an SCR.
(a) increases *dv/dt* rating of SCR.
(b) increases holding current of SCR.
(c) increases noise immunity of SCR.
(d) increases turnoff time of SCR. **[U.P.S.C. I.E.S. E.E.-II, 2006]**

73. The sharing of the voltage between thyristors operating in series is influenced by their
(a) *di/dt* capabilities. (b) *dv/dt* capabilities.
(c) junction temperature.
(d) static *v-i* characteristics and leakage currents.
[U.P.S.C. I.E.S. E.E.-II, 2002]

74. Static voltage equalization in series connected SCRs is obtained by the use of
(a) one resistor across the string.
(b) resistors of different values across each SCR.
(c) resistors of the same value across each SCR.
(d) one resistor in series with the string.
[U.P.S.C. I.E.S. E.E.-II, 1999]

75. The transition capacitance of a diode is 1 nF and it can withstand reverse potential of 400 V. A capacitance of 2 nF which can withstand a reverse potential of 1 kV is obtained by connecting
(a) two 1 nF diodes in parallel.
(b) six parallel branches with each branch comprising three 1 nF diodes in series.
(c) two 1 nF diodes in series.
(d) three parallel branches with each branch comprising six 1 nF diodes in series. **[U.P.S.C. I.E.S. E.E.-II, 1999]**

76. The disadvantage of the method of selective harmonic elimination is that
(a) some required harmonics are also eliminated along with unwanted ones.

Answers: **57.** (d), **58.** (d), **59.** (d), **60.** (a), **61.** (a), **62.** (d), **63.** (b), **64.** (c), **65.** (b), **66.** (c), **67.** (c), **68.** (c), **69.** (d), **70.** (b), **71.** (a), **72.** (c), **73.** (d), **74.** (c), **75.** (b), **76.** (a),

(b) some spikes may occur in the output voltage waveform.
(c) the peak of the available voltage exceeds the rated value.
(d) the peak of the available voltage becomes limited.
[A.M.I.E. Sec B. Power Electronics Winter 2007]

77. In a thyristor, *di/dt* protection is achieved by the use of
(a) an inductance L in series with the thyristor.
(b) a resistor in series with the thyristor.
(c) R-C in series with the thyristor.
(d) R-L in series with the thyristor. [U.P.S.C I.E.S. E.E.-II, 2005]

78. For an SCR, *dv/dt* protection is achieved through the use of
(a) R-L in series with SCR. (b) R-C across SCR.
(c) L in series with SCR. (d) R-C in series with SCR.
[U.P.S.C. I.E.S. E.E.-II, 2004]

79. The snubber circuit is used in thyristor circuits for
(a) triggering. (b) *dv/dt* protection.
(c) *di/dt* protection. (d) phase shifting.
[U.P.S.C. I.E.S. E.E.-II, 2001]

80. R-C snubber is used in parallel with the thyristor to
(a) reduce *dv/dt* across it. (b) reduce *di/dt* across it.
(c) limit current through the thyristor.
(d) ensure its conduction after gate signal is removed.
[U.P.S.C. I.E.S. E.E.-II, 2002]

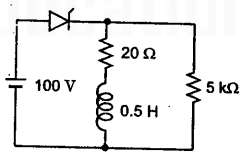
81. Snubber circuits are used to protect thyristor from which of the following ?
(a) High *di/dt* and low *dv/dt*. (b) High *dv/dt* and low *di/dt*.
(c) Low *dv/dt* and low *di/dt*. (d) High *dv/dt* and high *di/dt*.
[U.P.S.C. I.E.S. E.E.-II, 2007]

82. In ac applications, a different measure of harmonics is needed. The total harmonic ratio (THR) is given by :
(a) $\sqrt{\frac{f_{rms}^2 - f_{1\,rms}^2}{f_{rms}}}$ (b) $\sqrt{\frac{f_{rms}^2 - f_{1\,rms}^2}{f_{rms}^2}}$
(c) $\sqrt{\frac{f_{1\,rms}^2 - f_{rms}}{f_{rms}}}$ (d) $\sqrt{\frac{f_{1\,rms}^2 - f_{rms}}{f_{1\,rms}}}$
[U.P.S.C. I.E.S. E.E.-II, 2006]

83. In order to get best results per unit cost, the heat sinks on which the thyristors are mounted are made of
(a) aluminium. (b) copper.
(c) nickel. (d) stainless steel.
[U.P.S.C. I.E.S. E.E.-II, 2004]

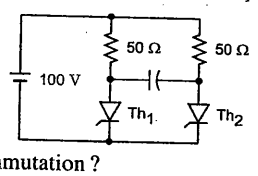
84. Thyristor as a solid state relay is useful
(a) only for ac control. (b) only for dc control.
(c) both ac and dc. [A.M.I.E. Sec B. Power Electronics Summer, 1996]

85. An SCR having a turn ON time of 5 μ sec, latching current of 50 mA and holding current of 40 mA is triggered by a short duration pulse and is used in the circuit shown in figure. The minimum pulse width required to turn the SCR ON will be



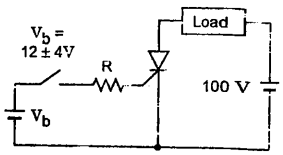
(a) 251 μ sec. (b) 150 μ sec.
(c) 100 μ sec. (d) 5 μ sec. [GATE E.E. 2006]

86. A voltage commutation circuit is shown in figure. If the turn off time of the SCRs is 50 μ sec and a safety margin of 2 is considered, what will be the approximate minimum value of capacitor required for proper commutation ?



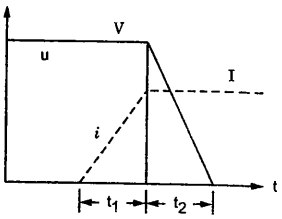
(a) 2.88 μF. (b) 1.44 μF.
(c) 0.91 μF. (d) 0.72 μF. [GATE E.E. 2006]

87. The triggering circuit of a thyristor is shown in figure. The thyristor requires a gate current 10 mA, for guaranteed turn-on. The value of R required for the thyristor to turn on reliably under all conditions of V_b variation is



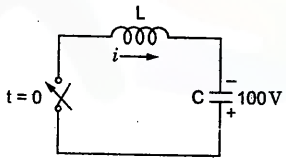
(a) 10,000 Ω. (b) 1,600 Ω.
(c) 1,200 Ω. (d) 800 Ω. [GATE E.E. 2004]

88. The figure shows the voltage across a power semiconductor device and the current through the device during a switching transition. If the transition a turn ON transition or a turn OFF transition? What is the energy lost during the transition ?



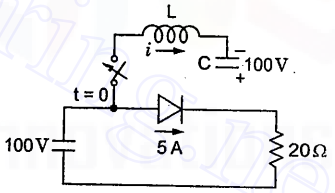
(a) Turn ON, $\frac{VI}{2}(t_1 + t_2)$ (b) Turn OFF, $VI(t_1 + t_2)$
(c) Turn ON, $VI(t_1 + t_2)$ (d) Turn OFF, $\frac{VI}{2}(t_1 + t_2)$
[GATE E.E. 2005]

Statement for Linked Answer Q. (89–90):
The L-C circuit shown in the figure has an inductance L = 1 mH and a capacitance C = 10 μF.



89. The initial current through the inductor is zero, while the initial capacitor voltage is 100 V. The switch is closed at $t = 0$. The current i through the circuit is
(a) $5 \cos (5 \times 10^3\, t)$ A (b) $5 \sin (10^4\, t)$ A
(c) $10 \cos (5 \times 10^3\, t)$ A
(d) $10 \sin (10^4\, t)$ A
[GATE E.E. 2010]

90. The L-C circuit of Q89 is used to commutate a thyristor, which is initially carrying a current of 5 A as shown in the figure. The values and initial conditions of L and C are the same as in Q89. The switch is closed at $t = 0$. If the forward drop is negligible, the time taken for the device to turn off is



(a) 52 μs (b) 156 μs
(c) 312 μs (d) 26 μs [GATE E.E., 2010]

Common Data for Questions 91 and 92.

A 1 : 1 Pulse transformer (PT) is used to trigger the SCR in the adjacent figure. The SCR is rated at 1.5 kV, 250 A with $I_L = 250$ mA, $I_H = 150$ mA, and $I_{G\,max} = 150$ mA with $I_L = 250$ mA, $I_{G\,min} = 100$ mA. The SCR is connected to an inductive load, where L = 150 mH in series with a small resistance and the supply voltage is 200 V dc. The forward drops of all transistors/diodes and gate-cathode junction during ON state are 1.0 V.

Answers: **77.** (a), **78.** (b), **79.** (b), **80.** (a), **81.** (d), **82.** (b), **83.** (a), **84.** (b), **85.** (b), **86.** (a), **87.** (d), **88.** (a), **89.** (d), **90.** (a),

Downloaded From : www.EasyEngineering.net

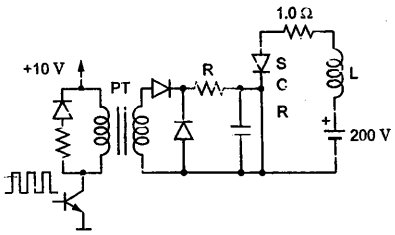
91. The resistance R should be



(a) 4.7 kΩ. (b) 470 kΩ. (c) 47 Ω. (d) 4.7 Ω.
[GATE E.E. 2007]

92. The minimum approximate volt-second rating of the pulse transformer suitable for triggering the SCR should be : (Volt-second rating is the maximum of product of the voltage and the width of the pulse that may be applied)
(a) 2,000 μV-s. (b) 200 μV-s.
(c) 20 μV-s. (d) 2 μV-s. [GATE E.E. 2007]

93. A reverse conducting thyristor (RCT) normally replaces
(a) a pair of anti-parallel thyristors in a circuit.
(b) a combination of a thyristor and an anti-parallel diode in a circuit.
(c) a thyristor in a situation where it is not required to have reversed blocking capability at all.
(d) conventional conversion grade thyristors having large turn-off time. [U.P.S.C. I.E.S. E.E.-II, 2011]

94. Static VAR controllers are used to provide dynamic voltage regulation. These controllers are primarily of
(a) thyristor switched inductors.
(b) thyristor controlled capacitors.
(c) thyristor switched resistors.
(d) thyristor controlled inductors and thyristor switched capacitors.
[U.P.S.C. I.E.S. E.E.-II, 2010]

95. Consider the following devices:
1. Synchronous condenser 2. Saturable reactor
3. SCCR 4. FCCR
In which of these devices, the accuracy of compensation is very high and noise level is very low?
(a) 1, 2, 3 and 4. (b) 3 and 4 only.
(c) 3 only. (d) 2 and 3 only.
[U.P.S.C. I.E.S. E.E.-II, 2010]

96. In a switched capacitor network for VAr compensation the SCRs are commutated by
(a) forced commutation. (b) resonant commutation.
(c) natural commutation. (d) delayed commutation.
[U.P.S.C. I.E.S. E.E.-II, 2004]

97. A triac is a
(a) 2 terminal switch. (b) 2 terminal bilateral witch.
(c) 3 terminal unilateral switch.
(d) 3 terminal bidirectional switch. [U.P.S.C. I.E.S. E.E.-II, 2004]

98. The triac is equivalent to
(a) two SCRs connected in parallel.
(b) two SCRs connected in antiparallel.
(c) one SCR, one diode connected in parallel.
(d) one diode, one SCR connected in antiparallel.
[A.M.I.E. Sec B. Power Electronics Summer, 1995]

99. Consider the following semiconductor devices:
1. Triac. 2. Thyristor 3. Amplifying gate thyristor.
The correct sequence of these devices in increasing order of their *di/dt* capabilities is
(a) 1, 3 2. (b) 1, 2 3. (c) 3, 1, 2. (d) 3, 2, 1.
[U.P.S.C. I.E.S. E.E.-II, 1997]

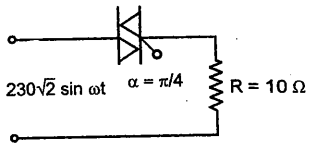
100. The device commonly used for triggering a triac is
(a) diode. (b) transistor.
(c) zener diode. (d) diac.
[A.M.I.E. Sec B. Power Electronics Summer, 1995]

101. The TRIAC can be used only in
(a) inverter. (b) rectifier.
(c) multi-quadrant chopper. (d) cycloconverter.
[A.M.I.E. Sec B. Power Electronics Summer 2008]

102. Triacs cannot be used in ac voltage regulator for a
(a) resistive load. (b) back emf load.
(c) inductive load. (d) resistive inductive load.
[U.P.S.C. I.E.S. E.E.-II, 2005]

103. Triac cannot be used in
(a) ac voltage regulators. (b) cycloconverters.
(c) solid state type of switch. (d) inverter.
[U.P.S.C. I.E.S. E.E.-II, 2001]

104. The triac circuit shown in the figure controls the ac output power to the resistive load. The peak power dissipation in the load is



(a) 3,968 W. (b) 5,290 W. (c) 7,935 W. (d) 10,580 W.
[GATE E.E. 2004]

105. An LASCR
(a) can conduct in both directions.
(b) has a built-in antiparallel diode.
(c) is preferred in high voltage and high current applications where optical isolation is used between trigger source and switching device.
(d) can be turned off by negative gate signal.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

106. In a GTO, anode current begins to fall when the gate current
(a) is negative peak at time $t = 0$
(b) is negative peak at t = storage period t_s
(c) just begins to become negative at $t = 0$
(d) just begins to become positive at $t = 0$
[U.P.S.C. I.E.S. E.E.-II, 2011]

107. A gate turn off (GTO) thyristor has capacity to
(a) Amplify the gate-current.
(b) Turn-off when positive current pulse is given at the gate.
(c) Turn-off when a gate-pulse is given at the gate even though it is reverse biased.
(d) Turn-off when a negative current pulse is given at the gate.
[U.P.S.C. I.E.S. E.E.-II, 2005]

108. Two thyristors A and B have rated gate current of 100 mA and 2 A respectively.
(a) B is GTO and A is conventional SCR.
(b) A is GTO and B is conventional SCR.
(c) Thyristor A may operate as transistor.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-II, 2004]

109. UJT is known as
(a) voltage controlled device. (b) current controlled device.
(c) relaxation oscillator. (d) none of the above.
[A.M.I.E. Sec B. Electronic Devices & Circuits Summer 1999]

Answers: **91.** (c), **92.** (a), **93.** (b), **94.** (d), **95.** (c), **96.** (b), **97.** (d), **98.** (b), **99.** (a), **100.** (d), **101.** (d), **102.** (c), **103.** (c), **104.** (d), **105.** (c), **106.** (b), **107.** (d), **108.** (b), **109.** (a),

110. A UJT has
(a) stable negative resistance characteristics.
(b) low firing current.
(c) use as a waveform generator.
(d) all of these characteristics.

111. Which of the following statements is not correct in regard to UJT ?
(a) It exhibits a negative resistance.
(b) It is operated with emitter junction reverse biased.
(c) It has no ability to amplify while it has stability to control a large ac power with a small signal.
(d) It has one P-N junction and three leads.

112. For an UJT employed for triggering an SCR, stand-off ratio η = 0.64 and dc source voltage V_{BB} is 20 V. The UJT would trigger when the emitter voltage is
(a) 6.4 V (b) 12.8 V (c) 6.55 V (d) 13.1 V
[A.M.I.E. Sec B. Power Electronics Winter 2006]

113. Which one of the following devices can be turned 'ON' or 'OFF' by applying gate signal ?
(a) SCR (b) SCS (c) TRIAC (d) UJT
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

114. A pulse transformer is used for pulse isolation in case of
(a) an SCR, TRIAC and IGBT.
(b) an SCR, TRIAC and GTO.
(c) an SCR, power transistor and GTO.
(d) power MOSFET, IGBT and TRIAC.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

115. Which semiconductor device acts like a diode and two transistors?
(a) SCR. (b) Triac. (c) UJT. (d) Diac.

116. Which one of the following is NOT the advantage of solid state switching of ac capacitors into ac supply over relay-based switching?
(a) low transients. (b) low losses.
(c) fast response. (d) long life.
[U.P.S.C. I.E.S. E.E.-II, 2001]

117. An electronic switch S is required to block voltage of either polarity during its OFF state as shown in the Fig. (a). This switch is required to conduct in only one direction its ON state as shown in the Fig. (b). Which of the following are valid realizations of the switch S ?

1. 2. 3. 4. 
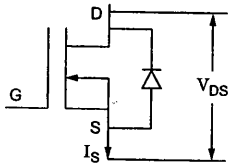
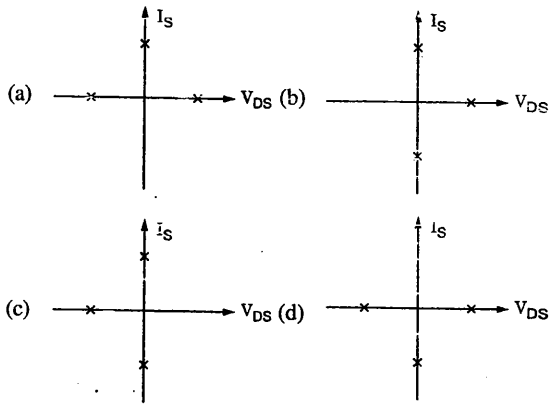
(a) Only 1 (b) 1 and 2 (c) 1 and 3 (d) 3 and 4
[GATE E.E. 2005]

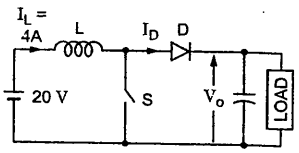
118. Figure shows a MOSFET with an integral body diode. It is employed as a power switching device in the ON and OFF states through appropriate control. The ON and OFF states of the switch are given on the $V_{DS} - I_S$ plane by





[GATE E.E. 2003]

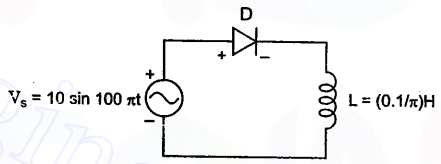
119. In the circuit shown in the figure, the switch is operated at a duty cycle of 0.5. A large capacitor is connected across the load. The inductor current is assumed to be continuous.



The average voltage across the load and the average current through the diode will respectively by
(a) 10 V, 2 A (b) 10 V, 8 A
(c) 40 V, 2 A (d) 40 V, 8 A **[GATE E.E. 2008]**

120. The uncontrolled electronic switch employed in power electronic converters is
(a) thyristor. (b) bipolar Junction transistor.
(c) diode. (d) MOSFET. **[GATE E.E. 1998]**

121. The circuit shows an ideal diode connected to a pure inductor and is connected to a purely sinusoidal 50 Hz voltage source.



Under ideal conditions the current waveform through inductor will look like

(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2009]

122. The rms value of a half-wave rectified symmetrical square wave current of 2 A is
(a) $\sqrt{2}$ A (b) 1 A (c) $1/\sqrt{2}$ A (d) $\sqrt{3}$ A
[A.M.I.E. Sec B. Power Electronics Summer 2008]

123. The average on state current for a thyristor is 20 A for a conduction angle of 120°. Its average on state current for 60° conduction angle would be
(a) 20 A (b) less than 20 A
(c) 10 A (d) 40 A
[A.M.I.E. Sec B. Power Electronics Summer 2006]

Answers: **110.** (a), **111.** (b), **112.** (d), **113.** (a), 114. (b), **115.** (c), **116.** (a), **117.** (c), **118.** (d), **119.** (a), **120.** (d), **121.** (c), **122.** (a), **123.** (b),

124. A thyristor controlled reactor is used to get
(a) variable resistance. (b) variable capacitance.
(c) variable inductance.
(d) improved reactive power factor. [U.P.S.C. I.E.S. E.E.-II, 2002]

125. In a thyristor controlled reactor, the firing angle of thyristor is to be controlled in the range of
(a) 0 to 90°. (b) 0 to 180°.
(c) 90 to 180°. (d) 90 to 270°.
[U.P.S.C. I.E.S. E.E.-II, 2001]

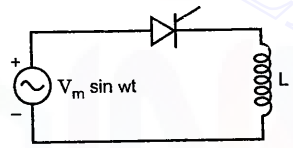
126. A thyristor-controlled inductor will work as a variable inductor OR as a fixed inductor, respectively for firing angles
(a) less than or equal to 90°, greater than 90°.
(b) less than 90°, greater than or equal to 90°.
(c) greater than 90°, less than or equal to 90°.
(d) less than 90°, greater than 90°. [U.P.S.C. I.E.S. E.E.-II, 2008]

127. A single-phase, 230 V, 50 Hz ac mains fed step-down transformer (4 : 1) is supplying power to a half-wave uncontrolled ac-dc converter used for charging a battery (12 V dc) with the series current limiting resistor being 19.04 Ω. The charging current is
(a) 2.43 A (b) 1.65 A (c) 1.22 A (d) 1.0 A
[GATE E.E. 2007]

128. A solar cell of 350 V is feeding power to an ac supply of 440 V, 50 Hz through a 3-phase fully controlled bridge converter. A large inductance is connected in the dc circuit to maintain the dc current at 20 A. If the solar cell resistance is 0.5 Ω, then each thyristor will be reverse biased for a period of
(a) 125° (b) 120° (c) 60° (d) 55°
[GATE E.E. 2006]

129. A single phase half-wave controlled rectifier has 400 sin 314t as the input voltage and R as the load. For a firing angle of 30°, the average output voltage is
(a) 118.8 V (b) 127.4 V (c) 95.5 V (d) 76.4 V
[A.M.I.E. Sec B. Power Electronics Summer 2006]

130. A half-wave thyristor convertor supplies a pure inductive load, as shown in the figure. If the triggering angle of the thyristor is 120°, the extinction angle will be

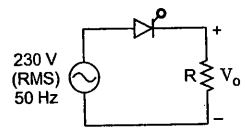


(a) 240°. (b) 180°. (c) 200°. (d) 120°.
[GATE E.E. 2001]

131. In a single-phase full-wave controlled bridge rectifier, minimum output voltage and maximum output voltage are obtained at which conduction angles ?
(a) 0°, 180° respectively. (b) 180°, 0° respectively.
(c) 0°, 0 ° respectively. (d) 180°, 180° respectively.
[U.P.S.C. I.E.S. E.E.-II, 2007]

132. When the firing angle α of a single-phase, fully controlled rectifier feeding constant dc current into a load is 30°, the displacement power factor to the rectifier is
(a) 1 (b) 0.5 (c) $\frac{1}{\sqrt{3}}$ (d) $\frac{\sqrt{3}}{2}$
[GATE E.E. 1998; A.M.I.E. Sec B. Power Electronics Summer 2008; U.P.S.C. I.E.S. E.E.-II, 2006]

133. Consider a phase-controlled converter shown in the figure. The thyristor is fired at an angle α in every positive half cycle of the input voltage. If the peak value of the instantaneous output voltage equals 230 V, the firing angle α is close to



(a) 45° (b) 135° (c) 90° (d) 83.6°
[GATE E.E. 2005]

Common Data Questions (134–135)
The input voltage given to a converter is

$$v_i = 100\sqrt{2}\ \sin(100\ \pi t)\ \text{V}$$

The current drawn by the converter is

$$i_i = (10\sqrt{2}\ \sin(100\ \pi t - \pi/3) + 5\sqrt{2}\ \sin(300\ \pi t + \pi/4) + 2\sqrt{2}\ \sin(500\ \pi t - \pi/6)\ \text{A}$$

134. The input power factor of the converter is
(a) 0.31 (b) 0.44 (c) 0.5 (d) 0.71
[GATE E.E. 2011]

135. The active power drawn by the converter is
(a) 181 W (b) 500 W (c) 707 W (d) 887 W
[GATE E.E., 2011]

136. The average output voltage of a fly-back converter is $V_o = 24$ V at a resistive load of R = 0.8 Ω. The duty cycle ratio is α = 50% and the switching frequency is f = 1 kHz. The on-state voltage drop of transistors and diodes are V_t = 1.2 V and V_d = 0.7 V respectively. The turn ratio of the transformer is $a = N_s/N_p = 0.25$. What is the efficiency of the converter?
(a) 86.5% (b) 96% (c) 75% (d) 90%
[U.P.S.C. I.E.S. E.E.-II, 2010]

137. Commutation overlap in the phase-controlled ac to dc converter is due to
(a) load inductance.
(b) harmonic content of load current.
(c) switching operation in the converter.
(d) source inductance.
[U.P.S.C. I.E.S. E.E.-II, 1999; A.M.I.E. Sec B. Power Electronics Summer 2008]

138. Consider the following statements :
The overlap angle of a phase controlled converter would increase on increasing the
1. Supply voltage. 2. Supply frequency.
3. Load current. 4. Source inductance.
Of these statements
(a) 1, 2 and 3 are correct. (b) 2, 3 and 4 are correct.
(c) 1, 2 and 4 are correct. (d) 1, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1998]

139. A single-phase full-bridge converter with a freewheeling diode feeds an inductive load. The load resistance is 15.53 Ω and it has a large inductance providing constant and ripple free dc current. Input to converter is from an ideal 230 V, 50 Hz single phase source. For a firing delay angle of 60°, the average value of diode current is
(a) 10 A (b) 8.165 A (c) 5.774 A (d) 3.33 A
[U.P.S.C. I.E.S. E.E.-II, 2002]

140. A single-phase fully controlled thyristor bridge ac-dc converter is operating at a firing angle of 25° and on overlap angle of 10° constant dc output current of 20 A. The fundamental power factor (displacement factor) at input ac mains is
(a) 0.78 (b) 0.827 (c) 0.866 (d) 0.9
[GATE E.E. 2007]

141. A single phase fully bridge converter supplies a load drawing constant and ripple free load current. If the triggering angle is 30°, the input power factor will be
(a) 0.65 (b) 0.78 (c) 0.85 (d) 0.866
[GATE E.E. 2008]

Answers: **124.** (d), **125.** (b), **126.** (b), **127.** (d), **128.** (a), **129.** (a), **130.** (a), **131.** (b), **132.** (d), **133.** (b), **134.** (c), **135.** (b), **136.** (b), **137.** (a), **138.** (b), **139.** (d), **140.** (c), **141.** (b),

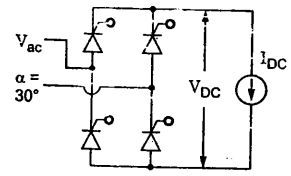
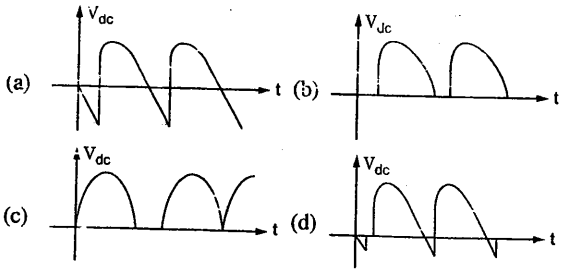
142. A phase-controlled half-controlled single-phase converter is shown in figure. The control angle $\alpha = 30°$.
The output dc voltage waveshape will be as shown in





[GATE E.E. 2003]

143. In a single-phase semiconverter with resistive load and for a firing angle α, each SCR conduction and freewheeling action take place respectively, for
(a) α, 0° (b) $\pi - \alpha$, α (c) $\pi + \alpha$, α (d) $\pi - \alpha$, 0°
[U.P.S.C. I.E.S. E.E.-II, 1998]

144. In a single-phase semiconverter, with discontinuous conduction and extinction angle $\beta < \pi$, freewheeling action takes place for
(a) α. (b) $\pi - \beta$.
(c) $\beta - \pi$. (d) zero degree.
[U.P.S.C. I.E.S. E.E.-II, 2005]

145. Freewheeling diode at the output of a rectifier allows
(a) SCR to trigger properly.
(b) turn-off SCR at the end of half cycle.
(c) protection of SCR against overvoltage.
(d) none of the above. [A.M.I.E. Sec B. Power Electronics Summer 1993]

146. A freewheeling diode is connected across R-L load, because
(a) it prevents, infinite voltage across switch which breakes current.
(b) it rectifies current.
(c) it prevents current in opposite direction.
[A.M.I.E. Sec B. Power Electronics Summer 1996]

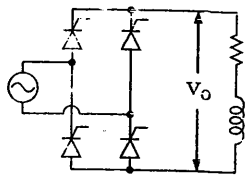
147. The advantage of using a freewheeling diode with bridge type ac/dc converter is
(a) regenerative braking. (b) reliable speed control.
(c) improved power factor. (d) reduced cost of the system.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

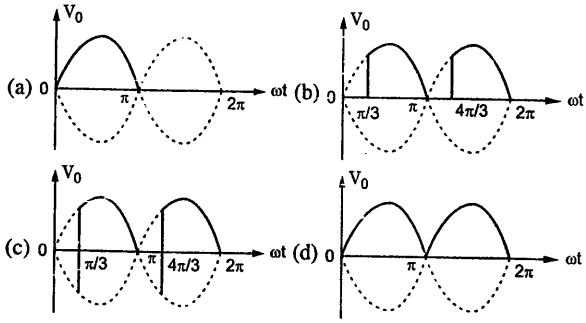
148. A single-phase fully controlled line commutated ac to dc converter operates as an inverter, when
(a) $0 \le \alpha \le 90°$. (b) $90° \le \alpha \le 180°$.
(c) it supplies to a back emf load.
(d) $90° \le \alpha \le 180°$ and there is a suitable dc source in the load circuit. [U.P.S.C. I.E.S. E.E.-II, 1999]

149. The average value of voltage of a single-phase ac voltage converter with resistive load is
(a) $\frac{V_m}{\pi}(1+\cos\alpha)$. (b) $\frac{V_m}{2\pi}(1+\cos\alpha)$.
(c) $\frac{V_m}{\pi}\cos\alpha$. (d) $\frac{V_m}{2\pi}\cos\alpha$.
[A.M.I.E. Sec B. Power Electronics Summer 2007]

150. A single-phase full convertor is connected across 250 V ac. Its output voltage when firing angle is 30° is given by
(a) 210 V. (b) 195 V.
(c) 250 V. (d) none of the above.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1995]

151. A single-phase half controlled converter shown in the figure is feeding power to highly inductive load. The converter is operating at a firing angle of 60°.
If the firing pulses are suddenly removed, the steady state voltage (V_0) waveform of the converter will become





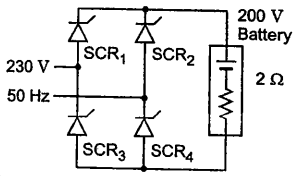
[GATE E.E. 2008]

152. A single-phase full-wave half-controlled bridge converter feeds an inductive load. The two SCRs in the converter are connected to a common DC bus. The converter has to have a freewheeling diode
(a) because the converter inherently does not provide for free-wheeling.
(b) because the converter does not provide for freewheeling for high values of triggering angles.
(c) or else the freewheeling action of the converter will cause shorting of the AC triggering angles.
(d) or else if a gate pulse to one of the SCRs is missed, it will subsequently cause a high load current in the other SCR.
[GATE E.E. 2007]

153. A half-controlled bridge converter is operating from an rms input voltage of 120 V. Neglecting the voltage drops, what are the mean load voltage at firing delay angle of 0° and 180°, respectively ?
(a) $\frac{120\times 2\sqrt{2}}{\pi}$ V and 0 (b) 0 and $\frac{120\times 2\sqrt{2}}{\pi}$ V
(c) $\frac{120\sqrt{2}}{\pi}$ V and 0 (d) 0 and $\frac{120\sqrt{2}}{\pi}$ V
[U.P.S.C. I.E.S. E.E.-II, 2008]

154. Analysis of voltage waveform of a single-phase bridge converter shows that it contains x% of 6th harmonic. The 6th harmonic content of the voltage waveform of a 3-phase bridge converter would be
(a) less than x%, due to an increase in the number of pulses.
(b) equal to x%, the same as that of the single-phase converter.
(c) greater than x% due to changes in the input and output voltages of the converter.
(d) difficult to predict as the analysis of converters is not governed by any generalized theory. [U.P.S.C. I.E.S. E.E.-II, 1998]

155. A single-phase bridge converter is used to charge a battery of 200 V having an internal resistance of 2 Ω as shown in figure. The SCRs are triggered by a constant dc signal. If SCR_2 gets open circuited, what will be the average charging current?



(a) 23.8 A (b) 15 A (c) 11.9 A (d) 3.54 A
[GATE E.E. 2006]

Answers: **142.** (a), **143.** (b), **144.** (d), **145.** (c), **146.** (a), **147.** (c), **148.** (b), **149.** (a), **150.** (a), **151.** (a), **152.** (c), **153.** (a), **154.** (a), **155.** (c),

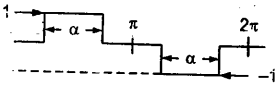
156. In a single-phase full converter with resistive load and for firing angle α, the load current is zero and non-zero, respectively for
(a) $\pi-\alpha, \alpha$ (b) $\alpha, \pi-\alpha$ (c) $\alpha, \pi+\alpha$ (d) $\pi-\alpha, \pi$
[A.M.I.E. Sec B. Power Electronics Summer 2007]

157. With reference to the output waveform given in figure, the output of the converter will be free from 5th harmonic when



(a) $\alpha = 72°$ (b) $\alpha = 36°$ (c) $\alpha = 150°$ (d) $\alpha = 120°$
[GATE E.E. 2003]

158. In a 2-pulse bridge converter with freewheeling diode, the width of the diode current pulse is (α is the firing angle)
(a) $\pi+\alpha$ (b) $\pi-\alpha$ (c) π (d) 2α
[U.P.S.C. I.E.S. E.E.-II, 2000]

159. If a full-wave fully controlled converter is modified as a full-wave half controlled converter, what will be the maximum value of active power (P) and the maximum value of reactive power demand (Q)?

	P	Q
(a)	Double	Half
(b)	Unchanged	Unchanged
(c)	Half	Double
(d)	Unchanged	Half

[U.P.S.C. I.E.S. E.E.-II, 2009]

160. A single-phase full converter feeds power to RLE load with R = 10 Ω, L = 10 mH and E = 50 V, the ac source voltage is 230 V, 50 Hz. For continuous conduction, what is the average value of load current for firing angle delay of 60°?
(a) 4.63 A (b) 6 A (c) 6.5 A (d) 5.35 A
[U.P.S.C. I.E.S. E.E.-II, 2009]

161. In HVDC converter station equipment using thyristors it is necessary to use a large number of thyristors in series because :
(a) Current rating of thyristors are low.
(b) Voltage rating of thyristors are low.
(c) Thyristors always fail to an internal open circuit.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-II, 2003]

162. The characteristic features of discontinuous conduction compared to continuous conduction in a four-pulse, single-phase bridge converter are
(a) Larger average value of load voltage and larger ripple-content.
(b) Larger average value of load voltage and smaller ripple-content.
(c) Smaller average value of load voltage and smaller ripple-content.
(d) Smaller average value of load voltage and larger ripple-content.
[U.P.S.C. I.E.S. E.E.-II, 2003]

163. Which one of the following is the correct statement ?
In a two quadrant converter working in the 1st and 2nd quadrants
(a) load current and load voltage are always positive.
(b) load current is always negative.
(c) load current can be positive or negative.
(d) load current and load voltage are always negative.
[U.P.S.C. I.E.S. E.E.-II, 2007]

164. A four quadrant operation requires
(a) two full converters in series.
(b) two full converters connected back to back.
(c) two full converters connected in parallel.
(d) two semiconverters connected back to back.
[A.M.I.E. Sec B. Winter 1995]

165. The following converters can feed power in any of the four quadrants:
(a) semiconverter. (b) full converter.
(c) dual converter.
(d) combination of a semi and full-converters.
[A.M.I.E. Sec B. Winter 1993]

166. AC-to-dc circulating current dual converters are operated with following relationship between their triggering angles (α_1 and α_2)
(a) $\alpha_1 + \alpha_2 = 180°$. (b) $\alpha_1 + \alpha_2 = 360°$.
(c) $\alpha_1 - \alpha_2 = 180°$. (d) $\alpha_1 + \alpha_2 = 90°$.
[A.M.I.E. Sec B. Power Electronics Summer 2003; Gate E.E. 2001]

167. In a dual converter, the circulating current
(a) allows smooth reversal of load current, but increases the response time.
(b) allows smooth reversal of load current with improved speed of response.
(c) does not allow smooth reversal of load current, but reduces the response time.
(d) flows if there is no interconnecting inductor.
[U.P.S.C. I.E.S. E.E.-II, 2006]

168. In order to simplify the design of a converter transformer, the two converters in a dual converter should be connected using:
(a) series connection. (b) cross connection.
(c) direct anti-parallel connection.
(d) anti-parallel connection. [U.P.S.C. I.E.S. E.E.-II, 2011]

169. A 220 V, 1400 rpm, 40 A separately-excited dc motor has an armature resistance of 0.4 Ω. The motor is fed from a single-phase circulating current dual converter with an input ac line voltage of 220 V (rms). The approximate firing angles of the dual converter for motoring operation at 50% of rated torque and 1,000 rpm will be
(a) 43°, 137° (b) 43°, 47°
(c) 39°, 141° (d) 39°, 51° [GATE E.E. 2008]

170. The circulating current inductor is required in a dual converter to
(a) Improve the pf.
(b) Smoothen the waveform of circulating current.
(c) Limit the circulating current.
(d) Increase the circulating current. [U.P.S.C. I.E.S. E.E.-II, 2005]

171. A fully controlled line commutated converter functions as an inverter when firing angle (α) is in the range
(a) 0°–90° (b) 90°–180°
(c) 90°–180° only when there is a suitable dc source in the load.
(d) 90°–180° only when it supplies a back emf load.
[U.P.S.C. I.E.S. E.E.-II, 2006]

172. Resonant converters are basically used to
(a) generate large peaky voltage.
(b) reduce the switching losses. (c) eliminate harmonics.
(d) convert a square wave into a sine wave.
[GATE E.E. 1999; A.M.I.E. Sec B. Power Electronics Summer 2008]

173. In the buck-boost converter, what is the maximum value of the switch utilization factor ?
(a) 1.00 (b) 0.75 (c) 0.50 (d) 0.25
[U.P.S.C. I.E.S. E.E.-II, 2004]

174. A thyristor converter of 415 V, 100 A is operating at rated load. Details of the thyristor used are as follows :
'ON' state power loss = 150 W

Answers: **156.** (b), **157.** (a), **158.** (d), **159.** (b), **160.** (d), **161.** (b), **162.** (d), **163.** (c), **164.** (b), **165.** (c), **166.** (a), **167.** (b), **168.** (c), **169.** (c), **170.** (c), **171.** (c), **172.** (b), **173.** (b), **174.** (a),

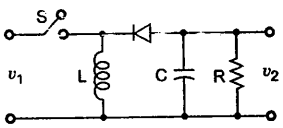
Thermal resistance :
Junction to case = 0.01°C/W
Case to sink = 0.08°C/W
Sink to atmosphere = 0.09°C/W
Assume ambient temperature as 35°C. The junction temperature for 100% load is
(a) 48.5°C (b) 54.5°C (c) 60°C (d) 62°C
[U.P.S.C. I.E.S. E.E.-II, 2000]

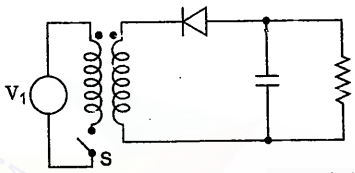
175. The circuit shown in the figure will work as which one of the following ?



(a) Buck-Boost converter.
(b) Buck converter.
(c) Boost converter.
(d) Dual converter.
[U.P.S.C. I.E.S. E.E.-II, 2007]

176. What is the waveform of the current flowing through the diode in a buck-boost converter?
(a) Square wave (b) Triangular wave
(c) Trapezoidal (d) Sinusoidal wave
[U.P.S.C. I.E.S. E.E.-II, 2011]

177. For the isolated buck-boost converter as shown in the circuit, the output voltage is to be 35 V at a duty cycle of 30%. The dc input is obtained from a front end rectifier without voltage doubling fed from a 115 V ac. What is the peak forward blocking voltage of the switching element?



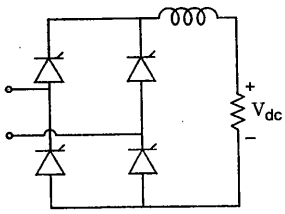
(a) 232.3 V (b) 69.69 V
(c) 162.61 V (d) 542 V [U.P.S.C. I.E.S. E.E.-II, 2009]

178. The average load voltage of a three-phase half-wave controlled circuit using thyristors is given by
(a) $(3\sqrt{6}/2\pi)E_m \cos\alpha$. (b) $(3\sqrt{6}/\pi)E_m \cos\alpha$.
(c) $(3\sqrt{3}/\pi)E_m \cos\alpha$. (d) $(3\sqrt{3}/2\pi)E_m \cos\alpha$.
[A.M.I.E. Sec B. Power Electronics Winter 2007]

179. In a 3-phase bridge rectifier fed from star-connected secondary winding of a transformer, let the voltage to the neutral of the A-phase (phase sequence A, B, C) be $V_m \sin \omega t$. At the instant when the voltage of A phase is maximum, the output voltage at the rectifier terminals will be
(a) $\frac{V_m}{\sqrt{2}}$ (b) V_m (c) $1.5\,V_m$ (d) $\sqrt{3}V_m$
[A.M.I.E. Sec B. Power Electronics Summer 2008]

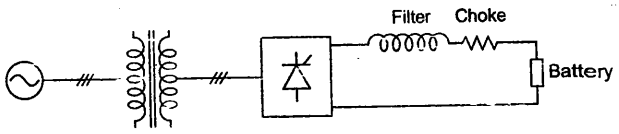
180. In a 3-phase bridge rectifier circuit for HVDC transmission, the ratio of output dc voltage to input ac voltage is
(a) 0.5 (b) 1.0 (c) $\sqrt{3}$ (d) 2
[U.P.S.C. I.E.S. E.E.-II, 2004]

181. The fully controlled thyristor converter in the figure is fed from a single-phase source. When the firing angle is 0°, the dc output voltage of the converter is 300 V. What will be the output voltage for a firing angle of 60°, assuming continuous conduction?



(a) 150 V (b) 210 V
(c) 300 V (d) 100 π V [GATE E.E., 2010]

182. A solar energy installation utilizes a three-phase bridge converter to feed energy into power system through a transformer of 400 V/400 V, as shown below



The energy is collected in a bank of 400 V battery and is connected to converter through a large filter choke of resistance 10 Ω. The maximum current through the battery will be
(a) 14 A (b) 40 A (c) 80 A (d) 94 A
[GATE E.E., 2011]

183. Two fully controlled three-phase bridges are connected in antiparallel across a load to provide reversible dc voltage to the load. The bridges operate in circulating current mode. The input is 3-phase 440 volt, 50 Hz ac supply, and the maximum load current is 30 Amp. The peak value of the circulating current is taken to be 6 A. What is the value of inductance for limiting circulating current?
(a) 30 mH (b) 32 mH (c) 36 mH (d) 38 mH
[U.P.S.C. I.E.S. E.E.-II, 2009]

184. In a 3-phase semiconverter, for firing angle less than or equal to 60°, freewheeling diode conducts for
(a) 90° (b) 60° (c) 30° (d) 0°
[U.P.S.C. I.E.S. E.E.-II, 2011]

185. In a 3-phase semiconverter, for firing angle equal to 120° and extinction angle equal to 110°, each SCR and freewheeling diode conduct, respectively for
(a) 60°, 50° (b) 30°, 50° (c) 60°, 10° (d) 30°, 10°
[U.P.S.C. I.E.S. E.E.-II, 2001]

186. In a 3-phase semiconverter, if firing angle is less than or equal to 60°, then the duration of conduction of each thyristor and diode would be respectively
(a) 60° and 60°. (b) 90° and 30°.
(c) 120° and 120°. (d) 180° and 180°.
[U.P.S.C. I.E.S. E.E.-II, 2000; A.M.I.E. Sec B. Power Electronics Summer 2006]

187. In a 3-phase controlled bridge rectifier, with an increase of overlap angle, the output dc voltage
(a) decreases. (b) increases.
(c) does not changes.
(d) depends upon load inductance.
[A.M.I.E. Sec B. Power Electronics Summer 2006]

188. A three-pulse converter has a freewheeling diode across its load. The operating range of the converter is
(a) $0° \le \alpha \le 150°$. (b) $60° \le \alpha \le 120°$.
(c) $30° \le \alpha \le 150°$. (d) $180° \le \alpha \le 360°$.
[U.P.S.C. I.E.S. E.E.-II, 1999]

189. A three pulse converter is feeding a purely resistive load. What is the value of firing delay angle α, which dictates the boundary between continuous and discontinuous mode of current conduction?
(a) $\alpha = 0°$ (b) $\alpha = 30°$ (c) $\alpha = 60°$ (d) $\alpha = 150°$
[U.P.S.C. I.E.S. E.E.-II, 2005]

190. In a three-phase full-wave ac to dc converter, the ratio of output ripple frequency to the supply voltage frequency is
(a) 2. (b) 3. (c) 6. (d) 12.
[U.P.S.C. I.E.S. E.E.-II 2002]

Answers: **175.** (a), **176.** (c), **177.** (a), **178.** (b), **179.** (d), **180.** (a), **181.** (a), **182.** (a), **183.** (c), **184.** (d), **185.** (a), **186.** (c), **187.** (d), **188.** (b), **189.** (d), **190.** (c),

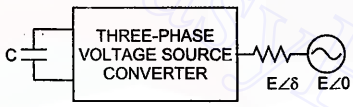
191. A 3-phase ac to dc converter which requires neutral point connection is
(a) 3-phase semiconverter. (b) 3-phase full converter.
(c) 3-phase half-wave converter.
(d) 3-phase full converter with diodes. [A.M.I.E. Sec B. Summer 1996]

192. A three-phase thyristor bridge rectifier is used in a HVDC link. The firing angle α (as measured from the point of natural commutation) is constrained to lie between 5° and 30°. If the dc side current and ac side voltage magnitudes are constant, which of the following statements is true (neglect harmonics in the ac side currents and commutation overlap in your analysis)
(a) Reactive power absorbed by the rectifier is maximum when $\alpha = 5°$
(b) Reactive power absorbed by the rectifier is maximum when $\alpha = 30°$
(c) Reactive power absorbed by the rectifier is maximum when $\alpha = 15°$
(d) Reactive power absorbed by the rectifier is maximum when $\alpha = 15°$ [GATE E.E. 2002]

193. A three-phase full converter is supplying a purely resistive load at 300 V dc for 0° firing angle. The output voltage for 90° firing angle would be
(a) 0 V (b) 40 V (c) 50 V (d) 100 V
[U.P.S.C. I.E.S. E.E.-II, 2008]

194. A converter which can operate both in 3-pulse and 6-pulse modes is a
(a) 1-phase full converter. (b) 3-phase half-wave converter.
(c) 3-phase semiconverter. (d) 3-phase full converter.
[U.P.S.C. I.E.S. E.E.-II, 2005]

195. The figure shows a three-phase self-commutated voltage source converter connected to a power system. The converter's dc bus capacitor is marked as C in the figure. The circuit is initially operating in steady state with $\delta = 0$ and the capacitor dc voltage is equal to V_{dc0}. You may neglect all losses and harmonics. What action should be taken to increase the capacitor dc voltage slowly to a new steady state value.



(a) Make δ positive and maintain it at a positive value.
(b) Make δ positive and return it to its original value.
(c) Make δ negative and maintain it at a negative value.
(d) Make δ negative and return it to its original value.
[GATE E.E. 2007]

196. A fully controlled natural commutated 3-phase bridge rectifier is operating with a firing angle $\alpha = 30°$. The peak to peak voltage ripple expressed as a ratio of the peak output dc voltage at the output of the converter bridge is
(a) 0.5 (b) $\sqrt{3}/2$ (c) $\left(1-\frac{\sqrt{3}}{2}\right)$ (d) $\sqrt{3}-1$
[GATE E.E. 2003]

197. A 3-pulse converter feeds an RLE load. The source has a definite inductance causing overlap. The thyristors are ideal. It has an overlap angle 'μ' of 20° at the minimum firing angle 'α'. The current remains constant in the complete range of firing angles. The range of firing angles of the converter would be
(a) $0° < \alpha < 180°$. (b) $20° < \alpha < 180°$.
(c) $20° < \alpha < 160°$. (d) $0° < \alpha < 160°$.
[U.P.S.C. I.E.S. E.E.-II, 2000]

198. A 3-phase fully controlled converter is feeding power into a dc load at a constant current of 150 A. The rms current through each thyristor of the converter is
(a) 50 A. (b) 100 A.
(c) $15\sqrt{2}/\sqrt{3}$A. (d) $150/\sqrt{3}$A.
[A.M.I.E. Sec B. Power Electronics Summer 2008]

199. A three-phase fully controlled converter can work as a
(a) converter for $\alpha = 0$ to 90°.
(b) converter for $\alpha = 0°$ to 180°.
(c) converter for $\alpha = 90°$ to 180°.
(d) converter for $\alpha = 0$ to 90°.
[A.M.I.E. Sec B. Power Electronics Summer 2007; GATE E.E. 1998]

200. A 3-phase full converter has an output voltage of 200 V for zero degree firing angle and for resistive load. If output voltage is 26.8 V, then firing angle is
(a) 15° (b) 30° (c) 60° (d) 90°
[A.M.I.E. Sec B. Power Electronics Winter 2006]

201. A 3-phase fully controlled bridge converter with freewheeling diode is fed from 400 V, 50 Hz ac source and is operating at a firing angle of 60°. The load current is assumed constant at 10 A due to high load inductance. The input displacement factor (IDF) and the input power factor (IPF) of the converter will be
(a) IDF = 0.867, IPE = 0.828.
(b) IDF = 0.867; IPF = 0.552.
(c) IDF = 0.5; IPF = 0.478. (d) IDF = 0.5; IPF = 0.318.
[GATE E.E. 2006]

202. A thyristorised, three-phase, fully controlled converter feeds a dc load that draws constant current. Then the input ac line current to the converter has
(a) an rms value equal to the dc load current.
(b) an average value equal to the dc load current.
(c) a peak value equal to the dc load current.
(d) a fundamental frequency component, whose rms value is equal to the dc load current. [GATE E.E. 2000]

203. A six pulse thyristor rectifier bridge is connected to a balanced 50 Hz three phase ac source. Assuming that the dc output current of the rectifier is constant, the lowest frequency harmonic component in the ac source line current is
(a) 100 Hz (b) 150 Hz (c) 250 Hz (d) 300 Hz
[GATE E.E. 2002]

204. A 6-pulse SCR converter is connected to a 230 V, 3-phase, 50 Hz, ac mains and is controlling a dc drive with terminal voltage 205 volt and rated current of 105 Amp. The commutation angle $\mu = 18°$ and firing angle $\alpha = 45°$, what is the rating of shunt compensator and power factor?
(a) 21.6 kVAR, 0.707 (b) 22.68 kVAR, 0.69
(c) 21.6 kVAR, 0.69 (d) 22.68 kVAR, 0.707
[U.P.S.C. I.E.S. E.E.-II, 2009]

205. A 3-phase thyristor controlled rectifier is feeding a purely resistive load on the dc side. The firing angle of the 6 thyristors of the converter is 90°. AC side is connected to a balanced 3-phase supply. Considering only the fundamental of the input current, active power P and reactive power Q estimated at the ac side of the rectifier are
(a) $P \neq 0, Q = 0$ (b) $P = 0, Q \neq 0$
(c) $P \neq 0, Q \neq 0$ (d) $P = 0, Q = 0$
[U.P.S.C. I.E.S. E.E.-II, 2010]

206. A separately-excited dc motor is started using a 3-phase ac/dc controlled rectifier using 'soft starting'. For limiting the starting current, it is required that firing angle should be

Answers: **191.** (c), **192.** (b), **193.** (a), **194.** (c), **195.** (d), **196.** (a), **197.** (c), **198.** (d), **199.** (b), **200.** (d), **201.** (c), **202.** (c), **203.** (c), **204.** (a), **205.** (c), **206.** (c),

(a) gradually increased from 0° to 180°
(b) fixed at 30°
(c) gradually reduced from 180° to 30°
(d) gradually increased from 30° to 180°

[U.P.S.C. I.E.S. E.E.-II, 2010]

207. Interphase reactor as used in 6-pulse converter
(a) gives better utilisation of components.
(b) filters out load ripple.
(c) equalises load. [A.M.I.E. Sec B. Power Electronics Summer 1996]

208. A 6-phase bridge-converter feeds a purely resistive load. The delay angle α is measured from the point of natural-commutation. The effective control of voltage can be obtained when α lies in the range
(a) $0 \le \alpha \le 105°$. (b) $0 \le \alpha \le 120°$.
(c) $0 \le \alpha \le 150°$. (d) $0 \le \alpha \le 180°$.

[U.P.S.C. I.E.S. E.E.-II, 2002]

209. What is the dc output voltage for a 6-pulse Graetz bridge converter for HVDC transmission ?

(a) $V_d = \frac{3E_m}{\pi}\cos\alpha$. (b) $V_d = \frac{3\sqrt{2}E_m\cos\alpha}{\pi}$.

(c) $V_d = \frac{3\sqrt{3}E_m\cos\alpha}{\pi}$. (d) $V_d = \frac{3\sqrt{3}E_m\cos\alpha}{2\pi}$.

[U.P.S.C. I.E.S. E.E.-II, 2007]

210. For the same voltage output, which one of the following has larger peak inverse voltage of the thyristor ?
(a) Single-phase full-wave centre tapped circuit.
(b) Single-phase full-wave bridge circuit.
(c) Three-phase full-wave bridge circuit.
(d) Three-phase full-wave centre tapped circuit.

[U.P.S.C. I.E.S. E.E.-II, 2006]

211. The total harmonic distortion (THD) of ac supply input current of rectifiers is maximum for
(a) single-phase diode rectifier with dc inductive filter.
(b) 3-phase diode rectifier with dc inductive filter.
(c) 3-phase thyristor rectifier with inductive filter.
(d) single-phase diode rectifier with capacitive filter.

[U.P.S.C. I.E.S. E.E.-II, 2001]

212. A three-phase fully controlled bridge converter is feeding a load drawing a constant and ripple free load current of 10 A at a firing angle of 30°. The approximate Total Harmonic Distortion (%THD) and the rms value of fundamental component of the input current will respectively be
(a) 31% and 6.8 A. (b) 31% and 7.8 A.
(c) 66% and 6.8 A. (d) 66% and 7.8 A.

[GATE E.E. 2008]

213. A power chopper converts
(a) ac to dc. (b) dc to dc. (c) dc to ac. (d) ac to ac.

[A.M.I.E. Sec B. Power Electronics Summer 1994]

214. DC to dc converter or chopper can
(a) only step-down dc voltage.
(b) only step-up dc voltage.
(c) step-up or step-down dc voltage.

[A.M.I.E. Sec B. Power Electronics Summer 1996]

215. Which one of the following is the most suitable device for a dc-to-dc converter ?
(a) BJT (b) GTO (c) MOSFET (d) Thyristor

[U.P.S.C. I.E.S. E.E.-II, 2004]

216. In dc choppers, the waveforms for input and output voltages are respectively:
(a) Discontinuous and continuous.
(b) Both continuous.
(c) Both discontinuous.
(d) Continuous and discontinuous. [U.P.S.C. I.E.S. E.E.-II, 2011]

217. If p is the pulse number and n is an integer, what is the order of harmonics on ac side and dc side of an HVDC converter ?
(a) $(np + 1)$ and $(np - 1)$, respectively.
(b) $(np - 1)$ and np, respectively.
(c) $(np + 1)$ and np, respectively.
(d) $(np \pm 1)$ and np, respectively. [U.P.S.C. I.E.S. E.E.-II, 2006]

218. In a thyristorised dc-dc chopper, the commutation of main SCR can be of
(a) voltage commutation, current commutation or line commutation.
(b) voltage commutation, current commutation or load commutation.
(c) natural commutation or load commutation.
(d) current commutation or line commutation.

[A.M.I.E. Sec B. Power Electronics Winter 2005]

219. In a thyristor dc chopper, which type of commutation results in best performance ?
(a) Voltage commutation. (b) Current commutation.
(c) Load commutation. (d) Supply commutation.

[A.M.I.E. Sec B. Power Electronics Summer 2008]

220. A step-down chopper is operated in the continuous conduction mode in steady state with a constant duty ratio D. If V_0 is the magnitude of the dc output voltage and if V_s is the magnitude of the input voltage, the ratio V_o/V_s is given by

(a) D. (b) $1 - D$. (c) $\frac{1}{1-D}$. (d) $\frac{D}{1-D}$.

[GATE E.E. 2002]

221. Turn-on time of an SCR (t_{on}) is related to its turn-off time (t_{off}) in the following way
(a) $t_{on} > t_{off}$. (b) $t_{on} < t_{off}$.
(c) t_{on} depends on L/R ratio of load.
(d) t_{off} increases with t_{on}.

[A.M.I.E. Sec B. Power Electronics Summer 1994]

222. A dc chopper has a T_{ON} of 1 ms and its frequency is 500 Hz. What will be its duty cycle ?
(a) 100%. (b) 75%. (c) 50%. (d) 25%.

[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1993]

223. In a dc chopper, if T_{ON} is the ON period and f, the chopping frequency, the output voltage in terms of input voltage, V_S, is given by
(a) $V_S T_{ON}/f$ (b) $V_S f/T_{ON}$ (c) $V_S f T_{ON}$ (d) $V_S f\, T_{ON}$

[A.M.I.E. Sec B. Power Electronics Winter 2007]

224. For a step-down dc chopper operating with discontinuous load current, what is the expression for the load voltage ? (K is duty ratio of chopper)

(a) $V_0 = V_{dc} \times K$. (b) $V_0 = \frac{V_{dc}}{K}$.

(c) $V_0 = \frac{V_{dc}}{(1-K)}$. (d) $V_0 = V_{dc}(1 - K)$.

[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **207.** (a), **208.** (b), **209.** (c), **210.** (d), **211.** (d), **212.** (b), **213.** (b), **214.** (c), **215.** (b), **216.** (d), **217.** (d), **218.** (b), **219.** (a), **220.** (a), **221.** (c), **222.** (c), **223.** (d), **224.** (a),

225. In dc choppers, per unit ripple is maximum when duty cycle α is
(a) 0.2 (b) 0.5 (c) 0.7 (d) 0.9
[A.M.I.E. Sec B. Power Electronics Summer 2005]

226. A two-quadrant dc to dc chopper can operate with which of the following load conditions ?
(a) +ve voltage, +ve current (b) –ve voltage, +ve current
(c) –ve voltage, –ve current (d) +ve voltage, –ve current
Select the correct answer using the code given below :
Code :
(a) 1 only. (b) 1 and 2 only.
(c) 1 and 4 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2008]

227. In a two-quadrant dc to dc chopper, the load voltage is varied from positive maximum to negative maximum by varying the time ratio of the chopper from
(a) zero to unity. (b) unity to zero.
(c) zero to 0.5. (d) 0.5 to zero.
[U.P.S.C. I.E.S. E.E.-II 1998]

228. A four quadrant chopper cannot be operated as
(a) one quadrant chopper. (b) cycloconverter.
(c) inverter. (d) bidirectional rectifier.
[U.P.S.C. I.E.S. E.E.-II, 2001]

229. A dc chopper is fed from a constant voltage mains the duty ratio of chopper is progressively increased while the chopper feeds an RL load. The per unit current ripple would
(a) increase progressively. (b) decrease progressively.
(c) decrease to a minimum value at $\alpha = 0.5$ and then increase.
(d) increase to a maximum value $\alpha = 0.5$ and then decrease.
[U.P.S.C. I.E.S. E.E.-II, 1998]

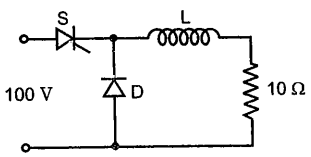
230. A step-up chopper as source voltage and duty cycle of V and α. The output voltage of this chopper is
(a) $\frac{V}{1-\alpha}$ (b) $V(1-\alpha)$ (c) $V/(1+\alpha)$ (d) $V(1+\alpha)$
[A.M.I.E. Sec B. Power Electronics Winter 2006]

231. For a step-up dc – dc chopper with an input dc voltage of 220 volts, if the output voltage required is 330 volts and the non-conducting time of thyristor is 100 μs the ON time of thyristor would be
(a) 66.6 μs. (b) 100 μs. (c) 150 μs. (d) 200 μs.
[U.P.S.C. I.E.S. E.E.-II, 2002]

232. If an ac chopper is feeding an inductive load, the firing pulse to the SCR
(a) may have a width equal to turn ON time of the SCR.
(b) should be a series of pulses of short duration.
(c) should be a single pulse of long duration.
(d) should be train of pulses of duration equal to the conduction period of the SCR. [U.P.S.C. I.E.S. E.E.-II, 1999]

233. In a type-A chopper, given that source voltage = 100 V dc. ON-period = 100 μs. OFF-period = 150 μs and load R = 2 Ω, L = 5 mH with back emf E = 10 V connected in series for continuous conduction, average output voltage and average output current will be respectively
(a) 40 V and 15 A. (b) 66.66 V and 28.33 A.
(c) 60 V and 25 A. (d) 40 V and 20 A.
[U.P.S.C. I.E.S. E.E.-II, 1999]

234. Figure shows a chopper operating from a 100 V dc input. The duty ratio of the main switch S is 0.8. The load is sufficiently inductive so that the load current is ripple free. The average current through the diode under steady state is

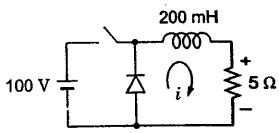


(a) 1.6 A. (b) 6.4 A. (c) 8.0 A. (d) 10.0 A.
[GATE E.E. 2004]

235. An ideal chopper operating at a frequency of 500 Hz, supplies a load having resistance of 3 ohms and inductance of 9 mH from a 60 V battery. The mean value of the load voltage for on/off ratio of 4/1, (assuming that load is shunted by a perfect commutating diode and battery is lossless) is
(a) 240 V (b) 48 V (c) 15 V (d) 4 V
[U.P.S.C. I.E.S. E.E.-II, 2003]

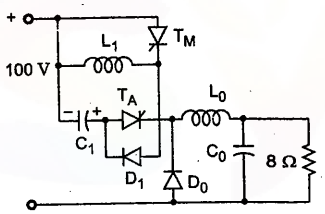
236. An ideal chopper is operating at a frequency of 500 Hz from a 60 V battery input. It is supplying a load having 3 Ω resistance and 9 mH inductance. Assuming the load is shunted by a perfect commutating diode and assuming battery is lossless, what is the mean load current at an on/off ratio of 1/1 ?
(a) 10 A (b) 15 A (c) 20 A (d) None of these
[U.P.S.C. I.E.S. E.E.-II, 2008]

237. The given figure shows a step-down chopper switched at 1 kHz with a duty ratio D = 0.5. The peak-peak ripple in the load current is close to



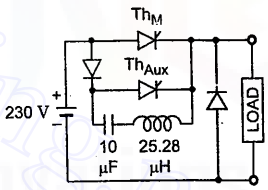
(a) 10 A (b) 0.5 A (c) 0.125 A (d) 0.25 A
[GATE E.E. 2005]

238. In the chopper circuit shown, the main thyristor (T_M) is operated at a duty ratio of 0.8 which is much larger than commutation interval. If the maximum allowable reapplied *dv/dt* on TM is 50 V/μs, what should be the theoretical minimum value of C_1 ? Assume current ripple through L_0 to be negligible.



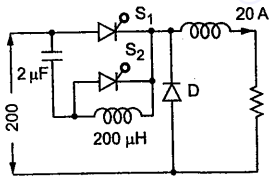
(a) 0.2 μF (b) 0.02 μF (c) 2 μF (d) 20 μF
[GATE E.E. 2009]

239. The circuit in the figure is a current commutated dc-dc chopper where, Th_M is the main SCR and Th_{AUX} is the auxiliary SCR. The load current is constant at 10 A. Th_M is ON. Th_{AUX} is triggered at $t = 0$. Th_M is turned OFF between.



(a) $0\ \mu s < t \le 25\ \mu s$. (b) $25\ \mu s < t \le 50\ \mu s$.
(c) $50\ \mu s < t \le 75\ \mu s$. (d) $75\ \mu s < t \le 100\ \mu s$.
[GATE E.E. 2007]

240. Figure shows a chopper. The device S_1 is the main switching device. S_2 is the auxiliary commutation device. S_1 is rated for 400 V, 60 A. S_2 is rated for 400 V, 30 A. The load current is 20 A. The main device operates with a duty ratio of 0.5. The peak current through S_1 is



(a) 10 A (b) 20 A (c) 30 A (d) 40 A
[GATE E.E. 2004]

Answers: **225.** (b), **226.** (c), **227.** (a), **228.** (b), **229.** (b), **230.** (a), **231.** (d), **232.** (d), **233.** (a), **234.** (a), **235.** (b), **236.** (a), **237.** (c), **238.** (a), **239.** (b), **240.** (d),

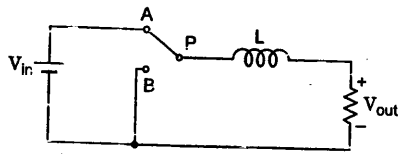
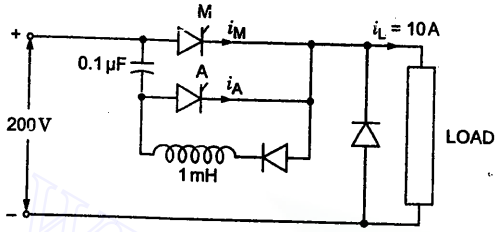
241. The power electronic converter shown in the figure has a single-pole double-throw switch. The pole P of the switch is connected alternately to throws A and B. The converter shown is a



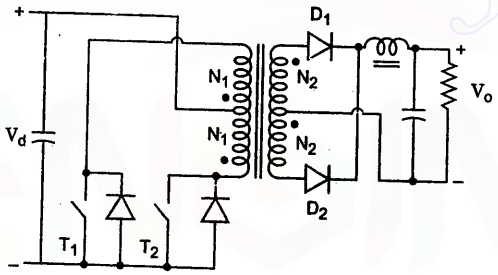
(a) step-down chopper (buck converter)
(b) half-wave rectifier
(c) step-up chopper (boost converter)
(d) full-wave rectifier. [GATE E.E. 2010]

242. A voltage commutated chopper circuit, operated at 500 Hz, is shown below.



If the maximum value of load current is 10 A, then the maximum current through the main (M) and auxiliary (A) thyristors will be
(a) $i_{M\,max} = 12$ A and $i_{A\,max} = 10$ A
(b) $i_{M\,max} = 12$ A and $i_{A\,max} = 2$ A
(c) $i_{M\,max} = 10$ A and $i_{A\,max} = 12$ A
(d) $i_{M\,max} = 10$ A and $i_{A\,max} = 8$ A [GATE E.E. 2011]

243. In push-pull type dc-dc converter the output voltage V_o is given by



(a) $V_o = 2\frac{N_2}{N_1} \cdot V_d \left(\frac{t_{ON}}{t_{ON} + t_{OFF}}\right)$

(b) $V_o = \frac{N_2}{N_1} \cdot V_d \left(\frac{t_{ON}}{t_{ON} + t_{OFF}}\right)$

(c) $V_o = 2\frac{N_2}{N_1} \cdot V_d \left(\frac{t_{ON}}{t_{OFF}}\right)$

(d) $V_o = \frac{N_2}{N_1} \cdot V_d \left(\frac{t_{ON}}{t_{OFF}}\right)$ [U.P.S.C. I.E.S. E.E.-II, 2010]

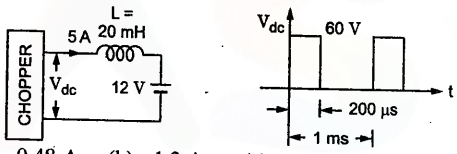
244. A dc to dc transistor chopper supplied from a fixed voltage dc source feeds a fixed resistive inductive load and a freewheeling diode. The chopper operates at 1 kHz and 50% duty cycle. Without changing the value of the average dc current through the load, if it is desired to reduce the ripple content of the load current, the control action needed will be to
(a) increase the chopper frequency keeping its duty cycle constant.
(b) increase the chopper frequency and duty cycle in equal ratio.
(c) decrease only the chopper frequency.
(d) decrease only the duty cycle. [U.P.S.C. I.E.S. E.E.-II, 2010]

245. A 220 V, 20 A, 1,000 rpm, separately-excited dc motor has an armature resistance of 2.5 Ω. The motor is controlled by a step-down chopper with a frequency of 1 kHz. The input dc voltage to the chopper is 250 V. The duty cycle of the chopper for the motor to operate at a speed of 600 rpm delivering the rated torque will be
(a) 0.518 (b) 0.608 (c) 0.852 (d) 0.902 [GATE E.E. 2003]

246. A dc motor operated from a type A chopper is switched to type B chopper. How does the motor operate when type A and B are in operation respectively?
(a) Plugging and motoring. (b) Motoring and plugging.
(c) Regenerative braking and motoring.
(d) Motoring and regenerative braking. [U.P.S.C. I.E.S. E.E.-II, 2010]

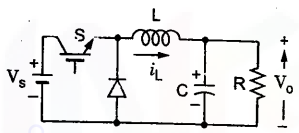
247. A dc chopper is used in regenerative braking mode of a dc series motor. The dc supply is 600 V, the duty cycle is 70%. The average value of armature current is 100 A. It is continuous and ripple free. What is the value of power fed back to the supply?
(a) 3 kW (b) 9 kW (c) 18 kW (d) 35 kW [U.P.S.C. I.E.S. E.E.-II, 2009]

248. A chopper is employed to charge a battery as shown in figure. The charging current is 5 A. The duty ratio is 0.2. The chopper output voltage is also shown in figure. The peak to peak ripple current in the charging current is



(a) 0.48 A (b) 1.2 A (c) 2.4 A (d) 1 A [GATE E.E. 2003]

249. In the chopper circuit shown in the figure, the input dc voltage has a constant value V_s. The output voltage V_o is assumed ripple-free. The switch S is operated with a switching time period T and a duty ratio D. What is the value of D at the boundary of continuous and discontinuous conduction of the inductor current i_L?

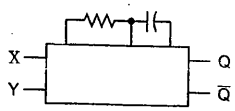


(a) $D = 1 - \frac{V_s}{V_0}$ (b) $D = \frac{2L}{RT}$

(c) $D = 1 - \frac{2L}{RT}$ (d) $D = \frac{RT}{L}$ [GATE E.E. 2002]

250. The truth table of a monoshot shown in the figure is given in the table below :
Two monoshots, one positive edge triggered and other negative edge triggered, are connected as shown in the figure. The pulse widths of the two monoshot outputs, Q_1 and Q_2 are T_{ON1} and T_{ON2} respectively.

X	Y	Q	$\bar{Q}$
0	↑	⎍	⎎
↓	1	⎍	⎎



The frequency and the duty cycle of the signal at Q_1 will respectively be

Answers: **241.** (a), **242.** (a), **243.** (c), **244.** (a), **245.** (b), **246.** (d), **247.** (c), **248.** (a), **249.** (c), **250.** (b),

(a) $f = \frac{1}{T_{ON_1} + T_{ON_2}}, D = \frac{T_{ON_1}}{T_{ON_1} + T_{ON_2}}$

(b) $f = \frac{1}{T_{ON_1} + T_{ON_2}}, D = \frac{T_{ON_2}}{T_{ON_1} + T_{ON_2}}$

(c) $f = \frac{1}{T_{ON_1}}, D = \frac{T_{ON_1}}{T_{ON_1} + T_{ON_2}}$

(d) $f = \frac{1}{T_{ON_2}}, D = \frac{T_{ON_1}}{T_{ON_1} + T_{ON_2}}$ [GATE E.E. 2008]

251. AC voltage regulators are widely used in
(a) traction drives. (b) fan drives.
(c) synchronous motor drives.
(d) slip power recovery scheme of slip-ring induction motor.
[U.P.S.C. I.E.S. E.E.-II, 2002]

252. A load resistance of 10 Ω is fed through a single-phase voltage controller from a voltage source of 200 sin 314*t*. If the power delivered to the load is 1 kW, the firing angle delay is
(a) 30° (b) 60° (c) 45° (d) 90°
[A.M.I.E. Sec B. Power Electronics Winter 2006]

253. A single-phase ac voltage controller is controlling current in a purely inductive load. If the firing angle of the SCR is α, what will be the conduction angle of the SCR ?
(a) π (b) (π – α) (c) (2π – α) (d) 2π
[U.P.S.C. I.E.S. E.E.-II, 2007]

254. A purely inductive load is controlled by a single-phase ac voltage controller using back to back connected SCRs. If the firing angle of the SCRs is 75°, the current through the two SCRs will flow for
(a) 285° and 0°. (b) 210° and 0°.
(c) 105° and 0°. (d) 105° and 105°.
[U.P.S.C. I.E.S. E.E.-II, 2002]

255. A single-phase ac voltage regulator is fed from at 50 Hz supply system. If it supplies a load comprising a resistance of 2 Ω connected in series with an inductance of 6.36 mH, then the range of firing angle 'α' providing controlled voltage would be
(a) $0° < \alpha < 180°$. (b) $45° < \alpha < 180°$.
(c) $90° < \alpha < 180°$. (d) $0° < \alpha < 45°$.
[U.P.S.C. I.E.S. E.E.-II, 2000]

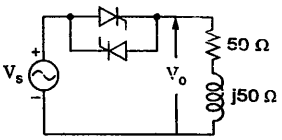
256. A single-phase ac voltage controller feeding a pure resistive load has a load voltage of 200 V (rms) when fed from a source of 250 V (rms). The input power factor of the controller is
(a) 0.64 (b) 0.8 (c) 0.894
(d) difficult to estimate because of insufficiency of data.
[U.P.S.C. I.E.S. E.E.-II, 2001]

257. An ac voltage-regulator using back-to-back connected SCRs is feeding an RL load. The SCR firing angle $\alpha < \phi$ (ϕ is power factor angle of the load). If SCRs are fired using short-duration gate pulses, the output load-voltage waveform will be
(a) Symmetrical chopped ac voltage.
(b) Half-wave rectified.
(c) Full-wave rectified. (d) Sinusoidal.
[U.P.S.C. I.E.S. E.E.-II, 2003]

258. An integral cycle ac voltage controller is feeding a purely resistive circuit from a single-phase ac voltage source. The current waveform consists alternately burst of N-complete cycle of conduction followed by M-complete cycles of extinction. The rms value of the load voltage equals the rms value of the supply voltage for:
(a) N = M (b) N = 0 (c) N = M = 0 (d) M = 0
[U.P.S.C. I.E.S. E.E.-II, 2011]

259. What is the power factor of a single-phase ac regulator feeding a resistive load ?
(a) (Per unit power)^2 (b) (Per unit power)$^{1/2}$
(c) $\frac{(\text{Per unit power})^2}{\sqrt{2}}$ (d) $\frac{(\text{Per unit power})^{1/2}}{2}$
[U.P.S.C. I.E.S. E.E.-II, 2006]

260. In the single-phase voltage controller circuit shown in the figure, for what range of triggering angle (α), the output voltage (V_0) is not controllable ?



(a) $0° < \alpha < 45°$. (b) $45° < \alpha < 135°$.
(c) $90° < \alpha < 180°$. (d) $135° < \alpha < 180°$.
[GATE E.E. 2008]

261. In the ac regulator of Fig. 1 the supply voltage and gate currents waveforms are as in Fig. 2, what is the load voltage waveform for R = 0?

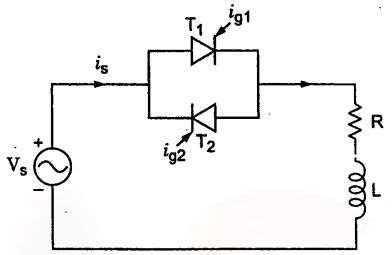


Fig. 1

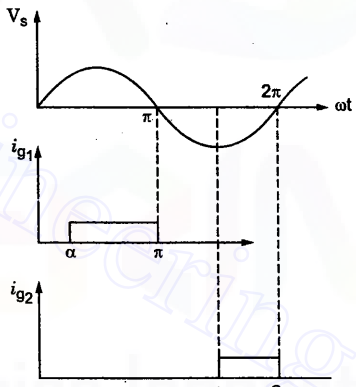

Fig. 2

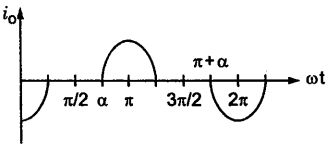
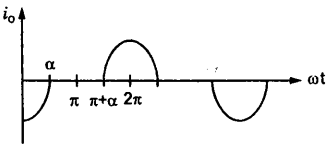
(a)



(b)



Answers: **251.** (b), **252.** (d), **253.** (b), **254.** (c), **255.** (a), **256.** (b), **257.** (d), **258.** (d), **259.** (b), **260.** (a), **261.** (a),

(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2009]

262. For a single-phase ac voltage controller feeding a resistive load, what is the power factor ?
(a) Unity for all values of firing angle.
(b) $\left[\frac{1}{\pi}\left\{(\pi-\alpha)+\frac{1}{2}\sin 2\alpha\right\}\right]^{1/2}$ (c) $\left[\frac{1}{\pi}\left\{(\pi+\alpha)+\frac{1}{2}\sin 2\alpha\right\}\right]^{1/2}$
(d) $\left[\frac{1}{\pi}\left\{(\pi+\alpha)-\frac{1}{2}\sin 2\alpha\right\}\right]^{1/2}$
where α is firing angle measured from voltage zero.
[U.P.S.C. I.E.S. E.E.-II, 2005]

263. A cycloconverter-power electronic equipment is a
(a) frequency converter which has no intermediate dc state.
(b) device which converts ac to dc.
(c) device which converts dc to ac.
(d) none of the above. [A.M.I.E. Sec B. Power Electronics Winter 2007]

264. The output frequency of a cycloconverter is less than the input frequency because
(a) there is no intermediate dc link.
(b) the number of switching devices is large compared to that in a cascaded converter pair.
(c) the cycloconverter is normally used for high voltage and high current applications.
(d) the cycloconverter employs natural commutation of the SCRs and more number of supply voltage cycles are needed to form one cycle of the output voltage.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

265. The output frequency of a cycloconverter is generally limited to
(a) four times the supply frequency.
(b) twice that of line frequency.
(c) 33% to 50% line frequency.
(d) less than 10% of line frequency.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

266. For low-speed high-power reversible operation, the most suitable drives are:
(a) voltage source inverter fed ac drives.
(b) current source inverter fed ac drives.
(c) dual converter fed dc drives.
(d) cycloconverter fed ac drives. [U.P.S.C. I.E.S. E.E.-II, 2011]

267. An advantage of a cycloconverter is:
(a) very good power factor.
(b) requires few number of thyristors.
(c) commutation failure does not short circuit the source.
(d) load commutation is possible. [U.P.S.C. I.E.S. E.E.-II, 2011]

268. The quality of output ac voltage of a cycloconverter is improved with
(a) increase in output voltage at reduced frequency.
(b) increase in output voltage at increased frequency.
(c) decrease in output voltage at reduced frequency.
(d) decrease in output voltage at increased frequency.
[U.P.S.C. I.E.S. E.E.-II, 2001]

269. An intergroup reactor is used in a single-phase cycloconverter circuit to
(a) Reduce current-ripples. (b) Reduce voltage-ripples.
(c) Limit circulating current.
(d) Limit *di/dt* in the semiconductor switch.
[U.P.S.C. I.E.S. E.E.-II, 2003]

270. In a single-phase to single-phase cycloconverter, if α_1 and α_2 are the trigger angles of positive converter and negative converter, then
(a) $\alpha_1+\alpha_2=\frac{\pi}{2}$. (b) $\alpha_1+\alpha_2=\pi$.
(c) $\alpha_1+\alpha_2=\frac{3\pi}{2}$. (d) $\alpha_1+\alpha_2=2\pi$.
[U.P.S.C. I.E.S. E.E.-II, 1999]

271. A cycloconverter is operating on a 50 Hz supply. The range of output frequency that can be obtained with acceptable quality, is
(a) 0 – 16 Hz. (b) 0 – 32 Hz.
(c) 0 – 64 Hz. (d) 0 – 128 Hz.
[U.P.S.C. I.E.S. E.E.-II, 2001]

272. How many switches are used to construct a three-phase to three-phase cycloconverter ?
(a) 3. (b) 6. (c) 12. (d) 18.
[U.P.S.C. I.E.S. E.E.-II, 2002]

273. A three-phase to three-phase cycloconverter requires
(a) 18 SCRs for 6-pulse device.
(b) 36 SCRs for 3 pulse device.
(c) 36 SCRs for 6-pulse device .
(d) none of the above. [A.M.I.E. Sec B. Power Electronics Summer 2007]

274. The ratio of power handled by 18 SCRs to 36 SCRs three-phase to three-phase cycloconverter for the same voltage and current rating of SCRs is
(a) 1 (b) 1/2 (c) 1/4 (d) 1/8
[A.M.I.E. Sec B. Power Electronics Winter 2006]

275. In a 3-phase to 1-phase cycloconverter employing 6-pulse bridge circuit, if the input voltage is 200 V per phase, the fundamental rms value of output voltage will be
(a) $\frac{600}{\pi}$ V. (b) $300\sqrt{3}$ V.
(c) $\frac{300\sqrt{3}}{\pi}$ V. (d) $\frac{300}{\pi}$ V.
[U.P.S.C. I.E.S. E.E.-II, 1999]

276. 3-phase cycloconverter is used to obtain a variable frequency single phase ac output. The single phase ac load is 200 V, 60 A at a pf of 0.6 lagging. The rms value of input voltage per phase required is
(a) 376.2 V. (b) 311.2 V. (c) 266 V. (d) 220 V.
[U.P.S.C. I.E.S. E.E.-II, 2002]

277. A single-phase, half-bridge inverter has input voltage of 48 VDC. Inverter is feeding a load of 2.4 Ω. The rms output voltage at fundamental frequency is
(a) $\frac{2\times 48\text{ V}}{\pi}$ (b) $\frac{2\times 48\text{ V}}{\sqrt{2}\pi}$
(c) $\frac{\sqrt{2}\times 48\text{ V}}{\pi}$ (d) $\frac{48\text{ V}}{2\sqrt{2}\pi}$
[U.P.S.C. I.E.S. E.E.-II, 2003]

278. Compared to a single-phase half-bridge inverter, the output power of a single phase full-bridge inverter is higher by a factor of
(a) 12. (b) 8. (c) 4. (d) 2.
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **262.** (b), **263.** (a), **264.** (a), **265.** (c), **266.** (d), **267.** (d), **268.** (b), **269.** (c), **270.** (b), **271.** (d), **272.** (d), **273.** (c), **274.** (b), **275.** (a), **276.** (c), **277.** (b), **278.** (d),

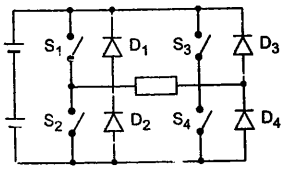
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

279. If for a single-phase half-bridge inverter, the amplitude of output voltage is V_S and the output power is P, then their corresponding values for a single-phase full-bridge inverter are
(a) V_S, P (b) $V_S/2$, P/2
(c) $2V_S$, 2P (d) $2V_S$, P
[A.M.I.E. Sec B. Power Electronics Summer 2006]

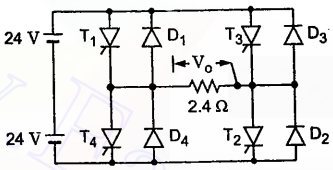
280. A single-phase full-bridge inverter is connected to a load of 2.4 Ω. The dc input voltage is 48 V. What is the rms output at fundamental frequency ?
(a) $\frac{4\times48}{\sqrt{2}\pi}$ V (b) $\frac{2\times48}{\sqrt{2}\pi}$ V (c) $\frac{4\times48}{\pi}$ V (d) $\frac{2\times48}{\pi}$ V
[U.P.S.C. I.E.S. E.E.-II, 2008]

281. For a single-phase, full-bridge inverter supplying power to a highly inductive load as shown in figure, the correct sequence of operation of switches and diodes is



(a) $S_1S_4 - S_3S_2 - S_1S_4 - S_3S_2$.
(b) $D_1D_4 - S_1S_4 - D_2D_3 - S_2S_3$.
(c) $S_1D_3 - S_1S_4 - S_4D_2 - D_2D_3$.
(d) $S_2D_4 - D_4D_1 - D_1S_3 - S_3S_2$. [U.P.S.C. I.E.S. E.E.-II, 2003]

282. Full-bridge inverter is shown in the figure. The maximum rms output voltage 'V_o' at fundamental frequency is

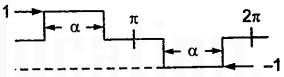


(a) 24 V.
(b) 33.94 V.
(c) 43.3 V. (d) 48 V. [U.P.S.C. I.E.S. E.E.-II, 1999]

283. A single-phase inverter has square wave output voltage. What is the percentage of the fifth harmonic component in relation to the fundamental component ?
(a) 40% (b) 30% (c) 20% (d) 10%
[U.P.S.C. I.E.S. E.E.-II, 2004]

284. The output voltage e_1 and e_2 of two full-bridge inverters are added using output transformer. In order to eliminate the 5th harmonic from output voltage, the phase angle between e_1 and e_2 should be
(a) $\frac{\pi}{3}$ rad (b) $\frac{\pi}{4}$ rad (c) $\frac{\pi}{5}$ rad (d) $\frac{\pi}{6}$ rad
[U.P.S.C. I.E.S. E.E.-II, 1999]

285. An inverter has a periodic output voltage with the output waveform as shown in figure. When the conduction angle $a = 120°$, the rms fundamental component of the output voltage is



(a) 0.78 V (b) 1.10 V (c) 0.90 V (d) 1.27 V
[GATE E.E. 2003]

286. The purpose of feedback transformer and diode in complementary commutated inverters is to
(a) improve the power factor of the load.
(b) return the trapped energy to source.
(c) improve the input power factor.
(d) absorb more reactive power from the source.
[U.P.S.C. I.E.S. E.E.-II, 1998]

287. The output voltage waveform of a three-phase square-wave inverter contains
(a) only even harmonics. (b) both old and even harmonics.
(c) only odd harmonics. (d) only triple harmonics.
[GATE E.E. 2005]

288. A series capacitor commuted inverter can operate satisfactorily
(a) if $\frac{1}{LC} > \frac{R^2}{4L^2}$. (b) if $\frac{1}{LC} = \frac{R^2}{4L^2}$.
(c) if $\frac{1}{LC} < \frac{R^2}{4L^2}$.
(d) irrespective of the values of R, L and C.
[U.P.S.C. I.E.S. E.E.-II, 2000]

289. For elimination of 5th harmonics from the output of an inverter, what will be the position of pulse in a PWM inverter?
(a) 72° (b) 36° (c) 60° (d) 90°
[U.P.S.C. I.E.S. E.E.-II, 2009]

290. In a single-pulse modulation of PWM inverters if pulse width is 72° then
(a) third harmonic will be eliminated.
(b) fifth harmonic will be eliminated.
(c) seventh harmonic will be eliminated.
(d) none of these. [A.M.I.E. Sec B. Power Electronics Winter 2006]

291. The pulse-width modulated inverter for the control of an ac motor is fed from which one of the following ?
(a) Controlled rectifier. (b) Uncontrolled rectifier.
(c) ac regulator. (d) Cycloconverter.
[U.P.S.C. I.E.S. E.E.-II, 2007]

292. Triangular PWM control, when applied to a three phase, BJT based voltage source inverter, introduces
(a) low order harmonic voltages on the dc side.
(b) very high order harmonic voltages on the dc side.
(c) low order harmonic voltages on the ac side.
(d) very high order harmonic voltage on the dc side.
[GATE E.E. 2000]

293. PWM switching is preferred in voltage source inverters for the purpose of
(a) controlling output voltage. (b) output harmonics.
(c) reducing filter size.
(d) controlling output voltage, output harmonics and reducing filter size. [U.P.S.C. I.E.S. E.E.-II, 2001]

294. A PWM switching scheme is used with a three phase inverter to
(a) reduce the total harmonic distortion with modest filtering.
(b) minimize the load on the dc side.
(c) increase the life of the batteries.
(d) reduce low order harmonics and increase high order harmonics.
[GATE E.E. 1999; A.M.I.E. Sec B. Power Electronics Summer 2008]

295. A dc source is switched in steps to synthesize the three-phase output. The basic three-phase bridge inverter can be controlled. The angle through which each switch conducts, and at any instant the number of switches conducting simultaneously are, respectively,
(a) 120° and 02. (b) 120° and 03.
(c) 180° and 02. (d) 180° and 04.
[U.P.S.C. I.E.S. E.E.-II, 2003]

296. A field controlled scheme using PWM (voltage source) inverter the output of the field controller is _____ and that of torque controller is _____
(a) $v_{qs(ref)}$, $v_{ds(ref)}$ (b) $i_{ds(ref)}$, $i_{qs(ref)}$
(c) $i_{\alpha s(ref)}$, $i_{\beta s(ref)}$ (d) $i_{qs(ref)}$, $i_{ds(ref)}$
[A.M.I.E. Sec B. Power Electronics Winter 2007]

Answers: **279.** (c), **280.** (a), **281.** (b), **282.** (d), **283.** (c), **284.** (c), **285.** (a), **286.** (b), **287.** (c), **288.** (b), **289.** (a), **290.** (b), **291.** (b), **292.** (d), **293.** (d), **294.** (d), **295.** (b), **296.** (b),

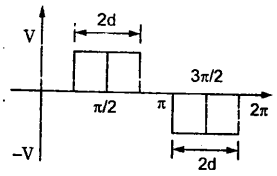
297. In a single phase IGBT bridge inverter, compared to a singic pulse PWM control, multiple pulse PWM
(a) gives higher maximum output voltage (rms).
(b) gives lower harmonic content in the output voltage.
(c) requires more number of switching devices.
(d) gives higher harmonic content in output voltage.
[A.M.I.E. Sec B. Power Electronics Winter 2005]

298. A single-phase inverter is operated in PWM mode generating a single-pulse of width $2d$ in the centre of each half cycle as shown in figure. It is found that the output voltage is free from 5th harmonic for pulse width 144°. What will be percentage of 3rd harmonic present in the output voltage ($V_{o3}/V_{o1\ max}$) ?



(a) 0.0% (b) 19.6% (c) 1.7% (d) 53.9%
[GATE E.E. 2006]

299. What is the effect of blanking time on output voltage in PWM inverter?
(a) Distortion in instantaneous voltage at current zero crossing.
(b) Low order space harmonics in output voltage.
(c) Distribution in instantaneous voltage at voltage zero crossing.
(d) High order time harmonics in output voltage.
[U.P.S.C. I.E.S. E.E.-II, 2009]

300. In single-pulse modulation of PWM inverters, the pulse width is 120°. For an input voltage of 220 V dc, what is the rms value at the fundamental component of the output voltage?
(a) 171.5 V (b) 254.0 V (c) 127.0 V (d) 89.81 V
[U.P.S.C. I.E.S. E.E.-II, 2009]

301. In a PWM inverter, f_o and f are the frequencies in Hz for the carrier signal and reference signal respectively. Then the number of pulses per half cycle is

(a) $N = \frac{f}{f_o}$ (b) $N = \frac{f}{2f_o}$

(c) $N = \frac{f_o}{2f}$ (d) $N = \frac{f_o}{f}$

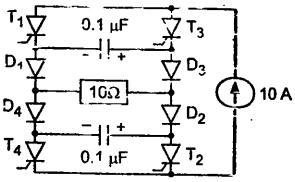
[U.P.S.C. I.E.S. E.E.-II, 2010]

302. In a CSI if frequency of voltage is f, then frequency of output voltage is
(a) f (b) $f/2$ (c) $f/4$ (d) $f/8$
[A.M.I.E. Sec B. Power Electronics Winter 2006]

303. A single-phase current source inverter is connected with capacitive load only. The waveform of the output voltage across the capacitor for constant source current will be
(a) sine wave. (b) square wave.
(c) triangular wave. (d) step function.
[U.P.S.C. I.E.S. E.E.-II, 2008]

304. Consider the following features :
1. Inherent short-circuited protection.
2. Regeneration capability.
3. Need for inverter grade thyristors.
4. Voltage spikes across the load.
Which of these are the features associated with current source inverter ?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 4. [U.P.S.C. I.E.S. E.E.-II, 2006]

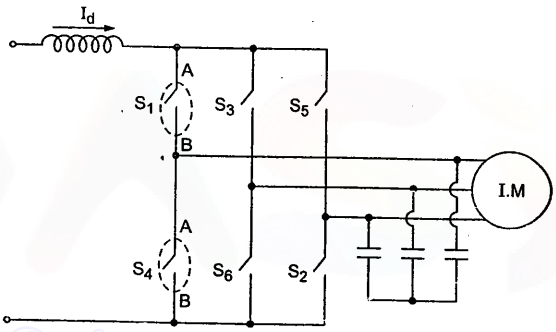
305. The Current Source Inverter shown in figure is operated by alternately turning on thyristor pairs (T_1, T_2) and (T_3, T_4). If the load is purely resistive, the theoretical maximum output frequency obtainable will be



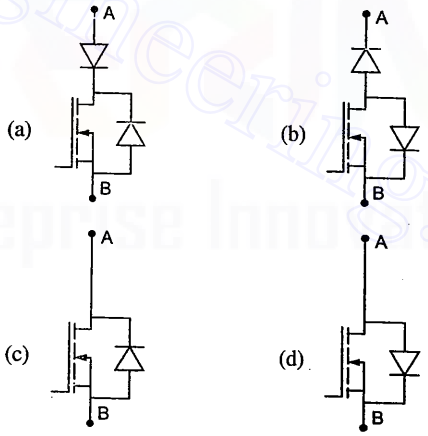
(a) 125 kHz (b) 250 kHz (c) 500 kHz (d) 50 kHz
[GATE E.E. 2009]

306. A constant current source inverter supplies 20 A to a load resistance of 1 Ω. If the load resistance is changed to 5 Ω, then the load current
(a) remains same at 20 A whereas the load voltage changes to 100 V.
(b) changes to 4 A from 20 A and the load voltage changes to 20 V.
(c) changes to 4 A from 20 A and the load voltage changes to 80 V.
(d) and load voltage stay at 20 A and 20 V, respectively.
[U.P.S.C. I.E.S. E.E.-II, 2010]

307. A three-phase current source inverter used for the speed control of an induction motor is to be realized using MOSFET switches as shown below. Switches S_1 to S_6 are identical switches.



The proper configuration for realizing switches S_1 to S_6 is



[GATE E.E., 2011]

308. In a single-phase VSI bridge inverter, the load current is I_o = 200 sin (ωt – 45°) mA. The dc supply voltage is 220 V. What is the power drawn from the supply?
(a) 9.8 W (b) 19.8 W
(c) 27.25 W (d) 34.03 W
[U.P.S.C. I.E.S. E.E.-II, 2009]

Answers: **297.** (b), **298.** (b), **299.** (d), **300.** (a), **301.** (c), **302.** (a), **303.** (c), **304.** (d), **305.** (b), **306.** (a), **307.** (a), **308.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

309. In case of voltage source inverter, freewheeling can be avoided for the load of
(a) inductive nature. (b) capacitive nature.
(c) resistive nature. (d) back emf nature.
[U.P.S.C. I.E.S. E.E.-II, 2001]

310. A voltage source inverter will have better performance if its
(a) load inductance is small and source inductance is large.
(b) both load and source inductances are small.
(c) both load and source inductances are large.
(d) load inductance is large and source inductance is small.
[U.P.S.C. I.E.S. E.E.-II, 2000]

311. A single-phase full-bridge voltage source inverter operating in square wave mode supplies a purely inductive load. If the inverter time period is T, then the time duration for which the feedback diodes conduct in a cycle is
(a) T (b) T/2 (c) T/4 (d) T/8
[U.P.S.C. I.E.S. E.E.-II, 2000]

312. In voltage source inverters load voltage waveform v_0 and load current waveform i_0 respectively
(a) depends on load impedance Z, does not depend on Z.
(b) depends on Z, depends on Z.
(c) does not depend on Z; does not depend on Z.
(d) does not depend on Z, depends on Z.
[A.M.I.E. Sec B. Power Electronics Summer 2006]

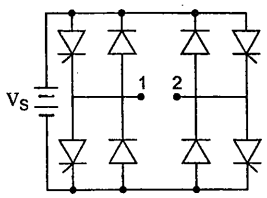
313. A single-phase voltage source inverter is controlled in a single pulse-width modulated mode with a pulse width of 150° in each half cycle. Total harmonic distortion is defined as

$$\text{THD} = \frac{\sqrt{V_{rms}^2 - V_1^2}}{V_1} \times 100,$$

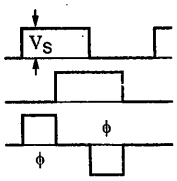
where V_1 is the rms value of the fundamental component of the output voltage. The THD of output ac voltage waveform is
(a) 65.65% (b) 48.42% (c) 31.83% (d) 30.49%
[GATE E.E. 2007]

314. Which one of the following statements is correct ?
A voltage source inverter is normally employed
(a) when the source has low impedance and load has high reactance.
(b) when the source has high impedance and load has low reactance.
(c) when both the source and load have high values of impedance and reactance respectively.
(d) when both the source and load have low values of impedance and reactance respectively. **[U.P.S.C. I.E.S. E.E.-II, 2005]**

315. The figure given below shows an inverter circuit with a dc source voltage V_S. The semiconductor switches of the inverter are operated in such a way that the pole voltages of V_{10} and V_{20} are shown in the figure (*b*). What is the RMS value of the pole voltage V_{12}?



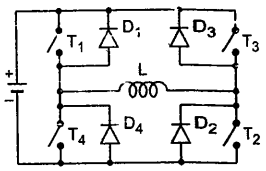
(*a*)



(*b*)

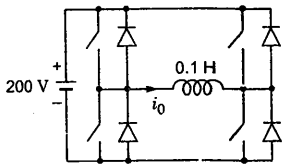
(a) $\frac{V_S\phi}{\sqrt{2\pi}}$ (b) $V_S\sqrt{\frac{\phi}{\pi}}$
(c) $V_S\sqrt{\frac{\phi}{2\pi}}$ (d) $\frac{V_S}{\pi}$
[U.P.S.C. I.E.S. E.E.-II, 2010]

316. A single-phase full-bridge voltage source inverter feeds a purely inductive load, as shown in figure, where T_1, T_2, T_3, T_4 are power transistors and D_1, D_2, D_3, D_4 are feedback diodes. The inverter is operated in square-wave mode with a frequency of 50 Hz. If the average load current is zero, what is the time duration of conduction of each feedback diode in a cycle?



(a) 5 msec (b) 10 msec (c) 20 msec (d) 2.5 msec
[GATE E.E. 2001]

317. A single-phase voltage source inverter is feeding a purely inductive load as shown in the figure.



The inverter is operated at 50 Hz 180° square wave mode. Assume that the load current does not have any dc component. The peak value of the inductor current i_0 will be
(a) 6.37 A (b) 10 A (c) 20 A (d) 40 A
[GATE E.E. 2008]

318. "Six MOSFETs connected in a bridge configuration (having no other power device) MUST be operated as a Voltage Source Inverter (VSI)". This statement is
(a) True, because being majority carrier devices, MOSFETs are voltage driven.
(b) True, because MOSFETs have inherently antiparallel diodes.
(c) False, because it can be operated both as Current Source Inverter (CSI) or a VSI.
(d) False, because MOSFETs can be operated as excellent constant current sources in the saturation region.
[GATE E.E. 2007]

319. In a three-phase voltage source inverter operating in square-wave mode, the output line voltage is free from
(a) 3rd harmonic. (b) 7th harmonic.
(c) 11th harmonic. (d) 13th harmonic.
[U.P.S.C. I.E.S. E.E.-II, 2006]

320. A three-phase voltage source inverter supplies a purely inductive three-phase load. Upon Fourier analysis, the output voltage waveform is found to have an *h*-th order harmonic of magnitude α_h times that of the fundamental frequency component ($\alpha_h < 1$). The load current would then have an *h*-th order harmonic of magnitude
(a) zero.
(b) α_h times the fundamental frequency component.
(c) $h\alpha_h$ times the fundamental frequency component.
(d) α_h/h times the fundamental frequency component.
[GATE E.E. 2000]

321. Consider the following statements :
1. Both voltage source inverter and current source inverter require feedback diodes.
2. Only current source inverter requires feedback diodes.

Answers: **309.** (a), **310.** (b), **311.** (b), **312.** (d), **313.** (c), **314.** (d), **315.** (b), **316.** (d), **317.** (b), **318.** (b), **319.** (a), **320.** (d), **321.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

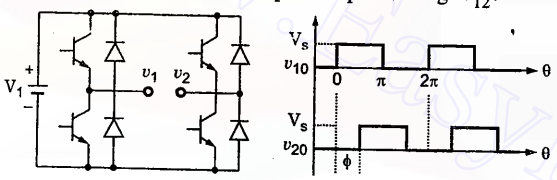
3. GTOs cannot be used in a current source inverter.
4. Only voltage source inverter requires feedback diodes.

Which of the statements given above is/are correct ?
(a) 1 only (b) 2 and 3 (c) 3 and 4 (d) 4 only
[U.P.S.C. I.E.S. E.E.-II, 2007]

322. A 3-phase voltage source inverter is operated in 180° conduction mode. Which one of the following statements is true ?
(a) Both pole-voltage and line-voltage will have 3rd harmonic components.
(b) Pole-voltage will have 3rd harmonic component but line-voltage will be free from 3rd harmonic.
(c) Line-voltage will have 3rd harmonic component but pole voltage will be free from 3rd harmonic.
(d) Both pole-voltage and line voltage will be free form 3rd harmonic components. [GATE E.E. 2003]

323. An inverter gate has guaranteed output levels as : logic '1' = 3.8 V and logic '0' = 0.7 V. The maximum low level input voltage at which the output remains high = 2 V. The minimum high-level input voltage at which the output remains low = 3.1 V. What are the noise margins of this gate ?
(a) $NM_H = 2.4$ V, $NM_L = 1.8$ V
(b) $NM_H = 1.8$ V, $NM_L = 1.3$ V
(c) $NM_H = 0.7$ V, $NM_L = 1.8$ V
(d) $NM_H = 0.7$ V, $NM_L = 1.3$ V [U.P.S.C. I.E.S. E.E.-II, 2004]

324. Figure (a) shows an inverter circuit with a dc source voltage V_s. The semiconductor switches of the inverter are operated in such a manner that the pole voltages v_{10} and v_{20} are as shown in Fig. (b). What is the rms value of the pole-to-pole voltage v_{12}?



(a) (b)

(a) $\frac{V_s\varphi}{\pi\sqrt{2}}$ (b) $V_s\sqrt{\frac{\varphi}{\pi}}$ (c) $V_s\sqrt{\frac{\varphi}{2\pi}}$ (d) $\frac{V_s}{\pi}$
[GATE E.E. 2002]

325. The phase controlled rectifiers used in speed control of dc motors converts fixed ac supply voltage into _____ output voltage.
(a) variable dc. (b) variable ac.
(c) variable frequency ac. (d) full rectified ac.

326. A single-phase half-controlled rectifier is driving a separately excited dc motor. The motor has a back emf constant of 0.25 V/rpm. The armature current is 5 A without any ripple. The armature resistance is 2 Ω. The converter is working from a 230 V, single phase ac source with a firing angle of 30°. Under this operating condition, the speed of the motor will be
(a) 339 rpm. (b) 359 rpm. (c) 366 rpm. (d) 386 rpm.
[GATE E.E.-II, 2004]

327. Armature of a dc motor is fed from a phase controlled rectifier whereas its field is supplied from a constant dc source. To reduce the speed of the motor regeneratively
(a) the firing angle of the converter should be increased.
(b) the polarity of the dc voltage should be reversed.
(c) the polarity of the armature induced voltage should be reversed.
(d) the firing angle should be varied in the range 90° to 180° simultaneously reversing the armature connections.
[A.M.I.E. Sec. B. Winter 1994]

328. The armature current of a dc motor fed from a thyristor power converter contains ripple. The ripple in the armature current affects
(a) commutating capability of the motor.
(b) overload capacity of the motor.
(c) torque capability of the motor.
(d) control ability of the speed of the motor.
[U.P.S.C. I.E.S. E.E.-II 1993]

329. A motor armature supplied through phase controlled SCRs receives a smoother voltage shape at
(a) High motor speed. (b) Low motor speed.
(c) Rated motor speed. (d) None of the above.
[U.P.S.C. I.E.S. E.E.-II, 2005]

330. When fed from a fully controlled rectifier, a dc motor, driving an active load can operate in
(a) forward motoring and reverse braking mode.
(b) forward motoring and forward braking mode.
(c) reverse motoring and reverse braking mode.
(d) reverse motoring and forward braking mode.
[U.P.S.C. I.E.S. E.E.-II 2002]

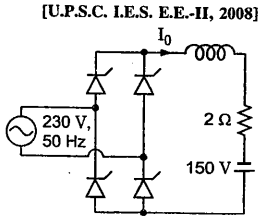
331. A single-phase, bridge type, full converter can be used for regenerative braking of a dc motor drive
(a) with change-over switch.
(b) without any additional device.
(c) by open-circuiting the field.
(d) by simply making firing angle equal to $\pi/2$.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

332. A three-phase, 440 V, 50 Hz ac mains fed thyristor bridge is feeding a 440 V dc, 15 kW, 1500 rpm separately excited dc motor with a ripple free continuous current in the dc link under all operating conditions, neglecting the losses, the power factor of the ac mains at half the rated speed is
(a) 0.354. (b) 0.372. (c) 0.90. (d) 0.955.
[GATE E.E. 2007]

333. For a single-phase ac to dc controlled rectifier to operate in regenerative mode, which of the following conditions should be satisfied ?
(a) Half-controlled bridge, $\alpha < 90°$, source of emf in load.
(b) Half-controlled bridge, $\alpha > 90°$, source of emf in load.
(c) Full-controlled bridge, $\alpha > 90°$, source of emf in load.
(d) Full-controlled bridge, $\alpha < 90°$, source of emf in load.
[U.P.S.C. I.E.S. E.E.-II, 2008]

334. A large dc motor is required to control the speed of blower from a 3-phase ac source. What is the most suitable ac to dc converter?
(a) 3-phase fully controlled bridge converter.
(b) 3-phase fully controlled bridge converter with freewheeling diode.
(c) 3-phase half-controlled bridge converter.
(d) A pair of 3-phase converters in sequence control.
[U.P.S.C. I.E.S. E.E.-II, 2008]

335. A single-phase fully controlled converter bridge is used for electrical braking of a separately excited dc motor. The dc motor load is respectively by an equivalent circuit as shown in the figure.



Assume that the load inductance is sufficient to ensure continuous and ripple free load current. The firing angle of the bridge for a load current of $I_0 = 10$ A will be
(a) 44° (b) 51° (c) 129° (d) 136°
[GATE E.E. 2008]

Answers: **322.** (b), **323.** (d), **324.** (b), **325.** (a), **326.** (d), **327.** (a), **328.** (a), **329.** (a), **330.** (a), **331.** (a), **332.** (a), **333.** (c), **334.** (c), **335.** (c),

336. A three-phase semiconverter feeds the armature of a separately-excited dc motor, supplying a non-zero torque. For steady-state operation, the motor armature current is found to drop to zero at certain instances of time. At such instances the voltage assumes a value that is
(a) equal to the instantaneous value of the ac phase voltage.
(b) equal to the instantaneous value of the motor back emf.
(c) arbitrary. (d) zero. [GATE E.E. 2000]

337. Chopper circuits are used to control the speed of dc motors which are fed from fixed dc voltage sources. Variable voltage output can be obtained by which of the following methods.
1. varying the 'on' to 'off' time ratio.
2. adjusting the wave shape.
3. adjusting the frequency of switching.
4. using a saturable core reactor in series with the motor.

The correct answer is
(a) 1 and 2 (b) 1 and 3 (c) 2 and 3 (d) 2 and 4
[A.M.I.E. Sec B. Power Electronics Summer 2006]

338. Which of the following configurations is used for both motoring and regenerative braking ?
(a) First quadrant chopper. (b) Second quadrant chopper.
(c) Two quadrant chopper. (d) Four quadrant chopper.
[U.P.S.C. I.E.S. E.E.-II, 2006]

339. In a chopper fed dc drive, the chopping frequency is approximately equal to
(a) 50 Hz. (b) 300 Hz.
(c) 1,000 Hz. (d) 5,000 Hz.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1996]

340. An SCR chopper circuit supplies power to a dc motor. What will be the nature of motor armature current ?
(a) Sinusoidal. (b) Exponential rise and decay.
(c) Constant. (d) None of the above.
[A.M.I.E. Sec B. Elec. Drives & Their Control Winter 1993]

341. A step-down chopper operates from a dc voltage source V_s and feeds a dc motor armature with counter emf E_b. From oscilloscopic traces, it is found that the current increases for on-time $t_r (= T_{on})$, falls to zero over time t_f and remains zero for time t_0 (off-period = $t_f + t_0 = T_{off}$) in every chopping cycle. Then the average voltage across the motor would be

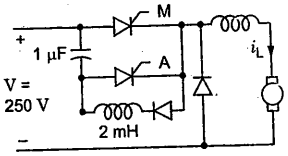
(a) $\dfrac{V_s . t_r}{(t_r + t_f + t_0)}$. (b) $\dfrac{V_s . t_r + E_b . t_f}{(t_r + t_f + t_0)}$.

(c) $\dfrac{V_s . t_r + E_b . t_0}{(t_r + t_f + t_0)}$. (d) $\dfrac{V_s . t_r + E_b (t_f + t_0)}{(t_r + t_f + t_0)}$.

[GATE 2000; U.P.S.C. I.E.S. E.E.-II, 2001]

Data for Question 342 and 343 are given below. Solve the problems and choose the correct answers.

A voltage commutated chopper operating at 1 kHz is used to control the speed of dc motor as shown in figure. The load current is assumed to be constant at 10 A.



342. The minimum time in μsec for which the SCR M should be ON is
(a) 280 (b) 140 (c) 70 (d) 0
[GATE E.E. 2006]

343. The average output voltage of the chopper will be
(a) 70 V (b) 47.5 V (c) 35 V (d) 0 V
[GATE E.E. 2006]

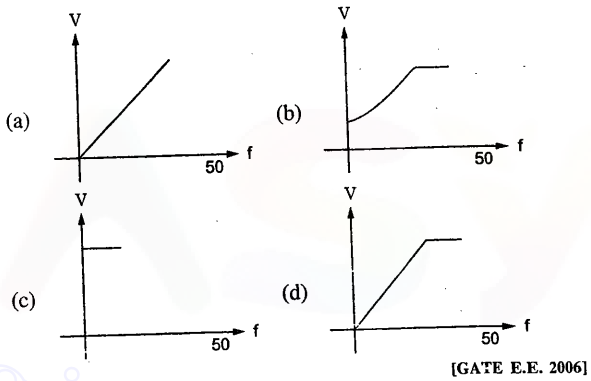
344. In ac motor control, the ratio of voltage-to-frequency is maintained at constant value
(a) to make maximum use of magnetic circuit.
(b) to make minimum use of magnetic circuit.
(c) to maximise the current drawn from the supply to provide torque.
(d) to provide maximum pull-out torque.
[A.M.I.E. Sec B. Power Electronics Winter 2007]

345. A 400 V, 50 Hz, 4 pole, 1,400 rpm, star-connected squirrel cage induction motor has the following parameters referred to the stator:

$R = 1.0\ \Omega, \quad X_S = X_r' = 1.5\ \Omega$

Neglect stator resistance and core and rotational losses of the motor. The motor is controlled from a 3-phase voltage source inverter with constant V/f control. The stator line-to-line voltage (rms) and frequency to obtain the maximum torque at starting will be :
(a) 20.6 V, 2.7 Hz. (b) 133.3 V, 16.7 Hz.
(c) 266.6 V, 33.3 Hz. (d) 323.3 V, 40.3 Hz.
[GATE E.E. 2008]

346. The speed of a 3-phase, 440 V, 50 Hz induction motor is to be controlled over a wide range from zero speed to 1.5 time the rated speed using a 3-phase voltage source inverter. It is desired to keep the flux in the machine constant in the constant torque region by controlling the terminal voltage as the frequency changes. The inverter output voltage vs frequency characteristic should be



[GATE E.E. 2006]

347. A cycloconverter-fed induction motor drive is most suitable for which one of the following ?
(a) Compressor drive. (b) Machine tool drive.
(c) Paper mill drive. (d) Cement mill drive.
[U.P.S.C. I.E.S. E.E.-II, 2008]

348. A three-phase fully-controlled thyristor bridge converter is used as line commutated inverter to feed 50 kW power 420 V dc to a three phase, 415 V (line), 50 Hz ac mains. Consider dc link current to be constant. The rms current of the thyristor is
(a) 119.05 A. (b) 79.37 A.
(c) 68.73 A. (d) 39.68 A. [GATE E.E. 2007]

349. The operation of an inverter fed induction motor can be shifted from motoring to regenerative braking by
(a) reversing phase sequence.
(b) reducing inverter voltage.
(c) decreasing inverter frequency.
(d) increasing inverter frequency. [U.P.S.C. I.E.S. E.E.-II, 2002]

350. A 3-phase induction motor is used as an adjustable speed drive from zero to 2.0 per unit speed using a variable frequency inverter. In the speed range of 1.0 to 2.0 per unit, in order to ensure satisfactory operation, which one of the following sets of quantities is to be maintained approximately constant ?
(a) Voltage and power. (b) Flux and torque.
(c) Voltage and torque. (d) Flux and power.
[U.P.S.C. I.E.S. E.E.-II, 1998]

Answers: **336.** (b), **337.** (b), **338.** (c), **339.** (c), **340.** (b), **341.** (c), **342.** (b), **343.** (c), **344.** (a), **345.** (b), **346.** (d), **347.** (b), **348.** (c), **349.** (c), **350.** (a),

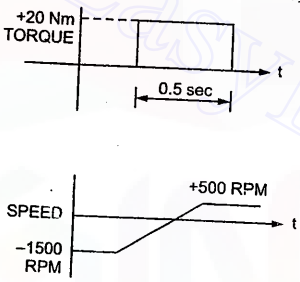
351. In a self-controlled synchronous motor fed from a variable frequency inverter
(a) The rotor poles invariably have damper windings.
(b) There are stability problems.
(c) The speed of the rotor decides stator frequency.
(d) The frequency of the stator decides the rotor speed.
[U.P.S.C. I.E.S. E.E.-II, 2003]

352. The torque produced by a single-phase induction motor fed through an ac voltage controller for speed control is due to
(a) fundamental component of current as well as harmonics, both odd and even.
(b) fundamental component and even harmonics of current.
(c) fundamental component and odd harmonics of current.
(d) fundamental component of current alone.
[U.P.S.C. I.E.S. E.E.-II, 1998]

353. A 3-phase wound rotor induction motor is controlled by a chopper-controlled resistance in its rotor circuit. A resistance of 2 Ω is connected in the rotor circuit and a resistance of 4 Ω is additionally connected during OFF periods of the chopper. The OFF period of the chopper is 4 ms. The average resistance in the rotor circuit for the chopper frequency of 200 Hz is
(a) $\frac{26}{5}\Omega$ (b) $\frac{24}{5}\Omega$ (c) $\frac{18}{5}\Omega$ (d) $\frac{16}{5}\Omega$
[U.P.S.C. I.E.S. E.E.-II, 2001]

354. An electric motor, developing a starting torque of 15 Nm, starts with a load torque of 7 Nm on its shaft. If the acceleration at start is 2 rad/sec^2, the moment of inertia of the systems must be (neglecting viscous and Coulomb friction)
(a) 0.25 kg m^2. (b) 0.25 Nm^2.
(c) 4 kg m^2. (d) 4 Nm^2.
[GATE E.E. 2005]

355. A variable speed drive rated for 1,500 rpm, 40 Nm is reversing under no load. Figure shows the reversing torque and the speed during the transient. The moment of inertia of the drive is



(a) 0.048 kg m^2.
(b) 0.064 kg m^2.
(c) 0.096 kg m^2.
(d) 0.128 kg m^2.
[GATE E.E. 2004]

356. Line regulation is determined by
(a) load current.
(b) load current and zener current.
(c) changes in load resistance and output voltage.
(d) changes in output voltage and input voltage.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

357. Which one of the following statements is correct ?
In the case of load regulation
(a) when the temperature changes the output voltage remains constant.
(b) when the input voltage changes, the load current remains constant.
(c) when the load changes, the load current remains constant.
(d) when the load changes, the output voltage remains constant.
[U.P.S.C. I.E.S. E.E.-II, 2005]

358. Which one of the following statements is correct ?
An ideal regulated power supply should have
(a) 100% regulation. (b) 50% regulation.
(c) 0% regulation. (d) 75% regulation.
[U.P.S.C. I.E.S. E.E.-II, 2004]

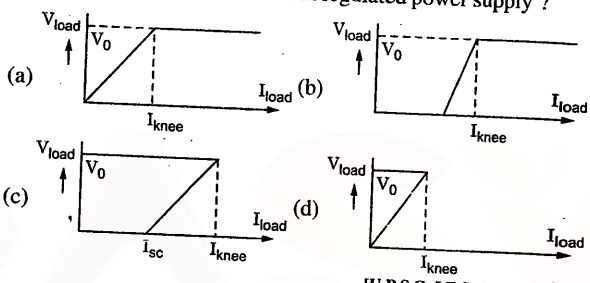
359. In a linear regulator, the control transistor is conducting
(a) a small part of the time. (b) half of the time.
(c) all the time.
(d) only when load current is excessive.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

360. Which stage of a dc power supply uses a zener as the main component ?
(a) rectifier. (b) voltage divider.
(c) regulator. (d) filter.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

361. The basic difference between a series regulator and a shunt regulator is
(a) the amount of current that can be handled.
(b) the position of control element.
(c) the type of sample circuit. (d) the type of error detector.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

362. The shunt type regulator is suitable for which of the following ?
(a) Low current, high voltage. (b) Low current, low voltage.
(c) High current, low voltage. (d) High current, high voltage.
[U.P.S.C. I.E.S. E.E.-II, 2007]

363. Which one of the following shows current fold back characteristics curve for an SCR controlled shunt regulated power supply ?



[U.P.S.C. I.E.S. E.E.-II, 2004]

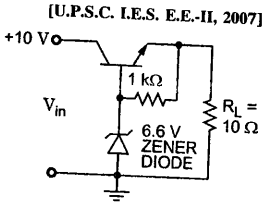
364. A series regulated power supply is provided with a short circuit protection section. If the transistor used for that purpose is made of silicon, find the value of resistor used when the dc output is 12 V and the load resistor cannot be below 100 Ω.
(a) 15 Ω (b) 10 Ω (c) 5 Ω (d) 1 Ω
[A.M.I.E. Sec B. Design Electronic Devices and Circuits Winter 2005]

365. Why is an external pass resistor used in a voltage regulator ?
(a) For short circuit protection.
(b) For increasing the current that regulator can handle.
(c) For increasing the output voltage.
(d) For improving the regulation.
[U.P.S.C. I.E.S. E.E.-II, 2006]

366. Which of the following are coefficients for a regulated power supply (in the expression for change in output voltage) ?
1. Stability factor. 2. Output resistance.
3. Temperature coefficient. 4. Input resistance.
Select the correct answer using the code given below :
(a) 1 and 4 only. (b) 1, 3 and 4.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

367. A power supply has full-load voltage of 24 V. What is its no-load voltage for 5% regulation (rounded to the nearest integer) ?
(a) 12 V (b) 23 V (c) 25 V (d) 6 V
[U.P.S.C. I.E.S. E.E.-II, 2007]

368. The three-terminal linear voltage regulator is connected to a 10 Ω load resistor as shown in the figure. If V_{in} is 10 V, what is the power dissipated in the transistor ?



Answers: **351.** (d), **352.** (c), **353.** (d), **354.** (c), **355.** (c), **356.** (d), **357.** (d), **358.** (c), **359.** (c), **360.** (c), **361.** (b), **362.** (c), **363.** (c), **364.** (a), **365.** (a), **366.** (d), **367.** (c), **368.** (b),

Downloaded From : www.EasyEngineering.net

(a) 0.6 W (b) 2.4 W (c) 4.2 W (d) 5.4 W
[GATE E.E. 2007]

369. An emitter follower regulator has the following disadvantage:
(a) It does not provide high gain.
(b) No provision exists for varying the output voltage.
(c) Its output resistance high.
(d) It cannot withstand high load current.
[U.P.S.C. I.E.S. E.E.-II, 2011]

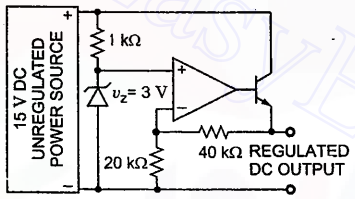
370. The use of multiphase rectifier in place of 1-phase rectifier results in:
(a) Increased output voltage and reduced harmonics.
(b) Increased output voltage and increased harmonics.
(c) Decreased output voltage and reduced harmonics.
(d) Increased output voltage and no effect on harmonics.
[U.P.S.C. I.E.S. E.E.-II, 2011]

371. What are the states of the three ideal diodes in the circuit as shown below?

	D_1	D_2	D_3
(a)	On	Off	Off
(b)	Off	On	Off
(c)	On	Off	On
(d)	Off	On	On

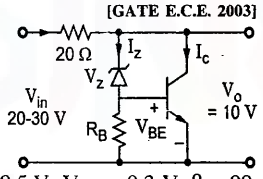
[U.P.S.C. I.E.S. E.E.-II, 2009]

372. The output voltage of the regulated power supply shown in the figure is
(a) 3 V.
(b) 6 V.
(c) 9 V.
(d) 12 V.



[GATE E.C.E. 2003]

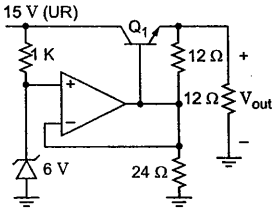
373. The transistor shunt regulator shown in the figure has regulated output voltage of 10 V, when the input varies from 20 V to 30 V. The relevant parameters for the zener diode and the transistor are : $V_Z = 9.5$ V, $V_{BE} = 0.3$ V, $\beta = 99$. Neglect the current through R_B. Then the maximum power dissipated in the zener diode (P_Z) and the transistor (P_T) are



(a) $P_Z = 75$ mW, $P_T = 7.9$ W. (b) $P_Z = 85$ mW, $P_T = 8.9$ W.
(c) $P_Z = 95$ mW, $P_T = 9.9$ W. (d) $P_Z = 15$ mW, $P_T = 11.9$ W.
[GATE E.C.E. 2001]

Common Data for Questions 374 and 375

A regulated power supply, shown in figure, has an unregulated input (UR) of 15 volts and generates a regulated output V_{out}. Use the component values shown in the figure.



374. The power dissipation across the transistor Q_1 shown in the figure is
(a) 4.8 Watts. (b) 5.0 Watts.
(c) 5.4 Watts. (d) 6.0 Watts. [GATE E.C.E. 2006]

375. If the unregulated voltage increases by 20%, the power dissipation across the transistor Q_1
(a) increases by 20%. (b) increases by 50%.
(c) remains unchanged. (d) decreases by 20%.
[GATE E.C.E. 2005]

376. Switching regulators are also called
(a) dissipative regulators. (b) current regulators.
(c) non-dissipative regulators. (d) large ripple regulators.
[A.M.I.E. Sec B. Design of Electronic Device and Circuits Winter 2007]

377. Consider the following statements :
Switched mode power supplies are preferred over the continuous type, because they are
1. suitable for use in both ac and dc.
2. more efficient.
3. suitable for low-power circuits.
4. suitable for high-power circuits.
Of these statements.
(a) 1 and 2 are correct. (b) 1 and 3 are correct.
(c) 2 and 3 are correct. (d) 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1997]

378. Which one of the following is the main advantage of SMPS over linear power supply ?
(a) No transformer is required.
(b) Only one stage of conversion.
(c) No filter is required. (d) low power dissipation.
[U.P.S.C. I.E.S. E.E.-II, 2007]

379. What are the advantages of switching power supplies over linear power supplies ?
1. The devices operate in linear/active region.
2. The devices operate as switches.
3. Power losses are less,
Select the correct answer using the code given below :
(a) 1 and 3 only. (b) 2 and 3 only.
(c) 1 and 2 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2008]

380. Which one of the following is used as the main switching element in a switched mode power supply operating in 20 kHz to 100 kHz range ?
(a) Thyristor. (b) MOSFET.
(c) Triac. (d) UJT.
[U.P.S.C. I.E.S. E.E.-II, 2004]

381. The most suitable device for high frequency inversion in SMPS is
(a) BJT. (b) IGBT. (c) MOSFET.
(d) GTO. [U.P.S.C. I.E.S. E.E.-II, 2001]

382. Which of the following devices should be used as a switch in a low power switched mode power supply (SMPS) ?
(a) GTO. (b) MOSFET.
(c) TRIAC. (d) Thyristor.
[U.P.S.C. I.E.S. E.E.-II, 2006]

383. In a switching regulator, the control transistor is conducting
(a) part of the time. (b) all of the time.
(c) only when the input voltage exceeds a set limit.
(d) only when there is an overload.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2005]

384. In a switched-mode power supply (SMPS), after conversion of ac supply to a highly filtered dc voltage, a switching transistor is switched *on* and *off* at a very high speed by a pulse width modulator (PWM) which generates a very-high frequency square pulses. The frequency of the pulses is typically in the range of

Answers: **369.** (b), **370.** (a), **371.** (a), **372.** (c), **373.** (c), **374.** (d), **375.** (b), **376.** (c), **377.** (c), **378.** (d), **379.** (b), **380.** (b), **381.** (c), **382.** (b), **383.** (a), **384.** (c),

(a) 100 Hz-200 Hz. (b) 500 Hz-1 kHz.
(c) 2 kHz-5 kHz. (d) 20 kHz-50 kHz.
[U.P.S.C. I.E.S. E.E.-II, 2002]

385. Which one of the following controls reduces the size of the transformer in a switch mode ac power supply ?
(a) Resonant control. (b) Bidirectional control.
(c) PWM control. (d) Phase control.
[U.P.S.C. I.E.S. E.E.-II, 1999]

386. A boost-regulator has an input voltage of 5 V and the average output voltage of 15 V. The duty cycle is
(a) $\frac{3}{2}$ (b) $\frac{2}{3}$ (c) $\frac{5}{2}$ (d) $\frac{15}{2}$
[U.P.S.C. I.E.S. E.E.-II, 2003]

387. A buck regulator has an input voltage of 12 V and the required output voltage is 5 V. What is the duty cycle of the regulator ?
(a) $\frac{5}{12}$ (b) $\frac{12}{5}$ (c) $\frac{5}{2}$ (d) 6
[U.P.S.C. I.E.S. E.E.-II, 2008]

388. In a UPS, the solid state switch normally transfer supply within
(a) 4 ms (b) 30 ms (c) 48 ms (d) 30 s
[A.M.I.E. Sec B. Power Electronics Summer 2007]

389. UPS find application in
(a) battery powered vehicle. (b) electric traction.
(c) HVDC. (d) computer power supply.
[A.M.I.E. Sec B. Power Electronics Summer 2005]

390. The surface dark current of a photodetector depends on
(a) surface defects. (b) cleanliness.
(c) bias voltage and surface area. (d) all of the above.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

391. Long wavelength cut-off for germanium photodetectors is between
(a) 1.2 to 1.3 micron. (b) 1.5 to 1.6 micron.
(c) 0.8 to 0.9 micron. (d) 1.7 to 1.8 micron.
(e) 1.6 to 1.7 micron.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

392. In a forward biased photodiode an increase in incident light causes the diode current to
(a) increase. (b) remain constant. (c) decrease.
(d) remain constant while the voltage drop across the diode increases. [U.P.S.C. I.E.S. E.E.-II, 2001]

393. Which one of the following statements is correct ?
A photodiode works on the principle of
(a) photovoltaic effect. (b) photoconductive effect.
(c) photoelectric effect. (d) photothermal effect.
[U.P.S.C. I.E.S. E.E.-II, 2004]

394. For photoconductors with equal electron and hole mobilities and perfect ohmic contacts at the ends, an increase in intensity of optical illumination results in
(a) a change in open-circuit voltage.
(b) a change in short-circuit current.
(c) decrease in resistance.
(d) increase in resistance. [U.P.S.C. I.E.S. E.E.-I, 2010]

395. Dark current in a semiconductor photodiode is
(a) the forward bias current.
(b) the forward saturation current.
(c) the reverse saturation current.
(d) the transient current. [U.P.S.C. I.E.S. E.E.-II, 2011]

396. Avalanche photodiodes are preferred over PIN diodes in optical communication system because of
(a) speed of operation. (b) higher sensitivity.
(c) larger bandwidth.
(d) larger power handling capacity. [U.P.S.C. I.E.S. E.E.-II, 1998]

397. Photons of energy 1.53×10^{-19} Joule are incident on a photodiode which has a responsivity of 0.65 A/W. If the optical power level is 10 μW, what is the photo current generated ?
(a) 64 nA (b) 1.5 μA (c) 2.1 μA (d) 6.5 μA
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

398. An *n*-type semiconductor is illuminated by a steady flux of photons with energy greater than the bandgap energy. The change in conductivity $\Delta\sigma$ obeys which relation ?
(a) $\Delta\sigma = 0$ (b) $\Delta\sigma = e(\mu_n + \mu_p)\Delta n$
(c) $\Delta\sigma = e(\mu_n \Delta n - \mu_p \Delta p)$ (d) $\Delta\sigma = e\,\mu_n \Delta n$
e is the electron charge, $\mu_n(\mu_p)$ the electron (hole) mobility, Δn (Δp) is the excess electron (hole) density.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

399. A solar cell is actually a device which utilises
(a) photoconductive effect. (b) photovoltaic effect.
(c) photoemissive effect. (d) photoresistive effect.
[A.M.I.E. Sec B. Solid State Physics & Semiconductor Devices Winter 2005]

400. Light dependent resistors are generally fabricated from thin film semiconductors belonging to
(a) group 2-6. (b) group 3-5.
(c) group 2. (d) group 5.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

401. GaAs LEDs emit radiation in the
(a) ultraviolet region.
(b) violet-blue-green range of the visible region.
(c) visible region. (d) infrared region.
[U.P.S.C. I.E.S. E.E.-II, 1997]

402. Which material is generally used for LED ?
(a) Compounds of silica. (b) Compounds of gallium.
(c) Compounds of phosphorus.
(d) Compounds of sulphur. [U.P.S.C. I.E.S. E.E.-II, 1992]

403. The wavelength of emitted light in LED depends on
(a) temperature of the surrounding.
(b) the type of material.
(c) the energy gap of the material. (d) all of the above.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2005]

404. The LED's for their display require
(a) a voltage of 1.2 V and a current of 20 mA.
(b) a voltage of 25 V and a current of 20 mA.
(c) a voltage of 25 V and a current of 100 mA.
(d) a voltage of 1.2 V and a current of 100 mA.
[A.M.I.E. Sec B. Winter 1996]

405. A particular green LED emits light of wavelength 5490 Å. The energy bandgap of the semiconductor material used there is (Planck's constant = 6.626×10^{-34} J-s)
(a) 2.26 eV (b) 1.98 eV (c) 1.17 eV (d) 0.74 eV
[GATE E.C.E. 2003]

406. The pattern form a surface emitter LED is called a
(a) isotropic pattern. (b) omni directional pattern.
(c) directional pattern. (d) Lambertian pattern.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

407. LCD displays are preferred over LED displays because they
(a) are more reliable. (b) consume less power.
(c) respond quickly. (d) are cheaper.
[U.P.S.C. I.E.S. E.E.-II, 2000]

408. As compared to an LED, an LCD has the distinct advantage of
(a) extremely low power requirement.
(b) providing a silver display.

Answers: **385.** (c), **386.** (b), **387.** (a), **388.** (a), **389.** (d), **390.** (a), **391.** (d), **392.** (d), **393.** (b), **394.** (c), **395.** (c), **396.** (b), **397.** (d), **398.** (b), **399.** (b), **400.** (b), **401.** (d), **402.** (b), **403.** (c), **404.** (a), **405.** (a), **406.** (d), **407.** (b), **408.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) being extremely thin.
(d) giving two types of displays.

[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2006]

409. Consider the following statements in connection with the biasing of semiconductor diodes.
1. LEDs are used under forward bias condition.
2. Photodiodes are used under forward-bias condition.
3. Zener diodes are used under reverse-bias condition.
4. Variable capacitance diodes are used under reverse-bias condition. Which of these statements are correct ?

(a) 1, 2 and 3. (b) 1, 2 and 4
(c) 2. 3 and 4. (d) 1, 3 and 4.

[U.P.S.C. I.E.S. E.E.-II, 2002]

410. A laser diode can readily be pulse-modulated, since the photon life time is _____ than the carrier lifetime.

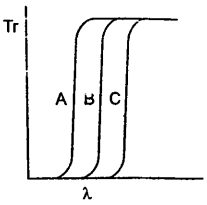
(a) much higher (b) higher
(c) smaller (d) much smaller

[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

411. Opto-coupler is used to
(a) reduce SCR turn-off time.
(b) protect IGBT's against *dv/dt*.
(c) regulate gate signal.
(d) isolate gating circuitry from power lines.

[A.M.I.E. Sec B. Power Electronics Summer 2005]

412. Photovoltaic devices may be made from various semiconductors as optical materials for which the transmission coefficient (Tr) is shown in the figure as a function of photon wavelength.



Which one of the following is the correct sequence of A, B and C pertaining to Ge, GaAs and Si, respectively ?

(a) A–B–C. (b) B–A–C.
(c) C–A–B. (d) C–B–A.

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

Answers: **409.** (d), **410.** (c), **411.** (d), **412.** (c).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): In a thyristor-controlled reactor, a minimum of 3 to 4 thyristors must be provided as redundant in capacitor switching.
(R): It is desired to protect the whole string against unexpected transients. [U.P.S.C. I.E.S. E.E.-II, 2004]

2. (A): The critical rate of change of forward-voltage is the value of *dv/dt*, at which the device just goes into conduction without a gate pulse.
(R): Thyristors go to a state of conduction with the application of sharp rate of change of forward-voltage in the absence of gate pulse, even before the break-forward voltage limit is reached. [U.P.S.C. I.E.S. E.E.-II, 2003]

3. (A): It is strongly recommended that the GTO (Gate Turn-Off Thyristor) should not be turned 'on' until it has been 'off' for a specified time.
(R): There may be poor current sharing between the various cathode islands. [U.P.S.C. I.E.S. E.E.-II, 2000]

4. (A): Many power devices utilize the case itself as one of the principal current-carrying terminals.
(R): Such a connection maximizes the thermal resistance between the working semiconductors and the transistor case.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

5. (A): High forward voltage protection is inherent in SCRs.
(R): The SCRs breakdown and start conducting before the peak forward voltage attained.

6. (A): A 3-phase thyristorised full converter feeding a purely resistive load with delayed firing angle of thyristors will draw reactive power from the ac supply.
(R): The ac supply current at delayed firing angle will be non-sinusoidal and its fundamental component would lag the supply voltage. [U.P.S.C. I.E.S. E.E.-II, 1998]

7. (A): Chopper drives are frequently used with dc series motors.
(R): The dc series motor has high armature inductance.

8. (A): If an ac-voltage regulator is feeding an R–L load, the minimum firing angle

$$\alpha_{min} = \phi \qquad \text{where } \phi = \tan^{-1}\left(\frac{\omega L}{R}\right)$$

(R): In an ac voltage regulator feeding R–L load, control is lost if $\alpha_{min} < \phi$. [U.P.S.C. I.E.S. E.E.-II, 1999]

9. (A): Variable frequency square wave inverter providing variable voltage cannot be operated below 10% of base frequency.
(R): The thyristors get damaged due to high $\frac{dt}{dt}$.
[U.P.S.C. I.E.S. E.E.-II, 2000]

10. (A): During inverter operation of a phase-controlled thyristor power converter, the upper value of firing angle range is limited to a value of less than 180°.
(R): A thyristor requires a definite amount of time to regain forward blocking capability after its current has become zero.
[U.P.S.C. I.E.S. E.E.-II, 1998]

Answers: **1.** (a), **2.** (a), **3.** (a), **4.** (c), **5.** (a), **6.** (b), **7.** (a), **8.** (b), **9.** (b), **10.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

11. (A): The maximum possible output frequency of the basic series inverter, using SCR's T_1 and T_2 is limited to the resonant frequency.

(R): Thyristor T_2 can only be fired when thyristor T_1 is OFF and vice-versa, otherwise a dead short-circuit will take place across the dc supply. [U.P.S.C. I.E.S. E.E.-II, 1999]

12. (A): Power electronic converters are extensively used in adjustable speed drives.

(R): Power electronic converters do not produce harmonic distortion. [U.P.S.C. I.E.S. E.E.-II, 2007]

13. (A): In HVDC systems, the voltage should be as high as possible and the rectifier control angle α should be as low as possible.

(R): Control of dc voltage is exercised by the rectifier and inverter control angles α and γ respectively. [U.P.S.C. I.E.S. E.E.-II, 2010]

14. (A): High frequency power supplies are light weight.

(R): Transformer size gets reduced at high frequency. [U.P.S.C. I.E.S. E.E.-II, 2001]

15. (A): The maximum voltage that a solar cell can generate cannot exceed the built-in potential of the diode.

(R): The voltage generated by a solar cell can be measured by connecting a voltmeter across its terminals exactly in a manner as the contact potential of a *p-n* junction diode is measured. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

16. (A): The L and C components of the communication circuit in McMurray inverter are chosen such that the peak value of resonant current pulse during communication is sufficiently greater than the load current.

(R): A thyristor will successfully turn off if the current is maintained below holding value for a time greater than the turn-off time of the device. [U.P.S.C. I.E.S. E.E.-II, 2010]

Answers: **11.** (a), **12.** (c), **13.** (a), **14.** (a), **15.** (b). **16.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (P-N Junction Diodes)	List 2 (Bias Condition in Normal Mode of Operation)
P. Zener diode.	1. Forward bias.
Q. Solar cell.	2. Reverse bias.
R. LASER diode.	
S. Avalanche photodiode.	

(a) P-1, Q-2, R-1, S-2 (b) P-2, Q-1, R-1, S-2
(c) P-2, Q-2, R-2, S-1 (d) P-2, Q-1, R-2, S-2 [GATE E.C.E. 2007]

2.

List 1 (Type of Device)	List 2 (Characteristic/Application)
A. MOSFET	1. Turn off by negative gate.
B. GTO	2. Bidirectional switching.
C. UJT	3. High speed switching.
D. TRIAC	4. Triggering circuit.

Codes :	A	B	C	D
(a)	3	1	4	2
(b)	3	1	2	4
(c)	1	2	3	4
(d)	1	2	4	3

[GATE E.E. 2007]

3.

List 1 (Devices)	List 2 (Properties)
A. Triac	1. Good *dt/dt* behaviour even at low gate currents.
B. Reverse conducting thyristor (RCT)	2. Normally provided with a small continuous negative gate pulse during off state.
C. Gate turn-off thyristor (GTO)	3. Negative gate pulse for reverse conduction.
D. Amplifying gate thyristor	4. No gate pulse for reverse conduction.

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	3	4	2	1
(c)	3	4	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2000]

4.

List 1 (Device)	List 2 (Monolithic Construction of)
A. Triac.	1. Two thyristors in antiparallel.
B. Reverse conducting thyristor.	2. A thyristor and a diode in antiparallel.
C. Diac.	3. Two diodes in antiparallel.

Codes :	A	B	C
(a)	1	2	3
(b)	3	2	1
(c)	2	3	1
(d)	3	1	2

[U.P.S.C. I.E.S. E.E.-II, 2008]

5.

List 1 (Characteristics/Action)	List 2 (Observations)
A. Turn-on time of thyristor.	1. Depends on junction capacitances.
B. Turn-on time of transistor.	2. Is the sum of delay and rise times.
C. Rate of rise of gate current in thyristor.	3. Thyristor switches back to OFF-state.
D. If the gate pulse is removed, when the thyristor is carrying a current, less than latching current.	4. Affects the delay time.

Codes :	A	B	C	D
(a)	2	1	4	3
(b)	1	2	3	4
(c)	2	1	3	4
(d)	1	2	4	3

[U.P.S.C. I.E.S. E.E.-II, 2003]

6.

List 1 (Semiconductor Devices)	List 2 (Characteristic/Property)
P. BJT.	1. Population inversion.
Q. MOS capacitor.	2. Pinch-off voltage.

Answers: **1.** (b), **2.** (a), **3.** (c), **4.** (a), **5.** (d), **6.** (c),

R. LASER diode. 3. Early effect.
S. JFET. 4. Flat-band voltage.
(a) P-3, Q-1, R-4, S-2 (b) P-1, Q-4, R-3, S-2
(c) P-3, Q-4, R-1, S-2 (d) P-3, Q-2, R-1, S-4
[GATE E.C.E. 2007]

7.

List 1 (Thyristors)		List 2 (Symbols)
A. Silicon-controlled rectifier (SCR)	1.	
B. Silicon-controlled switch (SCS)	2.	C. Silicon-unilateral switch (SUS)	3.	D. Light-activated SCR (LASCR)	4.	

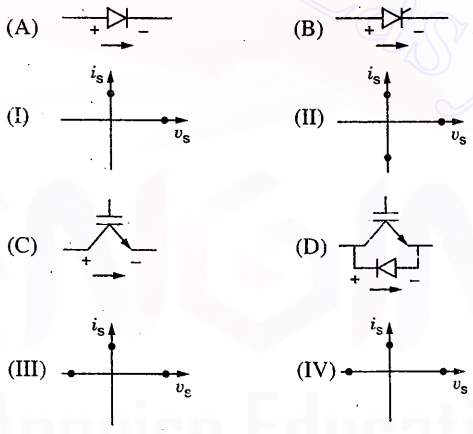
Codes :	A	B	C	D
(a)	3	4	1	2
(b)	4	3	1	2
(c)	3	4	2	1
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2003]

8. Match the switch arrangements on the top row to the steady-state V-I characteristics on the lower row. The steady state operating points are shown by large black dots.



(a) A–I, B–II, C–III, D–IV (b) A–II, B–IV, C–I, D–III
(c) A–IV, B–III, C–I, D–II (d) A–IV, B–III, C–II, D–I
[GATE E.E. 2009]

9.

List 1 (1–ϕ Rectifier Topology Feeding Resistive Load)		List 2 (Average Output Voltage)
A. Uncontrolled – half wave.	1.	$\frac{V_{peak}}{\pi}(1+\cos\alpha)$
B. Controlled – half wave.	2.	$\frac{2V_{peak}}{\pi}\cos\alpha$
C. Controlled – full wave.	3.	$\frac{V_{peak}}{\pi}$
D. Semi-controlled full wave.	4.	$\frac{V_{peak}}{2\pi}(1+\cos\alpha)$

Codes :	A	B	C	D
(a)	3	2	4	1
(b)	1	4	2	3
(c)	3	4	2	1
(d)	1	2	4	3

[U.P.S.C. I.E.S. E.E.-II, 2001]

10.

List 1		List 2
A. Phase-controlled rectifier feeding RL load with perfect smoothing.	1.	Output voltage depends on the values of R and L of the load.
B. Single-pulse converter feeding RL load.	2.	Depends on firing angle.
C. A constant dc voltage-fed dc to ac inverter feeding RL load.	3.	Constant and independent of R and L of the load.
D. A constant dc current-fed dc to ac inverter feeding RL load.	4.	Depends on firing angle and also impedance angle of the load.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	1	4	3	2
(c)	1	3	4	2
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-II, 2000]

11.

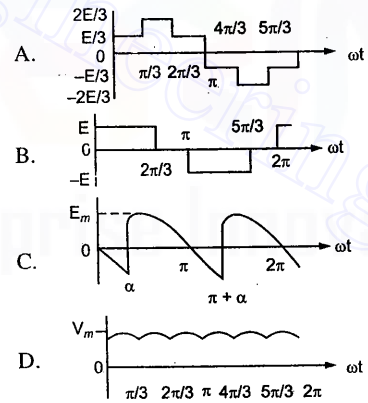
List 1		List 2
A. Discontinuous conduction of the converter.	1.	Additional reactive power loading.
B. Source inductance of the converter.	2.	Better displacement factor.
C. Use of freewheeling diode.	3.	Poor power factor.
D. Symmetrical angle control.	4.	Unity displacement factor.

Codes :	A	B	C	D
(a)	3	1	2	4
(b)	1	3	2	4
(c)	1	3	4	2
(d)	3	1	4	2

[U.P.S.C. I.E.S. E.E.-II, 1998]

12.

List 1 (Waveforms)



List 2 (Description)

1. Single phase fully controlled ac to dc.
2. Voltage commuted dc to dc chopper with input dc voltage E.
3. Phase voltage of a three phase inverter with 180° conduction and input dc voltage E.
4. Line voltage of a three phase inverter with 120° conduction and input dc voltage E.
5. Three-phase diode bridge rectifier.

(a)	2	3	1	4
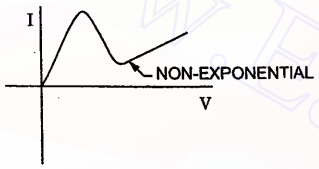
(b)	1	4	2	3
(c)	2	4	1	3
(d)	1	3	2	4

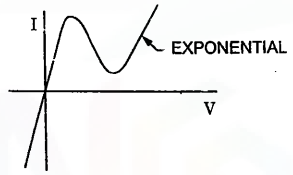
[U.P.S.C. I.E.S. E.E.-II, 2006]

23. Match the I–V characteristics given below with Gunn diode, Photo diode and Tunnel diode.

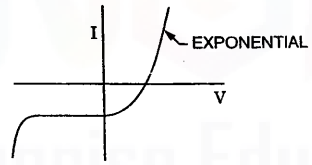
(A)



(B)



(C)



Select the correct answer using the code given below :

	Gunn diode	Photo diode	Tunnel diode
(a)	A	B	C
(b)	B	A	C
(c)	A	C	B
(d)	B	C	A

[U.P.S.C. I.E.S. E.E.-II, 2006]

24.

List 1 (Circuit Symbol)		List 2 (Device)
A.		1. N-channel FET
B.		2. Varactor
C.		3. Tunnel diode
D.		4. P channel MOSFET

Codes :	A	B	C	D
(a)	3	2	1	4
(b)	1	4	3	2
(c)	3	4	1	2
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-II, 2005]

25.

List 1	List 2
A. LED	1. Optical scattering.
B. LCD	2. Glow discharge.
C. NIXIE	3. Electromagnetic radiation emitter.

Codes :	A	B	C
(a)	1	3	2
(b)	3	1	2
(c)	2	3	1
(d)	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 1994]

26.

List 1	List 2
A. Display device. (lowest power).	1. Light emitting diode.
B. High speed display device.	2. Nixie tube.
C. Bright perfect numeral display.	3. Liquid crystal display.
D. Perfect light. transmitting device.	4. Optical fibre.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	4	3	1
(c)	3	1	2	4
(d)	4	2	3	1

[U.P.S.C. I.E.S. E.E.-II, 1995]

Answers: **22.** (c), **23.** (c), **24.** (a), **25.** (b), **26.** (c).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Thyristor (SCR) is a current-controlled device.
2. A power transistor differs in size from other transistors.
3. In a power transistor, maximum power dissipation occurs under zero signal conditions.
4. An SCR is a bidirectional switch.
5. The anode of SCR is always maintained at negative potential w.r.t. cathode.
6. In thyristor anode current is made of electrons and holes.
7. The gate can trigger on switch on SCR but it cannot switch off.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (F), **5.** (F), **6.** (T), **7.** (T).

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

8. The SCR can be switched off either by reducing the applied voltage or by increasing the circuit impedance.
9. With gate open, an SCR can be turned on by making supply voltage equal to forward breakover voltage.
10. The thyristor can be switched off by reducing its gate current. [A.M.I.E. Sec B. Electronic Devices & Circuits Summer 2001]
11. During forwarding blocking state thyristor is associated with low current and large voltage.
12. Once the SCR starts conducting its gate current loses control overail of its anode current, anode voltage and anode resistance.
13. In an SCR, the anode current is independent of gate current.
14. An SCR conducts appreciable current when anode and gate both are positive.
15. With the increase in firing angle of SCR, output is increased.
16. A conducting SCR can be opened by reducing supply voltage to zero.
17. A UJT has one anode, one base and one emitter.
18. A UJT is switched on when input voltage becomes equal to peak-point voltage.
19. A line-commutated inverter changes dc voltage into ac voltage. [GATE E.E. 1994; A.M.I.E. Sec B. Power Electronics Summer 2008]
20. Average output voltage from a full wave thyristor controlled rectifier is $\frac{V_{max}}{\pi}\cos\frac{\alpha}{2}$ where α is firing delay angle.
21. A single-phase full converter can operate in four quadrants.
22. For four-quadrant operation dual converter is required.
23. DC chopper can be used in both dc and ac drives. [A.M.I.E. Sec B. Winter 1993]
24. Thyristor drive provides higher accuracy, greater reliability, high operating efficiency, and fast response.
25. The thyristor drive motors have laminated yoke as well as main and commutating poles.
26. The thyristor drive motors have armatures of smaller diameter in comparison to ordinary dc motors.
27. A single-phase cycloconverter with centre input transformer needs 4 thyristors.
28. In a 3-phase to single-phase full-wave bridge cycloconverter the number of thyristors is 12.
29. Foldback current limiting needs transistor, resistor and potential divider.
30. High frequency power supplies are light weight.
31. Switching regulators are also called current regulators.
32. SMPS has the advantage of linear operation.
33. UPS finds application in HVDC.
34. A photodiode operates on the principle of photoelectric effect.
35. A solar cells is a device which utilises photoconductive effect.
36. GaAs LEDs emit radiation in visible region.
37. LEDs are fabricated from silicon or germanium.
38. LCD displays are more reliable that LED displays.
39. LEDs are used under forward bias condition.
40. Photodiodes are used under reverse bias condition.

Answers: **8.** (T), **9.** (T), **10.** (F), **11.** (T), **12.** (T), **13.** (T), **14.** (T), **15.** (F), **16.** (T), **17.** (F), **18.** (T), **19.** (T), **20.** (F), **21.** (F), **22.** (T), **23.** (F), **24.** (T), **25.** (T), **26.** (F), **27.** (T), **28.** (T), **29.** (F), **30.** (T), **31.** (F), **32.** (F), **33.** (F), **34.** (F), **35.** (F), **36.** (F), **37.** (F), **38.** (F), **39.** (T), **40.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Thyristor is a _____ device. (P-N-P-N/P-P-P-P/N-N-N-N)
2. SCR is the oldest and widely used member of _____ family.
3. Basic parts of the thyristor are its _____ layers of alternate P-type and N-type silicon semiconductors. [A.M.I.E. Winter 1997]
4. In a thyristor, when anode is positive w.r.t. cathode the blocked P-N junction of the SCR is _____. ($J_1/J_2/J_3/J_4$)
5. The holding current of a thyristor is _____ than the latching current. [A.M.I.E. Winter 1996]
6. In an SCR circuit, the angle of conduction can be changed by changing _____.
7. The normal way to close an SCR is by appropriate _____.
8. With the increase in gate current of an SCR, the forward breakdown voltage will _____.
9. In comparison with the turn-on time the turn-off time of a thyristor is _____. (lesser/larger/equal)
10. The ratio of latching current to holding current is _____. (0.5/1.5/2.5)
11. When two identical SCRs are placed back to back in series with a load and if each is fired at 90°, the voltage across the load will be _____.
12. The maximum firing angle that can be obtained by a pure resistive trigger circuit used in phase control circuit is _____. (45°/90°/135°/180°)
13. A triac can be triggered by a gate pulse of _____ polarity. [GATE E.E. 1994]
14. As compared to thyristor *dv/dt* capability of triac is _____. (lower/higher/equal)
15. A UJT has _____ bases and _____ emitter.
16. A UJT has _____ PN junction.
17. A UJT is triggered into conduction by applying a _____ pulse at the emitter and is brought back to OFF state by applying a _____ trigger pulse.
18. A UJT with $R_{BB} = 10\ k\Omega$ and $R_{B2} = 4\ k\Omega$ has intrinsic stand-off ratio of _____. (0.6/0.4/0.25/1.667)
19. A UJT is a _____ controlled device. (current/voltage/power)
20. The mean value of dc output voltage from a full-wave uncontrolled rectifier is _____ times of rms value of ac input voltage.
21. The mean value of output direct current from full-wave uncontrolled rectifier is _____ times of maximum value of ac input current.
22. Firing delay angle and conduction angle in a full-wave thyristor controlled rectifier always total _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

23. Average output voltage from half-wave thyristor controlled rectifier is _____.
24. If some of the switching devices in a converter are controlled one and the others are simply diodes, the converter is called _____.
25. A single-phase fully controlled dual converter uses _____ thyristors.
26. In a single-phase full converter fed by a source having inductance, the number of thyristors conducting during overlap period is _____.
27. In a single-phase converter using a centre tapped transformer and with a highly inductive load, the firing angle is α. Each thyristor conducts for a period _____ .
28. A chopper is a _____ converter.
29. Output voltage from a chopper circuit is _____ on the duty cycle and _____ of load current.
30. A dc chopper has a T_{on} of 1ms and its frequency is 500 Hz. Its duty cycle will be _____ percent. (25/50/75/100)
31. A single-phase half bridge inverter uses _____ thyristors.
32. A 3-phase inverter can operate in _____ mode or _____ mode.
33. A voltage source with a large inductance in series behaves as a _____ source.
34. In a step-down source, current can be discontinuous if duty cycle is _____ .
35. A single-phase ac regulator uses _____ thyristors connected in _____ .
36. A single-phase half-wave ac regulator uses one thyristor and _____ .
37. A 3-phase full-wave regulator uses _____ thyristors.
38. A cycloconverter is _____ converter.
39. A step-down cycloconverter uses _____ commutation.
40. A bridge type single-phase cycloconverter changes frequency from f to $f/4$, then one half-wave of output contains _____ of input.
41. The speed of a dc motor can be controlled by using _____ . (transistors/thyristors/diodes)
42. An automatic speed control system of a dc motor uses _____.
43. The shunt type regulator is suitable for _____ current _____ voltage. (low/high)
44. External pass resistor is used in a voltage regulator for _____ protection.
45. A power supply has a full load voltage of 24 V and no-load voltage of 25 V. Its voltage regulation is _____ .
46. LEDs are fabricated from _____ .
47. Photodiodes are used under _____ bias condition.
48. An LCD requires a power of _____ .

[A.M.I.E. Sec B. Winter 1999]

ANSWERS

1. P-N-P-N
2. thyristor
3. four
4. J_1
5. less
6. gate current
7. gate current
8. decrease
9. larger
10. 2.5
11. zero
12. 90°
13. + ve and + ve
14. lower
15. 2, 1
16. one
17. + ve, – ve
18. 0.6
19. voltage
20. 0.9
21. 0.636
22. 180°
23. $\frac{V_{max}}{\pi}\cos^2\frac{\alpha}{2}$
24. semiconverter
25. 8
26. 4
27. π
28. dc to dc
29. only dependent, independent
30. 50
31. 2
32. 120°, 180°
33. current
34. low
35. 2; antiparallel
36. one diode
37. 6
38. ac to ac
39. natural
40. four half-waves
41. thyristors
42. negative feedback
43. high; low
44. short-circuit
45. 4%
46. GaAs
47. reverse
48. 20 μW per segment

CHAPTER 15

Digital Electronics

Short Answer Type Questions With Answers

Q. 1. What is meant by radix (or base) of a number system ?

Ans. Radix or base of a number system is the number of digits or distinct symbols it uses to represent various numbers.

Q. 2. What is a weighted code ? Give one example. **[M.S. Univ. 1996]**

Ans. In a weighted code the value of a digit in a 4-bit depends on its position such as in BCD code.

Q. 3. What is non-weighted code ? **[Bharathiyar Univ. April 1997]**

Ans. In a non-weighted code, no definite weights are assigned to the four digit positions such as in excess-3 code.

Q. 4. What is meant by LSB and MSB ?

Ans. The right most bit of a binary number is called least-significant bit (LSB) while the left most bit of a binary number is known as most-significant bit (MSB).

Q. 5. What is (*a*) octal system (*b*) hexadecimal system ?

[Bharathiyar Univ. Nov. 1995]

Ans. The number systems with base (or radix) 8 and 16 are known as octal number system and hexadecimal number system respectively.

Q. 6. What is meant by BCD code ?

Ans. BCD code is a decimal system with each digit encoded in its binary equivalent of 4 bits.

Q. 7. What is an excess-3 code ?

Ans. Excess-3 code is derived from the natural BCD code by adding 3 (0011) to each coded number.

Q. 8. Why hexadecimal code is widely used in digital systems ?

Ans. It is very convenient to enter binary data in a digital system using hex code.

Q. 9. What is the difference between binary code and BCD ?

[Madurai Kamaraj Univ. April 1996]

Ans. BCD is not a number system like binary. It is a decimal system with each decimal digit encoded in its binary equivalent. A straight binary code takes the complete decimal number and represents it in binary while the BCD code converts each decimal digit to binary individually.

Q. 10. State the disadvantage of a 8-4-2-1 code.

Ans. BCD requires more bits than straight binary to represent decimal numbers of more than one digit. This is because BCD does not use all possible 4-bit groups and is, therefore, inefficient.

Q. 11. Why is an excess-3 code called an unweighted code ? What will be excess-3 code for decimal 5849.

Ans. Since no definite weights can be assigned to the four digit positions in an excess-3 code, it is an unweighted code.

$$(5849)_{10} = (1000\ 1011\ 0111\ 1100)_{XS-3}$$

Q. 12. Explain the use of excess-3 code.

[Madurai Kamaraj Univ. April 1996]

Ans. The key feature of the excess-3 code is that it is self-complementing code. It means that 1's complement of the coded number yields 9's complement of the number itself. The self-complementing property makes the excess-3 code useful in some arithmetic operations, because subtraction can be performed using 9's complement method and 1's complement can be easily produced with digital logic circuits by simply inverting each bit.

Q. 13. What are the advantages of Gray code ?

[Manonmanium Sundaranar Univ. Nov. 1996]

Ans. In Gray code, if we go from any one decimal number to the next, only one bit of the Gray code changes. Because of this feature, an amount of switching is minimized and the reliability of the switching systems is improved.

Q. 14. What is an alphanumeric code ? **[M.S. Univ. Nov. 1995]**

Ans. The codes used for representing letters of alphabet, punctuation marks and other special characters along with numbers are called alphanumeric codes.

Q. 15. Which is the most commonly used code for representing alphanumeric information ?

Ans. ASCII (American Standard Code for Information Interchange) is the most widely used alphanumeric code. It is a 7-bit code.

Q. 16. What is Boolean algebra ?

Ans. Boolean algebra is a mathematical system of logic in which truth functions are expressed as symbols and then these symbols are manipulated to arrive at conclusion.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 17. What are the basic logic elements ?

Ans. Basic logic elements are NOT gate, AND gate, OR gate and the flip-flop.

Q. 18. What is a truth table ?

Ans. Truth table is a table that gives outputs for all possible combinations of inputs to a logic circuit.

Q. 19. Define positive logic and negative logic.

Ans. If the higher of the two voltages represents a 1 and the lower voltage represents a 0, the logic is called a positive logic. On the other hand, if the lower voltage represents a 1 and the higher voltage a 0, we have a negative logic.

Q. 20. What is pulse logic system ?

Ans. A logic system in which a bit is recognised by the presence or absence of a pulse is called a pulse or dynamic logic system.

Q. 21. What is an inverter ? **[M.S. Univ. April 1996]**

Ans. An inverter is a logic gate whose output is the inverse or complement of its input.

Q. 22. What are the universal logic gates ? **[Bharathiyar Univ. April 1997]**

Ans. Universal gate is a gate that can perform all the basic logical operations such as NAND and NOR gates.

Q. 23. What are basic logic gates and what are universal logic gates ?

Ans. Basic logic gates are AND gate, OR gate, and NOT (INVERTER) gate. Universal logic gates are NAND and NOR gates.

Q. 24. What is the speciality of NAND and NOR gates ? **[Madurai Kamaraj Univ. Nov. 1995]**

Ans. The speciality of NAND and NOR gates is that they are universal gates and can perform all the basic logical operations.

Q. 25. Why NAND-NAND realization is preferred over AND-OR realization ?

Ans. NAND-NAND realization needs only one type of gate (NAND), that minimizes IC package counter.

Q. 26. Why is a two-input NAND gate called universal gate ? **[U.P.T.U. Second Semester 2000-01]**

Ans. NAND gate is called universal gate because any digital system can be implemented with the NAND gate. Sequential and combinational circuits can be constructed with these gates because element circuits like flip-flop can be constructed from two NAND gates connected back-to-back. NAND gates are common in hardware because they are easily available in the ICs form. A NAND gate is in fact a NOT-AND gate. It can be obtained by connecting a NOT gate in the output of an AND gate.

Q. 27. What is associate law ? **[Bharathiyar Univ. April 1997]**

Ans. Associate law is a law of addition and multiplication and according to this law grouping of the variables in the ORing or ANDing of several variables is immaterial and the results obtained are the same.

Q. 28. Distinguish between sum-of-products and product-of-sums. **[M.S. Univ. Nov. 1995]**

Ans. Sum-of-products (SOP) is a logic expression in the form of ANDed terms ORed together where as product-of-sums (POS) is a logic expression in the form of ORed terms ANDed together.

Q. 29. What is a minterm ? **[M.S. Univ. Nov. 1995]**

Ans. A term containing literals corresponding to all the variables in ANDed form is known as a minterm.

Q. 30. What are maxterms ? **[Madras Univ. April 1997]**

Ans. A term containing literals corresponding to all the variables in ORed form is known as a maxterm.

Q. 31. How many output functions are possible when we have n input variables ?

Ans. For n binary variables, we can have 2^n distinct minterms. Since the function can be either 0 or 1 for each minterm, and since there are 2^n minterms, one can calculate the possible functions that can be formed with n variables to be 2^n. Thus, for $n = 3$

$$\text{Number of minterms} = 2^n = 2^3 = 8$$

and number of possible functions $= 2 \cdot 2^n = 2 \times 2^3 = 16$.

Q. 32. What is the difference between canonical form and standard form ? **[U.P.T.U. Second Semester 2002-03]**

Ans. In canonical form, a Boolean function is expressed as sum of minterms or product of maxterms and is obtained by reading a function from the truth table. Canonical forms may or may not contain the least numbers of literals because by definition, each maxterm or minterm must contain all variables, complemented or uncomplemented. In standard form, the terms of function may contain one, two or any number of literals. Standard form is expressed as sum of products or product of sums.

Q. 33. What is the use of De Morgan's theorem ? **[M.S. Univ. April 1996]**

Ans. De Morgan's theorems are extremely useful in simplification of Boolean expressions in which a sum or product of variables is inverted.

Q. 34. What is Karnaugh map ? **[M.S. Univ. April 1996]**

Ans. Karnaugh map is essentially a geometrical pattern of squares that carry the labels of the logic variables in both normal and complemented forms.

Q. 35. What is the use of a Karnaugh map ? **[Bharathiyar Univ. Nov. 1995]**

Ans. Karnaugh map is used for simplification and manipulation of Boolean expressions.

Q. 36. State the limitation of Karnaugh's map ? **[Bharathiyar Univ. Nov. 1996]**

Ans. The limitation of Karnaugh's map is that beyond 6 variables it becomes very cumbersome and so it is generally used up to 6 variables.

Q. 37. What is the logic signal required to inhibit a NAND gate and what is its output when inhibited ?

Ans. Logic 0 is the logic signal required to inhibit a NAND gate and 1 is its output, irrespective of all other inputs, when inhibited.

Q. 38. What is a combinational circuit ?

Ans. In a combinational circuit, the output depends upon present input(s) only *i.e.* not dependent on the previous input(s). The combinational circuit has no memory element. It consists of logic gates only.

Q. 39. Write two characteristics of combinational circuits.

Ans. The two characteristics of combinational circuits are :

(*i*) In combinational circuits, the output exists as long as the input exists.

(*ii*) A combinational circuit will always respond in the same fashion to input function, when we apply signal to the input terminal of the combinational logic circuit.

Q. 40. What is a half-adder ? **[Bharathiyar Univ. Nov. 1995]**

Ans. A logic circuit, that can add two 1-bit numbers and produce outputs for sum and carry, is called a half-adder.

Q. 41. What is a full-adder ? **[Bharathiyar Univ. Nov. 1995]**

Ans. A binary adder, which can add two 1-bit binary numbers along with a carry bit and produces outputs for sum and carry is called a full-adder.

Q. 42. What is the logic signal required to inhibit a NAND gate and what is its output when inhibited ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. Logic 0 is the logic signal required to inhibit a NAND gate and 1 is its output, irrespective of all other inputs, when inhibited.

Q. 43. What is multiplexing ? [M.S. Univ. Nov. 1996]

Ans. Multiplexing is an operation performed with digital logic circuits called multiplexers and allows information to be switched from several lines into a single line in a specified sequence.

Q. 44. What is an encoder ? [Bharathiyar Univ. Nov. 1995]

Ans. An encoder is a logic circuit that produces coded binary inputs from uncoded inputs.

Q. 45. What is a demultiplexer ? [Bharathiyar Univ. April 1997]

Ans. Demultiplexer is a logic circuit that accepts one data input and distributes it over several outputs.

Q. 46. What is a decoder ? [M.S. Univ. Nov. 1995]

Ans. Decoder is a logic circuit that decodes from binary to octal, decimal, hexadecimal, or any other code such as 7-segment circuit etc.

Q. 47. What are the applications of multiplexer ?

Ans. Multiplexer have the applications of (*i*) data selection and routing (*ii*) operation sequencing, (*iii*) waveform generation, (*iv*) logic function generation, (*v*) parallel to serial conversion.

Q. 48. What is sequential circuit ? [Bharathiyar Univ. April 1997]

Ans. Sequential logic circuit is that circuit in which outputs of the circuit remain in their state, until instructed to change it. In other words sequential logic circuit may be defined as that logic circuit whose outputs are determined by the sequence in which input signals are applied.

Q. 49. What is a flip-flop ? [M.S. Univ. Nov. 1996]

Ans. A flip-flop is a basic memory element that is made of an assembly of logic gates and is used to store 1-bit of information.

Q. 50. What is a latch ? [M.S. Univ. Nov. 1995]

Ans. It is a D-type of flip-flop and stores one bit of data.

Q. 51. What is an excitation table ? [Bharathiyar Univ. April 1997]

Ans. Excitation table gives an information about what should be the flip-flop inputs if the outputs are specified before and after the clock pulses.

Q. 52. What is a state table ? [Bharathiyar Univ. April 1997]

Ans. State table consists of complete information about present state, next state, and outputs of a sequential circuit.

Q. 53. What is meant by a counter ?

Ans. Counter is a digital circuit which is used to count pulses and give the output in the binary form.

Q. 54. What is difference between synchronous and asynchronous counters ? [Bharathiyar Univ. April 1997]

Ans. In a synchronous counter all the flip-flops get clocked simultaneously where as in an asynchronous counter the output of one flip-flop drives another flip-flop.

Q. 55. What is a ripple counter ? [Madras Univ. April 1997]

Ans. When the output of one flip flop drives another flip-flop, the counter is called a ripple counter.

Q. 56. Why is a parallel counter faster than ripple counter ? [M.S. Univ. Nov. 1996]

Ans. In a ripple counter the output of one flip-flop drives another flip-flop while in a parallel counter all the flip-flops get clocked simultaneously. So parallel counter is faster than ripple counter.

Q. 57. What is counter MOD number ?

Ans. MOD number of a counter is the number of possible states that it has.

Q. 58. What is a ring counter ? [Madras Univ. October 1996]

Ans. In a ring counter, the Q output of the flip-flop and the D input of the successive flip-flop are connected in such a way that it forms a ring.

Q. 59. What is the difference between a bipolar logic family and unipolar logic family ?

Ans. Logic family using BJTs is known as bipolar logic family where as the logic family using unipolar transistors (MOSFETs) is known as unipolar logic family.

Q. 60. Differentiate between saturated and non-saturated logic.

Ans. The logic circuits, in which transistors are driven into saturation, are known as saturated logic circuits or simply the saturated logic and the logic circuits avoiding saturation of their transistors are known as non-saturated logic.

Q. 61. What is meant by breadth of a logic family ?

Ans. The number of various functions available in a logic family is known as the breadth of the logic family.

Q. 62. What is tristate logic ?

Ans. Tristate logic is a logic that has three states of output viz. *high* impedance state in addition to 0 and 1 states of output.

Q. 63. Which is the fastest of all logic families ?

Ans. ECL is the fastest of all logic families.

Q. 64. Which type of TTL gates can drive CMOS gates ?

Ans. TTL with open-collector can drive CMOS.

Q. 65. Name IC technologies for (*a*) lowest power consumption (*b*) highest speed of operation. [A.M.I.E. Sec B. Electronic Circuits Summer 2005]

Ans. IC technologies used for

(*a*) lowest power consumption – MOS technology.

(*b*) high speed of operation – Bipolar technology.

Q. 66. What precautions should be taken for handling CMOS ICs ? [A.M.I.E. Sec B. Electronic Circuits Summer 2005]

Ans. CMOS ICs are slow operating devices having low power consumption, so these devices should not be switched at high speed, otherwise these will have large power consumption and may get damaged.

Q. 67. Why conversion of an analog signal into an equivalent digital signal is essential ?

Ans. Because most sensors have analog output while much data processing is accomplished with digital computers, analog-to-digital conversion is essential.

Q. 68. What is digital-to-analog conversion ?

Ans. Basically, D/A conversion is the process of taking a value represented in digital code (such as simply binary or BCD) and converting it into a voltage or current which is proportional to the digital value.

Q. 69. What is A/D conversion ?

Ans. The A/D conversion is the process of converting an analog input voltage into an equivalent digital signal.

Q. 70. Mention the various types of analog to digital converters in the increasing order of speed of operation. [U.P.S.C. I.E.S. 2003]

Ans. A/D converters in the increasing order of speed of operation is given as dual slope type, successive approximation type.

Q. 71. Give the advantages and disadvantages of an integrating type A to D converters under the following heads :

(*i*) speed of operation (*ii*) change in R-C values (*iii*) presence of periodic noise (*iv*) offset voltage of the op-amp.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. (*i*) Speed of operation—Slow.

(*ii*) Change in R-C values—The accuracy of this converter is independent of R-C values or any change in them.

(*iii*) Presence of periodic noise—This converter is very less sensitive to periodic noise.

(*iv*) Offset voltage of op-amp—Accuracy depends upon the offset values, therefore, the reference voltage should be precise.

Q. 72. What are the advantages of integrating type A/D converters over the non-integrating type ? **[U.P.S.C. I.E.S. 1999]**

Ans. The integrating type ADC has the following advantages :

(*i*) It is relatively simple and inexpensive.

(*ii*) Conversion accuracies obtainable are very good.

(*iii*) Capacitors and resistors need not have high precision.

(*iv*) Errors due to propagation delay times are eliminated.

(*v*) Accuracy depends only on the stability of the reference voltage V_{REF}.

(*vi*) The comparator offset voltage and current are automatically compensated as the input signals cross zero voltage twice.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Which one of the following is correct ?
The convention is that the number 0 has the normal form representation as
(a) 0 (b) .0 (c) 0.0 (d) 0.10°
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

2. The binary equivalent of $(11.6275)_{10}$ is
(a) 101.11011 (b) 1011.1011
(c) 101.0011 (d) 1011.0011
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005]

3. 2's complement of the number of 1010101 is
(a) 0101010 (b) 0101011
(c) 1101010 (d) 1110011
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

4. Multiplication of two binary numbers 011 and 110 is
(a) 10010 (b) 11001 (c) 11100 (d) 01110
[A.M.I.E. Sec B Instrumentation & Control, Summer 1993]

5. Multiplication two binary numbers A and B is 11011. If A = 011, B is
(a) 0101 (b) 1100 (c) 1001 (d) 1011
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

6. The octal equivalent of decimal 98 is
(a) 89 (b) 98 (c) 142 (d) 241
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2007]

7. The decimal equivalent of $(1431)_8$ is
(a) 793 (b) 739 (c) 379 (d) 397
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005]

8. The decimal equivalent of the hexadecimal number $(BAD)_{16}$ is
(a) 111013 (b) 5929 (c) 3416 (d) 2989
[U.P.S.C. I.E.S. E.E.-II, 1995]

9. The binary equivalent of hexadecimal number 4F2D is
(a) 0101 1111 0010 1100 (b) 0100 1111 0010 1100
(c) 0100 1110 0010 1101 (d) 0100 1111 0010 1101
[U.P.S.C. I.E.S. E.E.-II, 2002]

10. The decimal equivalent of hexadecimal number 2AOF is
(a) 17670 (b) 17607 (c) 17067 (d) 10767
[U.P.S.C. I.E.S. E.E.-II, 2002]

11. The Octal equivalent of the HEX number AB.CD is
(a) 253.314 (b) 253.632 (c) 526.314 (d) 526.632
[GATE E.E. 2007]

12. The 4-bit group that is used in excess 3 code is
(a) 0001 (b) 0011 (c) 0010 (d) 1110

13. Which of the following statements is/are correct in regard to excess 3 code ?
(a) It is a BCD code. (b) It is an unweighted code.
(c) It is a self-complementing code.
(d) All of the above.

14. What is the addition of $(-64)_{10}$ and $(80)_{16}$?
(a) $(-64)_{16}$ (b) $(16)_{16}$
(c) $(110000)_2$ (d) $(01000000)_2$
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

15. Which of the following subtraction operations result in F_{16}?
1. $(BA)_{16} - (AB)_{16}$ 2. $(BC)_{16} - (CB)_{16}$
3. $(CB)_{16} - (BC)_{16}$
Select the correct answer using the code given below :
(a) Only 1 and 2. (b) Only 1 and 3.
(c) Only 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

16. BCD code is
(a) a binary code. (b) unweighted code.
(c) the same thing as binary numbers.
(d) the same as Gray code.

17. What is the Gray code word for the binary number 101011 ?
(a) 101011 (b) 110101 (c) 011111 (d) 111110
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

18. $(24)_8$ is expressed in Gray code as which one of the following ?
(a) 11000 (b) 10100 (c) 11110 (d) 11111
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

19. A four-bit BCD (DCBA) for numeral 9 can be decoded most economically by the logic operation
(a) AD (b) $A\bar{B}D$ (c) $A\bar{C}D$ (d) $A\bar{B}\bar{C}D$
[U.P.S.C. I.E.S. E.E.-II, 1999]

20. Which one of the following is a non-valid BCD code ?
(a) 0111 1001. (b) 0101 1011.
(c) 0100 1000. (d) 0100 1001.
[U.P.S.C. I.E.S. E.E.-II, 1998]

21. The binary representation 100110 is numerically equivalent to the
1. Decimal representation 46.
2. Octal representation 46.
3. Hexadecimal representation 26.
4. Excess-3 representation 13.
Select the correct answer using the codes given below.
Codes :
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 2003]

22. The number of bits required to represent an eight digit decimal number BCD is
(a) 8 (b) 16 (c) 24 (d) 32
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

23. An example of a self complementing code is
(a) 8421 code. (b) 7421 code.
(c) excess-3 code. (d) gray code.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

24. The ASCII is an input code
(a) it is a two bit code. (b) it is a four bit code.
(c) it is a seven bit code. (d) it is an eight bit code.
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2005]

25. What are the values respectively of R_1 and R_2 in the expression
$(235)_{R_1} = (565)_{10} = (865)_{R_2}$
(a) 8, 16 (b) 16, 8 (c) 6, 16 (d) 12, 8
[U.P.S.C. I.E.S. E.E.-II, 2004]

26. How many bits are required to represent decimal value from –50 to 50 ?

Answers: **1.** (c), **2.** (b), **3.** (b), **4.** (a), **5.** (c), **6.** (c), **7.** (a), **8.** (d), **9.** (d), **10.** (d), **11.** (b), **12.** (b), **13.** (d), **14.** (d), **15.** (b), **16.** (a), **17.** (d), **18.** (c), **19.** (d), **20.** (b), **21.** (b), **22.** (d), **23.** (c), **24.** (c), **25.** (b), **26.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) At least seven bits. (b) At least six bits.
(c) At least eight bits. (d) A least ten bits.
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer 2007]

27. The most negative number that can be represented by an 8 bit signal 2's complement system is
(a) -127_{10} (b) -128_{10} (c) -64_{10} (d) -256_{10}
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

28. Consider the following multiplication :
$(10w1z)_2 \times (15)_{10} = (y01011001)_2$
Which one of the following gives appropriate values of w, y and z?
(a) $w = 0, y = 0, z = 1$ (b) $w = 0, y = 1, z = 1$
(c) $w = 1, y = 1, z = 1$ (d) $w = 1, y = 1, z = 0$
[U.P.S.C. I.E.S. E.E.-II, 2004]

29. Which of the following notations have two representations of zero?
1. 1's complement with radix of number being 2.
2. 7's complement with radix of number being 8.
3. 9's complement with radix of number being 10.
4. 10's complement with radix of number being 10.
Select the correct answer using the code given below
(a) 1, 2 and 4. (b) 1 and 3.
(c) 2, 3 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2005]

30. Which one of the following is the correct sequence of the numbers represented in the series given below ?
$(2)_3$, $(10)_4$, $(11)_5$, $(14)_6$, $(22)_7$, ...
(a) 2, 3, 4, 5, 6, ... (b) 2, 4, 6, 8, 10, ...
(c) 2, 4, 6, 8, 10, 12, ... (d) 2, 4, 6, 10, 16, ...
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

31. A logic gate is an electronic circuit which
(a) operates on binary algebra.
(b) performs arithmetic and logic functions.
(c) allows flow of electrons only in one direction.
(d) alternates between 0 and 1 values.

32. Positive logic in a logic circuit is one in which
(a) logic 0 and 1 are represented by 0 and positive voltage respectively.
(b) logic 0 and 1 are represented by the negative and positive voltages respectively.
(c) logic 0 voltage level is higher than logic 1 voltage level.
(d) logic 0 voltage level is lower than logic 1 voltage level.
[U.P.S.C. I.E.S. E.E.-II, 1992]

33. The voltage levels for a negative logic system
(a) must necessarily be negative.
(b) could be negative or positive.
(c) must necessarily be positive.
(d) must necessarily be either zero or –5 V.
[U.P.S.C. I.E.S. E.E.-II, 1997]

34. Three Boolean operators are:
(a) NOT, OR, AND (b) NOT, NAND, OR
(c) NOR, OR, NOT (d) NOR, NAND, NOT
[U.P.T.U. Elec. Engg. Even Semester 2009-10]

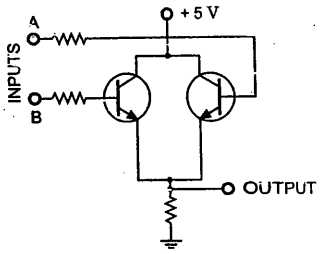
35. The only function of a NOT gate is to
(a) invert an input signal. (b) act as a universal gate.
(c) stop a signal. (d) none of the above.

36. When an input electrical signal A = 101010 is applied to a NOT gate, the output signal will be
(a) 111010 (b) 101010 (c) 010101 (d) 101011

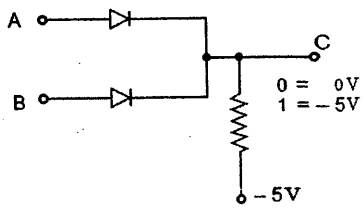
37. The output of a 2-input OR gate is zero only when its
(a) either input is 0. (b) either input is 1.
(c) both inputs are 1. (d) both inputs are 0.

38. A combinational circuit
(a) always contains memory elements.
(b) never contains memory elements.
(c) may sometimes contain memory elements.
(d) contain only memory elements.
[A.M.I.E. Sec B. Electronics Circuits Winter 2005]

39. The circuit shown in the given figure is
(a) an AND gate.
(b) an OR gate.
(c) a XOR gate.
(d) a NAND gate.
[U.P.S.C. I.E.S. E.E.-II, 2000]



40. If negative logic is used, the diode gate shown in the given figure will represent
(a) OR gate.
(b) AND gate.
(c) NOR gate.
(d) NAND gate.
[U.P.S.C. I.E.S. E.E.-II, 1996]



41. The output of a AND gate is high if
(a) both inputs are low.
(b) one input is high and the other is low.
(c) both inputs are high. (d) none of the above.
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

42. The complete set of only those Logic Gates designated as Universal Gates is
(a) NOT, OR and AND Gates.
(b) XNOR, NOR and NAND Gates.
(c) NOR and NAND Gates.
(d) XOR, NOR and NAND Gates. [GATE E.E. 2009]

43. Consider the following logic operators:
1. AND. 2. OR. 3. NOT.
Their correct hierarchy is
(a) 1, 2, 3. (b) 3, 1, 2. (c) 1, 3, 2. (d) 2, 3, 1.
[U.P.S.C. I.E.S. E.E.-II, 1995]

44. The output of an EX-OR gate with A and B as inputs will be
(a) $AB + \overline{AB}$ (b) $(A + B)\ \overline{(A + B)}$
(c) $(A + B)\ (\overline{AB})$ (d) $\overline{A + B + AB}$
[U.P.S.C. I.E.S. E.E.-II, 1998]

45. In exclusive OR gate, when output is zero the inputs are
(a) 0, 1 (b) 1, 0 (c) 1, 1 (d) 1, x
[A.M.I.E. Winter 1994]

46. The switching function of an Exclusive – OR gate is given by $f(x_1, x_2) = x_1 + x_2$ where $f(x_1, x_2)$ is equal to
(a) $x_1 + x_2$ (b) $\bar{x}_1 + \bar{x}_2$
(c) $\bar{x}_1\bar{x}_2 + x_1 + x_2$ (d) $\bar{x}_1 x_2 + x_1\bar{x}_2$
[U.P.S.C. I.E.S E.E.-II, 1993]

47. The output of a logic gate is '1' when all its inputs are at logic "0". The gate is either
(a) a NAND or an EX-OR gate. (b) a NOR or an EX-OR gate.
(c) an AND or an EX-NOR gate.
(d) a NOR or an EX-NOR gate. [GATE E.E. 2001]

Answers: **27.** (b), **28.** (c), **29.** (d), **30.** (d), **31.** (b), **32.** (d), **33.** (b), **34.** (a), **35.** (a), **36.** (c), **37.** (d), **38.** (b), **39.** (b), **40.** (a), **41.** (c), **42.** (c), **43.** (b), **44.** (c), **45.** (c), **46.** (d), **47.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

48. The truth table shown is one of the four units

	A	B	Y
(a) NAND.	1	0	1
(b) NOR.	0	1	1
(c) OR.	1	1	0
(d) Exclusive OR.			

[A.M.I.E. Winter 1995]

49. An XOR gate produces output only when two inputs are
(a) high. (b) low. (c) different. (d) equal.

50. Consider the following statements:
1. A NAND gate is equivalent to an OR gate with its inputs inverted.
2. A NOR gate is equivalent to an AND gate with its inputs inverted.
3. A NAND gate is equivalent to an OR gate with its output inverted.
4. A NOR gate is equivalent to an AND gate with its output inverted.

Which of these statemen are correct ?
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1999]

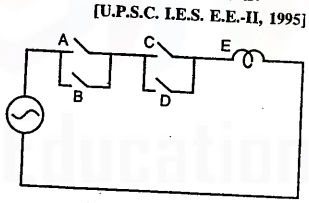
51. An AND gate
(a) implements logic addition.
(b) gives high output only when all inputs are low.
(c) is equivalent to a series switching circuit.
(d) is equivalent to a parallel switching circuit.

52. AND operation of $(79)_{10}$ and $(-56)_{10}$ results in:
(a) 50 H (b) 48 H (c) 42 H (d) 08 H
[U.P.S.C. I.E.S. E.E.-II, 2011]

53. Which one of the following statements is correct ?
(a) Static 1 hazard may occur in a 2-level AND-OR gate network.
(b) Static 0 hazard may occur in a 2-level AND-OR gate network.
(c) Dynamic hazard may occur in a 2-level OR-AND gate network.
(d) Essential hazards may occur in a combinational logic circuit.

54. Two Boolean variables FLAG 1 and FLAG 2 are assigned values FALSE and TRUE respectively. Which one of the following expressions is valid and has a True value ?
(a) FLAG 1 AND FLAG 2. (b) FLAG 1 < FLAG 2.
(c) FLAG 1 OR FLAG 2. (d) FLAG 1 > FLAG 2.
[U.P.S.C. I.E.S. E.E.-II, 1995]

55. The switching circuit given in the figure can be expressed in binary logic notation as



(a) $L = (A + B)(C + D)E$.
(b) $L = AB + CD + E$.
(c) $L = E + (A + B)(C + D)$.
(d) $L = (AB + CD)E$.
[U.P.S.C. I.E.S. E.E.-II, 1995]

56. Which of the following Boolean expressions is 'NOT TRUE' ?
(a) $A + 1 = A$ (b) $A + \bar{A} = 1$
(c) $A.A = A$ (d) $A.\bar{A} = 0$.
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

57. The simplified form of the Boolean expression $\bar{A} + A\bar{B}$ is
(a) $A + B$ (b) $A + \bar{B}$ (c) $\bar{B} + A$ (d) $\bar{A} + \bar{B}$
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

58. What is the Boolean expression $A \oplus B$ equivalent to ?
(a) $AB + \bar{A}\bar{B}$ (b) $\bar{A}B + A\bar{B}$
(c) B (d) $\bar{A}$ [U.P.S.C. I.E.S. E.T.E.-II, 2006]

59. If A and B are Boolean variables, then what is $(A + B).(A + \bar{B})$ equal to ?
(a) B (b) A (c) $A + B$ (d) AB
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

60. Which of the following Boolean algebra rules is correct ?
(a) $A.\bar{A} = 1$ (b) $A + AB = A + B$
(c) $A + \bar{A}B = A + B$ (d) $A(A + B) = B$
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

61. The Boolean expression $Y = AB + (A + B)(\bar{A} + B)$ may be simplified as
(a) $Y = A$ (b) $Y = \bar{A}$ (c) $Y = B$ (d) $Y = \bar{B}$
[U.P. Technical Univ. 2008-09]

62. Which one of the following statements is not correct ?
(a) $X + \bar{X}Y = X$ (b) $X(\bar{X} + Y) = XY$
(c) $XY + X\bar{Y} = X$ (d) $ZX + Z\bar{X}Y = ZX + ZY$
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

63. The expression $(X + Y)(X + \bar{Y})(\bar{X} + Y)$ is equivalent to
(a) $\bar{X}\bar{Y}$ (b) $\bar{X}Y$ (c) $X\bar{Y}$ (d) XY
[U.P.S.C. I.E.S. E.E.-II, 1998]

64. The Boolean expression $X = B + A.\bar{B} + A.B$ is equivalent to
(a) $A + B$ (b) $\bar{A}.B$ (c) $\overline{A + B}$ (d) $A.B$
[U.P.S.C. I.E.S. E.E.-II, 2005]

65. The function
$F = AB\bar{C} + ABC + \bar{A}BC + \bar{A}B\bar{C}$; can be reduced to which one of the following ?
(a) $F = A$ (b) $F = AB$ (c) $F = ABC$ (d) $F = B$
[U.P.S.C. I.E.S. E.E.-II, 2007]

66. The Boolean function $A + BC$ is a reduced form which one of the following ?
(a) $AB + BC$ (b) $\bar{A}B + A\bar{B}C$
(c) $(A + B).(A + C)$ (d) None of the above.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

67. The Boolean expression $\bar{Y}\bar{Z} + \bar{X}\bar{Z} + \overline{XY}$ is logically equivalent to
(a) $YZ + \bar{X}$ (b) $YZX + \bar{X}\bar{Y}\bar{Z}$
(c) $YZ + XZ + XY$ (d) $X\bar{Y}\bar{Z} + \bar{X}\bar{Y}\bar{Z} + \bar{X}Y\bar{Z} + \bar{X}\bar{Y}Z$
[U.P.S.C. I.E.S. E.E.-II, 2005]

68. What is the simplified form of the Boolean expression
$T = (X + Y)(X + \bar{Y})(\bar{X} + Y)$?
(a) $\bar{X}\bar{Y}$ (b) $\bar{X}Y$ (c) XY (d) $X\bar{Y}$
[U.P.S.C. I.E.S. E.E.-II, 2008]

69. The Boolean expression
$ABCD + A\bar{B}CD + ABC\bar{D} + A\bar{B}C\bar{D}$ is equivalent to
(a) A (b) AC (c) ABC (d) 1
[U.P.S.C. I.E.S. E.E.-II, 2008]

70. What does the Boolean expression
$AD + ABCD + ACD + \bar{A}B + A\bar{C}D + \bar{A}\bar{B}$,
on minimization result into ?
(a) $A + D$ (b) $AD + \bar{A}$ (c) AD (d) $\bar{A} + D$
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

71. The Boolean expression $A.B + \bar{A}.\bar{B}$ is logically equivalent to which of the following ?
1. $(A + \bar{B}) \cdot (\bar{A} + B)$ 2. $(\bar{A} + \bar{B}).(A + B)$
3. $\overline{A \cdot \bar{B} + \bar{A}B}$ 4. $\overline{(A.B)}.\overline{(\bar{A}.\bar{B})}$

Answers: **48.** (d), **49.** (c), **50.** (a), **51.** (c), **52.** (b), **53.** (d), **54.** (c), **55.** (a), **56.** (a), **57.** (d), **58.** (b), **59.** (b), **60.** (c), **61.** (c), **62.** (a), **63.** (d), **64.** (a), **65.** (d), **66.** (c), **67.** (d), **68.** (c), **69.** (b), **70.** (d), **71.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) None of these.
[U.P.S.C. I.E.S. E.E.-II, 2008]

72. The Boolean expression $\bar{X}Y\bar{Z} + \bar{X}\bar{Y}Z\ X.Y\bar{Z} + X\bar{Y}Z + XYZ$ can be simplified to
(a) $X\bar{Z} + \bar{X}Z + YZ$ (b) $XZ + \bar{Y}Z + Y\bar{Z}$
(c) $\bar{X}Y + YZ + XZ$ (d) $\overline{XY} + Y\bar{Z} + \bar{X}Z$
[GATE E.E. 2003]

73. The simplified form of the Boolean expression
$Y = (\bar{A}.BC + D)(\bar{A}.D + \bar{B}.\bar{C})$ can be written as
(a) $\bar{A}.D + \bar{B}.\bar{C}.D$ (d) $AD + B.\bar{C}.D$
(c) $(\bar{A} + D)(\bar{B}.C + \bar{D})$ (d) $A.\bar{D} + B.C.\bar{D}$
[GATE E.E. 2004]

74. In Boolean algebra, if $F = (A + B)(\bar{A} + C)$ then
(a) $F = AB + \bar{A}C$ (b) $F = AB + \bar{A}\bar{B}$
(c) $F = AC + \bar{A}B$ (d) $F = A\bar{A} + \bar{A}B$
[U.P.S.C. I.E.S. E.E.-II, 2001]

75. The reduced form of the Boolean expression
$A\left[B + C\left(\overline{AB + AC}\right)\right]$ is
(a) $\bar{A}B$ (b) $A\bar{B}$ (c) AB (d) $AB + B\bar{C}$
[U.P.S.C. I.E.S. E.E.-II, 2003]

76. The simplified form of a logic function
$Y = \overline{(A\bar{B})}.\overline{(\bar{A}B)}$ is
(a) $A + B$ (b) AB (c) $\bar{A} + \bar{B}$
(d) $\bar{A}B + A\bar{B}$ [U.P.S.C. I.E.S. E.E.-II, 2003]

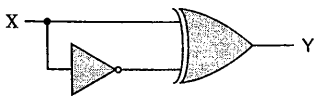
77. If x and y are Boolean variables, which one of the following is the equivalent of $x \oplus y \oplus xy$?
(a) $x + \bar{y}$. (b) $x + y$ (c) 0 (d) 1
[U.P.S.C. I.E.S. E.E.-II, 2004]

78. The complement form of $A(B + C)(\bar{C} + \bar{D})$ is
(a) $A + \bar{B}\bar{C} + \bar{D}C$ (b) $A + BC + CD$
(c) $A + BC$ (d) $\bar{A} + \bar{B}\bar{C} + CD$
[a.m.i.e. Sec B. Pulse and Digital Circuits Summer 2005]

79. The AND function can be realized by using only n number of NOR gates. What is n equal to ?
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.E.-II, 2008]

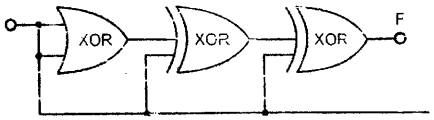
80. The open collector outputs of two 2-input NAND gates are connected to a common pull up resistor. If the inputs to the gates are P, Q, and R, S respectively. The output is equal to
(a) $\overline{P \cdot Q}, \overline{R \cdot S}$. (b) $\overline{PQ} + \overline{RS}$.
(c) $P \cdot Q + R \cdot S$ (d) $P \cdot Q \cdot R \cdot S$ [GATE E.E. 1998]

81. The output Y of the logic circuit given below is



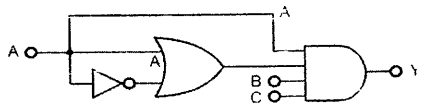
(a) 1 (b) 0 (c) X (d) $\bar{X}$
[GATE E.E., 2011]

82. For the circuit shown in figure, the output F will be



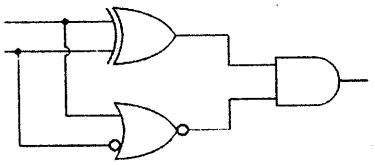
(a) 1 (b) zero (c) X (d) $\bar{X}$
[U.P.S.C. I.E.S. E.E.-II, 2001]

83. The Boolean expression for the output Y in the logic circuit is



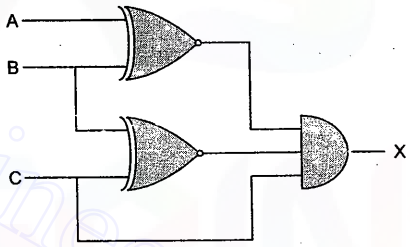
(a) $A\bar{B}C$ (b) ABC (c) $\bar{A}BC$ (d) $\bar{A}\bar{B}\bar{C}$
[U.P.S.C. I.E.S. E.E.-II, 2002]

84. The output X of the circuit shown in the figure will be



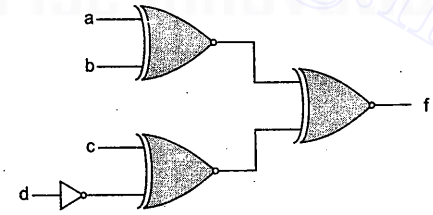
(a) AB (b) $\bar{A}B$ (c) $A\bar{B}$ (d) $\bar{A}\bar{B}$
[U.P.S.C. I.E.S. E.E.-II, 1998]

85. For logic circuit shown, the required inputs A, B and C to make the output X = 1 are, respectively,



(a) 1, 0 and 1 (b) 0, 0 and 1
(c) 1, 1 and 1 (d) 0, 1 and 1
[U.P.S.C. I.E.S. E.E.-II, 2011]

86. Which one of the following is the correct output (f) of the circuit?



(a) $(a + b)(c + \bar{d})$ (b) $(\bar{a} + \bar{b})(c + \bar{d})$
(c) $(a + \bar{b})(c + \bar{d})$ (d) $(a + b)(\bar{a} + \bar{d})$
[U.P.S.C. I.E.S. E.E.-II, 2009]

Answers: **72.** (b), **73.** (a), **74.** (c), **75.** (c), **76.** (d), **77.** (b), **78.** (d), **79.** (b), **80.** (a), **81.** (a), **82.** (b), **83.** (b), **84.** (b), **85.** (c), **86.** (a),

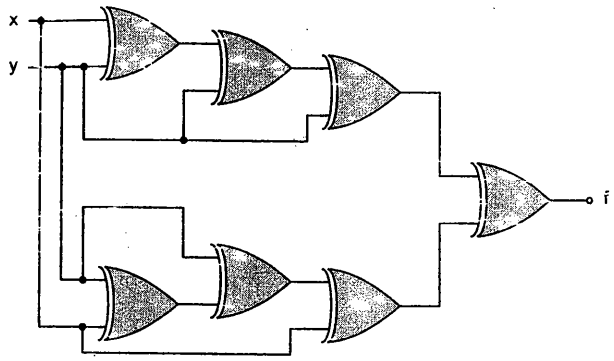
87. The circuit shown below generates the function of

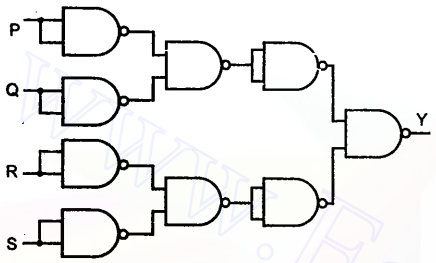


(a) $x \oplus y$ (b) 0

(c) $x\bar{y} + yx + \bar{y}x$ (d) $x \cdot \bar{y}$

[U.P.S.C. I.E.S. E.E.-II, 2010]

88. For the circuit shown in the figure the Boolean expression for the output Y in terms of inputs P, Q, R and S is

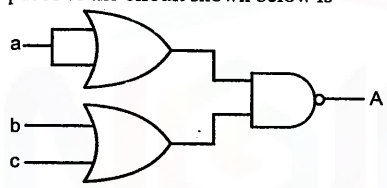


(a) $\bar{P} + \bar{Q} + \bar{R} + \bar{S}$ (b) $P + Q + R + S$

(c) $(\bar{P} + \bar{Q})(\bar{R} + \bar{S})$ (d) $(P + Q)(R + S)$

[GATE E.E. 2002]

89. The output A of the circuit shown below is

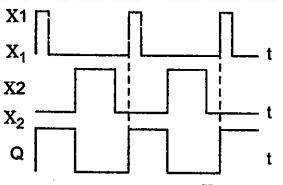


(a) $\bar{a} + \bar{b}\bar{c}$. (b) $a + bc$.

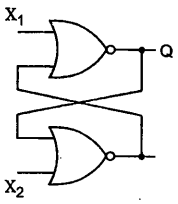
(c) $\bar{a}\bar{b} + \bar{a}\bar{c}$. (d) $a + b\bar{c}$.

[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2005]

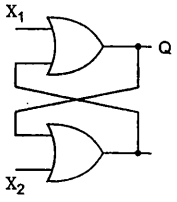
90. Select the circuit which will produce the given output Q for the input signals X_1 and X_2 given in the figure



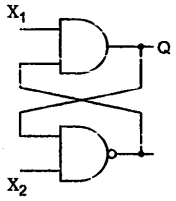
(a)



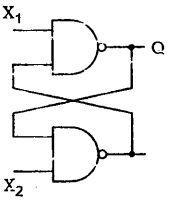
(b)



(c)

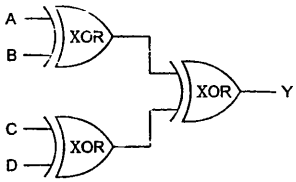


(d)



[GATE E.E. 2005]

91. A, B, C, and D are input, and Y is the output bit in the XOR gate circuit of the figure. Which of the following statements about the sum S of A, B, C, D and Y is correct ?



(a) S is always with zero or odd.

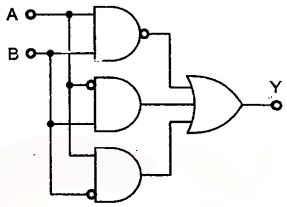
(b) S is always either zero or even.

(c) S = 1 only if the sum of A, B, C and D is even.

(d) S = 1 only if the sum of A, B, C and D is odd.

[GATE E.E. 2007]

92. In the given circuit, the output Y equals which one of the following?



(a) A + B

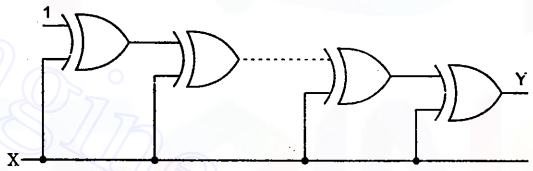
(b) $\bar{A}B + A\bar{B}$

(c) AB

(d) $\bar{A} + \bar{B}$

[U.P.S.C. I.E.S. E.E.-II, 2008]

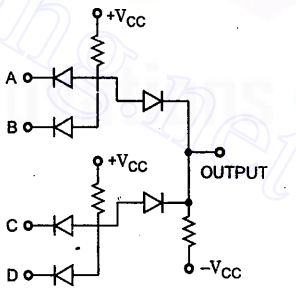
93. If the input to the digital circuit of the figure consisting of a cascade of 20 XOR gates is X, then what is the output Y ?



(a) 0 (b) 1 (c) X′ (d) X

[U.P.S.C. I.E.S. E.E.-II, 2007]

94. What is the output of the gate circuit shown in the figure ?



(a) (A + B) (C + D)

(b) AB + CD

(c) $\overline{AB + CD}$

(d) $\overline{(A + B)(C + D)}$

[U.P.S.C. I.E.S. E.E.-II, 2007]

95. The Boolean expression

$ABC + \bar{A}\bar{B}C + AB\bar{C} + \bar{A}\bar{B}\bar{C}$

(a) OR GATE (b) AND GATE

(c) EX-NOR GATE (d) EX-OR GATE

[U.P.S.C. I.E.S. E.E.-II, 2007]

96. A digital circuit which compares two numbers $A_3A_2A_1A_0$, $B_3B_2B_1B_0$ is shown in figure. To get output Y = 0, choose one pair of correct input numbers.

Answers: **87.** (a), **88.** (b), **89.** (a), **90.** (a), **91.** (b), **92.** (d), **93.** (b), **94.** (b), **95.** (c), **96.** (d),

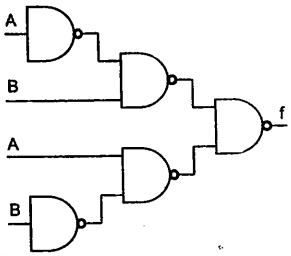
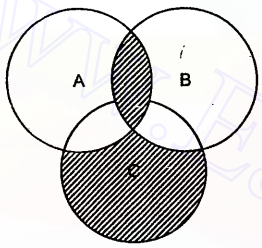
(a) 1010, 1010 (b) 0101, 0101
(c) 0010, 0010 (d) 1010, 1011 [GATE E.E. 2004]

97. The circuit shown is functionally equivalent to which one of the following ?



(a) NOR gate.
(b) OR gate.
(c) EX-OR gate.
(d) NAND gate.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

98. The Boolean expression for the shaded area in the Venn diagram shown is



(a) $A + \bar{B} + C$ (b) $AB + \bar{A}\,BC$
(c) $A\bar{B}C + \bar{A}BC$ (d) $AB + \bar{A}\bar{B}C$
[U.P.S.C. I.E.S. E.E.-II, 2011]

99. The Boolean expression
$Y(A, B, C) = A + BC$
is to be realized using 2-input gates of only one type. What is the minimum number of gates required for the realization ?
(a) 1 (b) 2 (c) 3 (d) 4 or more.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

100. The Boolean expression
$X(P, Q, R) = \pi(0, 5)$
is to be realized using only two 2-input gates. Which are these gates ?
(a) AND and OR. (b) NAND and OR.
(c) AND and XOR. (d) OR and XOR.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

101. Assume that only x and y logic inputs are available, and their complements $\bar{x}$ and $\bar{y}$ are not available. What is the minimum number of 2-input NAND gates required to implement $x \oplus y$?
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

102. The NAND-NAND realization is equivalent to
(a) AND-NOT realization. (b) AND-OR realization.
(c) OR-AND realization. (d) NOT-OR realization.
[A.M.I.E. Sec B. Electronics Circuits Winter 2005]

103. Which one of the following statements is correct ?
For a 4-input NOR gate, when only two inputs are to be used, the best option for the used inputs is to
(a) connect them to ground.
(b) connect them to V_{CC}. (c) keep them open.
(d) connect them to the used inputs. [U.P.S.C. I.E.S. E.E.-II, 2004]

104. Minimum number of two input NAND gates required to realize the logic function $(A\bar{B} + \bar{A}B)$ is
(a) 5 (b) 3 (c) 6 (d) 4
[A.M.I.E. Sec B. Electronic Circuits Summer 2006]

105. According to De-Morgan's second theorem
(a) A NAND gate is always complementary to an AND gate.
(b) An AND gate is equivalent to a bubbled NAND gate.
(c) A NAND gate is equivalent to a bubbled AND gate.
(d) A NAND gate is equivalent to a bubbled OR gate.
[U.P.S.C. I.E.S. E.E.-II, 1992]

106. If $\bar{x} \times \bar{y} = 0$, then which one of the following is true ?
(a) $\bar{x}y + \bar{y}x + xz = x\bar{y} + yz$
(b) $\bar{x}\,\bar{y}\,\bar{z} + xyz = xy\bar{z} + \bar{x}\,\bar{y}\,\bar{z}$
(c) $\bar{x}y + \bar{y}x = xy + \bar{x}\,\bar{y}$ (d) $\bar{x}yx = 1$
[U.P.S.C. I.E.S. E.E.-II, 1994]

107. The logic function $f = \overline{(x \cdot \bar{y}) + (\bar{x} \cdot y)}$ is the same as
(a) $f = (x + y)(\bar{x} + \bar{y})$ (b) $f = (\bar{x} + \bar{y})(x + y)$
(c) $f = (x \cdot y) \times (\bar{x} \cdot \bar{y})$ (d) f = none of (a), (b), (c)
[GATE 1999]

108. The POS form of expression is suitable for circuit using
(a) XOR (b) NAND (c) AND (d) NOR
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

109. Sum of product representation of Boolean equations can be easily realized by the following digital circuits
(a) NAND-NAND (b) AND-AND
(c) OR-OR (d) NOR-NOR
[a.m.i.e. Sec B. Design of Electronic Devices and Circuits Winter 2007]

110. The SOP form of $(A + C)(A\bar{B} + AC)(\bar{A}\bar{C} + \bar{B})$ is
(a) $A\bar{B} + A\bar{B}C$ (b) $\bar{A}B + \bar{A}B\bar{C}$
(c) $\bar{A}\bar{B} + \overline{ABC}$ (d) $(A + B)(A + \bar{B} + C)$
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005]

111. The Boolean functions can be expressed in canonical SOP (sum of products) and POS (product of sums) form. For the function, $Y = A + \bar{B}.C$, which are such two forms ?
(a) $Y = \Sigma(1, 2, 6, 7)$ and $Y = \Pi(0, 2, 4)$
(b) $Y = \Sigma(1, 4, 5, 6, 7)$ and $Y = \Pi(0, 2, 3)$
(c) $Y = \Sigma(1, 2, 5, 6, 7)$ and $Y = \Pi(0, 1, 3)$
(d) $Y = \Sigma(1, 2, 4, 5, 6, 7)$ and $Y = \Pi(0, 2, 3, 4)$
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

112. The function $F(A + \bar{B} + C)(A + \bar{B} + \bar{C})(\bar{A} + \bar{B} + C)$ is equivalent to
(a) $\pi(1, 4, 5)$ (b) $\pi(2, 3, 6)$ (c) $\pi(0, 2, 3)$ (d) $\pi(3, 4, 5)$
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

113. The canonical form of $\Pi(0, 3, 6, 7)$ is
(a) $\Pi(1, 2, 4, 5)$. (b) $\Sigma(1, 2, 4, 5)$.
(c) $\Sigma(0, 3, 6, 7)$. (c) $\Pi(0, 1, 2, 4, 5)$.
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

114. What are the ultimate purposes of minimizing logic expressions ?
1. To get a small size expression.
2. To reduce the number of variables in the given expression.
3. To implement the function of the logic expression with least hardware.
4. To reduce the expression for making it feasible for hardware implementation.

Answers: **97.** (c), **98.** (d), **99.** (c), **100.** (d), **101.** (c), **102.** (b), **103.** (d), **104.** (b), **105.** (d), **106.** (a), **107.** (d), **108.** (d), **109.** (a), **110.** (a), **111.** (b), **112.** (b), **113.** (b), **114.** (d),

Downloaded From : www.EasyEngineering.net

Select the correct answer from the codes given below
(a) 1 only. (b) 2 and 3. (c) 3 only. (d) 3 and 4.
[U.P.S.C. I.E.S. E.T.E. 2009]

115. Consider the following statements :
1. Minimization using Karnaugh map may not provide unique solution.
2. Redundant grouping in Karnaugh map may result in non-minimized solution.
3. Don't care states if used in Karnaugh map for minimization, the minimal solution is not obtained.

Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

116. When eight adjacent 1's grouped horizontally or vertically the group so found is called
(a) pair (b) quad (c) octet (d) hex
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

117. In K-map, a group of 8 adjacent ones leads to a term with less— than the total number of variables :
(a) one (b) two (c) three (d) four
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

118. The reason for using Gray code in K-maps is :
(a) gray code is efficient than binary codes.
(b) gray code provides cell values that differ in only one bit in adjacent cells.
(c) no other code is available.
(d) any other code can also be used.
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005; Winter 2005]

119. A combinational circuit has inputs A, B and C and its Karnaugh map is as shown. The output of the circuit is given by

C \ AB	00	01	11	10
0		1		1
1	1		1	

(a) $(\bar{A}B + A\bar{B})C$ (b) $(\bar{A}B + A\bar{B})\bar{C}$
(c) $\bar{A}\,\bar{B}\,\bar{C}$ (d) $A \oplus B \oplus C$
[U.P.S.C. I.E.S. E.E.-II, 1997]

120.

A \ BC	$\bar{B}\bar{C}$	$\bar{B}C$	BC	$B\bar{C}$
$\bar{A}$		1	1	1
A		1	1	

For a function F, the Karnaugh map is shown above. Then minimal representation of F is
(a) $AB + \bar{C}$ (b) $C + \bar{A}B$
(c) A+B + C (d) $A + \bar{B}C$
[U.P.S.C. I.E.S. E.E.-II, 2010]

Statement for Linked Answer Q. (121–122):

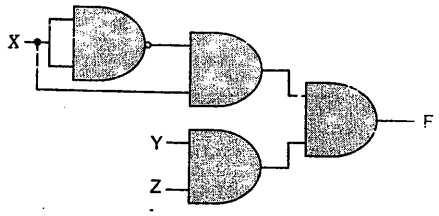
The following Karnaugh map represents a function F.

F \ YZ	00	01	11	10
0	1	1	1	0
X 1	0	0	1	0

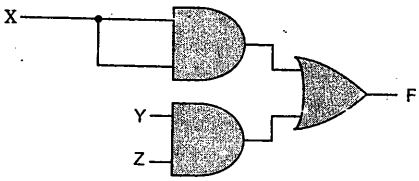
121. A minimized form of the function F is
(a) $F = \bar{X}Y + YZ$ (b) $F = \bar{X}\bar{Y} + YZ$
(c) $F = \bar{X}\bar{Y} + Y\bar{Z}$ (d) $F = \bar{X}\bar{Y} + \bar{Y}Z$
[GATE E.E. 2010]

122. Which of the following circuits is a realization of the above function F?

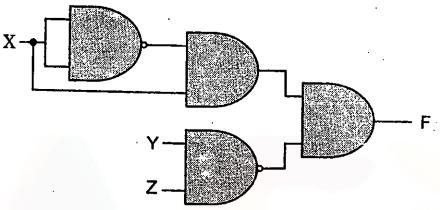
(a)



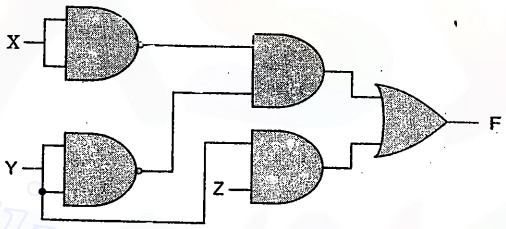
(b)



(c)



(d)



[GATE E.E. 2010]

123. By inspecting the Karnaugh map plot of the switching function
$F(x_1\, x_2\, x_3) = \Sigma(1, 3, 6, 7)$
one can say that the redundant prime implicant is
(a) $\bar{x}_1 x_3$ (b) $x_2 x_3$ (c) $x_1 x_2$ (d) x_3
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

124. What is the Boolean expression for the truth table shown above ?

A	B	C	f
0	0	0	0
0	0	1	0
0	1	0	0
0	1	1	1
1	0	0	0
1	0	1	0
1	1	0	1
1	1	1	0

(a) $B(A + C)(\bar{A} + \bar{C})$
(b) $B(A + \bar{C})(\bar{A} + C)$
(c) $\bar{B}(A + \bar{C})(\bar{A} + C)$
(d) $\bar{B}(A + C)(\bar{A} + \bar{C})$
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

125. Consider the following :
Any combinational circuit can be built using
1. NAND gates. 2. NOR gates.
3. EX-OR gates. 4. Multiplexers.
Which of these are correct ?
(a) 1, 2 and 3 (b) 1, 3 and 4
(c) 2, 3 and 4 (d) 1, 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **115.** (d), **116.** (c), **117.** (c), **118.** (b), **119.** (d), **120.** (b), **121.** (b), **122.** (d), **123.** (b), **124.** (a), **125.** (d),

Downloaded From : www.EasyEngineering.net

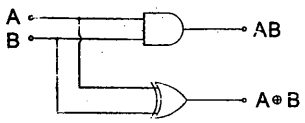
126. In a sequential circuit, the output state depends upon
(a) past output states and present input states.
(b) input states only. (c) input and output states.
(d) none of these.
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2005]

127. The logic circuit given in the figure represents



(a) full adder.
(b) half adder.
(c) half subtractor.
(d) boolean multiplier. [U.P.S.C. I.E.S. E.E.-II, 1995]

128. In a half adder having two inputs A and B and two outputs, S and C are Sum and Carry bits respectively), the Boolean expressions for S and C in terms of A and B is
(a) $S = \bar{A}B + A\bar{B}$; $C = A.B$
(b) $S = AB + \bar{A}B$; $C = A + B$
(c) $S = \bar{A}\bar{B} + AB$; $C = A + \bar{B}$
(d) $S = \bar{A} + A\bar{B}$; $C = \bar{A} + B$ [U.P.S.C. I.E.S. E.E.-II, 1997]

129. Which of the following circuits come under the class of combinational logic circuits ?
1. Full adder. 2. Full subtracter.
3. Half adder. 4. J-K flip.
5. Counter.
Select the correct answer from the codes given below :
(a) 1 only. (b) 3 and 4. (c) 4 and 5. (d) 1, 2, and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

130. Which of the following circuits come under the class of sequential logic circuits ?
1. Full adder 2. Full subtracter
3. Hall adder 4. J-K flip
5. Counter
Select the correct answer from the codes given below :
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 4 and 5.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

131. What are the output bits S (Sum) and C (Carry) of a Half Adder having input A = 1 and B = 1 ?

S	(a)	1	(b)	1	(c)	0	(d)	0
C		1		0		1		0

[U.P.S.C. I.E.S. E.E.-II, 2007]

132. A full adder can be made of
(a) two half adders
(b) two half adders and a NOR gate.
(c) two half adders and a OR gate
(d) two half adders and a AND gate
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

133. To add two m-bit numbers, the required number of half adders is
(a) $2m - 1$ (b) $2^m - 1$ (c) $2m + 1$ (d) $2m$
[U.P.S.C. I.E.S. E.E.-II, 2002]

134. Which one of the following statements is not correct ? Conversion of EXCESS-3 code to BCD can be achieved by using
(a) discrete gates. (b) 4–16 demultiplexer.
(c) A 4-bit full adder. (d) A 4-bit half adder.
[U.P.S.C. I.E.S. E.E.-II, 2003]

135. A gate is inhibited when its inhibit input is at '1'. The gate is :
(a) AND (b) NAND (c) OR (d) NOR
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

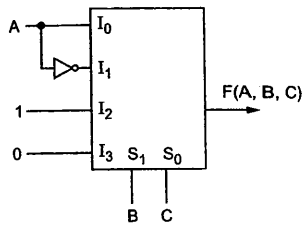
136. It is required to construct a 2^n-to-1 multiplexer by using 2-to-1 multiplexer only. How many of 2-to-1 multiplexers are needed ?
(a) n (b) 2^{2^n} (c) 2^{n-1} (d) $2^n - 1$
[U.P.S.C. I.E.S. E.E.-II, 2004]

137. What are the minimum number of 2-to-1 multiplexers required to generate a 2-input AND gate and a 2-input Ex-OR gate ?
(a) 1 and 2. (b) 1 and 3. (c) 1 and 1. (d) 2 and 2.
[GATE E.C.E. 2009]

138. When two 16-input multiplexers drive a 2-input MUX, what is the result ?
(a) 2-input MUX (b) 4-input MUX
(c) 16-input MUX (d) 32-input MUX
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

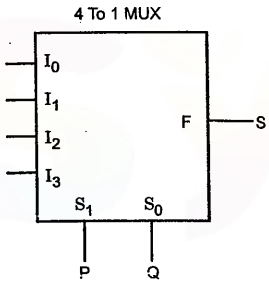
139. Consider a multiplexer with X and Y as data inputs and Z as control input. Z = 0 selects input X and Z = 1 selects input Y. What are the connections required to realize the 2-variable Boolean function $f = T + R$, without using any additional hardware ?
(a) R to X, 1 to Y, T to Z (b) T to X, R to Y, T to Z
(c) T to X, R to Y, 0 to Z (d) R to X, 0 to Y, T to Z
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

140. A 4 × MUX is used to implement a 3-input Boolean function as shown in figure. The Boolean function F(A, B, C) implemented is



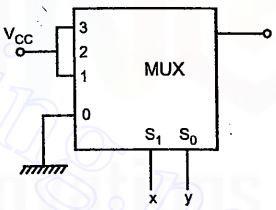
(a) $F(A, B, C) = \Sigma(1, 2, 4, 6)$
(b) $F(A, B, C) = \Sigma(1, 2, 6)$
(c) $F(A, B, C) = \Sigma(2, 4, 5, 6)$
(d) $F(A, B, C) = \Sigma(1, 5, 6)$
[GATE E.E. 2006]

141. Figure shows a 4 to 1 MUX to be used to implement the sum S of a 1-bit full adder with input bits P and Q and the carry input C_{in}. Which of the following combinations of inputs to I_0, I_1, I_2 and I_3 of MUX will realise the sum S ?



(a) $I_0 = I_1 = C_{in}$; $I_2 = I_3 = \bar{C}_{in}$
(b) $I_0 = I_1 = \bar{C}_{in}$; $I_2 = I_3 = C_{in}$
(c) $I_0 = I_3 = C_{in}$; $I_1 = I_2 = \bar{C}_{in}$
(d) $I_0 = I_3 = \bar{C}_{in}$; $I_1 = I_2 = C_{in}$
[GATE E.E. 2003]

142. The output f of the 4-to-1 MUX shown in the figure is :

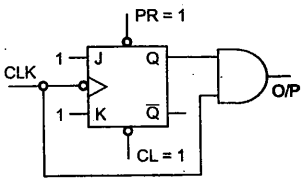


(a) $\overline{xy} + x$ (b) $x + y$
(c) $\bar{x} + \bar{y}$ (d) $xy + \bar{x}$
[GATE E.E. 2001]

143. What is the number of selector lines required in a single input n-output demultiplexer ?
(a) 2 (b) n (c) 2^n (d) $\log_2 n$
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

144. With which decoder it is possible to obtain many code conversions?
(a) 2 line to 4 line. (b) 3 line to 8 line.
(c) not possible with any decoder.
(d) 4 line to 16 line decoder. [U.P.S.C. I.E.S. E.T.E.-II, 2009]

145. The digital circuit shown in figure generates a modified clock pulse at the output. Choose the correct output waveform from the options given below.



Answers: **126.** (a), **127.** (b), **128.** (a), **129.** (d), **130.** (d), **131.** (c), **132.** (c), **133.** (a), **134.** (d), **135.** (d), **136.** (d), **137.** (a), **138.** (d), **139.** (a), **140.** (a), **141.** (c), **142.** (b), **143.** (d), **144.** (d), **145.** (b),

Downloaded From : www.EasyEngineering.net

(a) 
(b)
(c) (d)

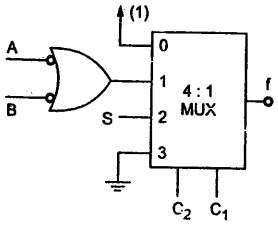
[GATE E.E. 2004]

146. Consider the following circuit:
Which one of the following gives the function implemented by the MUX- based digital circuit ?



(a) $f = C_2 \cdot \overline{C_1} \cdot S + \overline{C_2} \cdot C_1 \cdot (\overline{A} + \overline{B})$

(b) $f = \overline{C_2} \cdot \overline{C_1} + C_2 C_1 + C_2 \overline{C_1} \cdot S + \overline{C_2} \cdot C_1 \cdot \overline{AB}$

(c) $f = \overline{AB} + S$

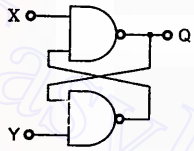
(d) $f = \overline{C_2} \cdot \overline{C_1} + C_2 \cdot \overline{C_1} \cdot S + \overline{C_2} \cdot C_1 \cdot \overline{AB}$

[U.P.S.C. I.E.S. E.E.-II, 2004]

147. Which of the following flip flop is used as a latch ?
(a) J-K flip-flop. (b) RS flip-flop.
(c) T flip-flop. (d) D flip-flop.

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

148. For a flip-flop formed from two NAND gates as shown in figure the unusable state corresponds to



(a) X = 0, Y = 0 (b) X = 0, Y = 1
(c) X = 1, Y = 0 (d) X = 1, Y = ∞

[GATE E.E. 1999]

149. The states of a R-S flip-flop are given in the following table.

States	R	S	Qn	Qn + 1
1	0	0	1	1
2	0	1	0	1
3	1	0	1	0

The mode operation of states 1, 2 and 3 are respectively.
(a) indeterminate, set and reset. (b) prohibited, set and hold.
(c) set, hold and reset. (d) hold, set and reset..

[U.P.S.C. I.E.S. E.E.-II, 2000]

150. When a flip-flop is reset, its output will be :
(a) $Q = Q; \overline{Q} = 1$ (b) $Q = 1; \overline{Q} = 0$
(c) $Q = 0; \overline{Q} = 0$ (d) $Q = 1; \overline{Q} = 1$

[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

151. A J-K flip-flop can be made from an S-R flip-flop by using two additional
(a) NAND gates. (b) OR gates.
(c) NOT gates. (d) NOR gates.

[U.P.S.C. I.E.S. E.E.-II, 2008]

152. In the toggle mode, a JK flip-flop has
(a) J = 0, K = 0 (b) J = 0, K = 1
(c) J = 1, K = 0 (d) J = 1, K = 1

[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

153. The output Q_n of a J-K flip-flop is zero. it changes to 1 when a clock pulse is applied. The input J_n and K_n are respectively
(a) 1 and X (b) 0 and X (c) X and 0 (d) X and 1

[U.P.S.C. I.E.S. E.E.-II, 1997]

154. For a JK flip-flop, Q_n is the output at time step t_n. Which of the following Boolean expressions represents Q_{n+1} ?
(a) $J_n \overline{Q}_n + \overline{K}_n Q_n$ (b) $J_n Q_n + K_n \overline{Q}_n$
(c) $\overline{J}_n Q_n + K_n \overline{Q}_n$ (d) $J_n Q_n + \overline{K}_n \overline{Q}_n$

[U.P.S.C. I.E.S. E.E.-II, 2004]

155. In a JK flip-flow, J is connected to $\overline{Q}$ and K is connected to Q outputs. The JK flip-flop converts into a
(a) R–S flip-flop. (b) D flip-flop.
(c) T flip-flop. (d) Clocked R–S flip flop.

[U.P.S.C. I.E.S. E.E.-II, 1999]

156. Which one of the following equations satisfies the JK flip-flop truth table ?
(a) $Q_{n+1} = J_n \overline{Q_n} + \overline{K_n} Q_n$ (b) $Q_{n+1} = \overline{J_n}\ \overline{Q_n} + \overline{K_n} Q_n$
(c) $Q_{n+1} = J_n Q_n + K_n Q_n$ (d) $Q_{n+1} = \overline{J_n}\ \overline{Q_n} + \overline{K_n}\ \overline{Q_n}$

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

157. The characteristic equation of a flip-flop gives the next state Q_{N+1} in terms of the present state Q_N and the inputs. Which one of the following is the characteristic equation of J-K flip-flop ?
(a) $Q_{N+1} = J\overline{Q}_N + \overline{K}Q_N$ (b) $Q_{N+1} = J + \overline{K}Q_N$
(c) $Q_{N+1} = \overline{K}Q_N + \overline{J}Q_N$ (d) $Q_{N+1} = K + \overline{J}Q_N$

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

158. The 'race-around' condition occurs when
(a) J = 0, K = 0 (b) J = 0, K = 1
(c) J = 1, K = 0 (d) J = 1, K = 1

[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005]

159. If t_p is pulse width, Δt is the propagation delay, T is period of pulse train then the following condition can avoid the race around condition.
(a) $t_p = \Delta t = T$ (b) $2t_p > \Delta t > T$
(c) $2t_p < \Delta t > T$ (d) $2t_p < \Delta t < T$

[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2005]

160. D flip-flop can be configured from a
(a) J-K flip-flop and an inverter.
(b) RS flip-flop. (c) RS flip-flop and an inverter.
(d) Both (a) and (b) above.

[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2006]

161. D flip-flop can be made from a J-K flip-flop by making
(a) J = K. (b) J = K = 1.
(c) J = 0, K = 1. (d) J = $\overline{K}$.

[U.P.S.C. I.E.S. E.E.-II, 2003]

162. An X-Y flip-flop whose characteristic table is given below is to be implemented using a J-K flip-flop.
This can be done by making

X	Y	Qn + 1
0	0	1
0	1	Q_n
1	0	$\overline{Q}_n$
1	1	0

(a) J = X, K = $\overline{Y}$.
(b) J = Y, K = $\overline{X}$.
(c) J = $\overline{X}$, K = Y. (d) J = $\overline{Y}$, K = X.

[GATE E.E. 2003]

163. Consider the following statements :
For a master slave J-K flip-flop
1. the toggle frequency is the maximum clock frequency at which the flip-flop will toggle reliably.

Answers: **146.** (d), **147.** (d), **148.** (a), **149.** (d), **150.** (a), **151.** (a), **152.** (d), **153.** (a), **154.** (a), **155.** (c), **156.** (a), **157.** (a), **158.** (d), **159.** (d), **160.** (a), **161.** (d), **162.** (d), **163.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

2. the data input must precede the clock triggering edge transition time by some minimum time.
3. the data input must remain fixed for a given time after the clock triggering edge transition time for reliable operation.
4. propagation delay time is equal to the rise time and fall time of the data.

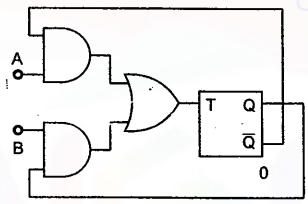
Which of the above statement(s) is/are correct ?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

164. Consider the following statements :
1. A flip-flop is used to store 1-bit of information.
2. Race around condition occurs in a J-K flip-flop when the both the inputs are 1.
3. Master slave configuration is used in flip-flop to store 2-bits of information.
4. A transparent latch consists of a D-type flip-flop.

Which of the above statement(s) is/are correct ?
(a) 1 only. (b) 1, 3 and 4.
(c) 1, 2 and 4. (d) 2 and 3 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

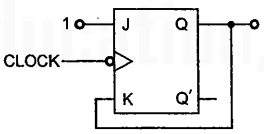
165. A master slave configuration consists of two identical flip-flops connected in such a way that the output of the master is input to the slave. Which one of the following is correct ?
(a) Master is level triggered and slave is edge triggered.
(b) Master is edge triggered and slave is level triggered.
(c) Master is positive edge triggered and slave is negative edge triggered.
(d) Master is negative edge triggered and slave is positive edge triggered. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

166. What is represented by the digital circuit given in figure ?



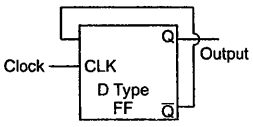
(a) An SR flip-flop with A = S and B = R.
(b) A JK flip-flop with A = K and B = J.
(c) A JK flip-flop with A = J and B = K.
(d) An SR flip-flop with A = R and B = S.
[U.P.S.C. I.E.S. E.E.-II, 2006]

167. In the circuit given in the figure, Q = 0 initially. What shall be the subsequent states of Q when clock pulses are given ?



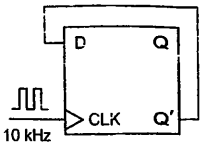
(a) 1, 0, 1, 0, ...
(b) 0, 0, 0, 0, ...
(c) 1, 1, 1, 1, ... (d) 0, 1, 0, 1, ...
[U.P.S.C. I.E.S. E.E.-II, 1998; 2008]

168. For the circuit shown in the figure, what is the frequency of the output Q ?



(a) Twice the input clock frequency.
(b) Half the input clock frequency.
(c) Same as the input clock frequency.
(d) Inverse of the propagation delay of the FF.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

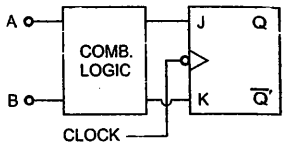
169. The frequency of the clock signal applied to the rising edge triggered D flip-flop shown in the figure is 10 kHz. What is the frequency of the signal available at Q ?



(a) 2.5 kHz (b) 5 kHz
(c) 10 kHz (d) 20 kHz
[GATE E.E. 2002; U.P.S.C. I.E.S. E.E.-II, 2007]

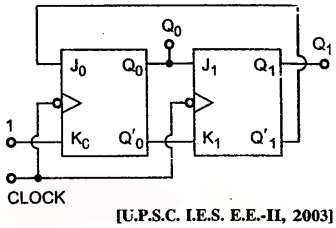
170. The following truth table has to realized with the circuit shown in the figure:

A	B	Q_{n+1}
0	0	Q_n
0	1	1
1	0	Q_n
1	1	0



What is the output of the combinational logic circuit to the J input?
(a) $\overline{AB}$ (b) $\bar{A}$ (c) $\bar{B}$ (d) AB
[U.P.S.C. I.E.S. E.E.-II, 2008]

171. In the circuit shown in the figure, assuming initially $Q_0 = Q_1 = 0$. Then the states of Q_0 and Q_1 immediately after the 33rd pulse are

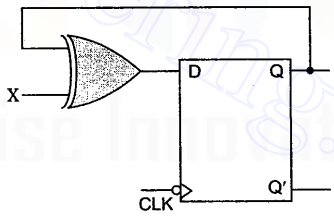


(a) 1 1 (b) 1 0
(c) 0 1 (d) 0 0
[U.P.S.C. I.E.S. E.E.-II, 2003]

172. Which one of the following statements is correct ?
For coherent detection of digital signals, the receiver must be
(a) synchronized in time only.
(b) synchronized in phase only.
(c) synchronized in time and phase.
(d) unsynchronized. [U.P.S.C. I.E.S. E.E.-II, 2004]

173. A square wave with a period of 10 μs drives a T flip-flop. The period of the output signal will be
(a) 100 μs. (b) 20 μs. (c) 10 ms. (d) 5 ms.
[U.P.S.C. I.E.S. E.E.-II, 1993]

174. The digital circuit as shown below represents to which one of the following?



(a) JK flip-flop. (b) Clocked RS flip-flop.
(c) T flip-flop. (d) Ring counter.
[GATE E.E. 2005; U.P.S.C. I.E.S. E.E.-II, 2009]

175. A ring counter consisting of five flip-flops will have
(a) 5 states. (b) 10 states.
(c) 32 states. (d) infinite states.
[A.M.I.E. Sec B. Electronics Circuits Winter 2005]

176. A 10 MHz square-wave clocks a 5-bit ripple counter. The frequency of the third flip-flop's output would be
(a) 2 MHz. (b) 1.25 MHz.
(c) 50 MHz. (d) 615 MHz.
[U.P.S.C. I.E.S. E.E.-II, 2000]

Answers: **164.** (c), **165.** (c), **166.** (c), **167.** (a), **168.** (b), **169.** (b), **170.** (b), **171.** (b), **172.** (b), **173.** (b), **174.** (c), **175.** (a), **176.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

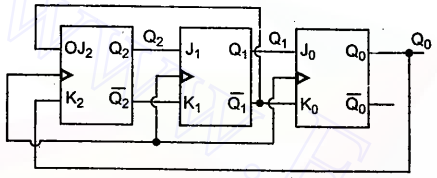
177. A 4-bit module-16 ripple counter uses J-K flip-flop. If the propagation delay of each flip-flop is 50 ns, the maximum clock frequency that can be used is equal to
(a) 20 MHz. (b) 10 MHz. (c) 8 MHz. (d) 5 MHz.
[U.P.S.C. I.E.S. E.E.-II, 2000, 2003]

178. In a ripple counter, the stage whose output has a frequency equal to 1/8th that of the clock signal applied to the first stage, also has an output periodicity equal to 1/8th that of the output signal obtained from the last stage. The counter is
(a) Modulo-8 (b) Modulo-6
(c) Modulo-64 (d) Modulo-16
[U.P.S.C. I.E.S. E.E.-II 2005]

179. The maximum possible number of states in a ripple counter with 5 flip-flops is
(a) 32 (b) 15 (c) 10 (d) 5
[A.M.I.E. Sec B. Pulse and Digital Circuits Winter 2006]

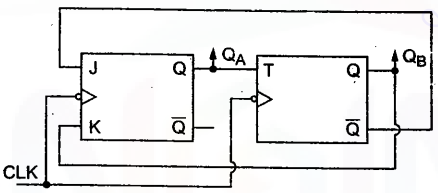
180. A 25 : 1 ripple counter is required. If 4 flip-flops are available on a chip, how many chips are needed ?
(a) 1 (b) 2 (c) 3 (d) 25
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2005]

181. The counter shown in the figure has initially $Q_2\,Q_1\,Q_0 = 000$. The status of $Q_2\,Q_1\,Q_0$ after the first pulse is



(a) 001 (b) 010 (c) 100 (d) 101
[U.P.S.C. I.E.S. E.E.-II, 1999]

182. A two-bit counter circuit is shown below.



If the state $Q_A Q_B$ of the counter at the clock time t_n is "10" then the state $Q_A Q_B$ of the counter at $t_n + 3$ (after three clock cycles) will be
(a) 00 (b) 01 (c) 10 (d) 11
[GATE E.E. 2011]

183. If a mod-6 counter is constructed using 3 flip-flops, the counter will skip
(a) 4 counts. (b) 3 counts. (c) 2 counts.
(d) none of the counts. [U.P.S.C. I.E.S. E.E.-II, 1998]

184. The number of flip flops required in a decade counter is
(a) 2 (b) 3 (c) 4 (d) 10
[U.P.S.C. I.E.S. E.E.-II, 1994]

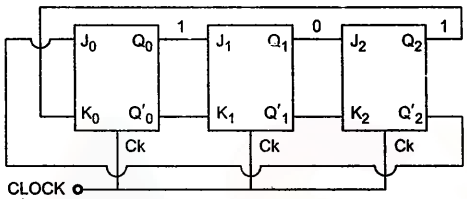
185. A synchronous sequential circuit is designed to detect a bit sequence 0101 (overlapping sequence included). Every time this sequence is detected, the circuit produces an output of 1. What is the minimum number of states the circuit must have ?
(a) 4 (b) 5 (c) 6 (d) 7
[U.P.S.C. I.E.S. E.E.-II 2004]

186. In order to build a MOD-12 counter, the minimum number of flip-flops needed is equal to
(a) 12 (b) 4 (c) 3 (d) 1
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Summer 2006]

187. A 4-bit Johnson counter is initialized to 0101. Whenever the state 1011 is reached, the counter is reinitialized to 0000 at the next clock active edge. Again when the state 0001 is reached, the counter is initialized back to 0101 at the next clock active edge. The cycle length of the counter is
(a) 6 (b) 8 (c) 16 (d) 12
[U.P.S.C. I.E.S. E.E.-II, 1999]

188. Consider the following statements in Johnson counter :
1. A MOD-6 Johnson counter requires 3 FFs.
2. Johnson counter requires decoding gates.
3. To decode each count, one logic gate is used. Each gate requires only two inputs regardless of the number of FFs.
Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2008]

189. The three-stage Johnson Ring Counter as shown in figure is clocked at a constant frequency of f_c from the starting state of $Q_0Q_1Q_2 = 1\,0\,1$. The frequency of outputs $Q_0Q_1Q_2$ will be

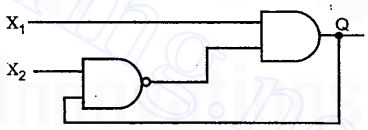


(a) $f_c/8$ (b) $f_c/6$ (c) $f_c/3$ (d) $f_c/2$
[U.P.S.C. I.E.S. E.E.-II, 2003]

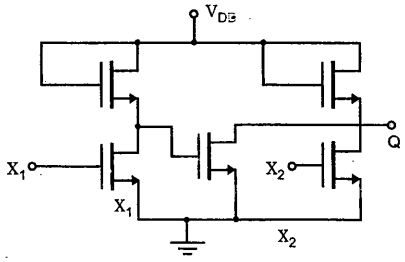
190. Which of the following counter results in least delay?
(a) Ring counter. (b) Ripple counter.
(c) Synchronous counter. (d) Asynchronous counter.
[U.P.S.C. I.E.S. E.E.-II, 2010]

191. Which of the following measurements can be done using counter?
1. Pulse duration 2. Interval between two pulses
3. Amplitude of the pulse 4. Rise time of a pulse
Select the correct answer from the codes given below :
(a) 1 and 2. (b) 2 and 3. (c) 1 and 4. (d) 2 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

192. In the figure as long as $X_1 = 1$ and $X_2 = 1$, the output Q remains
(a) at 1
(b) at 0
(c) at its initial value (d) unstable [GATE E.E. 2005]



193. If X_1 and X_2 are the inputs to the circuit shown in the figure, the output Q is



Answers: **177.** (d), **178.** (c), **179.** (a), **180.** (b), **181.** (c), **182.** (c), **183.** (c), **184.** (c), **185.** (c), **186.** (b), **187.** (d), **188.** (d), **189.** (d), **190.** (c), **191.** (a), **192.** (a), **193.** (d),

Downloaded From : www.EasyEngineering.net

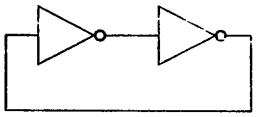
Downloaded From : www.EasyEngineering.net

(a) $\overline{X_1 + X_2}$ (b) $\overline{X_1 . X_2}$

(c) $\overline{X_1} . X_2$ (d) $X_1 . \overline{X_2}$

[GATE E.E. 2005; U.P.S.C. I.E.S. E.E.-II, 2009]

194. The digital circuit using two inverters shown in the figure will act as



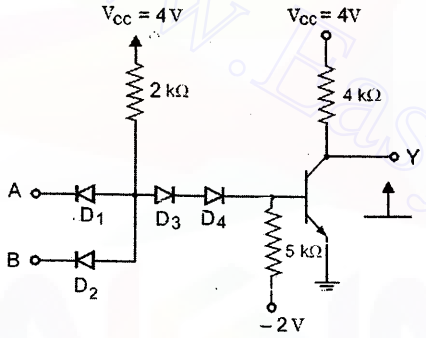
(a) a bistable multivibrator.
(b) an astable multivibrator.
(c) a monostable multivibrator.
(d) an oscillator. [GATE E.E. 2004; U.P.S.C. I.E.S. E.E.-II, 2010]

195. Saturated logic circuits have inherently
(a) low switching speed. (b) low noise immunity.
(c) high power dissipation. (d) short saturation delay time.

196. 7483 is a
(a) TTL binary adder. (b) TT clock.
(c) 8-bit binary subtractor. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-II, 1992]

197. Which one of the following is **not** a characteristic of RTL logic families?
(a) High switching speed. (b) Poor noise immunity.
(c) Low power dissipation. (d) Fan out is 5.
[U.P.S.C. I.E.S. E.E.-II, 2010]

198. The above fig shows a DTL circuit. The output Y will be low (logical zero) when the inputs A and B are



(a) both low. (b) low and high respectively.
(c) high and low respectively. (d) both high.
[U.P.S.C. I.E.S. E.E.-II, 1993]

199. The specification for a standard 74 series TTL gate reads propagation delay as 35 ns and power dissipation as 1 mW. This circuit is
(a) high speed TTL. (b) low speed TTL.
(c) standard Schottky TTL. (d) low power Schottky TTL.
[U.P.S.C. I.E.S. E.E.-II, 1993]

200. Which of the following statements is true ?
(a) ICs are always linear.
(b) Digital circuits are linear circuits.
(c) AND gate is a logic circuit where output is equal to its highest input.
(d) In a four-input AND circuit, all inputs must be UP for the output to be UP. [U.P.S.C. I.E.S. E.E.-II, 1992]

201. While _____ is the fastest unsaturated logic gate _____ has the excellent noise immunity.
(a) ECL, TTL (b) TTL, ECL
(c) ECL, HTL (d) RTL, DTL
[U.P.S.C. I.E.S. E.E.-II, 1992]

202. In Schottky TTL, a Schottky diode is used for
(a) forming the gate. (b) connecting the resistor.
(c) clamping of the base collector junction.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-II, 1992]

203. The product of which of the following gives the figure of merit of a logic family ?
(a) Gain and bandwidth.
(b) Propagation delay time and power dissipation.
(c) Fan-out and propagation delay time.
(d) Noise margin and power dissipation.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

204. The full forms of the abbreviations TTL and CMOS in reference to logic families are
(a) Triple Transistor Logic and Chip Metal Oxide Semiconductor.
(b) Tristate Transistor Logic and Chip Metal Oxide Semiconductor.
(c) Transistor Transistor Logic and Complementary Metal Oxide Semiconductor.
(d) Tristate Transistor Logic and Complementary Metal Oxide Silicon. [GATE E.E. 2009]

205. The I^2L (Integrated Injection Logic) has higher density of integration than TTL, because it
(a) does not require transistors with high current gain and hence they have smaller geometry.
(b) use compact bipolar transistors.
(c) does not require isolation diffusion.
(d) uses dynamic logic instead of static logic.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

206. Why does an I^2L (Integrated Injection Logic) have higher density of integration than TTL ?
(a) It does not require transistors with high current gain and hence they have smaller geometry.
(b) It uses multicollector transistors.
(c) It does not require isolation diffusion.
(d) It uses dynamic logic instead of static logic.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

207. Consider the following statements in respect of ECL gate:
1. Its switching speed is high.
2. It provides OR and NOR logic operations.
3. Its power dissipation is small as compared to other logic gates.
4. Its logic levels are compatible with other logic family gates.
Which of these statements are correct ?
(a) 1 and 2 (b) 1, 2 and 3 (c) 1, 2 and 4 (d) 3 and 4
[U.P.S.C. I.E.S. E.E.-II, 2003]

208. In standard TTL gates, the totem pole output stage is primarily used to
(a) increase the noise margin of the gate.
(b) decrease the output switching delay.
(c) facilitate a wired OR logic connection.
(d) increase the output impedance of the circuit. [GATE E.E. 1998]

209. Consider the following statements :
1. TTL has high switching speed and good fan-out capability.
2. ECL has the least propagation delay.
3. I^2L uses multicollector transistors.
4. NMOS has more silicon area.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 2 and 4.
(c) 1, 3 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2004]

Answers: **194.** (a), **195.** (a), **196.** (a), **197.** (a), **198.** (d), **199.** (b), **200.** (d), **201.** (c), **202.** (c), **203.** (b), **204.** (c), **205.** (a), **206.** (b), **207.** (a), **208.** (b), **209.** (a),

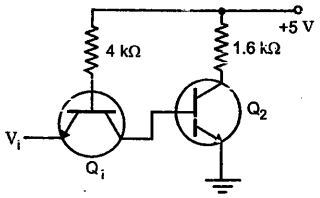
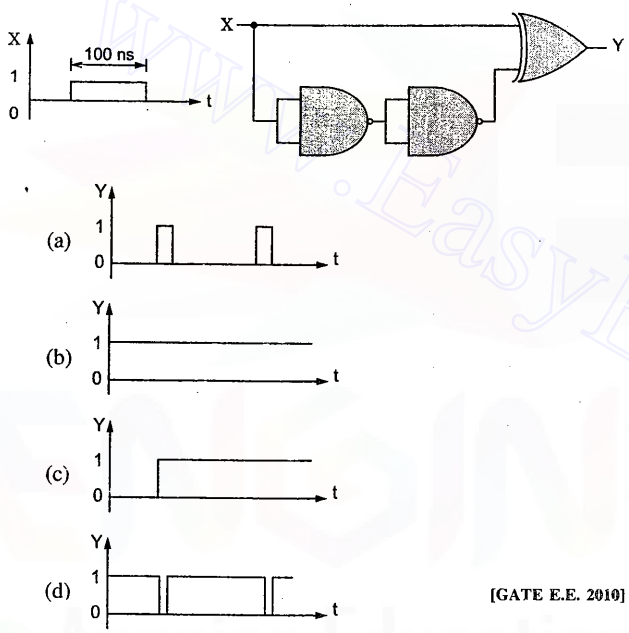
210. The logic circuit which belongs to non-saturated logic is
(a) ECL (b) TTL (c) CMOS (d) NMOS
[A.M.I.E. Sec B. Electronic Circuits Summer 2006]

211. A TTL NOT gate circuit is shown in figure. Assuming $V_{BE} = 0.7$ V of both the transistors, if $V_i = 3.0$ V, then the states of the two transistors will be



(a) Q_1 ON and Q_2 OFF
(b) Q_1 reverse ON and Q_2 OFF
(c) Q_1 reverse ON and Q_2 ON
(d) Q_1 OFF and Q_2 reverse ON [GATE E.E. 2006]

212. The TTL circuit shown in the figure is fed with the waveform X (also shown). All gates have equal propagation delay of 10 ns. The output Y of the circuit is

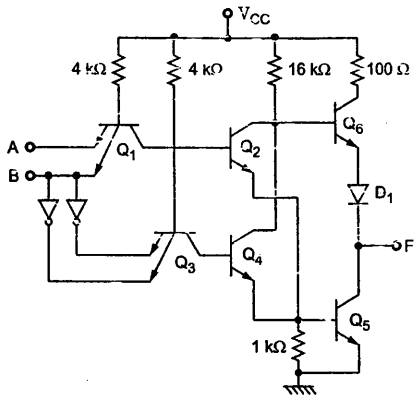


[GATE E.E. 2010]

213. Which one of the following statements is correct ?
Removing the small resistance (~100 Ω) in the collector lead of the pull-up transistor of a totempole output gate, will result in
(a) reduced switching time from $V_{out}(I)$ to $V_{out}(O)$.
(b) incorrect operation of the gate.
(c) lower power dissipation.
(d) more noise generation in the power supply distribution at high frequencies. [U.P.S.C. I.E.S. E.E.-II, 2005]

214. Floating-gate avalava-injection MOS (FAMOS) is electrically programmable but it can be erased only with
(a) IR light. (b) γ rays.
(c) UV light. (d) microwaves.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

215. The output 'F' of the circuit shown in the given figure is



(a) $A\bar{B}$ (b) $\bar{A}B$ (c) $AB + \bar{A}\bar{B}$ (d) $\bar{A}B + A\bar{B}$
[U.P.S.C. I.E.S. E.E.-II, 1998]

216. In the CMOS inverter, the power dissipation is
(a) low only when V_{IN} is low.
(b) low only when V_{IN} is high.
(c) high during dynamic operation.
(d) low during dynamic operation. [U.P.S.C. I.E.S. E.E.-II, 2001]

217. Extremely low power dissipation and low cost per gate can be achieved in the following IC :
(a) ECL (b) CMOS (c) TTL (d) MOS
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2006]

218. The standard power dissipation of an MOS inverter is of the order of
(a) 100 mW (b) 100 nW (c) 10 nW (d) 10 mW
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

219. The total power dissipation of a CMOS inverter is
(a) due to standby power alone.
(b) due to transient power loss during switching.
(c) due to standby power and the transient power loss during switching.
(d) due to ohmic loss in the device.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

220. Which one of the following is not a characteristic of CMOS configuration ?
(a) CMOS devices dissipate much lower static power than bipolar devices.
(b) CMOS devices have low input impedances.
(c) CMOS devices have higher noise margins.
(d) CMOS devices have much lower transconductance than bipolar devices. [U.P.S.C. I.E.S. E.E.-II, 2006]

221. In a CMOS inverter,
(a) one transistor is N channel depletion type and the other is P channel enhancement type.
(b) one transistor is N channel depletion type and the other is N channel enhancement type.
(c) one transistor is N channel enhancement type and the other is P channel enhancement type.
(d) one transistor is N channel enhancement type and the other is also N channel enhancement type. [U.P.S.C. I.E.S. E.E.-II, 1993]

222. Consider the following statements describing the property of a complementary MOS (CMOS) inverter :
1. It is a combination of an *n*-channel FET and a *p*-channel FET.
2. There is power dissipation when the input carries the logical 1 signal.

Answers: **210.** (a), **211.** (c), **212.** (a), **213.** (d), **214.** (a), **215.** (d), **216.** (d), **217.** (b), **218.** (c), **219.** (c), **220.** (b), **221.** (c), **222.** (d),

Downloaded From : www.EasyEngineering.net

3. There is no power dissipation when the input carries the logical 0 signal.
4. There is power dissipation during transition from 0 to 1 from 1 to 0.

Which of the statements given above are correct ?

(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2 and 4.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

223. Consider the following statements :

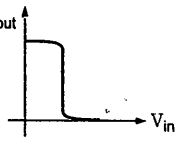
1. CMOS gates require very little power when they are not changing states.
2. Transmission gates are widely used in CMOS design.
3. CMOS circuits have considerable resistance to noise.

Which of the statements given above are correct ?

(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

224. Given figure is the voltage transfer characteristic of



(a) an NMOS inverter with enhancement mode transistor as load.
(b) an NMOS inverter with depletion mode transistor as load.
(c) a CMOS inverter. (d) a BJT inverter.

[GATE E.C.E. 2004]

225. The logic family which has minimum power dissipation is

(a) TTL (b) I^2L (c) ECL (d) CMOS

[A.M.I.E. Sec B. Electronic Circuits Winter 2005]

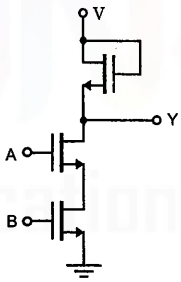
226. Three open-collector TTL gates in wired AND configuration, drive the inputs of five TTL gates. What would be a suitable value for external pull-up resistor connected to the wired -AND circuit, if the following specifications applied to TTL gates ?

Low level input current = 1.6 mA
Low level output current = 16 mA
Low level input voltage = 0.8 V
Low level output voltage = 0.4 V

(a) 600 Ω. (b) 300 Ω. (c) 60 Ω. (d) 30 Ω.

[U.P.S.C. I.E.S. E.E.-II, 1994]

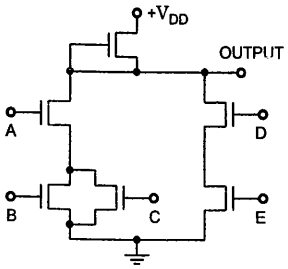
227. The below shown NMOS circuit is a gate of the type



(a) NAND (b) NOR
(c) AND (d) EX-OR

[U.P.S.C. I.E.S. E.E.-II, 2003]

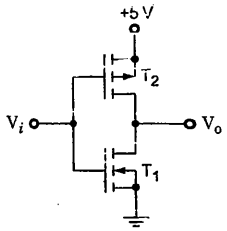
228. An NMOS circuit is shown in the figure. The logic function for the output (o/p) is



(a) $\overline{(A+B)}\cdot C+\bar{D}\cdot\bar{E}$ (b) $(AB+\bar{C})\cdot(\bar{D}+E)$
(c) $\overline{A\cdot(B+C)+D\cdot E}$ (d) $\overline{ABCDE}$

[U.P.S.C. I.E.S. E.E.-II, 2001]

229. Consider the following statements in connection with the CMOS inverter in the figure, where both the MOSFETs are of enhancement type and both have a threshold voltage of 2 V.

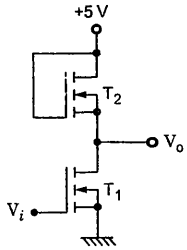


Statement 1 : T_1 conducts when $V_i \geq 2$ V.
Statement 2 : T_1 is always in saturation when $V_0 = 0$ V.
Which of the following is correct ?

(a) Only Statement 1 is TRUE.
(b) Only Statement 2 is TRUE.
(c) Both the statements are TRUE.
(d) Both the statements are FALSE.

[GATE E.C.E. 2002]

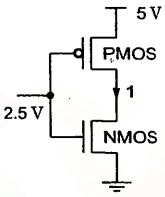
230. $r_{d(ON)}$ for $T_2 = 100$ kΩ
$r_{d(OFF)}$ for $T_2 = 10^5$ MΩ
$r_{d(ON)}$ for $T_1 = 1$ kΩ
$r_{d(OFF)}$ for $T_1 = 10^4$ MΩ
The value V_0 for ? V_1 in logic for the above figure is



(a) 5 V. (b) 4.8 V.
(c) 0.05 V. (d) 0 V.

[U.P.S.C. I.E.S. E.E.-II, 2001]

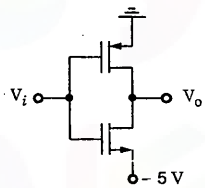
231. In the CMOS inverter circuit shown, if the transconductance parameters of the NMOS and PMOS transistors are $k_n = k_p = \mu_n C_{ox} W_n/L_n = \mu_p C_{ox} W_p/L_p = 40\ \mu A/V^2$ and their threshold voltages are $V_{THn} = |V_{THp}| = 1$ V, the current I is



(a) 0 A. (b) 25 mA.
(c) 45 μA. (d) 90 μA.

[GATE E.E. 2007]

232. The threshold voltage for each transistor in the figure shown is 2.0 V. What are the values of V_i for this circuit to work as an inverter ?



(a) –5 V and 0 V.
(b) –5 V and 5 V.
(c) 0 V and 5 V.
(d) –3 V and 3 V.

[U.P.S.C. I.E.S. E.T.E.-II, 2008]

233. Which one of the following logic families can be operated using a supply voltage from 3 V to 15 VC ?

(a) TTL (b) ECL (c) PMOS (d) CMOS

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

234. Which of the following factors are responsible to design IC logic gates to operate at a fixed supply voltage of 5 V ?

1. Low heating of IC logic gates.
2. Compatibility with other logic gates.
3. Satisfactory and safe operation.
4. Standardization from IC manufacturing point of view.

Select the correct answer from the codes given below :

(a) 1 only. (b) 2 only. (c) 2 and 3. (d) 3 and 4.

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

235. Which of the following output configurations are available in a TTL gate ?

1. Open collector output. 2. Totem-pole output.
3. Tristate output.

Select the correct answer from the codes given below :

(a) 1 only. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1, 2, and 3.

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

Answers: **223.** (d), **224.** (c), **225.** (d), **226.** (b), **227.** (b), **228.** (c), **229.** (c), **230.** (c), **231.** (d), **232.** (d), **233.** (d), **234.** (c), **235.** (d),

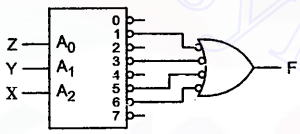
236. Which of the following statements is not correct ?
(a) Propagation delay is the time required for a gate to change its state.
(b) Noise immunity is the amount of noise which can be applied to the input of a gate without causing the gate to change state.
(c) Fan-in of a gate is always equal to fan-out of the same gate.
(d) Operating speed is the maximum frequency at which digital data can be applied to a gate. **[U.P.S.C. I.E.S. E.T.E.-II, 2009]**

237. Which of the following conditions should be satisfied to call an astable multivibrator circuit using discrete components as a digital circuit ?
1. A flip-flop is always a digital circuit.
2. Only when we assign 1 and 0 to the high and low levels of the output, a flip-flop is called a digital circuit.
3. Only if the power supply voltage is maintained at +5 V or –5 V, it is called a digital circuit.
4. Only if it is in IC form, following the technology of IC manufacture, it is called a digital circuit.

Select the correct answer from the codes given below :
(a) 1 only. (b) 2 and 3. (c) 2 only. (d) 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

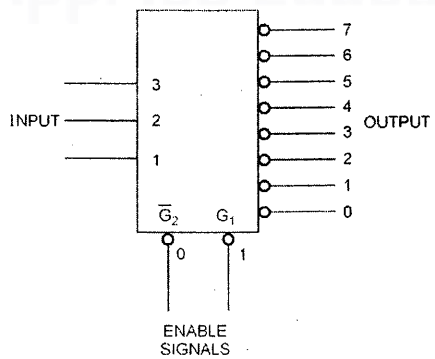
238. A range decoder is a digital circuit which outputs a '1' whenever an m-bit number X falls within the range, $2^P \le X \le 2^q$, $0 \le p$, $q \le m-1$. Which one of the following functions describes the range-decoder ?
(a) $(X_p . X_p + 1 .... X_{q-1} . X_q)\ (X_{q+1} + X_{q+2} + ... + X_{m-1})$
(b) $(X_p \oplus X_{p+1} \oplus ... X_q)\ (\bar{X}_{q+1} + \bar{X}_{q+2} + ... + \bar{X}_{m-1})$
(c) $(X_p + X_{p+1} + ... + X_{q-1} + X_q)\ (\bar{X}_{q+1} ... X_{m-1})$
(d) $(X_0 + X_1 + X_2 + ... + X_q)\ (\bar{X}_{q+1} \cdot \bar{X}_{q+2} \cdot ... \cdot \bar{X}_{m-1})$
[U.P.S.C. I.E.S. E.E.-II, 2004]

239. A 3 line to 8 line decoder, with active low outputs, is used to implement a 3-variable Boolean function as shown in the figure. The simplified form of Boolean function F(A, B, C) implemented in 'Product of Sum' form will be



(a) $(X + Z) \cdot (\bar{X} + \bar{Y} + \bar{Z})(Y + Z)$.
(b) $(\bar{X} + \bar{Z}) \cdot (X + Y + Z) \cdot (\bar{Y} + \bar{Z})$.
(c) $(\bar{X} + \bar{Y} + Z) \cdot (\bar{X} + Y + Z) \cdot (X + \bar{Y} + Z) \cdot (X + Y + \bar{Z})$.
(d) $(\bar{X} + \bar{Y} + \bar{Z}) \cdot (\bar{X} + Y + \bar{Z}) \cdot (X + \bar{Y} + Z) \cdot (X + \bar{Y} + \bar{Z})$.
[GATE E.E. 2008]

240. A 3-to-8 decoder is shown below :



All the output lines of the chip will be high, when all the inputs 1, 2 and 3
(a) are high, G_1, G_2 are low.
(b) are high, G_1 is low, G_2 is high.
(c) are low, G_1 is low, G_2 is high.
(d) are high, G_1 is high, G_2 is low. **[U.P.S.C. I.E.S. E.E.-II, 2002]**

241. Among the following four, the slowest ADC analog-to-digital converter is
(a) parallel comparator (i.e. flash) type.
(b) successive approximation type.
(c) integrating type. (d) counting type. **[GATE E.E. 2001]**

242. In which one of the following types of analog-to-digital converters the conversion time is practically independent of the amplitude of the analog signal.
(a) The dual slope integrating type.
(b) Successive approximation type.
(c) Counter ramp type. (d) Tracking type.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

243. The factors to be considered in the design and application of successive approximation ADCs are
(a) stability and regulation of the reference voltage source.
(b) overload and recovery characteristics of the comparator.
(c) characteristics of analog switches and speed and response of the ladder network.
(d) all of the above.

244. Which of the following is NOT true in the circuit for digital-to-analog voltage converter ?
(a) Some logic circuitry. (b) A resistor network.
(c) A reference voltage. (d) A resonant circuit.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

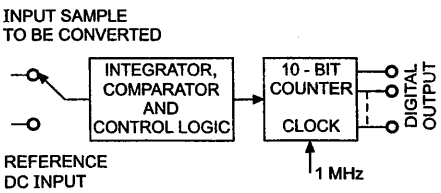
245. Consider the following A/D converters used commonly in digital instruments :
1. Successive approximation type.
2. Flash type.
3. Dual slope type.

The correct sequence in increasing order of their conversion times is
(a) 1, 2, 3 (b) 2, 3, 1 (c) 2, 1, 3 (d) 3, 1, 2
[U.P.S.C. I.E.S. E.E.-I, 1999]

246. Which of the following terms is NOT associated with a sample-and-hold circuit ?
(a) Conversion time. (b) Acquisition time.
(c) Aperture time. (d) Sample mode.
[U.P.S.C. I.E.S. E.E.-I, 1993]

247. The reference voltage and the input voltage are sequentially connected to the integrator with the help of a switch in a
(a) Successive approximation A/D converter.
(b) Dual slope integration A/D converter.
(c) Voltage to time converter.
(d) Voltage to frequency converter. **[U.P.S.C. I.E.S. E.E.-I, 2005]**

248. The simplified block diagram of a 10-bit A/D converter of dual slope integrator type is shown in the figure. The 10-bit counter at the output is clocked by a 1 MHz clock. Assuming negligible timing overhead for the control logic, the maximum frequency of the analog signal that can be converted using this A/D converter is approximately



Answers: **236.** (c), **237.** (a), **238.** (c), **239.** (a), **240.** (b), **241.** (c), **242.** (a), **243.** (d), **244.** (d), **245.** (c), **246.** (a), **247.** (b), **248.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 2 kHz (b) 1 kHz (c) 500 Hz (d) 250 Hz
[GATE E.E. 2003]

249. A dual-slope ADC uses an N-bit counter. When the input signal V_a is being integrated, the counter is allowed to count up to a value
(a) equal to 2^N-2. (b) equal 2^N-1.
(c) proportional to V_a. (d) inversely proportional to V_a.
[GATE E.E. 2000]

250. In order to build a 3 bit simultaneous A/D converter, what is the number of comparator circuits required ?
(a) 7 (b) 8 (c) 15 (d) 16
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

251. A 10-bit A/D converter is used to digitize an analog signal in the 0 to 5 V range. What is the approximate value of the maximum peak to peak ripple voltage that can be allowed in the dc supply voltage?
(a) 100 mV (b) 50 mV (c) 25 mV (d) 5.0 mV
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

252. A 12 bit A/D converter has a range of 0–10 V. What is the approximate resolution of the converter ?
(a) 1 mV (b) 2.5 mV (c) 2.5 μV (d) 12 mV
[U.P.S.C. I.E.S. E.E.-I, 2005]

253. An n-bit A/D converter is required to convert an analog input in the range 0.5 V to an accuracy of 10 mV. The value of n should be
(a) 16 (b) 10 (c) 9 (d) 8
[U.P.S.C. I.E.S. E.E.-II 2000, 2003]

254. The resolution of a 12-bit analog-to-digital converter in percent is
(a) 0.01220 (b) 0.02441 (c) 0.04882 (d) 0.09760
[U.P.S.C. I.E.S. E.E.-II, 2002]

255. A successive approximation ADC has a resolution of 20 mV. What is its digital output for an analog input of 2.17 V ?
(a) 0110 1100 (b) 0110 1101
(c) 0110 1011 (d) 0111 0100
[U.P.S.C. I.E.S. E.E.-I, 2006]

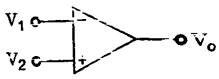
256. The number of comparators needed in a parallel conversion type 8-bit A to D convertor is
(a) 8 (b) 16 (c) 255 (d) 256
[GATE E.E. 1992]

257. A 31/2 digit 2 V full scale slope ADC has its integration time set to 300 ms. If the input to the ADC is $(1 + 1 \sin 314\, t)$ then the ADC output will be
(a) 1.000. (b) 1.999. (c) 1.414. (d) 1.500.
[GATE E.E. 1995]

258. Two 8-bit ADCs, one of single slope integrating type and other of successive approximate type, take T_A and T_B times to convert 5V analog input signal to equivalent digital output. If the input analog signal is reduced to 2.5 V, the approximate time taken by two ADCs will respectively, be
(a) T_A, T_B (b) $T_A/2, T_B$ (c) $T_A, T_B/2$ (d) $T_A/2, T_B/2$
[GATE E.E. 2008]

259. A doctor is using a digital clinical thermometer, which employs an A/D converter. The converter provides for both +ve and –ve reference inputs in place of only +ve and ground potential reference inputs. $V^-_{ref} = 2.16$ V and $V_{ref} = 1.85$ V. The amplifier used for the converter input generates signal of 20 mV per °F of body temperature. The converter output is between 00000 and 11111, which one of the following is correct ?
(a) The thermometer range is 92.5°F to 108°F.
(b) The thermometer range is 46°F to 216°F.
(c) The thermometer range is 0°F to 108°F.
(d) The thermometer cannot be used to measure body temperature 98.4°F.
[U.P.S.C. I.E.S. E.E.-I, 2006]

260. The voltage comparator shown in the figure can be used in the analog-to-digital conversion as



(a) a 1-bit quantizer.
(b) a 2-bit quantizer.
(c) a 4-bit quantizer. (d) a 8-bit quantizer.
[GATE E.E. 2004]

261. Given below are three types of converters :
1. Successive approximation type.
2. Weighted resistor type. 3. R-2 R ladder type.
Which of the types are D to A converters ?
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

262. The voltage resolution for an n-stage ladder network is given as
(a) $\frac{V_{REF}}{2^{n+1}}$ (b) $\frac{V_{REF}}{2^n}$ (c) $\frac{V_{REF}}{2^{n-1}}$ (d) $\frac{V_{REF}}{n-1}$

263. A digital-to-analog converter with a full scale output voltage of 3.5 V has a resolution close to 14 mV. Its bit size is
(a) 4 (b) 8 (c) 16 (d) 32
[GATE E.E. 2005]

264. A 3-bit resistance ladder D/A (R-2R network) has resistor values of R = 10 kΩ and 20 kΩ. If $V_{ref} = 8$ V, I_0 for a digital input of 111 will be
(a) 0.1 mA (b) 0.2 mA (c) 0.7 mA (d) 1 mA
[U.P.S.C. I.E.S. E.E.-II, 1999]

265. A 10 bit A/D convertor is used to digitise an analog signal in the 0 to 5 V range. The maximum peak to peak ripple voltage that can be allowed in the dc supply voltage is
(a) nearly 100 mV. (b) nearly 50 mV.
(c) nearly 25 mV. (d) nearly 5 mV. [GATE E.E. 1993]

266. The resolution of Digital-to-Analog Converter is governed by which one of the following (where n is the number of digital inputs)?
(a) $2n$ (b) $2/n$ (c) $(2)^n$ (d) $\sqrt{2^n}$
[U.P.S.C. I.E.S. E.E.-II, 2007]

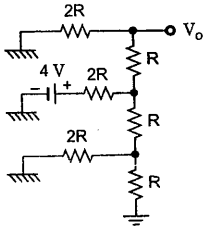
267. Which one of the following D/A converters has the resolution of approximately 0.4 % of its full scale range ?
(a) 8-bit (b) 10-bit (c) 12-bit (d) 16-bit
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

268. The successive approximation A/D output for a 4-bit converter to a 8.217 volt input (if the reference is 5 V) will be
(a) 1101 (b) 0110 (c) 1010 (d) 1001
[U.P.S.C. I.E.S. E.E.-I, 2008]

269. How many bits will a D/A converter use so that its full-scale output voltage is 5 V and its resolution is at the most 10 mV ?
(a) 5 (b) 7 (c) 9 (d) 11
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

270. What is the value of LSB of an 8 bit DAC for 0–12.8 V range ?
(a) 1.6 V (b) 50 mV (c) 0.625 V (d) 1.28 V
[U.P.S.C. I.E.S. E.E.-II, 2007]

271. What is the output voltage 'V_o' of the R-2R decoder ladder network?



(a) 1 V (b) 2 V
(c) 3 V (d) 4 V
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

272. An analog voltage signal whose highest significant frequency is 1 kHz is to be digitally coded with a resolution of 0.01%

Answers: **249.** (c), **250.** (a), **251.** (d), **252.** (b), **253.** (c), **254.** (b), **255.** (d), **256.** (c), **257.** (b), **258.** (a), **259.** (a), **260.** (b), **261.** (b), **262.** (b), **263.** (b), **264.** (c), **265.** (d), **266.** (c), **267.** (a), **268.** (a), **269.** (c), **270.** (b), **271.** (a), **272.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

covering the voltage range of 0 to 10 V. To avoid loss of information the minimum number of bits in the digital code should be
(a) 4 (b) 8 (c) 10 (d) 14
[U.P.S.C. I.E.S. E.E.-I, 1993]

273. Which of the following is NOT true for a digital frequency counter?
(a) High accuracy. (b) Less costly.
(c) Wide range of frequency measurement.
(d) Accepts input in the form of train of pulses.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1997]

274. The important characteristics of a frequency counter are given below :
1. Time base accuracy.
2. Least significant bit count.
3. Gain of the input amplifier.
The more important characteristic(s) responsible for the overall accuracy of frequency measurement using the counter would include
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 2 alone
[U.P.S.C. I.E.S. E.E.-I, 1994]

275. The measurement of very low and very high frequency is invariably done using a frequency counter/timer in the
(a) frequency measurement mode only.
(b) period measurement mode only.
(c) frequency and period measurements mode respectively.
(d) period and frequency measurements modes respectively.
[U.P.S.C. I.E.S. E.E.-I, 1993]

276. A decade frequency range is specified by
(a) $\frac{\omega_2}{\omega_1} = 2$ (b) $\frac{\omega_2}{\omega_1} = 10$
(c) $\frac{\omega_2}{\omega_1} = 8$ (d) none of the above.
[U.P.S.C. I.E.S. E.E.-I, 1992]

277. Which of the following measurements can be made with the help of a frequency counter ?
1. Fundamental frequency of input signal.
2. Frequency components of the input signal at least upto third harmonic.
3. Time interval between two pulses.
4. Pulse width.
Select the correct answer using the codes given below.
(a) 1, 3 and 4 (b) 1, 2 and 3
(c) 2 and 4 (d) 1 and 2
[U.P.S.C. I.E.S. E.E.-I, 1998]

278. Which of the following characteristics is NOT relevant to electronic counters ?
(a) High resolution. (b) High accuracy.
(c) Wide range of frequency counting.
(d) Slow speed.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

279. Which one of the following sets of building blocks mainly decides the accuracy of a frequency counter ?
(a) Crystal and ADC. (b) ADC and DAC.
(c) DAC and gate width generator.
(d) Gate width generator and crystal. [U.P.S.C. I.E.S. E.E.-I, 2000]

280. An analog voltage signal whose highest significant frequency is 1 kHz is to be coded with a resolution of 0–01 percent for a voltage range of 0–10 V. The minimum sampling frequency and the minimum number of bits should respectively be
(a) 1 kHz and 12. (b) 1 kHz and 14.
(c) 2 kHz and 12. (d) 2 kHz and 14.
[U.P.S.C. I.E.S. E.E.-I, 2001]

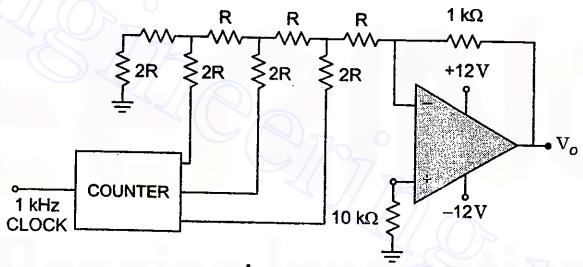
281. Pulses of a frequency of 1 MHz are applied to the time base selector of a digital frequency meter which consists of 6 frequency dividers, each dividing the incoming frequency by a factor of 10. What is the time base setting at the output of 4th frequency divider
(a) 1 ms. (b) 10 ms. (c) 100 ms. (d) 1 second.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

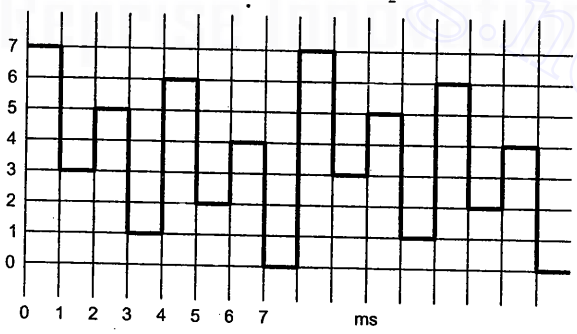
282. A single channel digital storage oscilloscope uses a 12 bit, 10^8 samples/s ADC. For a 10 kHz sine wave input, what is the number of samples taken per cycle of input ?
(a) 10^{12} (b) 10^8 (c) 10^4 (d) 10^2
[U.P.S.C. I.E.S. E.E.-I, 2005]

283. The output frequency of a decade counter that is clocked from a 50 kHz signal is
(a) 12.5 kHz (b) 50 kHz (c) 5 kHz (d) 500 kHz
[U.P.S.C. I.E.S. E.E.-II, 2006]

284. The measurement of very low and very high frequencies is invariably done using a frequency counter in which one of the following ?
(a) Frequency measurement mode only.
(b) period measurement mode only.
(c) Frequency and period measurement modes, respectively.
(d) Period and frequency measurement modes, respectively.
[U.P.S.C. I.E.S. E.E.-I, 2007]

285. A student has made a 3-bit binary down counter and connected to the R-2R ladder type DAC [Gain = (–1 kΩ/2R) as shown in figure to generate a staircase waveform. The output achieved is different as shown in figure. What could be possible cause of this error ?





(a) The resistance values are incorrect.
(b) The counter is not working properly.
(c) The connection from the counter to DAC is not proper.
(d) The R and 2R resistances are interchanged. [GATE E.E. 2006]

Answers: **273.** (b), **274.** (a), **275.** (d), **276.** (b), **277.** (a), **278.** (d), **279.** (d), **280.** (d), **281.** (c), **282.** (c), **283.** (c), **284.** (d), **285.** (c),

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below.

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

1. (A): When all inputs of a NAND gate are shorted to get a one input, one output gate, it becomes an inverter.
(R): When all inputs of a NAND gate are at logic '0' level, the output is at logic '1' level. **[U.P.S.C. I.E.S. E.T.E.-II, 2009]**

2. (A): In digital transducers used for measurement of displacement, it is quite common to use Gray Code instead of natural binary code.
(R): Gray Code is used for overcoming the inherent disadvantages of a natural binary code. These include errors that are caused on account of even slight misalignment which may cause change of decimal number thereby changing the number of bits. Gray Code does not suffer from this disadvantage. **[U.P.S.C. I.E.S. E.E.-I, 2001]**

3. (A): A 64 input MUX can be built by using eight 8 input multiplexers.
(R): Any six variable function can always be implemented by a multiplexer with six address lines. **[U.P.S.C. I.E.S. E.E.-II, 1999]**

4. (A): D-latch and edge-triggered D-flip flop (FF) are functionally different.
(R): In D-latch the output (Q) can change while enable (EN) is High. In D-FF the output can change only on the active edge of CLK. **[U.P.S.C. I.E.S. E.E.-II, 2001]**

5. (A): In an asynchronous counter, output of each FF serves as CLK input signal for the next FF.
(R): All the FFs do not change states in exact synchronism with the clock pulses. **[U.P.S.C. I.E.S. E.E.-II, 2003]**

6. (A): To obtain high switching speed in BJT based logic circuits, transistors are operated in active region.
(R): In active region a transistor works as a linear element. **[U.P.S.C. I.E.S. E.T.E.-II, 2006]**

7. (A): The emitter logic reduces the transistor rise time and hence results in logic gates which switch very fast.
(R): In emitter-coupled logic, the transistors are maintained in unsaturated condition. **[U.P.S.C. I.E.S. E.E.-II, 1993]**

8. (A): A digital multiplexer can also be used to implement combinational logic functions.
(R): In a combinational circuit, the current output depends on the previous outputs only. **[U.P.S.C. I.E.S. E.E.-II, 1995]**

9. (A): Dual-slope A/D converter is the most preferred A/D conversion approach in digital multi-meters.
(R): Dual -slope A/D converter provides high accuracy in A/D conversion while at the same time suppressing the hum effect on the input signal. **[U.P.S.C. I.E.S. E.E.-I, 1995]**

10. (A): The DAC (Digital Analog Converter) cannot be interfaced to microprocessor in an interrupt driven mode.
(R): DAC neither needs a start convert pulse nor it has indication of conversion. **[U.P.S.C. I.E.S. E.E.-II, 2009]**

Answers: **1.** (b), **2.** (a), **3.** (d), **4.** (a), **5.** (b), **6.** (d), **7.** (a), **8.** (c), **9.** (b), **10.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

	List 1 (Binary)		List 2 (Decimal)
A	10101010	1.	128
B	11110000	2.	240
C	10001000	3.	170
D	10000000	4.	136

Codes:	A	B	C	D
(a)	3	2	4	1
(b)	2	3	1	4
(c)	2	4	1	3
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-II, 1995]

2.

List 1 (Circuit Symbols)		List 2 (Nomenclature)
A.		1. NAND
B.		2. NOR
C.		3. Buffer
D.		4. Schmitt trigger

Answers: **1.** (a), **2.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	3	4	2	1
(c)	4	3	2	1
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-II, 2004]

3.

List 1 (Expression-I)	List 2 (Expression-II)
A. $ABC + AB\bar{C} + A\bar{B}C$	1. $\bar{A} + BC$
B. $\bar{A}B\bar{C} + AB\bar{C} + B\bar{C}$	2. $A(B + C)$
C. $\bar{A}BC + A\bar{B}C + AB\bar{C} + ABC$	3. $B\bar{C}$
D. $\overline{AB} + \bar{A}B + ABC$	4. $AB + BC + AC$

Codes :	A	B	C	D
(a)	2	1	4	3
(b)	4	3	2	1
(c)	2	3	4	1
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2008]

4.

List 1	List 2
A. 	1. AB
B.	2. $\overline{AB}$
C. 	3. A + B
D. 	4. $\overline{A + B}$

Codes:	A	B	C	D
(a)	3	1	4	2
(b)	2	1	4	3
(c)	3	4	1	2
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-II, 2010]

5.

List 1 (Logic Circuit/Function)	List 2 (Circuit Realization)
A. D flip-flop	1. B. T flip-flop	2. C. Exclusive OR	3. D. Half Adder	4. 
Codes :	A	B	C	D
(a)	1	4	3	2
(b)	2	3	4	1
(c)	1	3	4	2
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-II, 2008]

6.

List 1 (Semiconductor Technology)	List 2 (Characteristic)
A. TTL	1. Maximum power consumption,
B. ECL	2. Highest packing density.
C. NMOS	3. Least power consumption.
D. CMOS	4. Saturated logic.

Codes :	A	B	C	D
(a)	1	4	2	3
(b)	4	1	2	3
(c)	1	4	3	2
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E.-II, 2008]

7.

List 1 (Types of Gates)	List 2 (Values of Propagating Delay)
A. ECL	1. 5 ns
B. TTL	2. 20 ns
C. CMOS	3. 100 ns
D. NMOS	4. 1 ns

Codes :	A	B	C	D
(a)	1	4	3	2
(b)	4	1	3	2
(c)	1	4	2	3
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 2001]

8.

List 1 (Logic Gates)	List 2 (Characteristics)
A. HTL	1. High fan-out.
B. CMOS	2. Highest speed of operation.
C. I^2L	3. High noise immunity.
D. ECL	4. Lowest product of power and delay.

Codes :	A	B	C	D
(a)	3	2	4	1
(b)	4	2	3	1
(c)	3	1	4	2
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E.-II, 2006 and 2007]

9.

List 1 (Type of Logic)	List 2 (Characteristics/Applications)
A. Direct coupled logic.	1. Good for monolithic IC.
B. Diode transistor logic.	2. Slow speed of operation.
C. Emitter coupled logic.	3. Very fast speed of operation.
D. Resistor transistor logic.	4. Current hogging.

Codes :	A	B	C	D
(a)	2	1	3	4
(b)	4	3	1	2
(c)	2	3	1	4
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E.-II, 2005]

10.

List 1 (Type of N-bit ADC)	List 2 (Characteristics)
A. Flash converter.	1. Integrating type.
B. Successive. approximation.	2. Fastest converter.
C. Counter ramp.	3. Maximum conversion time = N bits.
D. Dual slope	4. Uses a DAC in the feedback path.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	1	3	4	2
(c)	2	4	3	1
(d)	1	4	3	2

[U.P.S.C. I.E.S. E.E.-II, 2009]

Answers: **3.** (c), **4.** (d), **5.** (b), **6.** (b), **7.** (d), **8.** (c), **9.** (d), **10.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

11.

List 1 (Operation)	List 2 (Associated Devices)
A. Counting	1. ROM
B. Decoding	2. Multiplexer
C. Data selection	3. Demultiplexer
D. Code conversion	4. Register

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	3	4	1	2
(c)	4	3	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2004]

Answers: **11.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Transistor, as a digital device. operates in both cut-off and saturation conditions.
2. A binary number with four bits is called nibble.
3. The BCD code has the characteristic that only one bit changes in going from one step to the next.
4. In BCD code 1010, 1011, 1100, 1101, 1110 and 1111 are not valid numbers.
5. BCD code is the same as the straight binary.
6. Excess-3 code is unweighted but self-complementing code.
7. In a dc logic system 0 level is necessarily zero voltage.
8. EBCDIC is a seven-bit code.
9. Almost all digital circuits are designed for 2 state operation.
10. Flip-flop is also called bistable multivibrator.
11. NOR gate is equivalent to an AND gate with its inputs inverted.
[A.M.I.E. Sec B. Instrumentation & Control Winter 1995]
12. Digital ICs use JFETs.
13. Main advantage of ECL family of logic gates is its very large fan-in.
14. DTL circuits use resistors, diodes and transistors.
15. The main advantage of Schottky devices is its least propagation delay time.
16. The main advantage of Schottky devices is its least noise-immunity.
17. The main advantage of CMOS over TTL devices is its much reduced power dissipation.
18. DAC stands for digital-to-analog converter.
19. DAC is often referred to an encoding device.
20. ADC stands for analog-to-digital converter.
21. ADC is often referred to a decoding device.
22. The main advantage of a successive approximation ADC is that it can operate faster than other ADCs.
23. For high speed of applications ADCs are successive approximation form of conversion.
24. Trigger circuit is not normally included in the design of frequency multiplier.

Answers: **1.** (T), **2.** (T), **3.** (F), **4.** (T), **5.** (F), **6.** (T), **7.** (F), **8.** (F), **9.** (T), **10.** (T), **11.** (T), **12.** (F), **13.** (T), **14.** (T), **15.** (T), **16.** (F), **17.** (T), **18.** (T), **19.** (F), **20.** (T), **21.** (F), **22.** (T), **23.** (T), **24.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. The system on which digital system usually operates is _____.
(binary/octal/hexadecimal)
2. A string of 8 bits is known as _____.
3. A binary number with four bits is called _____.
(byte/quad/octet/nibble)
4. Bit is used for _____ binary digit.
5. For potential values the powers used by the binary system are _____.
(2/8/16/10)
6. A binary with n digits all of which are unity has the value _____.
(n^2–1/2^n/2^{n-1}/2^n–1)
7. The number next to 0, 1, 10, 11, 100, 101 in counting is _____.
[A.M.I.E. Sec B. Electronics & Elec. Measurements Winter 1999]
8. Binary number 11001 is equivalent to decimal number_____.
[A.M.I.E. Winter 1995]
9. Binary number 1100 is equivalent to decimal number _____.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1993]
10. Equivalent fractional binary number of fractional number 0.625 is _____.
11. Binary equivalent of 35.625 is _____.
12. The largest number that can be represented by a 4-bit word is _____.
13. In a binary number system, shifting of the binary point one place to the left means _____ by 2. (division/multiplication)
14. In a digital computer, binary subtraction is performed using _____ complement.
15. Conversion from decimal to _____ needs repeated division by 8.
16. The decimal number corresponding to its octal representation $(167)_8$ is _____. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1994]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

17. $(CA\ 95.12)_{16} \cdot (9\ FF.A)_{16}$ = _____ .
[Mahamaya Technical Univ. Even Semester 2010-11]

18. In the BCD code, each _____ is converted to its 4-bit binary equivalent.

19. The _____ code has the characteristic that only one bit changes in going from one step to the next.

20. Given the binary coded decimal representation 0111, its decimal equivalent is _____. [A.M.I.E. Summer 1993]

21. Binary coded decimal representation of decimal number 13 is _____. [A.M.I.E. Winter 1993]

22. The _____ code is the most common alphanumeric code used in computer systems.

23. Minimum number of bits required to represent negative number in the range 1–31 in 2's complement is _____ .

24. The minimum number of bits required to represent negative number in the range of –1 to –9 using two complement representation is _____ . (2/3/4/5)

25. If logic 1 = – 5 V, then it represents a _____ logic.

26. The output will be 1 if all the inputs go to 1 in case of _____ gate. [A.M.I.E. Summer 1994]

27. Any logical expression can be realized with the help of either only _____ or only _____ gates.

28. Logic circuit corresponding to '–' signs is _____ gate.

29. If the inputs of a gate are A and B and the output is $\overline{\overline{A}\overline{B}}$, the gate is _____ gate.

30. A NOR gate is ON only when all the inputs are _____ .

31. The exclusive OR gate does _____ operation.

32. In exclusive OR gate, when output is zero, the inputs are _____.

33. $A + \overline{A}\,B$ = _____. [U.P. Technical Univ. First Semester 2009-10]

34. $A(\overline{A} + B)$ = _____.[U.P. Technical Univ. First Semester 2009-10]

35. $A\overline{B}\overline{C} + \overline{A}\,\overline{B}\,C + \overline{A}\,B\overline{C} + A\,B\overline{C}$ = _____.
[Mahamaya Technical Univ. Even Semester 2010-11]

36. The number of control lines required for 1 to 8 multiplexer will be _____. [Madras Univ. Oct. 1995]

37. Output of flip flop circuit are _____ . (0/1/2/4)

38. One output of a flip flop is _____ of the other.

39. In an R-S flip flop when R=1 and S=1, the output will be _____.

40. In a R-S flip-flop if R = 1 and S = 0, the output will be _____.
[Madras Univ. October 1995]

41. JK flip-flop is a combination of _____ type and _____ type flip-flops.

42. Input(s) to 0 flip flop circuit is/are _____ .

43. The term T in T-flip-flop stands for _____.
[A.M.I.E. Summer 1993]

44. In T-flop-flop Q becomes $\overline{Q}$ when the input is _____ . (0/1)

45. For a J-K flip-flop its J input is tied to its own Q output and its K input is connected to its own Q output, if the flip-flop is fed with a clock of frequency 1 MHz, its Q output frequency will be _____. [GATE E.E. 1995]

46. Low cost digital IC is _____ (RTL/DTL/TTL/CMOS)

47. The noise margin for an ECL device is _____.

48. Emitter coupled logic circuit is used in _____ speed applications.

49. _____ operating speed is usually the main requirement of digital ICs.

50. _____ power consumption is desirable feature in any digital IC.

51. Digital ICs should be capable of operating for temperature ranging from _____ °C to _____ °C for consumers.

52. RTL logic circuit has _____ speed, _____ power requirement, _____ noise immunity and _____ cost.

53. DTL logic circuit has _____ operating speed _____ power requirement and _____ noise immunity.

54. Totem pole arrangement is used in TTL circuits to get _____ out impedance.

55. 54 series operates reliably over the power supply voltage range from _____ V to _____ V.

56. 74 series operates reliably over the power supply voltage range from _____ V to _____ V.

57. The major difference between 54 series and 74 series is that _____ series can operate over a wide range of temperatures and power supply voltages.

58. The polarity of bipolar digital ICs is always _____ .

59. The polarity of MOS digital ICs is either positive or negative depending upon its _____.

60. Propagation delay time for a TTL gate is _____second.

61. In order to eliminate the effect of deep saturation of transistors on propagation delay time _____ is used.

62. 74 AS series is much _____ than TTL 74 S series with _____ power requirement.

63. Main disadvantage of MOS ICs is _____ in comparison to TTL ICs.

64. CMOS uses only _____ . (BJTs/JFETs/MOSFETs)

65. With the increase in frequency power dissipation in CMOS _____. (increases/decreases)

66. Main disadvantage of _____ series is that these are not compatible pin to pin and function to function with TTL devices.

67. _____ series is compatible pin to pin and function to function with TTL devices.

68. _____ series can be used in wide range of temperatures.

69. _____ series can be used for higher frequency.

70. 54 C series can be operated in temperature ranging from _____ °C to _____ °C.

71. Power dissipation of CMOS is only _____ watt per gate.

72. The successive approximation method is used for _____ conversion.

73. The resolution of an eight bit D/A convertor is _____.
[A.M.I.E. Sec B. Summer 1996]

74. In a dual slope integrating type digital voltmeter the first integration is carried out for 10 periods of the supply frequency of 50 Hz. If the reference voltage used is 2 V, the total conversion time for an input 1 V is _____ second. [GATE 1992]

75. The number of comparators required to realize a flash 10 bit ADC is _____ . (10/9/1, 024/1, 023)

76. The full-scale input voltage to an ADC is 10 V. The resolution required is 5 mV. The minimum number of bits required for ADC is _____ . (6/10/11/12)

77. The LSB value of a 8 bit DAC whose full scale value is 9.96 V is _____ . (0.389V/0.389mV/0.0389V)

78. In a DAC LSB represents 0.2 V. If input changes from 0010 to 0100, the analog output will change by _____ V. (0.4/0.8/1.2/1.6)

79. The output voltage range of a 12-bit DAC is 0 to 10 V. The integer number of 516 causes an analog output of _____ V. (0.516/1.26/2.88/4.17)

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

80. An 8-bit ADC has a maximum output voltage of 2 V. If $V_{in} = 1.5$ V, the digital output at the end of conversion will be _____.

81. A crystal used for accurate and stable time base circuit in a digital frequency meter is _____. (quartz/aluminium/carbon)

82. A divide by 10 unit preceding the a frequency counter used for extending the range of counter is called _____.

[A.M.I.E. Sec. B Instrumentation & Control Summer 1996]

83. A frequency counter receives 250 pulses during a gating interval of 10 ms. The frequency measured will be _____ kHz.

84. When a 60 Hz frequency is measured for its period, an electronic meter display 16.6673 ms. The difference between the real value and measured one is _____ Hz.

16 CHAPTER

Microprocessors

Short Answer Type Questions With Answers

Q. 1. What is a microprocessor and how microcomputer is different from a microprocessor ?

Ans. A microprocessor is an LSI (large scale integration) chip that is capable of performing arithmetic and logic functions as defined by a given program and a computer built with a microprocessor is called a microcomputer.

Q. 2. What are the advantages of using a microprocessor in an instrument ?

Ans. The advantages of using a microprocessor in an instrument are (*i*) reduced size (*ii*) more reliability (*iii*) elimination of drift of analog circuits and (*iv*) changes in design of the system is not a cause for total redesign of the system.

Q. 3. What is a data bus ?

Ans. The data bus is a group of eight lines used for data flow. These lines are *bidirectional-data* flow in both directions between the MPU and memory and pheripheral devices. The MPU uses the data bus to perform the second function: transferring data.

The eight data lines enable the MPU to manipulate 8-bit data ranging from 00 to FF ($2^8 = 256$ numbers). The largest number that can appear on the data bus is 11111111 (255_{10}). The 8085 microprocessor is known as an 8-bit microprocessor. Microprocessors such as the Intel 8086, Zilog Z8000, and Motorola 68000 have 16 data lines; thus they are known as 16-bit microprocessors and the Intel 80386/486 have 32 data lines; thus they are classified as 32-bit microprocessors.

Q. 4. What is a control bus ?

Ans. The control bus is comprised of various single lines that carry synchronization signals. The bus is *bi-directional* but the individual line is *unidirectional*. The MPU uses such lines to perform the third function: providing timing signals.

Q. 5. What are the applications of microprocessor ?

Ans. Microprocessors find wide applications in the fields of instrumentation, communication, data processing, industrial process instrumentation, commerce and consumer products.

Q. 6. What is the frequency output of eighth FE when the input clock frequency is 512 kHz ?

[A.M.I.E. Sec B. Electronic Circuits Summer 2005]

Ans. 4 kHz.

Q. 7. What is expanded form of EEPROM ? How is an EPROM erased ? **[A.M.I.E. Sec B. Electronic Circuits Summer 2005]**

Ans. EEPROM stands for Electrically Erasable Programmable Read Only Memory. For erasing it, it is to be taken out of its normal circuit and placed in front of a special ultraviolet eraser for several minutes.

Q. 8. Why is the maximum number of instructions possible in an eight bit microprocessor 256 ?

[U.P.S.C. I.E.S. Electrical Engineering-II, 2000]

Ans. Maximum number of instructions possible in an *n*-bit microprocessor is 2^8, so for an eight bit microprocessor maximum number of instructions possible = $2^8 = 256$. There are 256 possible combinations of 00000000 to 11111111 in 8 bit microprocessor.

Q. 9. What is the function of signal at pin marked IO/M in 8085 microprocessor ? **[U.P.S.C. I.E.S. Electrical Engineering-II, 2004]**

Ans. This is a status signal used to differentiate between I/O and memory operations. When it is *high*, it indicates an I/O operation; when it is low, it indicates a memory operation.

Q. 10. Why is the Z-flag of a 8085 microprocessor not affected after execution of the instruction MOV D, B ?

[U.P.S.C. I.E.S. Electrical Engineering 2002]

Ans. Z-flag of an 8085 microprocessor is only affected after ALU operation of microprocessor. The zero flag is set in the ALU operation results in 0 and the flag is reset *i.e.* result is not 0. MOV D, B is not a ALU operation hence Z (zero) flag is not affected.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Digital computers use complemental subtraction. The main reason for it is
(a) very simple process.
(b) elimination of direct subtraction.
(c) easy handling of negative numbers.
(d) simplification of circuitry.

2. Personal computer cannot be used for which one of the following?
(a) Game playing. (b) Weather forecasting.
(c) Office automation. (d) Home computing.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

3. Which of the following are included in the architecture of computer?
1. Addressing modes, design a CPU.
2. Instruction set, data formats.
3. Secondary memory, operating system.
Select the correct answer using the code given below :
Code :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2007, 2009]

4. A microprocessor is ALU
(a) and control unit on a single chip.
(b) and memory on a single chip.
(c) register unit and I/O device on a single chip.
(d) register unit and control unit on a single chip.
[U.P.S.C. I.E.S. E.E.-II, 2003]

5. ALU (Arithmetic Logic Unit) of an 8085 microprocessor consists of:
(a) Accumulator, temporary register, arithmetic and logic circuits.
(b) Accumulator, arithmetic, logic circuits and five flags.
(c) Accumulator, arithmetic and logic circuits.
(d) Accumulator, temporary register, arithmetic, logic circuits and five flags. [U.P.S.C. I.E.S. E.E.-II, 2011]

6. Which of the following is/are correct statement(s) ?
1. Bus is a group of wires carrying information.
2. Bus is needed to achieve reasonable speed of operation.
3. Bus can carry data for address.
4. A bus can be shared by more than one device.
Select the correct answer from the codes given below :
(a) 1 only. (b) 1 and 2 only.
(c) 2, 3 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

7. Consider the following statements:
In 8085 microprocessor, data-bus and address-bus are multiplexed in order to
1. Increase the speed of microprocessor.
2. Reduce the number of pins.
3. Connect more peripheral chips.
Which of the above statements is/are correct?
(a) 1 only (b) 2 only (c) 2 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-II, 2009]

8. Consider the following statements on binary tree
1. A tree with n nodes has $(n-1)$ edges.
2. A labelled and rooted binary tree can be uniquely constructed given its post-order and pre-order travel results.
3. The maximum number of nodes in a binary tree of height (depth) h is $(2^{h+1}-1)$.
4. A complete binary tree with n internal nodes has $(n+1)$ leaves.
Which of the statements given above are correct ?
(a) 1, 2, 3 and 4. (b) 1, 2 and 3 only.
(c) 1 and 3 only. (d) 2 and 4 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

9. The parallel computers are divided into which of the following architectural configurations ?
1. Array processors. 2. Data processors.
3. Multi-processor systems. 4. Pipeline computers.
Select the correct answer using the code give below :
(a) 1, 2 and 3 only. (b) 2, 3 and 4 only.
(c) 1, 3 and 4 only. (d) 1, 2 and 4 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

10. Consider the following statements:
1. The output unit of a computer communicate the response of the computer to the user.
2. READ/WRITE memory is volatile.
3. The flip-flops in a register are connected in parallel.
Which of the above statements is/are correct?
(a) 1 only (b) 1 and 2 (c) 2 and 3 (d) 3 only
[U.P.S.C. I.E.S. E.E.-II, 2009]

11. The suitable programmable counter for 8086 microprocessor is
(a) 8253 chip. (b) 8254 chip.
(c) 8359 A chip. (d) 8251 chip.
[U.P.S.C. I.E.S. E.E.-II, 2003]

12. In 8085 microprocessor, how many interrupts are maskable.
(a) Two. (b) Three. (c) Four. (d) Five.
[U.P.S.C. I.E.S. E.E.-II, 2004]

13. Which components are NOT found on chip in a microprocessor but may be found on chip in a microcontroller?
(a) SRAM and USART. (b) EPROM and PORTS.
(c) EPROM, USART and PORTS.
(d) SRAM, EPROM and PORTS. [U.P.S.C. I.E.S. E.E.-II, 2011]

14. Which stack is used in 8085 microprocessors?
(a) FIFO (b) FILO (c) LIFO (d) LILO
[U.P.S.C. I.E.S. E.E.-II, 2004]

15. In an instruction of 8085 microprocessor, how many [illegible] present?
(a) One or two. (b) One, two or three.
(c) One only. (d) Two or three.
[U.P.S.C. I.E.S. E.E.-II, 2009]

16. The interfacing device used for generation of accurate time delay in a microcomputer system is
(a) Intel 8251. (b) Intel 8257.
(c) Intel 8253. (d) Intel 8259.
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **1.** (d), **2.** (b), **3.** (a), **4.** (d), **5.** (d), **6.** (d), **7.** (b), **8.** (c), **9.** (c), **10.** (b), **11.** (b), **12.** (c), **13.** (c), **14.** (c), **15.** (b), **16.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

17. The program counter in a 8085 microprocessor is a 16-bit register, because
(a) it counts 16 bits at a time.
(b) there are 16 address times.
(c) it facilitates the user storing 16-bit data temporarily.
(d) it has to fetch two 8-bit data at a time.
[U.P.S.C. I.E.S. E.E.-II, 2003]

18. Which one of the following addressing technique is not used in 8085 microprocessor?
(a) Register. (b) Immediate.
(c) Register indirect. (d) Relative.
[U.P.S.C. I.E.S. E.E.-II, 2009]

19. Which of the following are features in an 8085 microprocessor system with memory mapped I/O ?
1. I/O devices have 16-bit addresses.
2. I/O devices are accessed using IN and OUT instructions.
3. There can be maximum of 256 input devices and 256 output devices.
Select the correct answer using the code given below :
Codes :
(a) 1, 2 and 3. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

20. Which one of the following is the most suitable definition of ARRAY ?
(a) It is a collection of items which share a common name.
(b) It is a collection of items which share a common name and occupy consecutive memory locations.
(c) It is a collection of items of the same type and storage class which share common name and occupy consecutive memory locations.
(d) It is just a collection of unordered items.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

21. Consider the following statements :
1. Strictly speaking C supports 1-dimensional arrays only.
2. An array element may be an array by itself.
3. Array elements need not occupy consecutive memory locations.
Which of the above statements is/are correct ?
(a) 1 only. (b) 2 only. (c) 1 and 2. (d) 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

22. Which of the following are the memory performance parameters?
1. Access time and latency.
2. Block size and block access time.
3. Cycle time and bandwidth.
Select the correct answer from the codes given below :
(a) 1 only. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

23. What is the purpose of DMA facility in microprocessor based system ?
(a) To increase the speed of data transfer between the μP and I/O devices.
(b) To increase the speed of data transfer between the μP and the memory.
(c) To increase the speed of data transfer between the memory and the I/O devices.
(d) To improve the reliability of the system.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

24. A Direct Memory Access (DMA) transfer implies
(a) Direct transfer of data between memory and accumulator.
(b) direct transfer of data between memory and I/O devices without the use of microprocessor.
(c) Transfer of data exclusively within microprocessor registers.
(d) A fast transfer of data between microprocessor and I/O devices.
[U.P.S.C. I.E.S. E.E.-II, 2003]

25. Handshaking mode of data transfer is
(a) Synchronous data transfer.
(b) Asynchronous data transfer.
(c) Interrupt driven data transfer.
(d) Level mode of DMA data transfer. [U.P.S.C. I.E.S. E.E.-II, 2010]

26. Output of the assembler in machine code is referred to as
(a) Object program. (b) Source program.
(c) Macroinstruction. (d) Symbolic addressing.
[U.P.S.C. I.E.S. E.E.-II, 2003]

27. In a microprocessor, the address of the next instruction to be executed, is stored in
(a) stack pointer. (b) address latch.
(c) program counter. (d) general purpose register.
[GATE E.E. 1997]

28. In Intel 8085 A microprocessor ALE signals made high to
(a) enable the data bus to be used as low order address bus.
(b) to latch data D_0–D_7 from data bus.
(c) to disable data bus.
(d) to achieve all the functions listed above.
[U.P.S.C. I.E.S. E.E.-II, 2003]

29. Which one of the following statements for Intel 8085 is correct ?
(a) Program counter (PC) specifies the address of the instruction last executed.
(b) PC specifies the address of the instruction being executed.
(c) PC specifies the address of the instruction to be executed.
(d) PC specifies the number of instructions executed so far.
[U.P.S.C. I.E.S. E.E.-II, 2004]

30. Which one of the following register of 8085 microprocessor is not a part of programming model ?
(a) Instruction register. (b) Memory address register.
(c) Status register. (d) Temporary data register.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

31. In how many different modes a universal shift register operates?
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.E.-II, 2010]

32. A shift register with the serial output connected back to the serial input is a
(a) feedback shift register.
(b) shift register counter.
(c) universal shift register.
(d) serial to parallel converter. [U.P.S.C. I.E.S. E.E.-II, 2010]

33. Both the ALU and control section of CPU employ which special purpose storage locations ?
(a) Buffers. (b) Decoders.
(c) Accumulators. (d) Registers.
[U.P.S.C. I.E.S. E.E.-II, 2008]

34. Which one of the following statements does not describe property/ characteristic of a stack pointer-register in 8085 microprocessor ?
(a) It points to top of the stack. (b) It is UP/DOWN counter.
(c) It is automatically initialized to 0000H on power-on.
(d) It is a 16-bit register. [U.P.S.C. I.E.S. E.E.-II, 2007]

35. The description of a program counter (PC) in 8085 microprocessor is
(a) an up/down counter. (b) an 8-bit register.
(c) initialized automatically by microprocessor.
(d) used to point to stack memory area.
[U.P.S.C. I.E.S. E.E.-II, 2011]

Answers: **17.** (b), **18.** (d), **19.** (b), **20.** (c), **21.** (b), **22.** (d), **23.** (c), **24.** (b), **25.** (a), **26.** (b), **27.** (c), **28.** (d), **29.** (c), **30.** (c), **31.** (c), **32.** (b), **33.** (c), **34.** (c), **35.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

36. What is the address space of 8086 CPU ?
(a) One Megabytes. (b) 256 kilobytes.
(c) 1 k megabytes. (d) 64 kilobytes.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

37. A memory system has a total of 8 memory chips, each with 12 address lines and 4 data lines. The total size of the memory system is
(a) 16 k bytes. (b) 32 k bytes.
(c) 48 k bytes. (d) 64 k bytes. [GATE E.E. 2003]

38. The number of outpins of a 8085 microprocessor are
(a) 40. (b) 27. (b) 21. (d) 19.
[U.P.S.C. I.E.S. E.E.-II, 2002]

39. Which one of the following is used as the interface chip for data transmission between 8086 and a 16-bit ADC ?
(a) 8259 (b) 8255 (c) 8253 (d) 8251
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

40. Consider the following statements about register indirect addressing
1. It helps in writing code that executes faster.
2. It helps in writing compact code.
3. It allows reuse of memory CPU data transfer instruction.
4. It is essential for stack operations.
Which of the statements given above are correct ?
(a) 1, 3 and 4. (b) 1, 2 and 4.
(c) 2, 3 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2005]

41. MC 1488 and MC 1489 are needed when using RS 232 for which one of the following ?
(a) To convert the logical levels at the receiving and sending ends of RS 232 into TTL compatible levels.
(b) To convert the TTL level voltages at the sending and receiving ends of RS 232 to ± 12 V level.
(c) They are not required while using RS 232.
(d) To improve the current drive of the RS 232 output signals.
[U.P.S.C. I.E.S. E.E.-II, 2004]

42. The content of the Program Counter of an Intel 8085A microprocessor specifies which one of the following ?
(a) The address of the instruction being executed.
(b) The address of the instruction executed earlier.
(c) The address of the next instruction to be executed.
(d) The number of instructions executed so far.
[U.P.S.C. I.E.S. E.E.-II, 2008]

43. The content of the programme counter of an 8085 microprocessor is
(a) the total number of instructions in the program already executed.
(b) the total number of times a subroutine is called.
(c) the memory address of the instruction that is being currently executed.
(d) the memory address of the instruction that is to be executed next. [U.P.S.C. I.E.S. E.E.-II, 2010]

44. While a program is being executed in an Intel 8085 microprocessor, the program counter of the microprocessor contains
(a) the memory address of the instruction that is being currently executed.
(b) the memory address of the instruction that is to be executed next.
(c) the number of instructions that have already been executed.
(d) the total number of instructions in the current program still to be executed. [U.P.S.C. I.E.S. E.E.-II, 2011]

45. A finite state machine is
(a) an asynchronous sequential circuit.
(b) an abstract model describing the synchronous sequential machine and its spatial counter part, the iterative network.
(c) an asynchronous sequential circuit operating in the fundamental mode.
(d) an asynchronous sequential circuit operating in pulse mode.
[A.M.I.E. Sec B. Pulse and Digital Circuits Summer 2006]

46. Consider the following statements:
1. A total of about one million bytes can be directly addressed by the 8086 microprocessor.
2. 8086 has thirteen 16-bit registers.
3. 8086 has eight flags.
4. Compared to 8086, the 80286 provides a higher degree of memory protection.
Which of the statements given above are correct ?
(a) 2, 3 and 4. (b) 1, 3 and 4.
(c) 1, 2 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2005]

47. Consider the following functions of an 8086 microprocessor :
1. Temporary storage of data.
2. Storing offset of a memory address in DS.
3. String instructions. 4. JNLE instructions.
5. JCXZ instructions.
Which of these functions require the use of the SI and DI registers?
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) 2, 3 and 5. (d) 3, 4 and 5.
[U.P.S.C. I.E.S. E.E.-II, 2000]

48. In a microcomputer, why are wait states used ?
(a) To make the processor wait during a DMA operation.
(b) To make the processor wait during an interrupt processing.
(c) To make the processor wait during a power shutdown.
(d) To interface slow peripherals to the processor.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

49. A good assembly language programmer should use general purpose registers rather than memory in maximum possible ways for data processing. This is because
(a) Data processing with registers is easier than with memory.
(b) Data processsing with memory requires more instructions in the program than that with registers.
(c) Of limited set of instructions for data processing with memory.
(d) Data processing with registers takes fewer cycles than that with memory. [U.P.S.C. I.E.S. E.E.-II, 2008]

50. For the purpose of data processing an efficient assembly language programmer makes use of the general purpose registers rather than memory. The reason is
(a) the set of instructions for data processing with memory is limited.
(b) data processing becomes easier when registers are used.
(c) more memory related instructions are required in the program for data processing.
(d) data processing with registers takes fewer cycles than that with memory. [U.P.S.C. I.E.S. E.E.-II, 2011]

51. Consider the following statements :
1. Indirect addressing is not possible for I/O mapped I/O port addresses.
2. Pointers cannot be used to access memory mapped I/O addresses.
3. Fewer machine instructions can be used with I/O mapped I/O addressing as compared to memory mapped I/O addressing.
4. With an 8085 microprocessor, one can access at the most 512 devices with unique addresses using I/O mapped I/O addressing.
(a) 1, 2 and 3. (b) 2 and 4. (c) 3 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2006]

Answers: **36.** (a), **37.** (b), **38.** (b), **39.** (b), **40.** (b), **41.** (b), **42.** (c), **43.** (d), **44.** (b), **45.** (b), **46.** (c), **47.** (b), **48.** (d), **49.** (d), **50.** (d), **51.** (d),

52. What does the minimizing of the memory requirement of a program mean ?
(a) Maximizing number of macro calls.
(b) Minimizing number of macro calls.
(c) Minimizing depth of recursion.
(d) Both (a) and (c) above. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

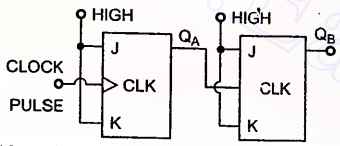
53. Which logical operation is performed by ALU of 8085 to complement a number
(a) AND. (b) NOT (c) OR
(d) EXCLUSIVE OR [U.P.S.C. I.E.S. E.E.-II, 2002]

54. The contents of memory location 4 FFFH are 11011011. The memory word could not be interpreted as which one of the following?
(a) 2's complement number. (b) 1's complement number.
(c) Octal number. (d) BCD number.
[U.P.S.C. I.E.S. E.E.-II, 2007]

55. If the ASCII character H is sent and the character I is received, what type of error is represented ?
(a) Single-bit. (b) Multiple-bit.
(c) Burst. (d) Recoverable.
[U.P.S.C. I.E.S. E.E.-II, 2008]

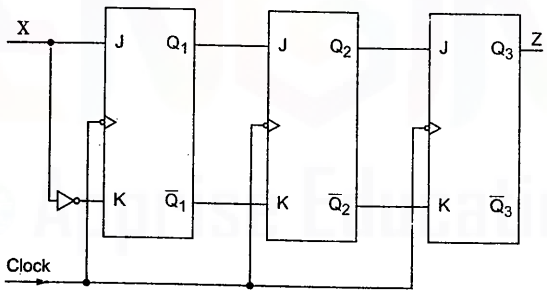
56. Which one of the following is correct for ASCII code of all upper case English letters compared to all lower case English letters ?
(a) Are all larger. (b) Are all smaller.
(c) Are all equal.
(d) Some are larger and some are smaller.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

57. The circuit illustrates a typical application of the JK flip-flops. What does this represent ?



(a) A shift register. (b) A data storage device.
(c) A frequency divider circuit. (d) A decoder circuit.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

58. Circuit shown below is a



(a) shift register. (b) binary counter.
(c) ripple counter. (d) sequence detector.
[U.P.S.C. I.E.S. E.E.-II, 2010]

59. Memory-mapped I/O scheme for the allocation of address to memories and I/O devices, is used for
(a) small systems. (b) large systems.
(c) both large and small systems.
(d) very large systems. [U.P.S.C. I.E.S. E.E.-II, 2002]

60. Which one of the following statements about RAM is not correct?
(a) RAM stands for random-access memory.
(b) It is also called read/write memory.
(c) When power supply is switched off, the information in RAM is usually lost.
(d) The binary contents are entered or stored in the RAM chip during the manufacturing. [U.P.S.C. I.E.S. E.E.-II, 2003]

61. Which one of the following statements is correct ?
(a) ROM is a Read/Write memory.
(b) PC points to the last instruction that was executed.
(c) Stack works on the principle of LIFO.
(d) All instructions affect the flags. [U.P.S.C. I.E.S. E.E.-II, 2004]

62. Which of the following are of the combinational logic types ?
1. Read Only Memory. 2. Random Access Memory.
3. Shift Register Memory.
Select the correct answer using the codes gives below :
Codes :
(a) 1 and 2 (b) 2 and 3 (c) 1 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-II, 1993]

63. Why does an increase of the RAM of a computer typically improve performance ?
(a) Virtual memory increase. (b) Larger RAMs are faster.
(c) Fewer page faults occur.
(d) Fewer segmentation faults occur. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

64. A single ROM is used to design a combinational circuit described by a truth table. What is the number of address lines in the ROM?
(a) Number of input variables in the truth table.
(b) Number of output variables in the truth table.
(c) Number of input plus output variables in the truth table.
(d) Number of lines in the truth table. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

65. Consider the following statements :
Data that are stored at a given address in a random access memory are lost
1. when power goes off.
2. when the data are read from the address.
3. when new data are written at the address.
4. because it is non-volatile memory.
Which of the statements give above are correct ?
(a) 1 and 2. (b) 1, 2 and 4. (c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2006]

66. Consider the following statements
In memories,
1. ROMs are used for temporary program and data storage.
2. dynamic RAM is less expensive than static RAM.
3. MASK ROM is used in high volume microprocessor base system.
Which of the statements given above is/are correct
(a) 1 only. (b) 1 and 2. (c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2005]

67. Consider the following statements :
1. The process of entering data is called burning in ROM.
2. ROMs are volatile memories.
3. ROMs are used in μC security systems.
Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.E.-II, 2007]

68. A semiconductor ROM is preferred to a semiconductor RAM because
(a) ROM is cheaper than RAM.
(b) ROM is faster.
(c) ROM does not require power supply for their operation.
(d) Program stored in the ROM cannot be altered.
[U.P.S.C. I.E.S. E.E.-II, 2011]

Answers: **52.** (d), **53.** (d), **54.** (d), **55.** (c), **56.** (b), **57.** (c), **58.** (a), **59.** (b), **60.** (d), **61.** (b), **62.** (a), **63.** (c), **64.** (a), **65.** (d), **66.** (c), **67.** (d), **68.** (d),

69. The increasing order of speed of data access for the following devices is
(i) Cache Memory. (ii) CD-ROM.
(iii) Dynamic RAM. (iv) Processor Registers.
(v) Magnetic Tape.
(a) (v), (ii), (iii), (iv), (i) (b) (v), (ii), (iii), (i), (iv)
(c) (ii), (i), (iii), (iv), (v) (d) (v), (ii), (i), (iii), (iv)
[GATE E.E. 2009]

70. A memory system of 64 k bytes needs to be designed with RAM chips of 1 k byte each, and a decoder tree constructed with 2 : 4 decoder chips with "Enable" input. What is the total number of decoder chips ?
(a) 21 (b) 64 (c) 32 (d) 25
[U.P.S.C. I.E.S. E.E.-II, 2004]

71. What are the number of memories required of size 16 × 4 to design a memory of size 64 × 8?
(a) 2 (b) 4 (c) 6 (d) 8
[U.P.S.C. I.E.S. E.E.-II, 2009]

72. Memory chips of four different sizes as below are available
1. 32 K × 4 2. 32 K × 16
3. 8 K × 8 4. 16 K × 4
All the memory chips as mentioned in the above list are Read/ Write memory. What minimal combination of chips or chip alone can map full address space of 8085 microprocessor ?
(a) 1 and 2. (b) 1 only. (c) 2 only. (d) 4 only.
[U.P.S.C. I.E.S. E.E.-II, 2005]

73. The smallest valid signed integer that can be stored in a memory location of a 4 k × 8 bit RAM is
(a) 0 (b) –128 (c) –2048 (d) –65536
[U.P.S.C. I.E.S. E.E.-II, 2010]

74. The capacity of a memory chip is 8192 bits, it has 2048 rows. Then the organization of the chip is
(a) word organized. (b) byte organized.
(c) nibble organized. (d) bit organized.
[A.M.I.E. SEC B. ELECTRONIC CIRCUITS SUMMER 2006]

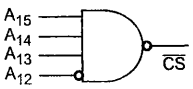
75. Eight memory chips of 32 × 4 bit size have their address buses connected together. What is the size of this memory system ?
(a) 512 × 2 bits. (b) 256 × 4 bits.
(c) 64 × 16 bits. (d) 32 × 32 bits.
[U.P.S.C. I.E.S. E.E.-II, 2007]

76. A 16 bit memory address register can address memory locations of
(a) 16 k (b) 32 k (c) 64 k (d) 128 k
[U.P.S.C. I.E.S. E.E.-II, 2010]

77. Suppose 64 kB, ROM ICs are available in abundance. 1 MB ROM can be obtained from
(a) 16 ICs in a row. (b) 16 ICs in a column.
(c) 8 ICs in a column and 2 ICs in a row.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-II, 2006]

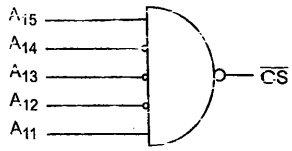
78. In which unit is the performance of cache memory measured ?
(a) Hz. (b) Bits/s.
(c) Cache constant. (d) Hit ratio.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

79. The logic circuit used to generate the active low chip select (CS) by an 8085 microprocessor to address a peripheral is shown in figure. The peripheral will respond to addresses in the range.



(a) E000-EFFF. (b) 000E-FFFE.
(c) 1000-FFFF. (d) 0001-FFF1. [GATE E.E. 2002]

80. The logic circuit used to generate the active low chip select signal (CS) by an Intel 8085 microprocessor to address a peripheral is shown in the figure. The peripheral will respond to address in the range.



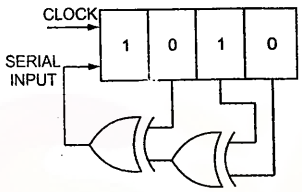
(a) 7800 H – 7 FFF H (b) 1000 H – 1 EFF H
(c) 8000 H – 8 FFF H (d) 8800 H – 8 FFF H
[U.P.S.C. I.E.S. E.E.-II, 2011]

81. Sixty-four number of 256 × 1 bit RAM IC is arranged in 8 rows and 8 columns to get memory of
(a) 1 kB (b) 2 kB (c) 4 kB (d) 8 kB
[U.P.S.C. I.E.S. E.E.-II, 2010]

82. The reduced state table of a sequentie machine has 7 rows. What is the minimum number of flip-flops needed to implement the machine?
(a) Zero (b) 2 (c) 7 (d) 3
[U.P.S.C. I.E.S. E.E.-II, 2007]

83. To address the memory 14 bits are used. Then what is the address of the last memory location?
(a) 16382 (b) 16383 (c) 16384 (d) 16385
[U.P.S.C. I.E.S. E.E.-II, 2009]

84. The shift register shown in figure is initially loaded with the bit pattern 1010. Subsequently the shift register is clocked, and with each clock pulse the pattern gets shifted by one bit position to the right. With each shift, the bit at the serial input is pushed to the left most position (msb). After how many clock pulses will the content of the shift register become 1010 again ?



(a) 3 (b) 7 (c) 11 (d) 15
[GATE E.E 2003]

85. If 8255A chip is selected when A_2 to A_7 pins are 1, what is the address of Port C ?
(a) F C (b) F D (c) F B (d) F E
[U.P.S.C. I.E.S. E.E.-II, 2007]

86. If 8255 A chip is selected when A_2 is to A_7 bits are all 1, what is the address of port A ?
(a) 80 (b) F A (c) F B (d) F C
[U.P.S.C. I.E.S. E.E.-II, 2007]

87. In mode '0' (Zero) operation of 8255, the ports can be used as port
(a) A as input port only. (b) B as output port only.
(c) A as output port only. (d) A as input or output port.
[U.P.S.C. I.E.S. E.E.-II, 2010]

88. Ports are used to connect the CPU to which of the following units ?
1. Printer. 2. Floppy disk drives.
3. Video display unit. 4. Incoming power supply.
Select the correct answer using the codes given below:
Codes:
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2003]

89. When a program is being executed in an 8085 microprocessor, its Program Counter contains
(a) the number of instructions in the current program that have already been executed.
(b) the total number of instructions in the program being executed.

Answers: **69.** (b), **70.** (a), **71.** (d), **72.** (c), **73.** (c), **74.** (b), **75.** (d), **76.** (c), **77.** (b), **78.** (d), **79.** (a), **80.** (d), **81.** (b), **82.** (c), **83.** (b), **84.** (b), **85.** (b), **86.** (d), **87.** (d), **88.** (d), **89.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) the memory address of the instruction that is being currently executed.
(d) the memory address of the instruction that is to be executed next. [GATE E.E. 2003]

90. If the status of the control lines SI and SO is LOW, then 8085 microprocessor is performing
(a) Reset operation. (b) HOLD operation.
(c) Halt operation. (d) Interrupt acknowledge. [U.P.S.C. I.E.S. E.E.-II, 2011]

91. Consider the following:
1. Sign flag. 2. Trap flag.
3. Parity flag. 4. Auxiliary carry flag.
Which of the above flags is/are present in 8085 microprocessor?
(a) 1 only. (b) 1 and 2. (c) 2 and 3. (d) 1, 3 and 4. [U.P.S.C. I.E.S. E.E.-II, 2009]

92. The sign-flag of 8085 microprocessor is set to 1, if
(a) the result of an arithmetic operation is zero.
(b) the most significant bit of the result of an arithmetic or logic operation is 1.
(c) there is a carry from addition or borrow from subtraction.
(d) The result of the operation carries four 1s in accumulator. [U.P.S.C. I.E.S. E.E.-II, 2004]

93. In the case of a 16-bit processor, a single instruction is enough to process a function. For processing the same function,
(a) more than one 8-bit processors will be required to work in sequence.
(b) more than one 8-bit processors will be required to work in parallel.
(c) a long sequence of instructions will be required for a 8-bit processor.
(d) the same instruction will do for a 8-bit processor also. [U.P.S.C. I.E.S. E.E.-II, 2000]

94. The output data lines of microprocessors and memories are usually tristated because
(a) more than one device can transmit information over the data bus by enabling only one device at a time.
(b) more than one device can transmit over the data bus at the same time.
(c) the data lines can be multiplexed for both input and output.
(d) it increases the speed of data transfers over the data bus. [U.P.S.C. I.E.S. E.E.-II, 2011]

95. Which one of the following is correct ?
A microprogram is
(a) any source program run on microcomputers.
(b) any set of instructions for primitive operations in a system.
(c) a general name for 'macros' used in assembly language programming.
(d) any program of a very small size. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

96. Which one of the following is correct ?
A microprogram
(a) is usually written in high level language.
(b) is a program for microcomputers.
(c) is a program written in assembly language.
(d) is a sequencing program for the control unit of any processor. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

97. Which are the characteristics of vertical micro instructions ?
1. Considerable encoding of control information.
2. Limited ability to express parallel micro operation.
3. Long format.
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3. [U.P.S.C. I.E.S. E.E.-II, 2008]

98. In an Intel 8085A, which is always the first machine cycle of an instruction ?
(a) An op-code fetch cycle. (b) A memory read cycle.
(c) A memory write cycle. (d) An I/O read cycle. [U.P.S.C. I.E.S. E.E.-II, 2008]

99. The first machine cycle of an instruction is always
(a) a memory read cycle. (b) a fetch cycle.
(c) an I/O read cycle. (d) a memory write cycle. [U.P.S.C. I.E.S. E.E.-II, 2011]

100. A group of personal computers are configured to work together for speeding up the execution of a single program in
(a) simulated evaluation. (b) cluster computing.
(c) network computing. (d) client serves computing. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

101. If the HLT instruction of an Intel 8085 microprocessor is executed
(a) the microprocessor is disconnected from the system bus till the RESET is pressed.
(b) the microprocessor halts the execution of the program and returns to the monitor.
(c) the microprocessor enters into a HALT state and the buses are tri-stated.
(d) the microprocessor reloads the program counter from the locations 0024 H and 0025 H. [U.P.S.C. I.E.S. E.E.-II, 2008]

102. The contents of memory locations 2000 H, 2001 H and 2002 H are AAH, BBH and CCH respectively. What are the contents of H and L registers after executing the following instructions in sequence?

LXI	H, 2001 H
LHDL	2001 H

Select the correct answer using the code given below :
(a) Contents of H and L registers are 20 H and 01 H, respectively.
(b) Contents of H and L registers are AAH and BBH, respectively.
(c) Contents of H and L registers are BBH and CCH, respectively.
(d) Contents of H and L registers are CCH and BBH, respectively. [U.P.S.C. I.E.S. E.E.-II, 2006]

103. What must be the contents of the control word of Intel 8255 for Mode O (operation) and for the following ports configuration :
Port A — output, Port B — output,
Port C_{lower} — output, Port C_{upper} — input ?
(a) 85 H (b) 86 H (c) 87 H (d) 88 H [U.P.S.C. I.E.S. E.E.-II, 2004]

104. Which of the following is not correct ?
(a) Bus is a group of wires.
(b) Bootstrap is a technique or device for loading first instruction.
(c) An instruction is a set of bits that defines a computer operation.
(d) An interrupt signal is required at the start of every program. [U.P.S.C. I.E.S. E.E.-II, 2005]

105. The addressing mode used in the instruction JMP F 347 H in case of an Intel 8085A microprocessor is which one of the following ?
(a) Direct. (b) Register-indirect.
(c) Implicit. (d) Immediate. [U.P.S.C. I.E.S. E.E.-II, 2008]

106. When the operand requires for an instruction is stored inside the processor, then what this addressing mode is called?
(a) Direct. (b) Register.
(c) Implicit. (d) Immediate. [U.P.S.C. I.E.S. E.E.-II, 2009]

Answers: **90.** (c), **91.** (d), **92.** (c), **93.** (c), **94.** (a), **95.** (b), **96.** (d), **97.** (c), **98.** (a), **99.** (b), **100.** (b), **101.** (c), **102.** (d), **103.** (d), **104.** (d), **105.** (d), **106.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

107. What are the commands to the assembler itself, called ?
(a) Macros. (b) Macro-instructions.
(c) Micro-instructions. (d) Pseudo-instructions.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

108. The cycle required to fetch and execute an instruction in a 8085 microprocessor is which one of the following ?
(a) Clock cycle. (b) Memory cycle.
(c) Machine cycle. (d) Instruction cycle.
[U.P.S.C. I.E.S. E.E.-II, 2007]

109. If K is the number of parity bits provided with a message, the number of errors which can be detected are
(a) K (b) K – 1 (c) K + 1
(d) dependent upon the number of bits in the message also.
[U.P.S.C. I.E.S. E.E.-II, 2002]

110. An 8254 programmable interval timer consists of independent 16-bit programmable counters. This number is
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.E.-II, 2008]

111. An Intel 8085A microprocessor is operated at a frequency of 2 MHz. If the instruction LXI H, E000 H that takes ten 'T' states, is executed, then what is the instruction cycle time ?
(a) 10 μs (b) 5 μs (c) 4 μs (d) 2.5 μs
[U.P.S.C. I.E.S. E.E.-II, 2008]

112. The 8085 assembly language instruction that stores the content of H and L registers into the memory locations 2050_H and 2051_H, respectively is
(a) SPHL 2050_H. (b) SPHL 2051_H.
(c) SHLD 2050_H. (d) STAX 2050_H.
[GATE E.E. 2005]

113. What is the correct 8085 assembly language instruction that stores the contents of H and L registers into the memory locations 1080 H and 1081 H respectively?
(a) SPHL 1080 H (b) SHLD 1080 H
(c) STAX 1080 H (d) SPHL 1081 H
[U.P.S.C. I.E.S. E.E.-II, 2009]

114. What is the number of machine cycles in the instruction LDA 2000 H that consists of thirteen states ?
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.E.-II, 2008]

115. In 8085, if the clock frequency is 5 MHz, the time required to execute an instruction of 18 T-states is
(a) 3.0 μs (b) 3.6 μs (c) 4.0 μs (d) 6.0 μs
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

116. To serially shift a byte of data into a shift register there must be
(a) one clock pulse. (b) one load pulse.
(c) eight clock pulse.
(d) one clock pulse for each one in the data.
[A.M.I.E. Sec B. Electronic Circuits Winter 2006]

117. A memory system of size 32 kbytes is required to be designed using memory chips which have 12 address lines and 4 data lines each. What is the number of such chips required to design the memory system ?
(a) 4 (b) 8 (c) 16 (d) 32
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

118. To address the full memory space of an Intel 8085 microprocessor four RAMS of different sizes are available:
1. 8 K × 8 2. 16 K × 4
3. 32 K × 4 4. 32 K × 16
What minimal combination of chip(s) will serve the purpose?
(a) 1, 2, 3 and 4 (b) 2
(c) 3 (d) 4 [U.P.S.C. I.E.S. E.E.-II, 2011]

119. Which one of the following statements corresponding to execution of SIM instructions is not correct ?
(a) It will selectively mark all the interrupts of 8085.
(b) Contents of bit (b_7) are copies on SOD pin only if bit b_6 in acc is '1'.
(c) RST 7.5 can reset without executing ISR for RST 7.5.
(d) It can handle interrupts and serial I/O. [U.P.S.C. I.E.S. E.E.-II, 2007]

120. INR instruction of 8085 does not affect carry flag. Which of the following is correct about INR instruction ?
(a) Overflow can not be detected.
(b) Overflow can be detected.
(c) If a program requires overflow to be detected, ADD instruction should be used instead of INR.
(d) It can be used to increase the contents of the BC register pair.
[U.P.S.C. I.E.S. E.E.-II, 2005]

121. On receiving an interrupt, the CPU of an 8085 microprocessor
(a) completes the current instruction and then goes to the interrupt service routine.
(b) branches off to the interrupt service routine immediately.
(c) hands over control of address bus and data bus to the interrupting device.
(d) goes to HALT state for predetermined period.
[U.P.S.C. I.E.S. E.E.-II, 2010]

122. The 8259 A programmable Interrupt controller can
1. manage eight interrupts.
2. vector an interrupt request anywhere in memory map.
3. have 8-bit or 16-bit interval between interrupt vector locations.
4. initialized with operational command words (OCW's)
(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2011]

123. The interrupt vector table IVT of 8086 contains
(a) The contents of CS and IP of the main program address at which the interrupt has occurred.
(b) The contents of CS and IP of the main program address to which the control has to come back after the service routine.
(c) The starting CS and IP value of the interrupt service routine.
(d) The starting address of the IVT. [U.P.S.C. I.E.S. E.E.-II, 2005]

124. In Intel 8085, the interrupt enable flip-flop is reset by
(a) DI instructions only. (b) system RESET only.
(c) interrupt acknowledgement only.
(d) either DI or system RESET or interrupt acknowledgement.
[U.P.S.C. I.E.S. E.E.-II, 2004]

125. When an 8086 executes an INT type instruction, it
(a) Resets both IF and TF flags. (b) Resets all flags.
(c) Sets both IF and TF. (d) Resets the CF and TF.
[U.P.S.C. I.E.S. E.E.-II, 2005]

126. What is an interrupt in which the external device supplies its address as well as the interrupt request known as ?
(a) Vectoral interrupt. (b) Maskable interrupt.
(c) Non-maskable interrupt. (d) None of the above.
[U.P.S.C. I.E.S. E.E.-II, 2008]

127. Control bus is used for transmitting and receiving control signals between
(a) processor and keyboard.
(b) processor and various devices.
(c) processor and memory. (d) input devices and memory.
[U.P.S.C. I.E.S. E.E.-II, 2000]

128. When TRAP interrupt is triggered in an Intel 8085A, the program control is transferred to which one of the following ?
(a) 0020 H (b) 0024 H (c) 0028 H (d) 002C H
[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **107.** (b), **108.** (c), **109.** (d), **110.** (b), **111.** (b), **112.** (c), **113.** (b), **114.** (c), **115.** (b), **116.** (c), **117.** (c), **118.** (d), **119.** (d), **120.** (c), **121.** (a), **122.** (d), **123.** (c), **124.** (d), **125.** (c), **126.** (a), **127.** (b), **128.** (b),

129. The power failure alarm must be connected to which one of the following inputs of 8085 ?
(a) RST 7.5 (b) TRAP (c) INTR (d) HOLD
[U.P.S.C. I.E.S. E.E.-II, 2007]

130. Which one of the following is not a vectored interrupt ?
(a) TRAP (b) INTR (c) RST 3 (d) RST 7.5
[GATE E.E. 2000; U.P.S.C. I.E.S. E.E.-II, 2003]

131. Which interrupt has the highest priority ?
(a) RST 7.5 (b) RST 7 (c) RST 6.5 (d) INTR
[U.P.S.C. I.E.S. E.E.-II, 2007]

132. Which one of the following interrupts is both level and edge sensitive?
(a) RST 7.5 (b) RST 5.5 (c) TRAP (d) INTR
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

133. Which one of the following is the software intercept of 8085 microprocessor ?
(a) RST 7.5 (b) RST 7 (c) TRAP (d) INTR
[U.P.S.C. I.E.S. E.E.-II, 2006]

134. Which value a program counter will have when non-maskable interrupt of 8085 microprocessor is serviced?
(a) 0004 H. (b) 0014 H.
(c) 0024 H. (d) 0034 H.
[U.P.S.C. I.E.S. E.E.-II, 2011]

135. In 8085 microprocessor, the order of priority for hardware interrupts, are
(a) INTR, RST 7.5, RST 6.5, RST 5.5, TRAP
(b) TRAP, RST 7.5, RST 6.5, RST 5.5, INTR
(c) TRAP, INTR, RST 5.5, RST 6.5, RST 7.5
(d) INTR, RST 5.5, RST 6.5, RST 7.5, TRAP
[U.P.S.C. I.E.S. E.E.-II, 2010]

136. Three devices P, Q and R have to be connected to an 8085 microprocessor. Device P has the highest priority and device R has the lowest priority. In this context, which of the following is the correct assignment of interrupt inputs ?
(a) P uses TRAP, Q uses RST 5.5 and R uses RST 6.5.
(b) P uses RST 5.5, Q uses RST 6.5 and R uses RST 7.5.
(c) P uses RST 7.5, Q uses RST 6.5 and R uses RST 5.5.
(d) P uses RST 5.5, Q uses RST 6.5 and R uses TRAP.
[U.P.S.C. I.E.S. E.E.-II, 2008]

137. Which one of the following statements regarding the INT (interrupt) and the BRQ (but request) pins in a CPU is true?
(a) The BRQ pin is sampled after every instruction cycle, but the INT is sampled after every machine cycle.
(b) Both INT and BRQ are sampled after every machine cycle.
(c) The INT pin is sampled after every instruction cycle, but the BRQ is sampled after every machine cycle.
(d) Both INT and BRQ are sampled after every instruction cycle.
[GATE E.E. 2007]

138. For 8085 microprocessor, the instruction RST.6 restarts subroutine at address
(a) 00H (b) 03H (c) 30H (d) 33H
[U.P.S.C. I.E.S. E.E.-II, 2002]

139. Which can be maximum dimension of an array in C language program ?
(a) 3. (b) 4. (c) 5.
(d) it is compiler independent. [U.P.S.C. I.E.S. E.T.E.-II, 2009]

140. In an Intel 8085A, what is the content of the Instruction Register (IR)?
(a) Op-code for the instruction being executed.
(b) Operand for the instruction being executed.
(c) Op code for the instruction to be exccuted next.
(d) Operand for the instruction to be executed next.
[U.P.S.C. I.E.S. E.E.-II, 2008]

141. The opcode for the instruction "Add Immediately to Accumulator with carry" in 8085 microprocessor is
(a) ADI (b) ACI (c) ADC (d) ADD
[U.P.S.C. I.E.S. E.E.-II, 2010]

142. In an Intel 8085A microprocessor, why is READY signal used ?
(a) To indicate to user that the microprocessor is working and is ready for use.
(b) To provide proper WAIT states when the microprocessor is communicating with a slow peripheral device.
(c) To slow down a fast peripheral device so as to communicate at the microprocessor's speed.
(d) None of these. [U.P.S.C. I.E.S. E.E.-II, 2008]

143. In 8085, the DAA instruction is used for
(a) Direct Address Accumulator.
(b) Double Add Accumulator.
(c) Decimal Adjust Accumulator.
(d) Direct Access Accumulator. [U.P.S.C. I.E.S. E.E.-II, 2006]

144. Which of the following does not take place when 8085 processor is reset ?
(a) 8085 gives reset out signal to reset external hardware.
(b) 8085 resets program counter to FFFFH.
(c) The interrupt system is disabled.
(d) The buses are tristated. [U.P.S.C. I.E.S. E.E.-II, 2005]

145. Which signal of 8085 microprocessor is used to insert wait states?
(a) Ready (b) ALE (c) HOLD (d) INTR
[U.P.S.C. I.E.S. E.E.-II, 2007]

146. When RET instruction is executed by any subroutine then
(a) the top of the stack will be popped out and assigned to the PC.
(b) without any operation, the calling program would resume from instruction immediately following the call instruction.
(c) the PC will be incremented after the execution of the instruction.
(d) without any operation, the calling program would resume from instruction immediately following the call instruction, and also the PC will be incremented after the execution of the instruction. [U.P.S.C. I.E.S. E.E.-II, 2001]

147. The field, which is never present in an assembly language statement, is
(a) Opcode (b) Operand
(c) Continue (d) Comment
[U.P.S.C. I.E.S. E.E.-II, 2010]

148. What are the sets of commands in a program which are not translated into machine instructions during assembly process, called ?
(a) Mnemonics. (b) Directives.
(c) Identifiers. (d) Operands.
[U.P.S.C. I.E.S. E.E.-II, 2007]

149. A sequence of instruction is executed as follows :
begin
decode the instruction fetched;
if operand in memory then fetch operand;
execute instructions;
end
This sequence of instructions has performed
(a) fetch cycle. (b) both fetch and execute cycles.
(c) execute and decode cycles. (d) execute cycle.
[U.P.S.C. I.E.S. E.E.-II, 2000]

Answers: **129.** (b), **130.** (b), **131.** (a), **132.** (c), **133.** (b), **134.** (c), **135.** (b), **136.** (c), **137.** (a), **138.** (c), **139.** (d), **140.** (a), **141.** (b), **142.** (b), **143.** (c), **144.** (b), **145.** (b), **146.** (a), **147.** (b), **148.** (d), **149.** (b),

150. The addressing mode used in the instruction SATX B is
(a) direct. (b) immediate. (c) implicit. (d) indirect.
[U.P.S.C. I.E.S. E.E.-II, 2008]

151. How many and which types of machine cycles are needed to execute PUSH PSW by an Intel 8085A microprocessor ?
(a) 2, Fetch and Memory write.
(b) 3, Fetch and 2 Memory write.
(c) 3, Fetch and 2 Memory read.
(d) 3, Fetch, Memory read and Memory write.
[U.P.S.C. I.E.S. E.E.-II, 2003]

152. In 8085 microprocessor, during PUSH/PSW operation, stack pointer is
(a) decremented by one. (b) decremented by two.
(c) incremented by one. (d) incremented by two.
[U.P.S.C. I.E.S. E.E.-II, 2011]

153. Which one of the following addressing modes is used in the instruction PUSH B ?
(a) Direct. (b) Register.
(c) Register indirect. (d) Immediate.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

154. Consider the following 8085 instructions
ANA A, ORA A, XRA A, SUB A, CMP A.
Now, consider the following statements
1. All are arithmetic and logic instructions.
2. All cause the accumulator to be cleared irrespective of its original contents.
3. All reset the carry flag.
4. All of them are 1-byte instructions.
Which of the statements given above is/are correct ?
(a) 1, 2, 3 and 4. (b) 2 only.
(c) 1, 2 and 4. (d) 1, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2005]

155. If the accumulator of an Intel 8085A microprocessor contains 37H and the previous operation has set the carry flag, the instruction ACI56H will result in
(a) 8E H (b) 94 H (c) 7E H (d) 84 H
[U.P.S.C. I.E.S. E.E.-II, 2003]

156. Which one of the following functions is performed by the 8085 instruction MOV H, C ?
(a) Moves the contents of register H to C register.
(b) Moves the contents of C register to H register.
(c) Moves the contents of C register to HL pair.
(d) Moves the contents of HL pair to C register.
[U.P.S.C. I.E.S. E.E.-II, 2002]

157. Consider the execution of the following instructions by a 8085 microprocessor :
LXI H, $01FF_H$ SHLD 2050_H
After execution the contents of memory locations 2050_H and 2051_H and the registers H and L, will be
(a) $2050_H \rightarrow FF$; $2051_H \rightarrow 01$; $H \rightarrow FF$; $L \rightarrow 01$.
(b) $2050_H \rightarrow 01$; $2051_H \rightarrow FF$; $H \rightarrow FF$; $L \rightarrow 01$.
(c) $2050_H \rightarrow FF$; $2051_H \rightarrow 01$; $H \rightarrow 01$; $L \rightarrow FF$.
(d) $2050_H \rightarrow FF$; $2051_H \rightarrow 01$; $H \rightarrow 00$; $L \rightarrow 00$.
[U.P.S.C. I.E.S. E.E.-II, 2002]

158. An output device is interfaced with an 8085 microprocessor as memory-mapped I/O. The address of the device is 1000 H. In order to output data from the accumulator to the device, what will be the sequence of instructions?
(a) LXI H, 1000H MOV A, M
(b) LXI H, 1000H MOV M, A
(c) LHLD 1000H MOV A, M
(d) LHLD 1000H MOV M, A [U.P.S.C. I.E.S. E.E.-II, 2009]

159. Carry flag is not affected after the execution of
(a) ADD B (b) SBB B (c) INR B (d) ORA B
[U.P.S.C. I.E.S. E.E.-II, 2008]

160. Processor status word of 8085 microprocessor has five flags. Which are these five flags ?
(a) S, Z, AC, P, CY. (b) S, OV, AC, P, CY.
(c) S, Z, OV, P, CY. (d) S, Z, AC, P, OV.
[U.P.S.C. I.E.S. E.E.-II, 2006]

161. Which one of the following 8085 assembly language instructions does not affect the contents of the accumulator ?
(a) CMA (b) CMPB (c) DAA (d) ADDB
[U.P.S.C. I.E.S. E.E.-II, 2004]

162. Which one of the following statements is NOT correct?
(a) CMP A is a single byte instruction and CMA is not an instruction.
(b) The instruction SUB A sets the zero flag.
(c) Bus is a group of wires.
(d) Instruction INR C does not affect carry flag.
[U.P.S.C. I.E.S. E.E.-II, 2011]

163. After an arithmetic operation, the flag register of a 8085 microprocessor has the following look :

D_7	D_6	D_5	D_4	D_3	D_2	D_1	D_0
1	0	X	1	X	0	X	1

The arithmetic operation has resulted in
(a) A carry and an odd parity number having 1 as the MSB.
(b) Zero and the auxiliary carry flag being set.
(c) A number with even parity and 1 as the MSB.
(d) A number with odd parity and 0 as the MSB.
[U.P.S.C. I.E.S. E.E.-II, 2003]

164. On execution of the following segment of instructions in sequence
MVI A, 91H XRI 91H
which one of the following is correct ?
(a) Content of accumulator is 00H. Carry, Auxiliary Carry and Zero flag set to 0, 1 and 0, respectively.
(b) Content of accumulator is 91 H. Carry, Auxiliary Carry and Zero flag set to 0, 0 and 1, respectively.
(c) Content of accumulator is 00H. Carry, Auxiliary Carry and Zero flag set to 0, 0 and 1, respectively.
(d) Content of accumulator is 91H. Carry, Auxiliary Carry and Zero flag set to 0, 1 and 0, respectively.
[U.P.S.C. I.E.S. E.E.-II, 2007]

165. Examine the following instruction to be executed by a 8085 microprocessor. The input port has an address of 01H and has a data 05H to input :
IN 01 ANI 80
After execution of the two instructions the following flag portions may occur :
1. Zero flag is set. 2. Zero flag is reset.
3. Carry flag is cleared. 4. Auxiliary carry flag is set.
Select the correct answer using the codes given below :
Codes :
(a) 1 and 3 (b) 2, 3 and 4 (c) 3 and 4 (d) 1, 2 and 4
[U.P.S.C. I.E.S. E.E.-II, 2003]

166. An input device is interfaced with Intel 8085A microprocessor as memory mapped I/O. The address of the device is 2500H. In order to input data from the device to accumulator, the sequence of instructions will be
(a) LXI H, 2500 H
MOV A, M

Answers: **150.** (d), **151.** (b), **152.** (b), **153.** (c), **154.** (d), **155.** (a), **156.** (b), **157.** (c), **158.** (b), **159.** (c), **160.** (a), **161.** (b), **162.** (a), **163.** (a), **164.** (c), **165.** (a), **166.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(b) LXI H, 2500 H
MOV M, A
(c) LHLD 2500 H
MOV A, M
(d) LHLD 2500 H
MOV M, A
[GATE E.E. 2008]

167. For 16 bit address-bus, if an 8 K RAM chip is selected when, A_{13}, A_{14} and A_{15} address bits are all one, then what is the range of the memory address?
(a) EOOOH – EFFFH (b) EOOOH – FFFFH
(c) FOOOH – FFFFH (d) FOOOH – FEEEH
[U.P.S.C. I.E.S. E.E.-II, 2009]

168.
```
LXI   SP,  7FFFH
MVI   A,   25H
XRI   02H
PUSH  PSW
POP   H
MOV   A,   L
ORI   10H
HLT
```
What are the contents of A, H, L, SP and PSW registers after executing the above set of instructions? Assume undefined flags always remain cleared.
(a) 10H, 25H, 00H, 7FFFH, 00H respectively.
(b) 14H, 27H, 04H, 7FFFH, 04H respectively.
(c) 14H, 25H, 00H, 7FFFH, 04H respectively.
(d) 10H, 27H, 04H, 7FFFH, 00H respectively.
[U.P.S.C. I.E.S. E.E.-II, 2010]

169. The stack pointer of an 8085A microprocessor contains ABCD H.
```
PUSH  PSW
XTHL
PUSH  D
JMP   EC    75 H
```
At the end of the execution of the above instructions, what would be the content of the stack pointer ?
(a) ABCB H (b) ABCA H (c) ABC9 H (d) ABC8 H
[U.P.S.C. I.E.S. E.E.-II, 2008]

170. The stack pointer of an 8085 microprocessor is ABCDH. At the end of execution of the sequence of instructions, what will be the content of the stack pointer?
```
PUSH PSW
XTHL
PUSH D
JMP  FC70H
```
(a) ABCBH (b) ABCAH
(c) ABC9H (d) ABC8H
[U.P.S.C. I.E.S. E.E.-II, 2009]

171. The contents of Program Counter (PC), when the microprocessor is reading from 2FFF H memory location, will be
(a) 2FFE H (b) 2FFF H (c) 3000 H (d) 3001 H
[U.P.S.C. I.E.S. E.E.-II, 2008]

172. If the following program is executed in a microprocessor, the number of instruction cycles it will take from START to HALT is
```
START MVI A, 14 H  ;  Move 14H to register A
SHIFT RLC          ;  Rotate left without carry
      JNZ SHIFT    ;  Jump on non-zero to SHIFT
      HALT
```
(a) 4 (b) 8 (c) 13 (d) 16
[GATE E.E. 2004]

173. An 8085 microprocessor is executing the programme as follows:
```
      MVI A, 20 H
      MVI B, 10H
BACK : NOP
       ADD B
       RLC
       JNC BACK
       HLT
```
How many times the instruction NOP will be executed?
(a) 4 (b) 3 (c) 2 (d) 1
[U.P.S.C. I.E.S. E.E.-II, 2009]

174. To execute the following instructions
(i) LDA 2100 H
(ii) LXI H, 2100 H
by an Intel 8085 microprocessor the numbers of memory cycles required are:
(a) 2 for (i) and 2 for (ii) (b) 4 for (i) and 2 for (ii)
(c) 3 for (i) and 3 for (ii) (d) 4 for (i) and 3 for (ii)
[U.P.S.C. I.E.S. E.E.-II, 2011]

175. The following sequence of instructions are executed by an 8085 microprocessor
1000 LXI SP, 27 FF 1003 CALL 1006 1006 POPH
What are the contents of the stack pointer (SP) and the HL register pair on completion of execution of these instructions ?
(a) SP = 27 FF, HL = 1003 (b) SP = 27 FD, HL = 1003
(c) SP = 27 FF, HL = 1006
(d) SP = 27 FD, HL = 1006 [U.P.S.C. I.E.S. E.T.E.-II, 2005]

176. The _____ instruction allows control to transfer to a subroutine, which when complete, issue the _____ instruction to return control to the main program.
(a) CALL, JMP (b) CALL, RET
(c) CALL, RSTI (d) EI, DI [U.P.S.C. I.E.S. E.E.-II, 2006]

177. Which one of the following signal combinations will generate $\overline{MEMR}$ signal ?
(a) $IO/\overline{M} \wedge \overline{RD}$ (b) $IO/\overline{M} \vee \overline{RD}$
(c) $\overline{IO/\overline{M}} \vee \overline{RD}$ (d) $\overline{IO/\overline{M}} \wedge \overline{RD}$
[U.P.S.C. I.E.S. E.E.-II, 2000]

178. In an 8085A microprocessor based system, it is desired to increment the contents of memory location whose address is available in (D, E) register pair and store the result in same location. The sequence of instruction is
(a) XCHG (b) XCHG (c) INX D (d) INR M
INR M INX H XCHG XCHG
[GATE E.E. 2006]

179. Which one of the following instructions is a 3-byte instruction?
(a) M V I A (b) L D A X B
(c) J M P 2050 (d) MOV A, M
[U.P.S.C. I.E.S. E.E.-II, 2006]

180. Read the following Assembly Language Program Segment of 8085 :
```
EI       RIM
ANI 80 H SIM
```
What kind of task is performed by above set of instructions ?
(a) Sends bit out on SOD pin.
(b) Accepts bit in from SID pin.
(c) Accepts RST 7-5 interrupt.
(d) Resets RST 7.5 interrupt. [U.P.S.C. I.E.S. E.E.-II, 2007]

181. How many times will the following loop be executed ?
```
      LXIB  0010 H
LOOP : DCX  B
       MOV  A, B
       ORA  C
       JNJ  LOOP
```

Answers: **167.** (b), **168.** (b), **169.** (c), **170.** (c), **171.** (c), **172.** (c), **173.** (b), **174.** (d), **175.** (c), **176.** (b), **177.** (b), **178.** (a), **179.** (c), **180.** (c), **181.** (d),

Downloaded From : www.EasyEngineering.net

Select the correct answer using the code given below :
(a) 10 (b) 100 (c) 16 (d) 15
[U.P.S.C. I.E.S. E.E.-II, 2006]

182. A software delay subroutine is written as given below :

```
DELAY :  MVI  H,   255 D
         MVI  L,   255 D
LOOP :   DCR  L
         JNZ  LOOP
         DCR  H
         JNZ  LOOP
```

How many times DCR L instruction will be executed ?
(a) 255 (b) 510 (c) 65025 (d) 65279
[GATE E.E. 2006]

183. Which one is the indirect addressing mode in the following instructions ?
(a) LXIH 2050 H (b) MOV A, B
(c) LDAX B (d) LDA 2050 H
[U.P.S.C. I.E.S. E.E.-II, 2008]

184. An example of 8085-instruction that uses direct addressing is
(a) RLC (b) STA (c) RRC (d) CMA
[U.P.S.C. I.E.S. E.E.-II, 2010]

185. In an 8085 microprocessor, the contents of the Accumulator, after the following instructions are executed will become

```
XRA A
MVIB F0H
SUB B
```

(a) 01 H (b) 0F H (c) F0 H (d) 10 H
[GATE E.E. 2009]

186.

```
MVI   A,   AAH
ORI   FFH
RRC
RRC
CMC
INR   A
```

What are the contents of A and PSW registers after executing the above set of instructions in sequence?
(a) AAH and 00H (b) FFH and 66H
(c) 00H and 54H (d) 00H and 00H
[U.P.S.C. I.E.S. E.E.-II, 2010]

187. For which one of the following, the instruction XRA A in 8085 microprocessor can be used?
(a) Set the carry flag.
(b) Set the zero flag.
(c) Reset the carry flag and clear the accumulator.
(d) Transfer FFH to the accumulator. [U.P.S.C. I.E.S. E.E.-II, 2009]

188. The following program is written for an 8085 microprocessor to add two bytes located at memory address 1FFE and 1FFF

```
LXI   H, 1FFE
MOV   B, M
INR   L
MOV   A, M
ADD   B
INR   L
MOV   M, A
XOR   A
```

On completion of the execution of the program, the result of addition is found
(a) in the register A. (b) at the memory address 1000.
(c) at the memory address 1F00.
(d) at the memory address 2000. [GATE E.E. 2003]

189. Read the following Assembly Language Program Segment of 8085 Microprocessor :

```
LXI   H, 2501 H     MOV   A, H
MOV   A, L          ANI   F0H
ORI   F0H           MOV   H, A
MOV   L, A          HLT
```

What are the contents of A, H and L registers after executing the above set of instructions in sequence ?
(a) Contents of A, H and L registers are 25, 20 F1, respectively.
(b) Contents of A, H and L registers are 05, 25 and 01, respectively.
(c) Contents of A, H and L registers are 20, 20 and F1, respectively.
(d) Contents of A, H and L registers are 25, 05 and 01, respectively. [U.P.S.C. I.E.S. E.E.-II, 2007]

190. Consider the program given, which transfers a block of data from one place in memory to another

```
MVI C   0BH     STAX   D
LXI H   2400    INR    L
LXI D   3400    INR E
L1 : MOV  A M   DCR C
                JNZ LI
```

What is the total number of memory accesses (including instruction fetches) carried out ?
(a) 118 (b) 140 (c) 98 (d) 108
[U.P.S.C. I.E.S. E.E.-II, 2005]

191. The content of some of the memory location in an 8085A based system are given below

Address	Content
..	..
26FE	00
26FF	01
2700	02
2701	03
2702	04
..	..

The content of stack (SP), program counter (PC) and (H, C) are 2700 H, 2100 H and 0000 H respectively. When the following sequence of instruction are executed

2100H : DAD SP 2101 H : PCHL

the content of (SP) and (PC) at the end of execution will be
(a) PC = 2102 H, SP = 2700 H.
(b) PC = 2700 H, SP = 2700 H.
(c) PC = 2800 H, SP = 26FE H.
(d) PC = 2,A02 H, SP = 2702 H. [GATE E.E. 2008]

192. A portion of the main program to call a subroutine SUB in an 8085 environment is given below.

```
    :
    :
    LXI    D, DISP
LP: CALL   SUB
    :
    :
```

It is desired that control be returned to LP + DISP + 3 when the RET instruction is executed in the subroutine. The set of instructions that precede the RET instruction in the subroutine are

(a)
```
POP   D
DAD   H
PUSH  D
```

(b)
```
POP   H
DAD   D
INX   H
INX   H
INX   H
PUSH  H
```

Answers: **182.** (a), **183.** (c), **184.** (b), **185.** (d), **186.** (c), **187.** (b), **188.** (c), **189.** (c), **190.** (a), **191.** (b), **192.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c)
```
POP  H
DAD  D
PUSH H
```
(d)
```
XTHL
INX  D
INX  D
INX  D
XTML
```
[GATE E.E. 2011]

193. When a 'CALL addr' instruction is executed, the CPU carries out the following sequential operations internally:
Note:
(R) means content of register R
((R)) means content of memory location pointed by R
PC means Program Counter
SP means Stack Pointer

(a) (SP) incremented
(PC) ← Addr
((SP)) ← (PC)

(b) (PC) ← Addr
((SP)) ← (PC)
(SP) incremented

(c) (PC) ← Addr
(SP) incremented
((SP)) ← (PC)

(d) ((SP)) ← (PC)
(SP) incremented
(PC) ← Addr

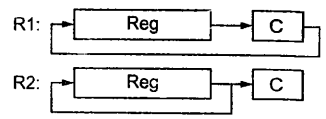
[GATE E.E. 2010]

194. Microprocessor based instruments can be used to measure
(a) temperature only. (b) pressure only.
(c) flow only.
(d) all the quantities at (a), (b) and (c).
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

195. An 8085 microprocessor based system drives a multiplexed 5 digit, 7-segment display. The digits are refreshed at a rate of 500 Hz. The ON time for each digit (assumed equal) is
(a) 4×10^{-3} s. (b) 0.4×10^{-3} s.
(b) 10^{-2} s. (d) 2.5×10^{-2} s.
[U.P.S.C. I.E.S. E.E.-II, 2000]

Statement for Linked Answer Questions (196–197):

The associated figure shows the two types of rotate right instruments R1, R2 available in a microprocessor where Reg is a 8-bit register and C is the carry bit. The rotate left instructions L1 and L2 are similar except that C now links the most significant bit of Reg instead of the least significant one.



196. Suppose Reg contains the 2's complement number 11010110. If this number is divided by 2 the answer should be
(a) 01101011 (b) 10010101
(c) 11101001 (d) 11101011 [GATE E.E. 2007]

197. Such a division can be correctly performed by the following set of operations
(a) L2, R2, R1 (b) L2, R1, R2
(c) R2, L1, R1 (d) R1, L2, R2 [GATE E.E. 2007]

Answers: **193.** (d), **194.** (d), **195.** (b), **196.** (d), **197.** (a).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): Analog computers are more widely used in comparison to digital computers.
(R): Analog computers are efficient in continuous calculations such as differentiation and integration.

2. (A): Digital computers are more widely used in comparison to analog computers.
(R): Digital computers are more accurate than analog computers.

3. (A): Stack is a group of memory locations in RAM used for temporary storage of data.
(R): PUSH and POP instructions are used to send and retrieve data from stack. [U.P.S.C. I.E.S. E.E.-II, 2006]

4. (A): STACK is used to temporarily store the data in RAM locations specified by the programmer in main program.
(R): PUSH and POP instructions are used to send or retrieve the data from the STACK. [U.P.S.C. I.E.S. E.E.-II, 2011]

5. (A): Analog to digital converters are used to interface microprocessor to analog signals.
(R): Many applications in real world produce signal analog in nature. [U.P.S.C. I.E.S. E.E.-II, 2007]

6. (A): A subtractor is normally not used in a modern digital transducer.
(R): The adder is geared for doing subtraction alone.

7. (A): Semiconductor memories are preferred.
(R): Semiconductor memories are non-volatile and of large size.

8. (A): Magnetic cores are generally used in main memory of a digital computer.
(R): Magnetic cores are slow and volatile.

9. (A): Read only memory (ROM) is a random access memory.
(R): Time taken to access any location of ROM is the same.
[U.P.S.C. I.E.S. E.E.-II, 1998]

10. (A): Each memory cell of a DRAM requires refreshing every 2, 4 or 8 ms or its data will be lost.
(R): DRAM stores 1s and 0s as charges on a small MOS capacitor which has tendency to leak off charge after a period of time.
[U.P.S.C. I.E.S. E.E.-II, 2008]

11. (A): DMA is faster than either Interrupt initiated I/O or Polling based I/O for very large data transfers.
(R): DMA takes control of the system buses and need no processor intervention during the data transfer.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

12. (A): A subroutine is a program written separately from the main program to perform function that occurs repeatedly in the main program.

Answers: **1.** (d), **2.** (b), **3.** (b), **4.** (b), **5.** (a), **6.** (a), **7.** (c), 8. (c), **9.** (a), **10.** (a), **11.** (a), **12.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): A subroutine can be called by a CALL instruction. [U.P.S.C. I.E.S. E.E.-II, 2007]

13. (A): Data-flow computers exploit maximum parallelism.
(R): Data-flow computers require no program counter. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

14. (A): D-flip-flops are used as buffer register.
(R): D-flip-flops are free from "race-around" condition. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

15. (A): D flip-flops are used to construct a buffer registers.
(R): Buffer registers are used to store binary word temporarily. [U.P.S.C. I.E.S. E.E.-II, 2001, 2010]

16. (A): Binary search function can be easily implemented using recursion.
(R): Recursion is based on number of elements in array to be searched. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

17. (A): The development of a microprocessor based product requires the design of program and the hardware.
(R): The design effort for an electronic product follows the same basic steps used in the development of software. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

18. (A): The zero-flag of a 8085 microprocessor is not affected after the execution of the following couple of instructions :

```
MVI    B, 03
MOV    A, B
```

(R): After the execution of a data transfer instruction, zero-flag is set if the accumulator content is zero. [U.P.S.C. I.E.S. E.E.-II, 2003]

19. (A): Neumann machines are called Control Flow Computers.
(R): Instructions are executed sequentially as controlled by a program counter. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

20. (A): In a microprogrammed CPU, each machine instruction is executed by a real-time interpreter.
(R): Real-time interpreter helps to achieve high degree parallelism in microprogrammed control. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

21. (A): Address bus is unidirectional.
(R): Data bus is bidirectional. [U.P.S.C. I.E.S. E.E.-II, 2010]

22. (A): The port address in IN/OUT instruction is 8 bit.
(R): The address byte is duplicated in machine cycle for IN/OUT instruction. [U.P.S.C. I.E.S. E.E.-II, 2010]

23. (A): An I/O device connected to microprocessor in I/O mapped I/O mode has an 8 bit port address.
(R): Microprocessor based system design uses concept of zero paging. [U.P.S.C. I.E.S. E.E.-II, 2010]

24. (A): A key specification of any memory device is its access time.
(R): The access time of the memory must be more than the access time of the microprocessor. [U.P.S.C. I.E.S. E.E.-II, 2010]

25. (A): Port B of 8255 A can only be used as input port.
(R): Port B can only be operated in Mode 0 or Mode 1. [U.P.S.C. I.E.S. E.E.-II, 2010]

26. (A): The frequency of 8085 system is 1/2 of the crystal frequency.
(R): Microprocessor (8085) requires a two phase clock. [U.P.S.C. I.E.S. E.E.-II, 2010]

27. (A): Instruction SIM is necessary to implement the interrupts INTR.
(R): INTR requires external hardware for implementation. [U.P.S.C. I.E.S. E.E.-II, 2011]

28. (A): SIM instruction cannot be used to disable or change priority of INTR pin.
(R): INTR is a pseudo-vectored interrupt PIN. [U.P.S.C. I.E.S. E.E.-II, 2010]

29. (A): Monostable multivibrators (IC 74121) are used in a microprocessor based system for frequency measurement.
(R): Microprocessor counts the number of interrupt signals/second or within a specified interval through ISR. [U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **13.** (c), **14.** (b), **15.** (a), **16.** (c), **17.** (b), **18.** (c), **19.** (a), **20.** (c), **21.** (b), **22.** (c), **23.** (c), **24.** (b), **25.** (d), **26.** (c), **27.** (d), **28.** (c), **29.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1	List 2
A. Monitor program.	1. Used to indicate memory location.
B. Assembler.	2. A combination of letters, symbols and numerals.
C. Mnemonic.	3. A program that translates symbolic instructions into binary equivalent.
D. Program counter.	4. An operating system.

Codes :	A	B	C	D
(a)	4	3	2	1
(b)	4	3	1	2
(c)	3	4	1	2
(d)	3	4	2	1 [U.P.S.C. I.E.S. E.E.-II, 2004]

2.

List 1 (Instructions)	List 2 (Application)
A. SIM	1. 16-bit addition.
B. DAD	2. Initializing the stack pointer.
C. DAA	3. Serial output data.
D. SPHL	4. Checking the current interrupt mask settings.
	5. BCD addition.

Codes :	A	B	C	D
(a)	5	4	2	1
(b)	3	1	5	3
(c)	5	1	2	4
(d)	3	4	5	1 [U.P.S.C. I.E.S. E.E.-II, 2004]

3.

List 1 (Type of Memory)	List 2 (Used as)
A. DRAM	1. Cache memory.
B. SRAM	2. Main memory.
C. Parallel Access Registers	3. BIOS memory.
D. ROM	4. CPU registers.

Answers: **1.** (a), **2.** (d), **3.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Codes :	A	B	C	D
(a)	1	4	2	3
(b)	3	4	2	1
(c)	1	2	4	3
(d)	3	2	4	1

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

4.

List 1 (Interrupt)	List 2 (Property)
A. RST 7.5	1. None maskable.
B. RST 5.5	2. Edge sensitive.
C. INTR	3. Level sensitive.
D. TRAP	4. Non-vectored.

Codes :	A	B	C	D
(a)	1	3	4	2
(b)	2	4	3	1
(c)	1	4	3	2
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.E.-II, 2005]

5.

List 1 (Feature of Instruction)	List 2 (Instruction)
A. Maskable interrupt.	1. RST 5.5
B. Signal.	2. XTHL
C. Instruction.	3. SID
D. Memory location 002 C H.	4. RST 6.5

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	2	3	4	1
(c)	4	3	2	1
(d)	2	1	4	3

[U.P.S.C. I.E.S. E.E.-II, 2008]

6.

List 1	List 2
A. Modified during fetch phase.	1. DI
B. Holds subscripts of arrays.	2. DS
C. Needed by the DEBUG program.	3. IP
D. Calculates addresses of data in data-segment.	4. TF

Codes :	A	B	C	D
(a)	2	4	1	3
(b)	3	1	4	2
(c)	2	1	4	3
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-II, 2005]

7.

List 1 (Interrupts)	List 2 (Corresponding Characteristics)
A. TRAP	1. Level triggered.
B. INTR	2. Non maskable.
C. RST 7.5	3. For increasing the number of interrupts.
D. RST 6.5	4. Positive edge triggered.

Codes :	A	B	C	D
(a)	2	4	3	1
(b)	1	4	3	2
(c)	1	3	4	2
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.E.-II, 2004]

8.

List 1 (Microprocessor Pin)	List 2 (Signals on Pin)
A. TRAP	1. Interrupt.
B. HLDA	2. Initializing.
C. RESET	3. Enable.
D. ALE	4. Memory access.

Codes :	A	B	C	D
(a)	1	2	4	3
(b)	3	2	4	1
(c)	1	4	2	3
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-II, 2009]

9.

List 1 (Instruction Code)	List 2 (Addressing Mode)
A. JUMP 2021 H	1. Direct addressing.
B. LDAX B	2. Immediate addressing.
C. IN 10H	3. Indirect register addressing.
D. RLC	4. Implicit addressing.

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	2	3	1	4
(c)	4	1	3	2
(d)	2	1	3	4

[U.P.S.C. I.E.S. E.E.-II, 2009]

10.

List 1 (Addressing Mode)	List 2 (Instruction)
A. Implicit addressing.	1. JMP 3 FAO H
B. Register-indirect.	2. MOV A, M
C. Immediate.	3. LDA 03 FCH
D. Direct addressing.	4. RAL

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	4	2	1	3
(c)	3	2	1	4
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-II, 2004]

11.

List 1 (Introduction)	List 2 (Type of Addressing)
A. MOV A, M	1. Direct addressing.
B. LXiH, E400H	2. Register addressing.
C. LDA F1CDH	3. Implicit addressing.
D. CMC	4. Register indirect addressing.
	5. Immediate addressing.

Codes :	A	B	C	D
(a)	5	4	1	3
(b)	4	5	3	1
(c)	5	4	2	3
(d)	4	5	1	3

[U.P.S.C. I.E.S. E.E.-II, 2003]

12.

List 1 (Instruction)	List 2 (Operation)
A. PCHL	1. Exchange the top of the stack with the contents of HL pair.
B. SPHL	2. Exchange the contents of HL with those of DE pair.
C. XTHL	3. Transfer the contents of HL to the stack pointer.
D. XCHG	4. Transfer the contents of HL to the programme counter.

Codes :	A	B	C	D
(a)	3	4	1	2
(b)	3	4	2	1
(c)	4	3	2	1
(d)	4	3	1	2

[U.P.S.C. I.E.S. E.E.-II, 2004]

Answers: **4.** (d), **5.** (c), **6.** (d), **7.** (d), **8.** (c), **9.** (b), **10.** (b), **11.** (d), **12.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F).

1. Computers are programmable calculators.
2. Analog computers operate in real world and perform operations like addition, scalar multiplication and integration.
3. The basic components of a modern digital computer are central processor and I/O devices.
4. The processing component of a microcomputer is a microprocessor.
5. A central processing unit (CPU) of a computer consists of control and arithmetic logic unit and primary storage.
6. A microcomputer is a small computer and has the basic elements – microprocessing unit, memory and input/output devices.
7. The arithmetic and logic unit controls the flow of programs and data in and out of the memory.
8. The retrieval of information from the computer is defined as the output.
9. An 8 bit accumulator can store up to 255 integers.
10. In a register the flip-flops are connected in parallel.
11. A PC counts the number of programs run after starting.
12. Most operating systems for microprocessors permit multi-programming.
13. Mnemonic symbols are used to assist human memory.
14. Semiconductor memories are non-volatile.
15. The contents of ROM are easily changed.
16. Secondary storage is volatile.
17. Primary storage is non-volatile.
18. Disks are connected directly to the CPU.
19. In comparison to secondary storage, primary storage is fast and expensive.
20. System software is more general than the application software.
21. Punched cards are inexpensive as data entry media.
22. Magnetic disk is expensive in comparison to magnetic tape.
23. Compilers used in microcomputers are classified as application softwares.
24. Compilers and interpreters are themselves programs.
25. An interpreter translates a high level language source program line by line, executes each line immediately.
26. FORTRAN is one of the oldest high level language.
27. COBOL is widely used in scientific applications.
28. Microprocessor carries out both logic and arithmetic operations.
29. DAC is an important part of the microprocessor.
30. Four byte instruction not true for the 8085 microprocessor.
31. Assembly language is used for programming in an 8085 microprocessor.
32. The memory chips used in microprocessor based units are only RAM.
33. Accumulator is an hardware which stores one of the operand to be maintained by the ALU.
34. The CPU controls all input, output and processing.
35. Registers and counters are similar in the sense that they both count pulses and store binary information.
36. In a microprogrammed CPU, each machine instruction is executed by a real-time interpreter.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (T), **5.** (T), **6.** (T), **7.** (F), **8.** (T), **9.** (T), **10.** (F), **11.** (F), **12.** (F), **13.** (T), **14.** (F), **15.** (F), **16.** (F), **17.** (F), **18.** (F), **19.** (T), **20.** (T), **21.** (F), **22.** (T), **23.** (F), **24.** (T), **25.** (T), **26.** (T), **27.** (F), **28.** (T), **29.** (F), **30.** (T), **31.** (T), **32.** (F), **33.** (T), **34.** (T), **35.** (F), **36.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. The physical part or electronic circuitry of a computer system is called _____ . (hardware/machine)
2. Intel 8085 is a _____ bit microprocessor. **[A.M.I.E. Summer 1994]**
3. _____ is the heart of an analog computer.
4. A microcomputer comprises the following elements :
   (a) _____ (b) random access memory (c) read only memory (d) input/output devices and (e) interface components.
   [A.M.I.E. Summer 1993]
5. The most common input device used today is the _____.
6. The organisational structure of a microprocessor is called the _____.
   [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]
7. When a number of inputs is to be processed by the microcomputer, an _____ is used.
   [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]
8. D/A converter _____ a constituent of a microprocessor.
9. In a microcomputer _____ is its heart.
10. The central processing unit of a small computer system, including ALU and control functions on a single LS chip is known as _____ .
11. The register which stores the operand, execute an instruction with the help of other registers and memory is called the _____.
12. The size of the memory, a microprocessor can access is determined by the number of _____ lines the processor has.
    [A.M.I.E. Elements of Electronics & Instrumentation Summer 1995]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

13. A programme written in machine language is called the _____ program.
14. A set of instructions written in computer language is called the _____.
15. Number of cards read per minute by a card reader may be of the order of _____.
16. The flow of data takes place on _____ bus in a microprocessor based system.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]
17. In 8085 microprocessor _____ interrupts are markable.
18. The number of bits required to address 4 k memory is _____.
19. In an 8 bit microcomputer, the fetch cycles required to fetch an 8 byte instruction will be _____. (2/4/8)
20. _____ keeps the track of next instruction to be executed in a microprocessor.
21. The interrupt pin TRAP of a 8085 microprocessor is _____.
22. The equipment attached to CPU which computer can access are called the _____.
23. Analog computers are used primarily in _____ control and _____ applications.
24. Analog computer produces its results in the form of _____.
25. A printed copy of computer output is called the _____.
26. MDR stands for _____ register.
27. The development of the programs for various requirements is called the _____.
28. A source program is the program written in _____ language.
29. Programs for applications are normally written in _____ language.
30. Computer equipment and peripherals are sensitive to temperature and _____.
31. The contents of ROM are _____.
32. Today the most popular microcomputer storage media are the hard disk and the _____.
33. The main advantage of a disk is its large _____.
34. A punched card has _____ rows and _____columns.
35. A _____ is a translating program that converts the source program into an object program.
36. The most business oriented language is _____.

ANSWERS

1. hardware	2. 16	3. Op-amp	4. microprocessor
5. keyboard	6. microprocessor architecture	7. interface	8. is not
9. microprocessor	10. microprocessor	11. accumulator	12. address
13. object	14. programme	15. 10,000	16. driver
17. four	18. twelve	19. 8	20. Programme counter
21. level triggered	22. peripherals	23. process, scientific	24. graph
25. hard copy	26. memory data	27. programming	28. high level
29. high level	30. humidity	31. fixed	32. floppy-disk
33. storage capacity	34. 12, 80	35. compiler	36. COBOL

CHAPTER 17

Communication System

Short Answer Type Questions With Answers

Q. 1. What is amplitude modulation?

Ans. The process of varying amplitude of the high frequency or carrier wave in accordance with the intelligence (code, voice or music) to be transmitted, keeping the frequency and phase of the carrier wave unchanged, is known as the amplitude modulation.

Q. 2. What is modulation index in AM?

Ans. The extent to which the amplitude of the carrier wave is varied by the modulating signal is called the modulation index and is defined as the ratio of change in amplitude of the carrier wave to the amplitude of normal carrier wave.

Q. 3. Why the reception in case of amplitude modulation is usually noisy ?

Ans. In case of AM, the reception is usually noisy because radio receiver cannot distinguish between the amplitude variations that represent noise and those contain the desired signal.

Q. 4. What is the bandwidth of AM wave ?

Ans. The difference between these two extreme frequencies is equal to the bandwidth of the AM wave.

Bandwidth, $BW = (\omega_c + \omega_m) - (\omega_c - \omega_m) = 2\omega_m$

Q. 5. What are the frequency components in an AM wave ?

Ans. The AM signal has three frequency components as follows :

(*i*) Carrier frequency ω_c having amplitude V_c

(*ii*) Upper sideband $(\omega_c + \omega_m)$ having amplitude $\frac{mV_c}{2}$

(*iii*) Lower sideband $(\omega_c - \omega_m)$ having amplitude $\frac{mV_c}{2}$

With the help of these frequency components, the frequency spectrum of a single-tone amplitude modulated wave can be plotted.

Q. 6. What is the current relationship for AM wave ?

Ans. Total modulated current (rms value) is given by the expression

$I_t = I_c\sqrt{1+\frac{m^2}{2}}$ where I_c is the rms value of unmodulated carrier current and m is the modulation index.

Q. 7. Why is DSB-FC transmission system widely used in broadcasting inspite of the fact that SSB-SC or SSB transmission system has numerous advantages over it ?

Ans. DSB-FC transmission system is widely used in broadcasting because of relative simplicity of its modulating equipment.

Q. 8. What is frequency deviation ?

Ans. The change or shift above or below the mean or centre frequency is called the frequency deviation.

Q. 9. What is carrier swing ?

Ans. The total variation in frequency from minimum to maximum value is called the carrier swing and it is twice the frequency deviation *i.e.* $CS = 2\Delta f$.

Q. 10. What is FM index ?

Ans. The ratio of frequency deviation to modulation frequency is called the FM index.

Q. 11. What is deviation ratio ?

Ans. The ratio of maximum permitted frequency deviation to the maximum permitted audio-frequency is known as the deviation ratio.

Q. 12. What is percent modulation in FM ?

Ans. The percent modulation when applied to FM, has slightly different meaning than when applied to AM. In FM, it is given as the ratio of actual frequency deviation to maximum permitted frequency deviation and multiplied by 100.

Q. 13. What is wideband FM ?

Ans. When the value of modulation index m_f is quite large, then in FM a large number of sidebands are produced and hence the BW of FM is sufficiently large. This type of FM system is known as wideband FM.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 14. What are the disadvantages of frequency modulation (FM) ?

Ans. A much wider channel typically 200 kHz is required in FM against only in 10 kHz in AM broadcast. This is serious drawback of FM. FM transmitting and receiving equipment particularly used for modulation and demodulation tend to be more complex and hence more costly.

Q. 15. What is demodulation ?

Ans. Demodulation or detection is a process of recovering the original modulating signal (intelligence) from the modulated carrier wave *i.e.* the demodulation is a process reverse of the process of modulation.

The devices used for demodulation or detection are called demodulators or detectors. For AM demodulators used are (*i*) square-law detectors, (*ii*) envelope detectors and (*iii*) transistor detectors.

AM signal with large carrier are detected by using the envelope detector. The envelope detector uses the circuit which extracts the envelope of the AM wave. But a low-level amplitude modulated signal can only be detected by using square-law detector. Envelope detector is most popular in commercial receiver circuits since it is very simple and is inexpensive, also at the same time, it provides satisfactory performance for the reception of the broadcast programmes.

Q. 16. What are the frequency range of the following bands :

(*i*) MF, (*ii*) HF, (*iii*) VHF, (*iv*) UHF, (*v*) Microwave, (*vi*) Optical range. Mention a typical application of each.

[U.P.S.E. I.E.S. 2003]

Ans. Frequency range and typical applications of different bands are given below in tabular form :

S. No.	*Band*	*Frequency Range*	*Applications*
1.	MF	300-3,000 kHz	AM, maritime radio, direction finding
2.	HF	3-30 MHz	SW radio, citizen's band
3.	VHF	30-300 MHz	TV, FM, Police, Mobile Radio Air Traffic Control
4.	UHF	300-3,000 MHz	Radar, TV, Navigation
5.	Micro-wave	3-300 GHz	Radar, satellite communication
6.	Optical range	10^{12} Hz-10^{24} Hz

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Modulation is primarily accomplished to
(a) produce sidebands.
(b) mix two waves of different frequencies.
(c) transmit audio-frequency signals over long distances.
(d) improve transmission efficiency.

2. An aerial having a directivity of 90 is operating at a wavelength of 2 m. The maximum effective aperture of the aerial is :
(a) 7.16 m^2 (b) 14.32 m^2
(c) 28.64 m^2 (d) 57.28 m^2
[U.P.S.C. I.E.S. E.E.-II, 2011]

3. In AM wave
(a) RF and AF waves are sent alternately.
(b) carrier wave magnitude varies with AF signal.
(c) RF signal should be an even multiple of AF signal.

4. The disadvantage of low level modulation system is
(a) high modulating power.
(b) linear device is to be used after modulation.
(c) amplifier of large power capacity is to be used after modulation.
(d) amplifier of large bandwidth is to be used after modulation.

5. Limitations of AM modulation is/are
(a) noisy reception.
(b) low transmission efficiency and small operating range.
(c) poor audio quality. (d) ail of the above.

6. In an AM system, for satisfactory operation, carrier frequency must be n times the bandwidth of message signal. What is the value of n ?
(a) > 2 (b) > 5 (c) > 10 (d) > 50
[U.P.S.C. I.E.S. E.E.-II, 2008]

7. In an AM wave V_{max} = 10 V and V_{min} = 5 V. The percentage of modulation is
(a) 20.00 (b) 33.3 (c) 50.0 (d) 75.0
[A.M.I.E. Sec. B Design of Electronic Devices and Circuits Winter 2007]

8. In a 100% amplitude modulated signal, if the total transmitted power is P, then carrier power will be
(a) $\frac{2}{3}$ P (b) $\frac{1}{2}$ P (c) $\frac{1}{3}$ P (d) $\frac{1}{4}$ P
[U.P.S.C. I.E.S. E.E.-II, 1998]

9. In AM, the percentage of total power in sideband is
(a) 10%. (b) 16.67%. (c) 23.34% (d) 37.5%.
[U.P.S.C. I.E.S. E.E.-II, 2003]

10. A broadcast AM radio transmitter radiates 125 kW when the modulation percentage is 70. How much of this a carrier power ?
(a) ≃ 25 kW (b) ≃ 50 kW (c) ≃ 75 kW (d) ≃ 100 kW
[U.P.S.C. I.E.S. E.E.-II, 2005]

11. How much power will an AM transmitter, rated at 50 kW, radiate if it is modulated to 100%?
(a) 25 kW (b) 50 kW (c) 75 kW (d) 100 kW
[U.P.S.C. I.E.S. E.E.-II, 2009]

12. What is the power contained in SSB transmission when the carrier power is 1 kW and the modulation index is 0.3 ?
(a) 22.5 W (b) 90 W (c) 300 W (d) 1 kW
[U.P.S.C. I.E.S. E.E.-II, 2007]

13. In an AM signal when the modulation index is one, the maximum power P_t (where P_c is the carrier power) is equal to
(a) P_c. (b) 1.5 P_c. (c) 2 P_c. (d) 2.5 P_c.
[U.P.S.C. I.E.S. E.E.-II, 2001]

14. If the modulation index of an AM wave is changed from 0 to 1, the transmitted power.
(a) increases by 50%. (b) increases by 75%.
(c) increases by 100%. (d) remains unaffected.
[U.P.S.C. I.E.S. E.E.-II, 2001]

15. In amplitude modulation, the modulation envelope has a peak value which is double the unmodulated carrier value. What is the value of the modulation index ?
(a) 25%. (b) 50%. (c) 75%. (d) 100%.
[U.P.S.C. I.E.S. E.E.-II, 2004]

16. An AM modulator has output
$S(t) = 20 \cos (300 \pi t) + 6 \cos (320 \pi t) + 6 \cos (280 \pi t)$.
Then what is the modulation index of the wave?
(a) More than 100% (b) 0.93
(c) 0.3 (d) 0.6 [U.P.S.C. I.E.S. E.E.-II, 2009]

17. If two signals modulate the same carrier with different modulation depths of 0.3 and 0.9, the resulting modulation signal will
(a) be overmodulated.
(b) have the resultant modulation limited to 1.0.
(c) have the resultant modulation index around 0.82.
(d) have the resultant modulation index around 0.95.
[U.P.S.C. I.E.S. E.E.-II, 2006]

18. The resultant spectrum of a carrier, amplitude modulated with a rectangular pulse will be (f_c is the carrier frequency)
(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 1993]

19. The original spectrum of a message contains 100 Hz, 200 Hz frequency components. It is amplitude modulated by a carrier of 0.9 kHz. Which frequency components are contained in the amplitude modulated signal spectrum ?
(a) 900, 1000 and 1100 Hz. (b) 700, 800 and 900 Hz.
(c) 700, 800, 900, 1000 and 1100 Hz.
(d) 100, 200 and 900 Hz. [U.P.S.C. I.E.S. E.E.-II, 2006]

20. What is the assigned bandwidth of each of the channels in the AM broadcast band?
(a) 5 kHz (b) 10 kHz (c) 15 kHz (d) 200 kHz
[U.P.S.C. I.E.S. E.E.-II, 2010]

21. For an AM signal, the bandwidth is 10 kHz and the highest frequency component present is 705 kHz. What is the carrier frequency used for this AM signal ?
(a) 695 kHz (b) 700 kHz (c) 705 kHz (d) 710 kHz
[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **1.** (c), **2.** (c), **3.** (b), **4.** (a), **5.** (d), **6.** (d), **7.** (b), **8.** (a), **9.** (b), **10.** (d), **11.** (b), **12.** (a), **13.** (b), **14.** (a), **15.** (d), **16.** (d), **17.** (d), **18.** (c), **19.** (c), **20.** (b), **21.** (b),

Downloaded From : www.EasyEngineering.net

22. A carrier is amplitude modulated by 4 signals of frequency 10 kHz, 15 kHz, 20 kHz and 25 kHz. What is the bandwidth of the modulated signal ?
(a) 25 kHz (b) 50 kHz (c) 70 kHz (d) 140 kHz
[U.P.S.C. I.E.S. E.E.-II, 2007]

23. A given AM broadcast station transmits an average carrier power output of 40 kW and uses a modulation index of 0.707 for sine wave modulation. What is the maximum (peak) amplitude of the output if the antenna is represented by a 50 Ω resistive load ?
(a) 50 kV (b) 50 V (c) 3.414 kV (d) 28.28 kV
[U.P.S.C. I.E.S. E.E.-II, 2005]

24. The antenna current of an AM transmitter is 8 A when only carrier is sent, but it increases to 8.93 A when the carrier is modulated. Then what is the percentage modulation of the wave?
(a) 43.00%. (b) 70.14%.
(c) 57.00%. (d) 100.00%.
[U.P.S.C. I.E.S. E.E.-II, 2009]

25. For a message signal $m(t) = \cos(2\pi f_m t)$ and carrier of frequency f_c, which of the following represents a single sideband (SSB) signal?
(a) $\cos(2\pi f_m t)\cos(2\pi f_c t)$ (b) $\cos(2\pi f_c t)$
(c) $\cos[2\pi(f_c + f_m)t]$ (d) $[1 + \cos(2\pi f_m t)]\cos(2\pi f_c t)$
[GATE E.C.E. 2009]

26. Which one of the following is considered as an AM signal?
(a) Binary phase shift keying (BPSK).
(b) Differential phase shift keying (DPSK).
(c) Differential encoded PSK.
(d) Quadrature PSK.
[U.P.S.C. I.E.S. E.E.-II, 2009]

27. A DSB-SC signal is generated using the carrier signal $\cos(\omega_c t + \theta)$ and modulating signal $m(t)$. What is the envelope detector output of this DSB-SC signal ?
(a) $m(t)\cos\theta$ (b) $|m(t)|$
(c) $m(t)\tan\theta$ (d) $m(t)\sin\theta$
[U.P.S.C. I.E.S. E.E.-II, 2006]

28. A 4 GHz carrier is amplitude-modulated by a low pass signal of maximum cutoff frequency 1 MHz. If this signal is to be ideally sampled, the maximum sampling frequency should be nearly
(a) 4 MHz (b) 4 GHz (c) 8 MHz (d) 8 GHz
[U.P.S.C. I.E.S. E.E.-II, 2001]

29. A modulator is a device to
(a) Separate two frequencies.
(b) Impress the information on to a radio frequency carrier.
(c) Extract information from the carrier.
(d) Amplify the audio frequency signal. [U.P.S.C. I.E.S. E.E.-II, 2003]

30. The collector modulation is commonly used because of its following advantage(s).
(a) Good linearity and high collector circuit efficiency.
(b) Low modulating power requirement.
(c) Hundred percent modulation can be achieved.
(d) All of the above.

31. Which of the following modulated signals can be detected by an envelope detector ?
(a) DSB-suppressed carrier. (b) DSB-full carrier.
(c) Frequency modulated signal.
(d) SSB-supported carrier. [U.P.S.C. I.E.S. E.E.-II, 2006]

32. Which of the following desirable features are possessed by SSB in comparison to AM ?
1. Less power is required. 2. Bandwidth required is less.
3. Antenna size can be reduced.
4. Low frequency can be used.
Select the correct answer using the codes given below codes :
(a) 3 and 4. (b) 2, 3 and 4.
(c) 1 and 2. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2003]

33. One of the advantage of base modulation over collector modulation of a transistor Class C amplifier is
(a) the lower modulating power required.
(b) higher power output per transistors.
(c) better efficiency. (d) better linearity.
[U.P.S.C. I.E.S. E.E.-II, 2005]

34. The demodulation of a delta modulated signal is achieved by:
(a) integration. (b) differentiation.
(c) sampling. (d) band pass filtering.
[U.P.S.C. I.E.S. E.E.-II, 2011]

35. A modulation technique in which bandwidth of the modulated signal is extended well beyond the bandwidth of the modulating signal, independent of the modulating signal bandwidth, is called
(a) Wideband modulation.
(b) Extended bandwidth modulation.
(c) Spread spectrum modulation.
(d) Narrowband modulation. [U.P.S.C. I.E.S. E.E.-II, 2003]

36. One disadvantage of adaptive delta modulation over linear delta modulation is that it
(a) requires more bandwidth.
(b) is more vulnerable to channel errors.
(c) requires a larger number of comparators in the encoder.
(d) is not suitable for signals with periodic components.
[U.P.S.C. I.E.S. E.E.-II, 2002]

37. In a delta modulation scheme, the step height is 75 mV and step width is 1.5 ms. The maximum slope that the staircase can track is
(a) 50 V/s (b) 55 V/s (c) 60 V/s (d) 65 V/s
[U.P.S.C. I.E.S. E.E.-II, 2000]

38. Which one of the following signals can be applied to a delta modulator whose step size is 0.1 V and sampling frequency is 20π kHz so that no slope overload occurs ?
(a) 2 sin (1200 πt). (b) 1 sin (2600 πt).
(c) 3 sin (1000 πt). (d) 4 sin (400 πt).
[U.P.S.C. I.E.S. E.E.-II, 2006]

39. "Slope overload" occurs in delta modulation when the
(a) frequency of the clock pulses is too low.
(b) rate of change of analog waveform is too large.
(c) step size is too small.
(d) analog signal varies very slowly with time.
[U.P.S.C. I.E.S. E.E.-II, 2001]

40. To overcome slope overload problem, which type of integrator is used in delta modulation ?
(a) Fixed slope integrator. (b) Variable slope integrator.
(c) Linear slope integrator. (d) Bipolar integrator.
[U.P.S.C. I.E.S. E.E.-II, 2005]

41. The most useful modulation technique for high fidelity audio broadcasting on radio in current practices is
(a) amplitude modulation. (b) frequency modulation.
(c) pulse amplitude modulation.
(d) pulse code modulation. [U.P.S.C. I.E.S. E.E.-II, 1998]

42. In frequency modulation
(a) the frequency of the carrier remains constant.
(b) the amplitude of carrier remains constant.
(c) the amplitude of the carrier wave is varied.
(d) the frequency of the signal is made equal to the carrier frequency.

Answers: **22.** (b), **23.** (c), **24.** (b), **25.** (c), **26.** (d), **27.** (b), **28.** (d), **29.** (b), **30.** (a), **31.** (b), **32.** (c), **33.** (a), **34.** (a), **35.** (c), **36.** (c), **37.** (a), **38.** (d), **39.** (b), **40.** (b), **41.** (b), **42.** (b),

43. Consider the following statements about FM:
1. Modulation index determines the number of significant sideband components.
2. Theoretical bandwidth is infinite.
3. Carrier suppression is not possible.
4. Sidebands are not symmetric about carrier.

Which of the above statements is/are correct?
(a) 1, 2, 3 and 4 (b) 1 and 2 only
(c) 3 and 4 only (d) 3 only
[U.P.S.C. I.E.S. E.E.-II, 2009]

44. Which one of the following factors is limited in case of F.M.?
(a) Maximum frequency deviation.
(b) Maximum permissible modulation index.
(c) Signal to noise voltage ratio.
(d) Minimum permissible modulation index.
[U.P.S.C. I.E.S. E.E.-II, 2009]

45. In FM, modulation index m_f is equal to (Δf is the frequency deviation, and f_m is the modulating signal frequency)
(a) $\Delta f \times f_m$ (b) $\frac{f_m}{\Delta f}$ (c) $\frac{\Delta f}{f_m}$ (d) $\frac{1}{\Delta f \times f_m}$
[U.P.S.C. I.E.S. E.E.-II, 1998]

46. FM broadcast standards specify a maximum deviation of frequency to be equal to 75 kHz and a maximum modulating frequency of 15 kHz. What is the modulation index for FM wave ?
(a) 1/5 (b) 5 (c) 60 (d) 1125
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

47. In a narrowband FM system, the highest modulating frequency is f_m. The bandwidth of the system will be
(a) $6f_m$ (b) f_m (c) $2f_m$ (d) $10f_m$
[U.P.S.C. I.E.S. E.E.-II, 1997]

48. In the frequency modulation, if f_m is the modulating frequency, Δf of the maximum frequency deviation and B is the bandwidth, then
(a) $B = \Delta f + f_m$ (b) $B = \Delta f - f_m$
(c) $B = 2(\Delta f + f_m)$ (d) $B = 2(\Delta f - f_m)$
[U.P.S.C. I.E.S. E.E.-II, 2001]

49. An FM wave uses a 2–5 V, 500 Hz modulating frequency and has a modulation index of 50. The deviation is
(a) 500 Hz (b) 1,000 Hz
(c) 1250 Hz (d) 25,000 Hz
[U.P.S.C. I.E.S. E.E.-II, 2002]

50. An F M signal which is modulated by a 4 kHz sine wave reaches a maximum frequency of 100.01 MHz and minimum frequency of 99.97 MHz, then what is the one side frequency deviation of the signal?
(a) 6.67 (b) 5.00 (c) 10.0 (d) 20.0
[U.P.S.C. I.E.S. E.E.-II, 2009]

51. Which one of the following statements is correct ?
One hundred percent modulation of the carrier for the broadcast FM radio band is achieved when
(a) carrier frequency changes by ±100%.
(b) carrier envelope changes by ±100%.
(c) carrier frequency changes by ±75%.
(d) carrier frequency changes by ±15 kHz.
[U.P.S.C. I.E.S. E.E.-II, 2004]

52. If an FM wave is represented by the equation $e = 10 \sin (9 \times 10^8 t + 4 \sin 1{,}500 t)$, then what is the carrier frequency?
(a) 127.32 MHz. (b) 150.00 MHz.
(c) 143.31 MHz. (d) 208.00 MHz.
[U.P.S.C. I.E.S. E.E.-II, 2009]

53. An FM signal with modulation index m is applied to a frequency tripler. The resulting output has a modulation index
(a) 0 (b) $m/3$ (c) m (d) $3m$
[A.M.I.E. Sec. B Design of Electronic Devices and Circuits Winter 2007]

54. Which of the following are the advantages of FM broadcasting over AM broadcasting ?
1. Better S/N ratio. 2. Not subject to signal fading.
3. Power efficiency is superior.
4. Demodulation is simpler.

Select the correct answer from the code given below :
(a) 1 and 2. (b) 1, 2 and 4
(c) 2, 3 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2006]

55. Why does an FM radio station perform better than an AM station radiating the same total power ?
(a) FM is immune to noise.
(b) AM has only two sidebands while FM has more.
(c) FM uses larger bandwidth for large modulation depth.
(d) Capture effect appears in FM. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

56. In FM broadcast, maximum deviation is 75 kHz and maximum modulating frequency is 15 kHz. In view of Carson's rule, the maximum required bandwidth is
(a) 15 kHz (b) 30 kHz (c) 150 kHz (d) 180 kHz
[U.P.S.C. I.E.S. E.E.-II, 2007]

57. A carrier signal at frequency 100 MHz is frequency modulated with modulation index 2 by a signal at 2 kHz. At what frequencies are the sidebands produced ?
(a) 102 MHz and 98 MHz.
(b) 100 MHz + 2 kHz and 100 MHz – 2 kHz.
(c) 100 MHz ± Δf_d, where f_d is frequency deviation.
(d) 100 MHz ± $n2$ kHz, where n is 1, 2, ..., 5 integer.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

58. In phase modulation, phase deviation is proportional to
(a) carrier amplitude. (b) carrier phase.
(c) message signal. (d) message signal frequencies.
[U.P.S.C. I.E.S. E.E.-II, 2011]

59. An angle modulated signal is described by the equation
$x_c(t) = 10 \cos [2\pi f_c t + 10 \sin (4{,}000\ \pi t) + 5 \sin 2{,}000\ \pi t]$
What is the bandwidth of this modulated signal?
(a) 6 kHz (b) 45 kHz (c) 54 kHz (d) 63 kHz
[U.P.S.C. I.E.S. E.E.-II, 2009]

60. Which one of the following in an indirect way of generating FM?
(a) Reactance FET modulator.
(b) Varactor diode modulator.
(c) Armstrong modulator. (d) Reactance tube modulator.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

61. An indirect way of generating FM, is
(a) the Armstrong modulator.
(b) the reactance FET modulator.
(c) the varactor diode modulator.
(d) the reactance bipolar transistor modulator.
[U.P.S.C. I.E.S. E.E.-II, 2011]

62. With the increase in the transmission bandwidth, received signal-power in AM and FM will, respectively
(a) increase, increase. (b) remain same, increase.
(c) increase, remain same. (d) remain same, remain same.
[U.P.S.C. I.E.S. E.E.-II, 2008]

63. The waveform A cos ($\omega t + k \cos \omega_2 t$) is
(a) amplitude modulated. (b) frequency modulated.
(c) phase modulated.
(d) frequency as well as phase modulated.
[U.P.S.C. I.E.S. E.E.-II, 2002]

Answers: **43.** (b), **44.** (a), **45.** (c), **46.** (b), **47.** (c), **48.** (c), **49.** (d), **50.** (d), **51.** (a), **52.** (c), **53.** (c), **54.** (a), **55.** (a), **56.** (d), **57.** (d), **58.** (c), **59.** (c), **60.** (c), **61.** (a), **62.** (b), **63.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

64. The frequency modulated (FM) radio frequency range is nearly
(a) 2,500–3,000 MHz (b) 150–200 MHz
(c) 90–105 MHz (d) 30–70 MHz
[U.P.S.C. I.E.S. E.E.-I, 1992]

65. With the doubling of the modulation index of a phase modulated signal, its maximum phase deviation will
(a) remain the same. (b) get doubled.
(c) get haived. (d) become four times as large.
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

66. The most common detector used in an AM radio broadcast receiver is
(a) envelope detector. (b) coherent detector.
(c) discriminator. (d) ratio detector.
[U.P.S.C. I.E.S. E.E.-II, 1993]

67. Diode demodulator will ignore:
(a) The amplitude modulation.
(b) The frequency modulation.
(c) PCM. (d) PWM.
[U.P.S.C. I.E.S. E.E.-II, 2011]

68. The threshold effect in demodulators is
(a) Exhibited by all receivers when the input SNR is low.
(b) Exhibited only by correlation receivers.
(c) The rapid fall in the output SNR when input SNR falls below a particular value.
(d) The exponential rise in the output SNR when input SNR increased above a particular value. [U.P.S.C. I.E.S. E.E.-II, 2009]

69. A linear diode detector just starts giving diagonally clipped output when the input is an amplitude modulated signal modulated by a single frequency modulating signal. Which of the following can remove this distortion ?
1. Reduction in carrier frequency.
2. Reduction of modulation frequency.
3. Reduction of modulation index.
4. Reduction of filter time constant.
Select the correct answer using the codes given below :
Codes :
(a) 1, 2 and 3. (b) 1, 3 and 4.
(c) 2, 3 and 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1996]

70. For which one of the following modulated signals, the original message up to a scaling factor can be recovered using envelope detection?
(a) $20 \cos (20 \pi t) + 30\, m(t) \cos (200 \pi t)$
(b) $20 \cos (20 \pi t) + 16\, m(t) \cos (200 \pi t)$
(c) $10\, m(t) \cos (400 \pi t)$
(d) $10 \cos m(t) \cos (400 \pi t)$ [U.P.S.C. I.E.S. E.E.-II, 2009]

71. The capacitor charging time in the AM envelope demodulator is based on the time for one
(a) half cycle of the carrier frequency.
(b) quarter cycle of the carrier frequency.
(c) half cycle of the lowest audio frequency.
(d) quarter cycle of the highest audio frequency.
[U.P.S.C. I.E.S. E.E.-II, 2004]

72. The operating point of RF amplifier in an AM receiver is normally biased in
(a) Class-A. (b) Class B.
(c) Class-C. (d) Class B-C condition.
[U.P.S.C. I.E.S. E.E.-II, 2006]

73. A practical local oscillator in the superheterodyne type of communication receiver is
(a) an R-C phase shift oscillator.
(b) a Colpitt's oscillator. (c) a Hartley oscillator.
(d) a phase-shift type of harmonic oscillator that employs L-C resonator. [U.P.S.C. I.E.S. E.E.-II, 1996]

74. An AM superheterodyne receiver with IF of 455 kHz is tuned to the carrier frequency of 1,000 kHz. The image frequency is
(a) 545 kHz (b) 1 MHz
(c) 1,455 kHz (d) 1,910 kHz
[U.P.S.C. I.E.S. E.E.-II, 2001]

75. When a radio receiver is tuned to 455 kHz, its local oscillator provides the mixer with an input at 1010 kHz. What is the frequency of the other station ?
(a) 910 kHz (b) 355 kHz (c) 455 kHz (d) 1465 kHz
[U.P.S.C. I.E.S. E.E.-II, 2005]

76. Without any filtering, a broadcast station at 1,600 kHz is heard together with another station at 2,500 kHz on a superheterodyne receiver. The IF employed would have been
(a) 900 kHz (b) 450 kHz (c) 300 kHz (d) 225 kHz
[U.P.S.C. I.E.S. E.E.-II, 2000]

77. Which one of the following blocks is not common in both AM and FM receivers ?
(a) RF amplifier. (b) Mixer.
(c) IF amplifier. (d) Slope detector.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

78. The output V_R of the ratio detector and the output V_F of similar Forster-Seeley discriminator are related as
(a) $V_F = V_R$ (b) $V_F > V_R$
(c) $V_F = 0.51\, V_F$ (d) $V_F = 2.51\, V_F$
[U.P.S.C. I.E.S. E.E.-II, 2000]

79. In conventional AM superheterodyne receivers, the detectors employed to extract intelligence include
(a) peak detectors. (b) ratio detectors.
(c) phase locked loops. (d) slope detectors.
[U.P.S.C. I.E.S. E.E.-II, 1999]

80. What is the automatic frequency control voltage of the FM transmitter VCO ?
(a) DC voltage. (b) Since wave voltage.
(c) Square wave voltage. (d) Ramp voltage.
[U.P.S.C. I.E.S. E.E.-II, 2007]

81. If the turn on and turn off energy losses in a transmitter are 51 mJ and 76.8 mJ respectively and the mean power loss is limited to 200 W, what is the maximum switching rate that can be achieved?
(a) 15,649 cycles/s. (b) 156.49 cycles/s.
(c) 1,564.9 cycles/s. (d) 15.649 cycles/s.
[U.P.S.C. I.E.S. E.E.-II, 2009]

82. The main advantage of pre-emphasis circuit in FM transmitter is
(a) to increase the carrier power.
(b) to improve the signal to noise ratio at low audio frequencies.
(c) to increase the bandwidth of side band.
(d) to improve the signal to noise ratio at high audio frequencies.
[U.P.S.C. I.E.S. E.E.-II, 2011]

83. The de-emphasis filter in an FM receiver comes
(a) before FM demodulator.
(b) after FM demodulator and before baseband filter.
(c) after baseband filter.
(d) before RF amplifier. [U.P.S.C. I.E.S. E.E.-II, 2010]

84. PLL demodulators are now used in commercial receivers because of which of the following :
1. PLL demodulators do not exhibit threshold in S/N performance.

Answers: **64.** (c), **65.** (b), **66.** (a), **67.** (b), **68.** (c), **69.** (b), **70.** (b), **71.** (a), **72.** (c), **73.** (d), **74.** (d), **75.** (d), **76.** (b), **77.** (d), **78.** (b), **79.** (c), **80.** (a), **81.** (c), **82.** (d), **83.** (b), **84.** (d),

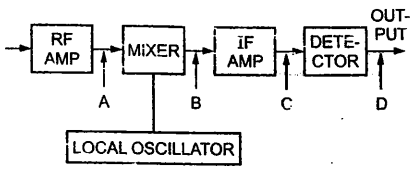
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

2. No requirement of pre-emphasis and de-emphasis.
3. Cheap PLL ICs are available.

Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-II, 2007]

85. The block diagram of an AM receiver is shown in the figure. The missing block and its location are respectively



(a) BPF at A (b) HPF at B (c) BPF at C (d) LPF at D
[U.P.S.C. I.E.S. E.E.-II, 1998]

86. MSK (Minimum Shift Keying) is an orthogonal FSK scheme that gets its name from the fact that
(a) the phase shift is minimum.
(b) the error probability is minimum.
(c) the transmission power required is minimum.
(d) the transmission bandwidth required is minimum.
[U.P.S.C. I.E.S. E.E.-II, 2011]

87. If the probability of a message is 1/4, then the information in bits is
(a) 1 bit. (b) 2 bit. (c) 4 bit. (d) 8 bit.
[U.P.S.C. I.E.S. E.E.-II, 2010]

88. Which one of the following is a disadvantage of digital transmission as compared to analog transmission?
(a) Digital signals cannot be multiplexed efficiently.
(b) Digital transmission is less immune to channel noise.
(c) Digital signals needs to be coded before transmission.
(d) Digital transmission needs more bandwidth.
[U.P.S.C. I.E.S. E.E.-II, 2009]

89. For a non-uniform quantizer more quantizing steps are used for signals of
(a) low frequency. (b) high amplitude.
(c) low amplitude. (d) high frequency.
[U.P.S.C. I.E.S. E.E.-II, 2010]

90. Which one of the following pulse communications systems is digital?
(a) PAM (b) PCM (c) PPM (d) PWM
[U.P.S.C. I.E.S. E.E.-II, 2010]

91. PPM signal is
(a) differentiation of PWM. (b) integration PWM.
(c) differentiation of PAM. (d) not related to PWM or PAM.
[U.P.S.C. I.E.S. E.E.-II, 2011]

92. In digital communication system, the data transmission rate is specified in
(a) MHz. (b) bits/second.
(c) bytes/second. (d) bauds.
[U.P.S.C. I.E.S. E.E.-II, 2008]

93. In differential PCM, each word indicates
(a) difference between a sample amplitude and a reference signal.
(b) difference in amplitude between a sample and the previous sample.
(c) addition of a sample amplitude and a reference signal.
(d) addition of amplitude of a sample and the previous sample.
[U.P.S.C. I.E.S. E.E.-II, 2011]

94. How much is contributed by each bit in the code word of a PCM system under uniform and symmetric quantization to the signal to noise ratio ?
(a) 3 dB (b) 4 dB (c) 5 dB (d) 6 dB
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

95. In a PCM system, if we increase the quantization levels from 2 to 8, how do the relative bandwidth requirements vary ?
(a) Get doubled. (b) Get tripled.
(c) Remain same. (d) Become eight times.
[U.P.S.C. I.E.S. E.E.-II, 2007]

96. A digital communication system uses 8-PSK modulation and transmits 3600 bps. What is the symbol rate ?
(a) 10800 symbols/sec (b) 450 symbols/sec
(c) 28800 symbols/sec (d) 1200 symbols/sec
[U.P.S.C. I.E.S. E.E.-II, 2008]

97. Voice is digitized using an ADC with a sampling period of 0.1 millisecond and 10 bits/sample. What is the bit rate in kbps generated by the system ?
(a) 100 kbps (b) 1000 kbps
(c) 9.9 kbps (d) 10.1 kbps
[U.P.S.C. I.E.S. E.E.-II, 2007]

98. Analog data having highest harmonic at 30 kHz generated by a sensor has been digitized using 6-level PCM. What will be the rate of digital signal generated ?
(a) 120 kbps (b) 200 kbps
(c) 240 kbps (d) 180 kbps
[U.P.S.C. I.E.S. E.E.-II, 2005]

99. The performance of the DPCM-Coder improves as the
(a) input probability density becomes more and more Gaussian.
(b) input power spectral density tends to be white.
(c) input dynamic range increases.
(d) sample-to-sample correlation of the input increases.
[U.P.S.C. I.E.S. E.E.-II, 2002]

100. Consider the following statements:
The thermal noise power generated by a resistor is proportional to
1. the value of the resistor.
2. the absolute temperature.
3. the bandwidth over which it is measured.
4. the Boltzmann's constant.

Which of the above statements is/are correct?
(a) 1, 2 and 3 (b) 2 only
(c) 2 and 3 only (d) 2, 3 and 4
[U.P.S.C. I.E.S. E.E.-II, 2009]

101. The signal to quantization noise ratio in an n-bit PCM system
(a) depends upon the sampling frequency employed.
(b) is independent of the value of n.
(c) increases with increasing value of n.
(d) decreases with increasing value of n.
[U.P.S.C. I.E.S. E.E.-II, 1999]

102. Quantization noise occurs in
(a) Pulse amplitude modulation. (b) Pulse width modulation.
(c) Pulse code modulation. (d) Pulse position modulation.
[U.P.S.C. I.E.S. E.E.-II, 2005]

103. Quantizing noise occurs in
(a) Pulse width modulation.
(b) Frequency division multiplexing.
(c) Pulse code modulation.
(d) Time division multiplexing. [U.P.S.C. I.E.S. E.E.-II, 2011]

104. Which one of the following modulation techniques has got maximum SNR?
(a) AM-SSB. (b) AM-DSB.
(c) FM. (d) AM-SC.
[U.P.S.C. I.E.S. E.E.-II, 2010]

Answers: **85.** (c), **86.** (a), **87.** (b), **88.** (d), **89.** (b), **90.** (b), **91.** (a), **92.** (d), **93.** (b), **94.** (d), **95.** (b), **96.** (d), **97.** (a), **98.** (d), **99.** (d), **100.** (d), **101.** (d), **102.** (c), **103.** (c), **104.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

105. For which of the following systems, the signal to noise ratio is the highest?
(a) PAM. (b) PWM.
(c) PPM. (d) PAM and PWM.
[U.P.S.C. I.E.S. E.E.-II, 2011]

106. The most noise immune system is
(a) SSB. (b) PCM. (c) PDM. (d) PWM.
[U.P.S.C. I.E.S. E.E.-II, 2010]

107. A speech signal occupying the bandwidth of 300 Hz to 3 kHz is converted into PCM format for use in digital communication. If the sampling frequency is 8 kHz and each sample is quantized into 256 level, then the output bit rate will be
(a) 3 kb/s. (b) 8 kb/s. (c) 64 kb/s. (d) 256 kb/s.
[U.P.S.C. I.E.S. E.T.E.-II, 1998]

108. Which one of the following pairs is not correctly matched ?
(a) DSB-SC modulation : balanced modulator.
(b) PCM : Pre-emphasis.
(c) FM : Reactance modulator.
(d) SSB modulation : Weaver's method.
[U.P.S.C. I.E.S. E.E.-II, 1993]

109. The types of modulation used generally in TV transmission for video and audio signals, respectively, are
(a) FM and AM. (b) FM and FM.
(c) AM and AM. (d) AM and FM.
[U.P.S.C. I.E.S. E.E.-II, 2004]

110. Which one of the following is **not** a part of typical TV receiver?
(a) Sweep signal generator. (b) Envelope detector.
(c) Video amplifier. (d) Pre-emphasis circuit.
[U.P.S.C. I.E.S. E.E.-II, 2009]

111. In TV transmission, picture signal is amplitude modulated and sound signal is frequency modulated. This is done because
(a) it is not possible to frequency modulate the picture signal.
(b) bandwidth requirement is minimised.
(c) sound signal is more susceptible to noise than picture signal.
(d) synchronisation of picture frames becomes easier.
[U.P.S.C. I.E.S. E.E.-II, 1995]

112. Which one of the following statement is correct ? The equalizing pulses in television transmission are sent during
(a) vertical blanking. (b) horizontal blanking.
(c) horizontal retrace. (d) picture forward trace.
[U.P.S.C. I.E.S. E.E.-II, 2004]

113. In order to obtain monochrome display in a colour TV monitor, the green, red and blue colours are respectively added in the proportion
(a) 0.59, 0.20, 0.21. (b) 0.60, 0.25 and 0.15.
(c) 0.59, 0.30 and 0.11. (d) 0.60, 0.10 and 0.30.
[U.P.S.C. I.E.S. E.E.-II, 1998]

114. A satellite channel can be fairly accurately modelled as a
(a) random delay channel. (b) panic button channel.
(c) additive white Gaussian noise channel.
(d) fading channel. [U.P.S.C. I.E.S. E.E.-II, 2002]

115. Consider the following statements :
1. An active satellite is one carrying a receiver, a transmitter and power supplies.
2. A passive satellite is simply a metallized sphere reflecting radio signals back to the earth.
Which of the statements given above is / are correct ?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.E.-II, 2008]

116. What is the reason for using frequencies of the order of a few GHz in satellite communication ?
(a) Antenna sizes are small and ionosphere does not reflect frequencies.
(b) Helical antennas can be used at these frequencies.
(c) Frequencies can pass through ionosphere without attenuation.
(d) Easy availability of components at these frequencies.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

117. Which one of the following is correct ?
In satellite communication links, generally
(a) the uplink carrier frequencies are greater than downlink carrier frequencies.
(b) the uplink carrier frequencies are lesser than downlink carrier frequencies.
(c) both uplink and downlink carrier frequencies are same.
(d) it is not necessary to use carrier at all.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

118. Power spectral density of a signal is
(a) Complex, even and non-negative.
(b) Rcal, even and non-negative.
(c) Real, even and negative. (d) Complex, odd and negative.
[U.P.S.C. I.E.S. E.E.-II, 2003]

119. As practical signals are time limited, they have infinite frequency bandwidth. Sampling of such signals lead to aliasing. To avoid aliasing, an anti-aliasing filter is used
(a) before the signal is reconstructed.
(b) after the signal is reconstructed.
(c) before the signal is sampled. (d) after the signal is sampled.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

120. Which one of the following statements is correct ?
Noise has the greatest effect in a communication system when it interferes with the signal
(a) in the transmitter. (b) in the channel.
(c) in the receiver. (d) in the transducer.
[U.P.S.C. I.E.S. E.E.-II, 2005]

121. The channel capacity of a noiseless channel is equal to
(a) Rate at which information is transmitted.
(b) Signalling speed.
(c) Bandwidth. (d) Bandwidth-SNR product.
[U.P.S.C. I.E.S. E.E.-II, 2005]

122. S_i and S_0 denote the signal at input and output of a linear network. N_i and N_0 are the corresponding noises. Which one of the following is the correct expression for noise figure of the network?
(a) $\frac{S_iS_0}{N_iN_0}$ (b) $\frac{S_iN_i}{S_0N_0}$ (c) $\frac{S_iN_0}{S_0N_i}$ (d) $\frac{S_0N_0}{S_iN_i}$
[U.P.S.C. I.E.S. E.E.-II, 2004]

123. Which one of the following is the correct statement ?
If the value of a resistor creating thermal noise is doubled, the noise generated is
(a) halved. (b) doubled.
(c) unchanged. (d) slightly changed.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

124. Which one of the following is the correct statement ?
If the channel bandwidth is doubled, the S/N ratio becomes
(a) double of the former S/N ratio.
(b) square root of the former S/N ratio.
(c) half of the former S/N ratio.
(d) None of the above. [U.P.S.C. I.E.S. E.E.-II, 2007]

125. A communication channel has a bandwidth of 100 MHz. The channel is extremely noisy such that the signal power is very much below the noise power. What is the capacity of this channel ?

Answers: **105.** (c), **106.** (b), **107.** (c), **108.** (b), **109.** (d), **110.** (d), **111.** (b), **112.** (a), **113.** (c), **114.** (c), **115.** (c), **116.** (a), **117.** (a), **118.** (b), **119.** (c), **120.** (b), **121.** (a), **122.** (c), **123.** (c), **124.** (c), **125.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 100 Mbps (b) 50 Mbps
(c) 2,400 bps (d) Nearly 0 bps
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

126. A 3,000 Hz bandwidth channel has a capacity of 30 kbps. The signal-to-noise ratio of the channel is
(a) 20 dB (b) 25 dB (c) 30 dB (d) 40 dB
[U.P.S.C. I.E.S. E.E.-II, 2010]

127. A communication channel is to receiver signal power S and the noise at the receiver input is additive thermal noise with uniform power spectral density (psd). It is found that if the bandwidth is 1 MHz, the channel capacity is 10 Mbps. What would be the channel capacity for the same signal power and same noise psd, if the bandwidth is unlimited (tends to be infinite)?
(a) Zero (b) Infinite
(c) 15 Mbps (d) 1.5 Gbps
[U.P.S.C. I.E.S. E.E.-II, 2009]

128. The noise figure of an amplifier is 6 dB. If the input S/N ratio is 38 dB, then the output S/N ratio will be
(a) 44 dB (b) 40 dB (c) 36 dB (d) 32 dB
[U.P.S.C. I.E.S. E.E.-II, 2000]

129. A microphone with inbuilt amplifier has an output noise level in a very quiet room of about 30 μV rms. The maximum output level is about 300 mV rms before sever distortion occurs. What dynamic range does this represent in dB ?
(a) 4 dB (b) 36 dB (c) 40 dB (d) 80 dB
[U.P.S.C. I.E.S. E.T.E.-II, 2005]

130. Which one of the following is correct ?
(a) Coding reduces the noise in the signal.
(b) Coding deliberately introduces redundancy into messages.
(c) Coding increases the information rate.
(d) Coding increases the channel bandwidth.
[U.P.S.C. I.E.S. E.E.-II, 2007]

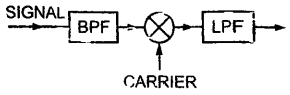
131. If two resistors of values R_1 and R_2 (at temperatures T_1 and T_2) are connected in series to form a white noise source, the equivalent noise temperature is
(a) $\frac{R_1T_1 + R_2T_2}{R_1 + R_2}$ (b) $\frac{R_1T_1 - R_2T_2}{R_1 + R_2}$
(c) $T_1 + T_2$ (d) $T_1 \cdot \frac{R_1}{R_2} + T_2 \cdot \frac{R_2}{R_1}$
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

132. How can the quantizing noise be reduced ?
(a) By using de-emphasis circuit.
(b) By using RF amplifier in the receiver.
(c) By increasing the number of quantization levels.
(d) By sending sloping pulses. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

133. Which one of the following statements is **incorrect** about the matched filter?
(a) The maximum output SNR depends on the input signal energy.
(b) The impulse response is reversed delayed version of the input signal.
(c) The error probability depends on the waveshape of the signal.
(d) Matched filter and correlator gives identical reception performances. [U.P.S.C. I.E.S. E.E.-II, 2010]

134. White noise is passed through an ideal low-pass filter. Which one of the following is the nature of the auto-correlation function of the filtered output noise ?
(a) Periodic infinite number of zero crossings.
(b) Periodic but the number of zero crossings depends on the bandwidth of the filter.
(c) Periodic but does not cross zero.
(d) A delta function. [U.P.S.C. I.E.S. E.E.-II, 2007]

135. A DSB suppressed carrier reception is shown in the figure. If $(SNR)_i$ is the S/N ratio for direct (incoherent) detection and $(SNR)_s$ is that for (coherent) synchronous detection, then



(a) $(SNR)_s = 2(SNR)_i$ (b) $(SNR)_s = (SNR)_i$
(c) $(SNR)_s = 4(SNR)_i$ (d) $(SNR)_s = 1/2(SNR)_i$
[U.P.S.C. I.E.S. E.E.-II, 2001]

136. In a communication system, a process for which statistical-averages and time-averages are equal, is called
(a) Stationary. (b) Ergodic.
(c) Gaussian. (d) BIBO stable.
[U.P.S.C. I.E.S. E.E.-II, 2003]

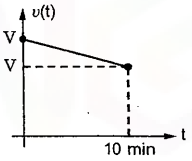
137. If ACF denotes the autocorrelation function and PSD denotes the power spectral density, then for white noise, ACF is
(a) a Gaussian while PSD is uniform.
(b) a delta function while PSD is uniform.
(c) a delta function while PSD is exponential.
(d) an exponential while PSD is uniform.
[U.P.S.C. I.E.S. E.E.-II, 2011]

138. What is the typical bandwidth of a 2-wire telephone line ?
(a) 300 Hz to 3.4 kHz (b) 20 Hz to 4 kHz
(c) DC to 4 kHz (d) 20 Hz to 20 kHz
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

139. A conventional telephone line with 3 kHz bandwidth and having 30 dB signal-to-noise ratios can carry information at a rate of
(a) 30 kbps (b) 15 kbps (c) 3 kbps (d) 16 Mbps
[U.P.S.C. I.E.S. E.E.-II, 2010]

140. The capacity of a channel is given by the
(a) number of digits used in coding.
(b) volume of information it can take.
(c) maximum rate of information transmitted.
(d) bandwidth required for information.
[U.P.S.C. I.E.S. E.E.-II, 1998]

141. A fully charged mobile phone with a 12 V battery is good for a 10 minute talk-time. Assume that, during the talk-time the battery delivers a constant current of 2 A and its voltage drops linearly from 12 V to 10 V as shown in the figure. How much energy does the battery deliver during this talk-time ?



(a) 220 J (b) 12 kJ (c) 13.2 kJ (d) 14.4 J
[GATE E.C.E. 2009]

142. If large amount of information is to be transmitted in a small amount of time, we require
(a) Low-frequency signals. (b) Narrowband signals.
(c) Wideband signals. (d) High-frequency signals.
[U.P.S.C. I.E.S. E.E.-II, 2003]

143. What is the radiation resistance of a dipole antenna λ/20 long approximately equal to ?
(a) 2 Ω (b) 40 Ω (c) 0.6 Ω (d) 20 Ω
[U.P.S.C. I.E.S. E.E.-I, 2008]

144. Cavity resonators are used in
(a) MF band. (b) HF band.
(c) VHF band. (d) SHF band.
[U.P.S.C. I.E.S. E.E.-II, 1999]

145. What is the main objective of trellis coding ?
(a) To narrow the bandwidth. (b) To simplify modulation.
(c) To increase the data rate. (d) To reduce the error rate.
[U.P.S.C. I.E.S. E.E.-II, 2008]

Answers: **126.** (c), **127.** (d), **128.** (d), **129.** (d), **130.** (c), **131.** (a), **132.** (c), **133.** (d), **134.** (d), **135.** (b), **136.** (b), **137.** (b), **138.** (c), **139.** (a), **140.** (c), **141.** (c), **142.** (c), **143.** (a), **144.** (c), **145.** (b),

146. Light travels along the optical fibres by which mechanism ?
(a) Refraction. (b) Reflection.
(c) Scattering. (d) Total internal reflection.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

147. Consider the following statements :
Transmission of a modulated signal in a communication system can take place by means of
1. coaxial cables. 2. optical fibres.
3. open-wire transmission lines.
4. waveguides.
Which of these statements are correct ?
(a) 1, 2 and 3. (b) 2, 3 and 4.
(c) 1 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 1999]

148. Why are semiconductor lasers important for communication engineering
1. They possess large bandwidth.
2. They operate at low voltage.
3. They are suitable for coupling to fibres at wavelengths, where the attenuation is very small.
4. Their integration with other components is easy.
Select the correct answer using the code given below :
(a) 1 only (b) 1 and 2 only
(c) 2 and 3 only (d) 1, 2, 3 and 4
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

149. A single mode fibre does not suffer from which type of dispersion?
(a) Waveguide dispersion. (b) Material dispersion.
(c) Intermodal dispersion. (d) Polarization mode dispersion.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

150. Which of the following introduces mode partition noise
(a) Coaxial line. (b) Waveguide.
(c) Fibre transmission line.
(d) Both coaxial line and waveguide. [U.P.S.C. I.E.S. E.T.E.-II, 2009]

151. In FDM systems used for telephone, which modulation scheme is adopted ?
(a) AM (b) DSB-SC (c) SSB-SC (d) FM
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

152. If the bandwidth of ith channel is 'w_i' and the total number of channels accommodated in a time interval of T is 'N', then the minimum bandwidth 'B_{min}' for TDM is equal to

(a) $N\sum_{i=1}^{N} w_i$ (b) $\sum_{i=1}^{N} w_i$ (c) $\sum_{i=1}^{N} w_i$ (d) $\sum_{i=1}^{\frac{1}{N}} w_i$

[U.P.S.C. I.E.S. E.E.-II, 2000]

153. Which is the most important sub-system for recovering and reconstructing signals in a TDM system ?
(a) Envelope detector followed by a low pass filter.
(b) Synchronization circuit for proper timing.
(c) Band pass filters to segregate channels.
(d) Coherent detector to ensure frequency and phase connection.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

154. An MTI radar is operating at the wavelength of 5×10^{-2} m and the pulse repetition frequency (PRF) is 1000. Then the first blind speed (in m/s) occurs at
(a) 25 (b) 50 (c) 500 (d) 1000
[U.P.S.C. I.E.S. E.E.-II, 2002]

155. A pulse radar is designed to detect objects up to 100 km and the time base is 10 μs/km. What is its maximum pulse repetition frequency ?
(a) 100 Hz (b) 1000 Hz (c) 10^6 Hz (d) 10^9 Hz
[U.P.S.C. I.E.S. E.E.-II, 2007]

156. Consider the following statements :
If the maximum range of a radar has to be doubled,
1. the peak transmitted power may be increased 16 fold.
2. the antenna diameter may be doubled.
3. the sensitivity of the receiver may be doubled.
4. the transmitted pulse width may be doubled.
Which of these statements are correct ?
(a) 1 and 2 (b) 2 and 3 (c) 3 and 4 (d) 1 and 4
[U.P.S.C. I.E.S. E.E.-II, 2002]

157. In which type of the switchings given below, entire capacity of a dedicated link is used ?
(a) Circuit switching. (b) Data gram packet switching.
(c) Virtual circuit packet switching.
(d) Message switching. [U.P.S.C. I.E.S. E.E.-II, 2003]

158. Two signals have the same frequency spectrum but different phase functions. Their power density spectrum will
(a) differ in phase. (b) differ by $e^{\omega t}{}_0$.
(c) differ by ω_0. (d) be identical.
[U.P.S.C. I.E.S. E.E.-II, 2000]

159. A sinusoidal signal with a random phase is given by $x(t) = A \sin [\pi/2 - (2\pi fi + \theta)]$ with the probability density function

$$P_\theta(\theta) = \begin{cases} 1/2\pi, & 0 \le \theta \le 2\pi \\ 0, & \text{otherwise} \end{cases}$$

What is the maximum amplitude of the autocorrelation function of this signal ?
(a) A (b) A/2 (c) A^2 (d) $A^2/2$
[U.P.S.C. I.E.S. E.E.-II, 2006]

160. Which one of the followings sets correctly describes the Block I and Block II in the diagram given above ?

	Block I	Block II
(a)	Integrator.	Phase modulator.
(b)	Integrator.	Frequency modulator.
(c)	Differentiator.	Phase modulator.
(d)	Differentiator.	Frequency modulator.

[U.P.S.C. I.E.S. E.E.-II, 2006]

161. Telemetry processes the information from a remote location by means of
(a) mechanical means. (b) electrical means.
(c) CRO. (d) all of the above.

162. Electrical telemetry has got basic components of
(a) sending and transmitting equipment.
(b) interconnecting channel.
(c) receiving end equipment. (d) all of the above.

163. The most commonly used transmission channels are
(a) cables. (b) radio links.
(c) pneumatic. (d) both (a) and (b).

164. The position telemetering system using synchros is
(a) a pulse telemetering system. (b) an rf telemetering system.
(c) a dc telemetering system. (d) an ac telemetering system.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

165. In microwave telemetry, repeater stations are required at every
(a) 2 km (b) 5 km (c) 40 km (d) 100 km
[U.P.S.C. I.E.S. E.E.-I, 2006]

166. Which one of the following telemetering system is a digital system ?
(a) Pulse code modulation (PCM) system.
(b) Position telemetering system using synchros.

Answers: **146.** (d), **147.** (d), **148.** (d), **149.** (c), **150.** (c), **151.** (c), **152.** (c), **153.** (b), **154.** (a), **155.** (b), **156.** (a), **157.** (a), **158.** (d), **159.** (d), **160.** (d), **161.** (b), **162.** (d), **163.** (d), **164.** (c), **165.** (d), **166.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) DC voltage telemetering system.
(d) Pulse duration modulation (PDM)
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

167. What are the three steps in generating PCM in the correct sequence?
(a) Sampling, quantizing and encoding.
(b) Encoding, sampling and quantizing.
(c) Sampling, encoding and quantizing.
(d) Quantizing, sampling and encoding. [U.P.S.C. I.E.S. E.E.-I, 2008]

168. Which one of the following modulation techniques is the most efficient for pulse telemetry ?
(a) PAM (b) PCM (c) PDM (d) PPM
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

169. When system noise is large and signal power is low in telemetry system, what is the preferred form of modulation ?
(a) Pulse-width modulation. (b) Pulse-amplitude modulation.
(c) Pulse-code modulation. (d) Pulse-position modulation.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

170. Which signalling scheme is most affected by noise ?
(a) ASK (b) FSK (c) PSK (d) QAM
[U.P.S.C. I.E.S. E.E.-I, 2008]

171. Which one of the following modulation technique is most affected by noise?
(a) ASK (b) PSK (c) FSK (d) MSK
[U.P.S.C. I.E.S. E.E.-II, 2009]

172. Which one of the following systems offers the best trade off between bandwidth and S/N ratio.
(a) PAM (b) PDM (c) PPM (d) PCM
[U.P.S.C. I.E.S. E.E.-I, 1993]

173. Which of the following pulse communication system is inherently immune to noise ?
(a) PPM (b) PCM (c) PWM (d) PAM
[U.P.S.C. I.E.S. E.E.-I, 1992]

174. Companding is used
(a) to overcome quantisting noise in PCM.
(b) in PWM receivers to reduce impulse noise.
(c) to protect small signal in PC from quantisting noise.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-I, 1992]

175. PDM is generated by using
(a) monostable multivibrator. (b) free running multivibrator.
(c) bistable multivibrator. (d) JK flip flop.

176. If large amount of information is to be transmitted in a small amount of time, we require
(a) low-frequency signals. (b) narrowband signals.
(c) wideband signals. (d) high-frequency signals.
[U.P.S.C. I.E.S. E.E.-I, 2003]

177. In comparison to PPM, the PDM has the disadvantage of requiring
(a) more samples per second. (b) powerful transmitter.
(c) pulses of larger widths. (d) none of the above.

178. In comparison to PPM, which of the following statements is/are true for PDM?
(a) The pulse amplitude in PDM remains constant.
(b) The PDM transmitter should be able to handle maximum width pulse.
(c) PDM will still work if synchronisation between transmitter and receiver fails.
(d) all of the above.

179. PPM
(a) needs constant transmitter power output.
(b) can be generated from PDM.
(c) depends upon transmitter receiver synchronisation.
(d) all of the above.

180. Which of the following pulse systems needs higher bandwidth?
(a) PPM. (b) PAM. (c) PDM. (d) none of these.

181. PCM
(a) is a digital system.
(b) is inherently most noise resistant.
(c) has no carrier-wave equivalent.
(d) all of the above.

182. In PCM, the high noise immunity is achieved with
(a) increased bandwidth. (b) reduced bandwidth.
(c) none of the above.

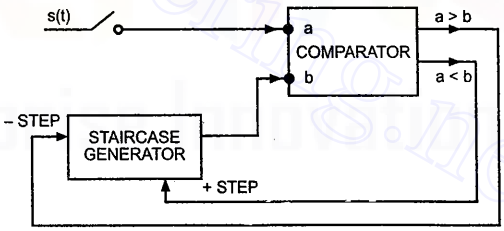
183. Which one of the following is the correct statement ?
An instantaneous code is the one which can be
(a) coded rapidly. (b) coded uniquely.
(c) decoded word by word without reference to succeeding code symbols.
(d) decoded uniquely. [U.P.S.C. I.E.S. E.E.-II, 2007]

184. Which of the following pulse modulations are digital ?
1. PCM. 2. Differential PCM.
3. PWM.
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

185. Pulse code modulation is commonly used in telemetry because
(a) It ensures immunity from noise during transmission.
(b) The bandwidth requirement of the channel is reduced.
(c) It removes quantization error.
(d) It permits lower rate of sampling than what is normally required under Shanon's theorem. [U.P.S.C. I.E.S. E.E.-I, 2005]

186. For a 10-bit PCM system, the signal to quantization noise ratio is 62 dB. If the number of bits is increased by 2, then how would the signal to quantization noise ratio change ?
(a) Increase by 6 dB. (b) Decrease by 6 dB.
(c) Increase by 12 dB. (d) Decrease by 12 dB.
[U.P.S.C. I.E.S. E.E.-II, 2007]

187. Which one of the following PCM schemes is depicted in the figure ?



(a) Adaptive DM. (b) Differential PCM.
(c) Companding. (d) Delta Modulation.
[U.P.S.C. I.E.S. E.E.-II, 2001]

188. Which one of the following circuits transmits two messages simultaneously in one direction ?
(a) Duplex. (b) Diplex. (c) Simplex. (d) Quadruplex.
[U.P.S.C. I.E.S. E.E.-I, 2001]

189. Medium wave radio signals can be received at far off distances at night because
(a) radio waves travel faster at night.
(b) ground wave attenuation is lower at night.

Answers: **167.** (a), **168.** (b), **169.** (c), **170.** (a), **171.** (a), **172.** (d), **173.** (b), **174.** (c), **175.** (a), **176.** (b), **177.** (b), **178.** (d), **179.** (d), **180.** (a), **181.** (d), **182.** (a), **183.** (c), **184.** (a), **185.** (a), **186.** (c), **187.** (a), **188.** (b), **189.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) sky wave is stronger at night.
(d) there is no fading at night. [U.P.S.C. I.E.S. E.E.-I, 1999]

190. The bandwidth requirement of an FM telemetry channel is
(a) equal to that of an AM telemetry channel.
(b) smaller than that of an AM telemetry channel.
(c) about 100 times that of an AM telemetry channel.
(d) about 10 times that of an AM telemetry channel.
[U.P.S.C. I.E.S. E.E.-I, 1998]

191. A PWM signal can be generated by
(a) an astable multivibrator. (b) a monostable multivibrator.
(c) integrating a PPM signal. (d) differentiating a PPM signal.
[U.P.S.C. I.E.S. E.E.-I, 1999]

192. In PCM,
(a) noise is removed by regenerating pulses at each repeater station.
(b) noise-free signal is transmitted at each repeater station.
(c) only noise on the link between repeater stations is to be considered.
(d) all of the above.

193. In PCM, the conditional probability of error is proportional to
(a) noise power (N_0). (b) peak signal energy (E_{max}).
(c) $\sqrt{N_0}$. (d) $\sqrt{E_{max}}$.
[U.P.S.C. I.E.S. E.E.-II, 2004]

194. Which one of the following statement is correct ?
Quantising noise is produced in
(a) all pulse modulation systems. (b) PCM.
(c) all modulation systems. (d) PDM.
[U.P.S.C. I.E.S. E.E.-II, 2004]

195. The noise is reduced by
(a) using redundancy.
(b) increasing the transmitted power.
(c) reducing the signaling rate. (d) all of the above.

196. Quantising noise can be reduced by increasing the
(a) number of standard quantum levels.
(b) sampling rate.
(c) bandwidth. (d) all of the above.

197. Which one of the following multiplexing technique involves signal composed of light beams ?
(a) CDM. (b) FDM. (c) TDM. (d) WDM.
[U.P.S.C. I.E.S. E.E.-II, 2003]

198. Time division multiplexing needs
(a) transmission of data samples.
(b) transmission of data at random.
(c) constant data transmission.
(d) transmission of data of only one measurand.

199. Time division multiplexing is used when the data to be transmitted is
(a) slow changing. (b) of small bandwidth.
(c) slow changing and has a small bandwidth.
(d) fast changing and has a wide bandwidth.
[U.P.S.C. I.E.S. E.E.-II, 2001]

200. In TDM, non-essential frequency components of the modulating signal are removed by
(a) sampler. (b) attenuator.
(c) pre-alias filter. (d) modulator.
[U.P.S.C. I.E.S. E.E.-II, 2004]

201. Which one of the following is the correct statement ?
Time division multiplexing
(a) stacks several channels in adjacent frequency slots
(b) interleaves pulses belonging to different transmissions.
(c) combines groups into a single super group.
(d) can be used with PCM only. [U.P.S.C. I.E.S. E.E.-II, 2007]

202. For separating the channels in TDM, one has to use
(a) differentiator. (b) integrator.
(c) bandpass filter. (d) AND gates
[U.P.S.C. I.E.S. E.E.-II, 2008]

203. In high speed TDM, the channels are separated in the receiver employing
(a) OR gate. (b) NAND gate.
(c) NOR gate. (d) AND gate.
[U.P.S.C. I.E.S. E.E.-II, 2011]

204. Which of the following component blocks is NOT required in the FDM transmitter block diagram?
(a) Filter cutting off lower and higher frequencies.
(b) Filter cutting off higher frequencies.
(c) Single side band modulator.
(d) Double side band modulator. [U.P.S.C. I.E.S. E.E.-II, 2011]

205. Consider the following statements about data-digital signal :
1. Amplifiers used in repeaters produce additive noise.
2. FDM is used for digital signals whereas TDM is used for analog signals.
3. With TDM there is no intermodulation noise whereas this is a concern for FDM.
4. Conversion to digital signalling allows the use of efficient digital switching techniques.
Which of the statements given above the correct ?
(a) 1 and 2. (b) 3 and 4.
(c) 1, 2 and 3. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II, 2006]

206. In case of data transmission, which one of the following systems will give the maximum probability error ?
(a) ASK. (b) FSK. (c) PSK. (d) DPSK.
[U.P.S.C. I.E.S. E.E.-II, 2004]

207. A handshake signal in a data transfer is transmitted
(a) along with the data bits. (b) before the data transfer.
(c) after the data transfer.
(d) either along with the data bits or after the data transfer.
[U.P.S.C. I.E.S. E.E.-II, 2003]

208. If the largest frequency present in the measured signal and number of bits used in the binary code, are respectively 'f_m' and 'n', then minimum bandwidth of pulse code modulation channel used for telemetry would be
(a) $\frac{f_m}{2n}$. (b) $\frac{f_m}{n}$. (c) nf_m. (d) $2nf_m$.
[U.P.S.C. I.E.S. E.E.-I, 2000]

209. A single even parity check bit in telemetry data transmission has which capability ?
(a) Only detection of a single error.
(b) Both detection and correction of a single error.
(c) Detection of even number of errors only.
(d) Detection of any number of errors. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

210. Which one of the following transmission systems for telemetry has largest bandwidth ?
(a) FM/FM radio transmission system.
(b) Co-axial copper cables transmission system.
(c) Fiber-optic data transmission system.
(d) Synchro-position repeater system. [U.P.S.C. I.E.S. E.E.-I, 2005]

Answers: **190.** (d), **191.** (b), **192.** (d), **193.** (d), **194.** (b), **195.** (d), **196.** (a), **197.** (d), **198.** (a), **199.** (d), **200.** (c), **201.** (b), **202.** (c), **203.** (d), **204.** (d), **205.** (b), **206.** (a), **207.** (b), **208.** (c), **209.** (a), **210.** (c),

Downloaded From : www.EasyEngineering.net

211. In an optical fibre, the light beam propagates due to which one of the following ?
(a) Simple reflection of light at a boundary between two media.
(b) Refraction of light in the medium.
(c) Total internal reflection at the boundary of the fibre.
(d) Scattering of light in the medium. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

212. In optical communication, wavelength 1,550 nm is used nowadays. What is / are the possible reason(s) ?
1. Dispersion is very low. 2. Loss is very low.
3. WDM and optical amplification are feasible.
Select the correct answer using the code given below :
(a) 1, 2 and 3. (b) 2 only.
(c) 1 only. (d) 1 and 3 only.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

213. Losses in optical fibres can be caused by which of the following ?
1. Impurities. 2. Microbending.
3. Stepped index operation.
Select the correct answer using the code given below :
(a) 1 and 3. (b) 2 and 3. (c) 1 and 2. (d) 3 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

214. Dispersion in an optical fibre used in a communication link is of which type ?
(a) Angular dispersion. (b) Modal dispersion.
(c) Chromatic dispersion.
(d) Dispersion arising due to structural irregularities in the fibre.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: **211.** (c), **212.** (d), **213.** (c), **214.** (b).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A
(b) Both A and R are true but R is not a correct explanation of A
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): FM transmission is noise free.
(R): In FM, information is carried as frequency variation.
[U.P.S.C. I.E.S. E.E.-II, 2003]

2. (A): FM systems employ pre-emphasis and de-emphasis.
(R): Pre-emphasis and de-emphasis are measured in micro-sec.
[U.P.S.C. I.E.S. E.E.-II, 2010]

3. (A): FM is capable of exchanging SNR for the transmission bandwidth while in AM systems this feature is not available.
(R): Transmission bandwidth in FM systems is much higher than in AM systems. [U.P.S.C. I.E.S. E.E.-II, 2009]

4. (A): In the FM receiver discriminator, both the sum of the voltages and ratio of the voltages are independent of frequency.
(R): The diodes face the same direction and the discriminator requires a limiter to reject amplitude changes of the carrier voltage. [U.P.S.C. I.E.S. E.E.-II, 2011]

5. (A): A frequency mixer is used in the Armstrong indirect FM wave generator.
(R): It is required to increase the carrier frequency by a very larger factor than that needed for the frequency deviation increase.
[U.P.S.C. I.E.S. E.E.-II, 2010]

6. (A): Bandwidth of angle-modulated signal is infinite.
(R): Angle modulation of a carrier results in the generation of an infinite number of sidebands. [U.P.S.C. I.E.S. E.E.-II, 2008]

7. (A): DSB modulation scheme is superior to SSB modulation scheme as far as noise performance is concerned.
(R): DSB modulation requires twice the bandwidth as compared to SSB modulation. [U.P.S.C. I.E.S. E.E.-II, 2009]

8. (A): Linear AM detector applied with two amplitude-modulated waves simultaneously, one being very weak with respect to the other, detects only the strong signal.
(R): Detector selectivity is increased in the presence of strong signal. [U.P.S.C. I.E.S. E.E.-II, 2001]

9. (A): A threshold effect is observed in square law detectors.
(R): Square law detector is nonlinear. [U.P.S.C. I.E.S. E.E.-II, 2000]

10. (A): Equalizers are used in receivers to increase the SNR of the demodulator.
(R): The equalizer is designed such that their transfer function is inversely related to that of the channel.

11. (A): An eight-bit PCM system performs better than a six-bit PCM system.
(R): Eight-bit system produces smaller quantization noise than a six-bit system. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

12. (A): Majority of the carrier telephone systems use TDM.
(R): A TDM system has the capability of achieving much higher S/N ratio. [U.P.S.C. I.E.S. E.E.-II, 2007]

13. (A): TDM can be employed to transmit channels having unequal bandwidths.
(R): If sampling theorem is strictly followed, any analog signal can be reconstructed from its samples.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

14. (A): In the power line communication, carrier frequency is chosen between 50 kHz and 500 kHz.
(R): No extra lines are necessary for the purpose and the same lines are used to carry both the electric power and information by carriers. [U.P.S.C. I.E.S. E.E.-II, 2011]

15. (A): Coherent FSK system is preferred over non-coherent FSK.
(R): Coherent FSK requires less power than non-coherent FSK.
[U.P.S.C. I.E.S. E.E.-II, 2001; 2011]

16. (A): PSK is inferior to FSK.
(R): PSK requires less bandwidth than FSK.
[U.P.S.C. I.E.S. E.E.-II, 2000]

17. (A): FSK signalling is inferior to PSK signalling.
(R): PSK requires less bandwidth than FSK.
[U.P.S.C. I.E.S. E.E.-II, 2009]

Answers: **1.** (d), **2.** (c), **3.** (a), **4.** (d), **5.** (a), **6.** (a), **7.** (d), **8.** (d), **9.** (d), **10.** (d), **11.** (a), **12.** (c), **13.** (b), **14.** (a), **15.** (a), **16.** (c), **17.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

18. (A): QPSK modulation allows higher data rate than BPSK for the same bandwidth occupying.
(R): Gray code is used for the 4 signals transmitted in QPSK.
[U.P.S.C. I.E.S. E.E.-II, 2009]

19. (A): Vestigial Side Band (VSB) modulation is used for TV broadcasting.
(R): Video signals have negligible power at low frequencies.
[U.P.S.C. I.E.S. E.E.-II, 2005]

20. (A): In television transmission, interlaced scanning is used.
(R): Interlaced scanning provides increased picture brightness.
[U.P.S.C. I.E.S. E.E.-II, 2008]

21. (A): Isolation transformers should always be used when servicing TV receivers without power transformers.
(R): TV receivers which use semiconductor rectifiers do not always use a power transformer. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

22. (A): Microwave links are generally preferred to coaxial cable for TV transmission.
(R): Microwave links have greater bandwidth than coaxial cables.
[U.P.S.C. I.E.S. E.E.-II, 2003]

23. (A): In microwave communication links, rain causes fading and this is great concern in communication systems.
(R): Water droplets in the path of an electromagnetic wave will scatter the energy in the waves and this collective scattering will weaken the incident wave in the forward direction.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

24. (A): Low frequencies are more suitable than high frequencies for underwater communication and for communication with underwater objects.
(R): Electric and magnetic fields in the underwater objects are out of phase by 45°. [U.P.S.C. I.E.S. E.E.-II, 2000]

25. (A): In mobile radio communication vertically polarized wave is preferred over horizontally polarized wave.
(R): Receiving antenna is always placed vertically.
[U.P.S.C. I.E.S. E.E.-II, 2010]

26. (A): Multiplexing of signals is invariably used in telemetry systems.
(R): Multiplexing improves signal to noise ratio over the communication channel and at destination.
[U.P.S.C. I.E.S. E.E.-I, 2003]

27. (A): In frequency division multiplexing (FDM), different carriers are to be generated for different channels. Also, each channel occupies a separate frequency band and different band pass filters are employed.
(R): The nonlinearities in various amplifiers of an FDM system do not produce any harmonic distortion and there is no interference within the channels. [U.P.S.C. I.E.S. II, 2006]

28. (A): Pulse broadening is a phenomenon associated with multimode fibres.
(R): Multimode fibres have core diameter much large compared with single mode fibres. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: **18.** (b), **19.** (c), **20.** (c), **21.** (b), **22.** (a), **23.** (a), **24.** (d), **25.** (a), **26.** (c), **27.** (c), **28.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Types of Analog Communication)	List 2 (System Bandwidth)
A. Single sideband AM.	1. BW proportional to modulation index.
B. Wideband FM.	2. BW = 2 × maximum signal frequency, f_{max}.
C. Vestigial sideband AM.	3. $f_{max} < BW < 2f_{max}$.
D. Double sideband AM.	4. $BW = f_{max}$.

Codes :	A	B	C	D
(a)	1	4	3	2
(b)	4	1	3	2
(c)	1	4	2	3
(d)	4	1	2	3 [U.P.S.C. I.E.S. E.E.-II, 1998]

2.

List 1 (Coding Technique in Digital Communication Systems)	List 2 (Purpose)
A. Huffman code.	1. Elimination of redundancy.
B. Error correcting code.	2. Reduces bit rate.
C. NRZ-coding.	3. Adapts the transmitted signal to the line.
D. Delta modulation.	4. Channel coding.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	3	4	1	2
(c)	1	4	3	2
(d)	3	2	1	4 [U.P.S.C. I.E.S. E.E.-II, 2005]

3.

List 1 (Modulation Reception Techniques)	List 2 (Disadvantages)
A. Superheterodyne	1. Threshold effect equation.
B. FM	2. Granular noise.
C. PCM	3. Image frequency interference.
D. Delta modulation	4. Quantization noise.

Codes :	A	B	C	D
(a)	1	3	4	2
(b)	3	1	4	2
(c)	1	3	2	4
(d)	3	1	2	4 [U.P.S.C. I.E.S. E.E.-II, 2002]

4.

List 1 (Modulation	List 2 (Application)
A. Wideband FM	1. Mobile communication.
B. Narrowband FM	2. Superimposition of binary waveform on carrier.

Answers: **1.** (b), **2.** (c), **3.** (b), **4.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

C. AM
D. VSB-AM

3. TV video.
4. TV audio.
5. Medium wave broadcast.

Codes :	A	B	C	D
(a)	4	3	5	1
(b)	5	1	2	3
(c)	4	1	5	3
(d)	5	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2006]

5.

List 1 (Characteristic)	List 2 (Modulation)
A. Capture effect is a characteristic of	1. FDM
B. Granular noise occurs in	2. PCM
C. Guard band is required in	3. FM

Codes :	A	B	C
(a)	3	2	1
(b)	3	1	2
(c)	1	2	3
(d)	1	3	2

[U.P.S.C. I.E.S. E.E.-II, 2008]

6.

List 1 (Problem)	List 2 (Causes)
A. Second time around echo.	1. Broad transmitted pulse.
B. Blind speeds.	2. Inadequate detection threshold.
C. Inadequate range resolution.	3. MTI filter.
D. False alarms.	4. Inadequate Inter Pulse Period.

Codes :	A	B	C	D
(a)	4	3	1	2
(b)	1	2	4	3
(c)	4	2	1	3
(d)	1	3	4	2

[U.P.S.C. I.E.S. E.E.-II, 2002]

7.

List 1 (System)	List 2 (Application)
A. Pre-emphasis	1. AM Detector
B. Armstrong Method	2. FM Receiver
C. Envelope Detector	3. FM Generator
D. De-emphasis	4. FM Transmitter
	5. AM Transmitter

Codes :	A	B	C	D
(a)	4	3	2	1
(b)	3	5	1	2
(c)	4	3	1	2
(d)	5	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2003]

8.

List 1	List 2
A. Phase locked loop.	1. Mixer.
B. Superheterodyne receiver.	2. De-emphasis filter.
C. FM receiver.	3. Diodes.
D. Envelope detector.	4. VCO.

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	3	1	2	4
(c)	4	2	1	3
(d)	3	2	1	4

[U.P.S.C. I.E.S. E.E.-II, 2011]

9.

List 1	List 2
A. Source encoder.	1. Reduce ISI.
B. Channel encoder.	2. Synchronization.
C. Line coder.	3 Message protection.
D. Equalizer.	4. Maximization of information transmitted.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	4	2	3	1
(c)	1	3	2	4
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2010]

10. [Given $m_i(t)$, $i = 1, 2$: base band message signals; f_c : carrier frequency, $\hat{m}_i(t)$: Hilbert transform of m_i]

List 1 (Mathematical Expression)	List 2 (Type of Signal)
A. $m_1(t) \cos \omega_c t + m_2(t) \sin \omega_c t$	1. DSB-SC
B. $m_1(t) \cos \omega_c t + \hat{m}_1(t) \sin \omega_c t$	2. USB
C. $m_2(t) \cos \omega_c t - \hat{m}_2(t) \sin \omega_c t$	3. QCM
D. $m_1(t) \cos \omega_c t$	4. LSB

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	3	4	1	2
(c)	1	2	4	3
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-II, 2007]

11.

List 1 (Modulation)	List 2 (Detector/Filter)
A. PSK	1. Square-law detector
B. FM	2. Ratio detector
C. AM	3. Matched filter

Codes :	A	B	C
(a)	3	1	2
(b)	3	2	1
(c)	2	1	3
(d)	2	3	1

[U.P.S.C. I.E.S. E.E.-II, 2008]

12.

List 1 (Parameter)	List 2 (Value of Parameter)
A. Line blanking period.	1. 4.5 to 4.9 μs
B. Line synchronization pulse.	2. 155 to 165 μs
C. Vertical field period.	3. 11.8 to 12.3 μs
D. Duration of pre-equalizing pulse sequence.	4. 20,000 μs

Codes :	A	B	C	D
(a)	3	1	4	2
(b)	4	2	3	1
(c)	3	4	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-II, 2006]

Answers: **5.** (a), **6.** (a), **7.** (c), **8.** (a), **9.** (d), **10.** (a), **11.** (b), **12.** (a).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Modulation is primarily accomplished to produce side bands.

2. In an AM wave, carrier wave magnitude varies with AF signals.

Answers: **1.** (F), **2.** (T),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

3. Modulation index in case of AM lies between 0 and 1.
4. The greater the modulation index the lesser is the power of AM wave.
5. Frequency modulation gives more noise in comparison of amplitude modulation.
6. A modulator is a device to separate two frequencies.
7. The demodulation of a delta modulation signal is achieved by sampling.
8. In phase modulation phase deviation is proportional to message signal.
9. Diode demodulator will ignore the frequency modulation.
10. The de-emphasis filter in an FM receiver is before FM demodulator.
11. In FM, the amplitude of the carrier remains constant.
12. Superhetcrodyne receivers are widely used as they are cheaper and provide higher amplification and improved selectivity.
13. Superheterodyne principle provides selectivity at IF stages.
14. A telemetry system transfers data from a centralized installation to various remote locations. [A.M.I.E. Summer 1993]
15. In the frequency spectrum of a PAM generation system, the information signals does not appear as part of the spectrum of the sampled pulse.
16. Bistable multivibrator is used for generating PDM.
17. The demodulation of PDM (or PWM) is more complex in comparison to that of PPM.
18. The pulse amplitude for PPM does not remain constant.
19. PCM needs small bandwidth.
20. In PCM the noise accumulates throughout the transmission path.

Answers: 3. (T), 4. (F), 5. (F), 6. (F), 7. (F), 8. (T), 9. (T), 10. (F), 11. (T), 12. (T), 13. (T), 14. (T), 15. (F), 16. (F), 17. (F), 18. (F), 19. (F), 20. (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. In an AM wave V_{max} = 10 V and V_{min} = 5 V the percentage of modulation is _____ %.
2. In AM, the percentage of total power in side band is _____ %.
3. If modulation index of an AM wave is changed from 0 to 1, the transmitter power increases by _____ .
4. The assigned bandwidth of each of the channels in the AM broadcast band is _____ .
5. The demodulation of a delta modulated signal is achieved by _____ .
6. To overcome slope overload problem, _____ integrator is used in delta modulation.
7. In FM, modulation index m_f is equal to _____ (Δf is the frequency deviation and f_m is the modulating signal frequency.
8. An indirect way of generating FM, is the _____ modulator.
9. With the increase in transmission bandwidth, received signal power in AM/FM will respectively _____ .
10. The most common detector used in an AM radio broadcast receiver is _____ detector.
11. _____ signal is differentiation of PWM.
12. The most noise immune system is _____ .
13. In digital communication system, the data transmission rate is specified in _____ .
14. Telemetry may be defined as measurement from a _____.
15. Radio links are usually suitable for lengths exceeding _____ km. (0.05/0.5/1/5)
16. Microwave links are used at a frequency of _____ .
17. DC telemetry is also called the _____ telemetry. (radio/frequency/landline)
18. Synchro-transmitter and receiver are used in _____ telemetry. (voltage/frequency/position)
19. In digital telemetry, commonly used modulation is _____. (PAM/PCM/PDM/PPM)
20. Pulse modulation is essentially a process of _____ . (multiplexing/message processing)
21. PDM is roughly analogous to _____ . (PPM/linear/exponential carrier wave modulation)
22. Repeating or amplifying of the encoded signal is permitted in _____ . (PPM/PCM/PDM)
23. In comparison to message bandwidth, the PCM has much _____ bandwidth. (larger/smaller)
24. For generating PCM, the signal is sampled and converted into _____ . (PDM/PAM/PPM)
25. To demodulate PCM, it is first converted into _____ . (PWM/PPM/PAM)
26. For modulation of PCM for transmission the most common type of modulation used is _____.
27. For transmission of normal speech signal, the PCM channels require a bandwidth of _____ kHz. (8/16/64/128)
28. In PCM, the number of pulse 'p' in a code group 'q' quantitising levels is given by _____ . ($\log_e q$, $\log_{10} q$, $\log_2 q$)
29. At high frequencies the most important type of noise is _____ noise. (short/flicker/thermal/transit time)
30. There are two methods of multiplexing in telemetering system, namely time division multiplexing and _____multiplexing.
31. Frequency multiplexing techniques are universally preferred over _____ multiplexing in use.
32. _____ modulation telemetering system has maximum immunity to noise. [A.M.I.E. Elements of Electronics & Instrumentation Summer 1995]

18 PART B

Electronic and Electrical Measurements and Instruments

Short Answer Type Questions With Answers

Q. 1. What is measurement ?

Ans. Measurement is essentially the act, or the result, of a quantitative comparison between a given quantity and a quantity of the same kind chosen as a standard or a unit.

Q. 2. What is meant by the term "measurand" ?

Ans. The quantity to be measured is known as the measurand.

Q. 3. What is measuring instrument ?

Ans. The device used for comparing the unknown quantity with the unit of measurement or a standard quantity is called a measuring instrument.

Q. 4. Why direct comparison methods of measurement are rarely used ?

Ans. It is not always possible, feasible and practicable to use direct comparison methods of measurement. These methods are inaccurate and less sensitive too. So direct comparison methods of measurement are rarely used.

Q. 5. What are the three essential elements of an instrument ?

Ans. The three essential elements of an instrument are a detector, an intermediate transfer device, and an indicator or a storage device.

Q. 6. What are the drawbacks of mechanical instruments ?

Ans. The drawbacks of mechanical instruments are (*i*) inability of responding rapidly to the measurements of dynamic and transient conditions and (*ii*) they are a potential source of noise.

Q. 7. What are the advantages of electronic instruments over their mechanical and purely electrical counterparts ?

Ans. The electronic instruments have a higher sensitivity, a faster response, lower weight, a greater flexibility, a higher degree of reliability, and low power consumption as compared to their mechanical and purely electrical counterparts.

Q. 8. Absolute instruments are rarely used in practice. Why ?

Ans. Absolute instruments are rarely used because working with absolute instruments for routine work is time-consuming.

Q. 9. Why are direct measuring instruments most widely used in engineering practice ?

Ans. Direct measuring instruments are the most simple and inexpensive ones and enable measurements to be made in the shortest possible time, and, therefore, are most widely used in engineering practice.

Q. 10. What for are null type instruments mainly used and why ?

Ans. The null type instruments are more accurate and highly sensitive as compared with deflection type instruments, and therefore, are more suitable for calibration purposes.

Q. 11. What is difference between analog and digital signals ?

Ans. Signals that vary in a continuous fashion and take on an infinite number of values in any given range are known as *analog signals* while the digital signals vary in discrete steps and thus take up only finite different values in a given range.

Q. 12. The importance of digital instruments is increasing. Why ?

Ans. The importance of digital instruments is increasing mainly because of the widespread use of digital computers in both data processing and automatic control systems.

Q. 13. Give classification of instruments on the basis of their functions.

Ans. The instruments, on the basis of their functions, are classified as indicating, recording and controlling instruments.

Q. 14. What is primary sensing element ?

Ans. The primary sensing element is that which makes contact with the physical quantity under measurement, receives energy from the measured medium and produces an output depending in some way on the measurand.

Q. 15. What is meant by transducer ?

Ans. The transducer is defined as a device which, when actuated by one form of energy, is capable of converting it into another form of energy.

Q. 16. What is meant by instrumentation ?

Ans. Instrumentation refers to the art and science of collection of several instruments and auxiliary equipment and their utilisation for conducting successfully a test or an experiment on a system, process or plant.

Q. 17. How are judged the performance characteristics of an instrumentation system ?

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The performance characteristics of an instrumentation system are judged by how faithfully the system measures the desired input and how thoroughly it rejects the undesirable inputs.

Q. 18. Enumerate the factors that influence the accuracy of a system.

Ans. In measurement, accuracy is influenced by static error, dynamic error, drift, reproducibility, nonlinearity, hysteresis, temperatures and vibration.

Q. 19. What is meant by bias ?

Ans. Bias describes a constant error which exists over the full range of measurement of an instrument.

Q. 20. What is tolerance ? Is it a static characteristic of measuring instrument ?

Ans. Tolerance is a term which is closely related to accuracy and defines the maximum error which is to be expected in some value. Strictly speaking it is not a static characteristic of measuring instrument.

Q. 21. What is meant by loading effect ?

Ans. The incapability of the system to faithfully measure, record or control the input signal (measurand) in undistorted form is known as loading effect.

Q. 22. What is meant by bandwidth of a system ?

Ans. Bandwidth of a system is the range of frequencies for which its dynamic sensitivity is satisfactory.

Q. 23. What is meant by an absolute error of measurement ?

Ans. The difference between the measured value A_m and the true value A of the unknown quantity or measurand is known as the absolute error of measurement δA i.e.

$$\delta A = A_m - A$$

Q. 24. What is meant by reading correction and how is it related to absolute error ?

Ans. The difference of true value A and measured value A_m of the measurand is known as the reading correction. Absolute error and reading correction are of the same magnitude but are of opposite sign.

Q. 25. What is difference between absolute error and relative error?

Ans. Absolute error δA is equal to the difference of the measured value A_m and the true value A of the measurand.

$$\text{i.e. } \delta A = A_m - A.$$

But relative error is equal to the ratio of absolute error to the true value of the quantity under measurement.

$$\text{i.e. Relative error, } \varepsilon_r = \frac{\delta A}{A} = \frac{\varepsilon_o}{A} = \frac{\text{Absolute error}}{\text{True value}}.$$

Q. 26. How is relative error expressed ?

Ans. Relative error is defined as the ratio of absolute error to the true value of the measurand and is expressed in fraction or percentage.

Q. 27. What is meant by limiting error ?

Ans. The limits of the deviations from the specified value, as mentioned by the manufacturer of the equipment/apparatus is known as limiting error.

Q. 28. What is meant by resolution of an instrument ?

Ans. The resolution of any instrument is the smallest change in the input signal (quantity under measurement) which can be detected by the instrument. It may be expressed as an actual value or as a fraction or percentage of the full-scale value.

Q. 29. How do accuracy and precision differ from each other ?

Ans. Accuracy is defined as the degree of exactness (closeness) of a measurement compared to the expected (desired) value, whereas precision is a measure of the consistency or repeatability of measurements, i.e. successive readings do not differ. (Precision is the consistency of the instrument output for a given value of input).

In brief, accuracy can be defined as *conforming to truth* and precision can be defined as *sharply or closely defined.*

Q. 30. Name the categories of static errors. **[A.M.I.E. Sec B. Summer 2004]**

Ans. Static errors can be grouped in three categories viz. gross errors, systematic errors and random or accidental errors. Systematic errors may further be categorised as instrumental errors, environmental errors and observational errors.

Q. 31. What are systematic errors ?

Ans. Systematic errors remain constant or change according to a definite law on repeated measurement of the given quantity. These errors can be evaluated and their influence on the results of measurement can be eliminated by the introduction of proper corrections.

Q. 32. How do random errors differ from systematic errors ?

Ans. Systematic errors remain constant or change according to a definite law on repeated measurement of the given quantity whereas random errors, also called the accidental errors, are of variable magnitude and sign and do not obey any known law.

Q. 33. What is meant by "arithmetic mean", "average deviation" and "standard deviation" ?

Ans. *Arithmetic mean* is the sum of the number of observations divided by the number of observations i.e.

$$\bar{x} = \frac{x_1 + x_2 + \ldots + x_n}{n} = \frac{\sum x}{n}$$

where $\bar{x}$ is the arithmetic mean and $x_1, x_2, \ldots, x_n$ are the readings taken and n is the number of readings taken.

Average deviation is the sum of the scaler values (without sign) of the deviations divided by the number of readings i.e.

$$\text{Average deviation, } D = \frac{|d_1| + |d_2| + \ldots + |d_n|}{n} = \frac{\sum d}{n}$$

where $d_1, d_2 \ldots d_n$ are the deviations of the readings from the mean.

Standard deviation, also known as *root mean square deviation*, of an infinite number of data is the square root of the sum of all the individual deviations squared, divided by the number of readings

$$\text{i.e. Standard deviation, } \sigma = \sqrt{\frac{d_1^2 + d_2^2 + d_3^2 + \ldots + d_n^2}{n}}.$$

Q. 34. What is difference between "standard deviation" and "variance" ?

Ans. Standard deviation is the root mean square deviation whereas variance is the mean square deviation.

So variance, V = Mean square deviation = σ^2.

Q. 35. What is probable error ?

Ans. The probable error is given as $r = 0.6745\ \sigma$, where σ is the standard deviation. The quantity r is called the probable error in the sense that there is an even chance that any one observation will have a random error not greater than $\pm r$.

Q. 36. What is the expression for probable error if the readings of measurement follow Gaussian distribution?

Ans. The probable error is given as $r = 0.6745\ \sigma$, where σ is the standard deviation.

Q. 37. What is meant by the term 'unit' in the measurements ?

Ans. The result of measurement of a physical quantity must be defined both in kind and magnitude. The standard measure of each kind of physical quantity is called a unit.

Q. 38. What is the difference between fundamental and derived units?

[U.P.S.C. I.E.S. Elec. Engineering-I, 2000; A.M.I.E. Sec B. Summer 1993; Winter 2000]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Ans. The size of the fundamental units is quite arbitrary and can be selected to fit a certain set of circumstances i.e., mass, length, time etc. whereas the derived units can be expressed in terms of fundamental units with the help of physical equations i.e. area, volume, force etc.

Q. 39. Distinguish between absolute, primary and auxiliary fundamental and derived units. **[U.P.S.C. I.E.S. Elec. Engineering-I, 1998]**

Ans. **Absolute Units.** An absolute system of units is defined as a system in which the various units are expressed in terms of a small number of fundamental units. Absolute measurements do not compare the measured quantity with arbitrary units of the same type but made in terms of fundamental unit.

Primary Fundamental Units. The size of primary fundamental units is quite arbitrary and can be selected to fit a certain set of circumstances i.e. mass, length, time etc.

Auxiliary Fundamental Units. These units are used only where particular disciplines are involved i.e. thermal, illumination etc.

Derived Units. The units which can be expressed in terms of fundamental units with the help of physical equations are called the derived units i.e. area, volume, density etc.

Q. 40. What do you understand by the dimension of a quantity ? **[U.P.S.C. I.E.S. Elec. Engineering-I, 1999]**

Ans. Every quantity has a quality which distinguishes it from all other quantities. This unique quality is called dimension. The dimension is written in a characteristic notation, as for example [L] for length, [T] for time etc.

Q. 41. What are the basic units in SI system? **[A.M.I.E. Sec B. Summer 1998]**

Ans. There are seven basic units, namely Metre, Kilogram. Second, Ampere, Kelvin, Candela, Mole, which form the basis of the new universally accepted international system of units called the SI system.

Q. 42. What is meant by 'dimensional equation'? **[A.M.I.E. Sec B. Summer 1981]**

Ans. The dimensional symbol for the derived unit of area is L^2 and that for volume, L^3. The dimensional symbol for the unit of force is LMT^{-2}, which follows from the defining equation for force. Expressions like $[a] = [L^2]$, $[v] = [L^3]$, $[F] = [MLT^{-2}]$, $[P] = [ML^2T^{-3}]$ indicate the nature of derived quantities in terms of the fundamental dimensions [L], [M] and [T] and are known as dimensional equations.

Q. 43. What is the difference between primary and secondary standards ?

Ans. Primary standards are absolute standards of such high accuracy that they can be used as the ultimate reference standards while the secondary standards are the basic reference standards used in industrial measurement laboratories. Secondary standards are calibrated and compared against the primary standards in national standard laboratories on a period basic.

Q. 44. How the accuracy of the secondary standards is ensured ? **[A.M.I.E. Sec B. Summer 1995]**

Ans. To ensure the accuracy of secondary standards, these standards are checked locally against reference standards available in the area and are also normally sent periodically for calibration and comparison against the primary standards.

Q. 45. What is meant by absolute measurement of electrical quantities ?

Ans. Measurement of electrical quantities in terms of the units of mass, length and time are called absolute measurement.

Q. 46. Why only emf and resistance standards are maintained in order to assign values to other electrical standards ?

Ans. The unit of current can be established in terms of the physical dimensions of a current balance which measures the force exerted between two current carrying coils. The unit of resistance can also be established in an absolute manner by using Lorentz method. So national laboratories usually maintain standards of emf and resistance and base the values of other standards on these two. In practice, an absolute volt can be obtained by passing an absolute ampere through an absolute ohm. This is possible because both absolute ampere and absolute ohm are physically realizable.

Q. 47. Why is it practically impossible to build a current standard on the same pattern as an emf or a resistance standard is built ?

Ans. Certain types of chemical batteries maintain emf of great accuracy so that they can serve as practical reference of emfs. It is possible, though not easy, to construct a standard ohm which is accurate and permanent. But it is highly impractical to maintain a standard current for the routine calibration of ammeters and voltmeters. This is because each absolute determination of current takes a long time involving precision work.

Q. 48. How is the standard metre defined ? **[Bangalore Univ. 1980]**

Ans. The metre is now defined as equal to 1,650,763.73 wavelengths in vacuum of the orange-red radiation of the krypton-86 atom.

Q. 49. What is Josephon effect ?

Ans. A current flows between two pieces of a superconducting material separated by an insulator. This is known as Josephon effect.

Q. 50. What are IEEE standards ?

Ans. IEEE standards are slightly different types of standards published and maintained by the Institute of Electrical and Electronics Engineers with headquarters in New York City. These standards are not physical items that are available for comparison and checking of the secondary standards but are standard procedures, nomenclature, definitions etc.

Q. 51. What is meant by the term 'residues' as used in circuit components ?

Ans. The impurities present in a circuit component develop undesirable quantities known as residues.

Q. 52. What is the important requirement imposed on high-resistivity materials intended for use in precision electrical measuring instruments and for making standard resistance ?

Ans. The main requirement is stability of resistance over long period of time (no tendency to age) and during fluctuations of temperature.

Q. 53. Name the most widely used materials for precision electrical measuring instruments and standards resistors ?

Ans. The most widely used materials for precision electrical measuring instruments and standard resistors are (*i*) platinum (*ii*) manganin (*iii*) constantan (*iv*) nichrome and (*v*) gold-chromium alloy.

Q. 54. Standard resistors use single layer coils. Why ?

Ans. Standard resistors make use of single layer coils from the point of view of availability of maximum heat dissipation.

Q. 55. Why for dc resistance standards metal spools are employed rather than wooden spools ?

Ans. Wooden spools absorb moisture and consequently expand and contract with changing humidity and may set up strains in the resistance wire causing variation in resistance value. Metal spools readily dissipate heat generated in the resistance coil due to flow of current through the coil. Metal spools are usually of brass which has about the same coefficient of expansion as that of most resistance alloys. This avoids large variations in the stress of the coil due to temperature variations.

Q. 56. What is a resistance box ?

Ans. An assembly of resistors which can be connected in series to cover a range of values is generally called the resistance box. It may consist of sets of resistances in the ratio 1 : 2 : 3 : 4 or 1 : 2 :

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

2 : 5; series combination of which provide all integral values from 1 to 10 with sockets and plugs to short-circuit the elements not in use.

Q. 57. Enumerate the properties that must be had by the materials used in the manufacture of a standard resistance.

Ans. The materials to be used in the manufacture of a standard resistance should have the properties of (*i*) high resistivity (*ii*) small temperature coefficient (*iii*) greater permanence (*iv*) low thermoelectric effects (*v*) free from effects of oxidation, moisture, acids etc.

Q. 58. Why is it necessary to use four-terminal resistance coils for low resistance standards ?

Ans. In order to obtain uniform current distribution through the cross-section of the resistance material, the current terminals should be at an appreciable distance from the tapping points of the potential leads. That is why the resistance coils for low resistance standards are fitted four terminals–2 current terminals and 2 potential terminals.

Q. 59. Enumerate the factors that are responsible for the variation of values of effective inductance and resistance of an inductor with frequency.

Ans. The different factors responsible for the variation of values of effective inductance and resistance of an inductor with frequency are (*i*) eddy current effects in the wire (*ii*) self capacitance of the winding and mutual capacitance between the primary and secondary of a mutual inductor and (*iii*) imperfect insulation of the coil.

Q. 60. Why variable standards of inductance are required ?

Ans. In applications where inductance must be varied or be set to a precise value, the adjustments provided by fixed steps of inductance is often inadequate and, therefore, variable standards of inductance are required.

Q. 61. What are drawbacks of Ayrton-Perry inductometer ?

Ans. The drawbacks of Ayrton-Perry inductometer are nonlinearity of scale and lack of astaticism.

Q. 62. What are distributed capacitances ?

Ans. There is a series of capacitors, and also a set of parallel capacitors along the coil. These types of capacitances along the length are called the distributed capacitances.

Q. 63. Why does a capacitor fail to represent a perfect and constant capacitance at different frequencies?

Ans. A capacitor fails to represent a perfect and constant capacitance at different frequencies. This is because of several effects such as I^2R loss in the plates and connecting wires, interfacial polarization and power loss in the dielectric, and inductance in the connections.

Q. 64. What are the principal requirements that standard capacitors must meet ?

Ans. The principal requirements that standard capacitors must meet are (*i*) permanence, (*ii*) low temperature coefficient (*iii*) small loss angle and high insulation resistance (*iv*) independence of capacitance from the supply frequency and waveform.

Q. 65. Why is air always used as the dielectric in primary capacitance standards ?

Ans. Air is the only dielectric whose permittivity is definitely known and is free from absorption and dielectric loss.

Q. 66. Why the capacitors of large capacitance make use of solid dielectric materials ?

Ans. Capacitors of large capacitance make use of solid dielectric materials because large permittivity and very thin dielectric layer makes the standards very compact.

Q. 67. Why dimensions need not to be known accurately in case of secondary standards of capacitance ?

Ans. Secondary standards are calibrated standards i.e. they are calibrated by comparing with air primary standards of capacitor and so their dimensions need not be known accurately.

Q. 68. Why secondary standard capacitors are not suitable for general purpose of laboratories ?

Ans. The secondary standard capacitors are not suitable for general purpose of laboratories because the capacitors meant for laboratory uses must be compact, sturdy, of high resistivity and dielectric strength.

Q. 69. Why is mica used as dielectric in precision capacitors ?

Ans. Mica capacitors are used as precision capacitors because of their small tolerances and high stability under varying temperature and electric stress. Mica is easily available in the form of very thin sheets and have a high resistivity and dielectric strength both of which characteristics are necessary for the purpose for which these are used.

Q. 70. What are the various effects of electric current/voltage, upon which the principle of operation of electrical measuring instruments is based ?

Ans. The effects utilised in the manufacturing of electrical instruments are magnetic, heating, chemical, electrostatic and electromagnetic effects.

Q. 71. What are the essentials of indicating instruments ?

Ans. Indicating instruments consist, essentially of a pointer moving over a calibrated scale and attached to the moving system pivoted on jewelled bearings. For satisfactory working of indicating instruments the torques required are: (*i*) deflecting torque, (*ii*) controlling torque and (*iii*) damping torque.

Q. 72. Why is controlling mechanism provided in indicating instruments ?

Ans. The controlling torque performs two functions. Firstly, it balances the deflecting torque and hence, insures that the magnitude of the deflection is always the same for a particular value of the measurand, and secondly, it brings back the moving element to its zero position on removal of the source producing the deflecting torque.

Q. 73. What are the essential qualities which the materials used for control springs must possess ?

Ans. The essential qualities, for materials used for springs, are that they should be non-magnetic, proof against mechanical fatigue and in particular of low resistivity and low temperature coefficient specially when it is used as lead for current flowing to the moving elements.

Q. 74. What are the materials, which are used for control springs ?

Ans. Silicon-bronze, hard-rolled silver or copper, platinum-silver, platinum-iridium or German silver have been used as spring materials but for most applications phosphor bronze is the most suitable except in low-resistance instruments.

Q. 75. How is gravity control inferior to spring control ?

Ans. Gravity controlled instrument's scales are not uniform but are crowded in the beginning. This is drawback when the pointer lies at the lower scale values. Secondly these are to be used in vertical position in order that the control may operate.

Q. 76. Why is damping mechanism provided in electrical measuring instruments ?

Ans. Damping mechanism is provided in order to avoid oscillations of the moving element about its final deflected position owing to inertia of the moving parts and to bring the moving element to rest in its deflected position quickly.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 77. When is the instrument said to be dead beat ?

Ans. When the degree of damping is such that the pointer (moving element) rises quickly to its deflected position without oscillations, the damping is said to be 'critical' and the instrument is said to be dead beat.

Q. 78. What are the various techniques by which damping torque is produced in electrical instruments ?

Ans. The various techniques of obtaining damping torque are (*i*) air friction, (*ii*) fluid friction and (*iii*) eddy current.

Q. 79. Which technique of obtaining damping is most efficient ?

Ans. Eddy current damping is most efficient.

Q. 80. Give the application of air friction damping.

Ans. Air friction damping is used in moving iron and dynamometer type instruments where the working magnetic field is weak and is likely to get distorted with the introduction of permanent magnet.

Q. 81. Why fluid friction damping has limited use ?

Ans. Fluid friction damping has several drawbacks such as creeping of oil, the necessity of using the instrument always in vertical position and, therefore, the use of this type of damping is restricted to laboratory type electrostatic instruments.

Q. 82. On what principle is eddy current damping based ?

Ans. The eddy current damping is based on the principle that whenever a sheet of conducting but non-magnetic material like copper or aluminium moves in a magnetic field so as to cut through magnetic flux, eddy currents are set up in the sheet. Due to these eddy currents, a force opposing the motion of the sheet is experienced. The eddy currents are proportional to the velocity of the moving system. If the magnetic field strength is constant, the damping force is proportional to the velocity of the moving system and is zero when the moving system is at rest.

Q. 83. How does eddy current damping torque vary with the variation in the velocity of the moving element ?

Ans. The damping torque varies linearly with the variation in velocity of the moving element provided that the strength of the magnetic field is constant.

Q. 84. How does eddy current damping torque vary with the radial position of the poles relative to the axis of the disc ?

Ans. Damping torque decreases with the movement of the magnet towards the edge of the disc and becomes zero when the centres of the poles are at the edge of the disc.

Q. 85. Why is an end play of 0.05 mm or 0.1 mm allowed while mounting the spindle in the jewels bearings ?

Ans. An end play of 0.05 mm or 0.1 mm is allowed while mounting the spindle in the jewels bearings in order to keep the pressure per unit area at the contact point lesser than the crushing strength of the materials of pivots.

Q. 86. Why in some instruments, the end of the pointer is flattened and a strip of mirror glass is fitted below the graduated scale and behind the pointer ?

Ans. In precision instruments, the end of the pointer is flattened and a strip of mirror glass is fitted immediately below the graduated scale and behind the pointer. The mirror assists the observer in positioning his eye so that it is directly above the pointer, when the pointer and its image coincide. Thus error in reading due to parallax avoided.

Q. 87. What is a galvanometer ?

Ans. The galvanometer is a highly sensitive instrument used for measuring current, voltage and quantity of electricity; the scale of the instrument is graduated directly by the observer.

Q. 88. Name the most commonly used galvanometers.

Ans. The most commonly used galvanometers are PMMC (D'Arsonval) galvanometers for dc measurements, vibration galvanometers for ac measurements and ballistic galvanometers for magnetic measurements.

Q. 89. What for galvanometers are used ?

Ans. Galvanometers are used for:

(*i*) measuring currents and voltages of small magnitudes;

(*ii*) determining equality of potentials between two points of an electric circuit (for example, as null detectors in bridge and potentiometer circuits);

(*iii*) determining the equality of two currents (differential galvanometers);

(*iv*) measuring quantity of electricity or current impulse (ballistic galvanometers).

Q. 90. On what principle does D'Arsonval galvanometer operate ?

Ans. When a current carrying conductor is placed in a magnetic field, a mechanical force is experienced on the conductor which tends to move the conductor in a direction given by Fleming's left hand rule. This principle is employed in galvanometers.

Q. 91. What is the main advantage of a PMMC galvanometer ?

Ans. The main advantage of a PMMC galvanometer lies in its freedom from the effects of stray fields and the ease with which a long and uniform scale may be attained.

Q. 92. What is logarithmic decrement ?

Ans. The logarithmic decrement is usually defined as the Naperian logarithm of the ratio of successive swings of the oscillating system. It may also be defined as the logarithm of the initial overshoot to the final deflection of a galvanometer.

Q. 93. What is meant by mechanical damping in a D'Arsonval galvanometer ?

Ans. In a D'Arsonval galvanometer, mechanical damping is mainly due to the motion of the coil through the air surrounding it and a small dissipation of energy associated with the flexing of the suspension.

Q. 94. What is meant by electromagnetic damping ?

Ans. Electromagnetic damping is developed because of induced effects in the moving coil when it rotates in the magnetic field and a close path is provided for the flow of current.

Q. 95. What is CDRX ?

Ans. The external resistance required for critical damping is called CDRX or ECDR (critical damping external resistance).

Q. 96. What is ballistic sensitivity ?

Ans. Ballistic sensitivity is defined as the first maximum deflection in mm caused on a scale at a distance of one metre from mirror by a unit charge suddenly passed in the galvanometer.

Q. 97. How does vibration galvanometer differ from D'Arsonval galvanometer ?

Ans. In appearance, the D'Arsonval type vibration galvanometer resembles the usual type of moving coil galvanometer but has a taut suspension which is usually under considerable tension, and very narrow coil.

Q. 98. What are the special features of vibration galvanometers ?

Ans. The special features of vibration galvanometers are large sensitivity, small damping and large restoring constant.

Q. 99. What is ballistic galvanometer ?

Ans. Ballistic galvanometer is an instrument, invariably used in almost all the dc magnetic measurements, is used for the measurement of charge or quantity of electricity.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 100. Why is ballistic galvanometer usually lightly damped ?

Ans. The ballistic galvanometer is usually lightly damped in order to have the first deflection of maximum amplitude.

Q. 101. Why damping used in a ballistic galvanometer must be necessarily electromagnetic one ?

Ans. The damping used in a ballistic galvanometer must be necessarily electromagnetic because it can be determined from the instrument constants while air damping is indeterminate.

Q. 102. What are the drawbacks of calibration of a ballistic galvanometer by means of a capacitor ?

Ans. The drawbacks of calibration of a ballistic galvanometer by means of a capacitor are that

(*i*) dampings of the instrument during calibration and during testing are not the same;

(*ii*) capacitance of the condenser is difficult to be determined accurately under all the conditions.

Q. 103. How can the range of a ballistic galvanometer be increased ?

Ans. The range of a ballistic galvanometer may be extended by using a shunt with it.

Q. 104. How does Grassot fluxmeter differ from a ballistic galvanometer ?

Ans. Grassot fluxmeter is a special type of ballistic galvanometer provided with heavy electromagnetic damping and very small controlling torque.

The Grassot fluxmeter, although not so sensitive and accurate as ballistic galvanometer, but possesses the following advantages:

(*i*) The instrument is portable and has a calibrated scale directly in Wb-turns.

(*ii*) The deflection is independent of the length of time taken for the change in flux causing the deflection.

Q. 105. How range of fluxmeter be increased ?

Ans. The range of a fluxmeter may be increased by using a low-resistance, non-inductive shunt.

Q. 106. What is meant by 'multiplying factor' in connection with Grassot fluxmeter ?

Ans. The multiplying factor of a Grassot fluxmeter equals $\frac{R_S + R_C}{R_C}$ where R_S and R_C are the resistances of shunt and search coil respectively.

Q. 107. What is difference between an ammeter and a voltmeter ?

Ans. Ammeter is a low resistance indicating instrument while the voltmeter is high resistance one.

Q. 108. Why an ammeter should be of very low resistance ?

Ans. *Ammeter,* which is connected in series with the circuit carrying the current under measurement, must be of *very low resistance* so that the voltage drop across the ammeter and power absorbed from the circuit are as low as possible.

Q. 109. Why a voltmeter should be of very high resistance ?

Ans. *Voltmeter*, which is connected in parallel with the circuit across which the voltage is to be measured, must be of very *high resistance* so that the current flowing through the voltmeter and the power absorbed from the circuit are minimum possible.

Q. 110. How an ammeter can be changed into a voltmeter ?

[A.M.I.E. Sec B. Summer 2004]

Ans. An ammeter of low range can be converted into a voltmeter by connecting a high resistance in series with it provided the current through the series combination is within the range of the ammeter when connected across the voltage under measurement.

Q. 111. What happens when an ammeter is connected across the circuit ?

Ans. If an ammeter is connected in parallel to the circuit like a voltmeter, a very high current will flow through it which will produce such an excessive heat that the insulation of the wire carrying the current will be destroyed. The wire may itself melt away. Thus the instrument will get damaged.

Q. 112. What happens when a voltmeter is connected in series with the circuit ?

Ans. If a voltmeter is connected in series with the circuit, the circuit resistance will become too large and consequently a very small current will flow through it. The instrument will, however, read almost the same emf acting in the circuit.

Q. 113. Why are the moving-iron indicating instruments popular for the ordinary measurement work ?

Ans. Moving iron indicating instruments are popular for the ordinary measurement work because these are cheaper in cost, robust in construction, and can be manufactured with required accuracy.

Q. 114. Can the same moving iron instrument be used for both dc and ac measurements ?

Ans. Yes, the same moving iron instrument can be used for both dc and ac measurements because it has a square-law response.

Q. 115. Why is the graduation of scale of moving-iron instrument not uniform throughout ?

Ans. Since the moving-iron instrument has a square-law response, the graduation of scale is not uniform throughout.

Q. 116. Why is eddy current damping not possible in moving-iron instruments ?

Ans. Eddy current damping is not possible in moving-iron instruments because of presence of permanent magnet required for such purpose would affect the deflection i.e. the reading of the instrument.

Q. 117. Why are irons made of mumetal employed in moving iron instruments ?

Ans. With the use of mumetal irons, the effects of saturation are avoided in the instruments and adequate torque can be obtained with low values of flux density since it has high permeability.

Q. 118. Why are repulsion type moving iron instruments more commonly used than the attraction type ones ?

Ans. Repulsion type moving iron instruments are more suitable for commercial production in manufacture and a nearly uniform scale is more easily obtained, they are, therefore, much more common than the attraction type.

Q. 119. What are the major differences between attraction and repulsion type of moving iron instruments?

Ans. An attraction instrument will usually have a lower inductance than the corresponding repulsion instrument, and voltmeters will, therefore, be accurate over a wider range of frequency and there is a greater possibility of using shunts with ammeters. On the other hand, repulsion instruments are more suitable for economical production in manufacture, and a nearly uniform scale is more easily obtained; they are, therefore, much more common than the attraction type.

Q. 120. What are the differences between moving coil and moving iron instruments ? **[A.M.I.E. Sec B. Winter 1995]**

Ans. Moving iron instruments are comparatively robust due to simple construction and are also cheaper in cost. Moving-iron instruments have less friction error but are subjected to errors due to hysteresis, change in frequency and waveforms. Moving-iron instruments can be used for both ac and dc measurements while moving-coil instruments can be used only for dc measurements. Moving-iron instrument scale is not uniform whereas moving coil instruments have linear scale. Moving-coil instruments have comparatively low power consumption.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 121. Why permanent magnet moving coil instruments cannot be used for ac measurement of high frequency ?

Ans. At high frequencies, the pointer of a PMMC instrument will not be able to follow the rapid variations in direction and will quiver slightly around the zero mark, seeking the average value of ac i.e. zero. That is why, PMMC instruments are unsuitable for ac measurements unless the current is rectified before applying it to the PMMC instrument.

Q. 122. How is controlling torque provided in PMMC instruments ?

Ans. In PMMC instruments, controlling torque is provided by two phosphor-bronze hair springs, either helical or spiral, coiled in opposite directions, normally equal in strengths.

Q. 123. What type of damping is provided in PMMC instruments ?

Ans. Usually eddy current damping is used in PMMC instruments.

Q. 124. Why are dynamometer type instruments suitable both for dc and ac measurements?

Ans. The dynamometer type instruments are suitable both for dc and ac measurements because they have square-law response.

Q. 125. Why dynamometer type instruments are most suitable as transfer instruments?

Ans. A transfer instrument is one that may be calibrated with a dc source and then used without modification to measure ac. This requires the transfer instrument to have same accuracy for both dc and ac measurements. As the dynamometer type instruments have same accuracy on dc and ac both, they are most suitable as transfer instruments.

Q. 126. Why dynamometer type instruments are not usually used for dc measurements?

Ans. Dynamometer type instruments are usually not used for dc measurements as these instruments have higher cost, higher power consumption, low torque-weight ratio, non-uniform scale and other several drawbacks in comparison to PMMC instruments.

Q. 127. What are the limitations of thermocouples ?

Ans. 1. Overload capacity of heaters is very small.
2. A rise in temperature (higher operating temperature) causes a change in the heater resistance.
3. Presence of harmonics affects meter indications, because the heating effect is proportional to the square of the current.

Q. 128. How would you increase the operating forces in an electrostatic voltmeter ?

Ans. The operating forces may be increased by increasing the capacitance, which can be brought about in three ways viz. (*i*) using plates of large area (*ii*) by multiplying the number of elements acting together (*iii*) using small spacing between plates and (*iv*) using a medium of high permittivity. In first two methods the weight of the moving system increases significantly, with the result that the pivot friction becomes vital. The reduction of distance between the plates is restricted both by mechanical difficulty of construction and by the tendency to spark over. However, compressed gas may be used as a dielectric to have a compact instrument.

Q. 129. Give the special features of electrostatic voltmeters.

Ans. The operation of electrostatic instruments depends on voltage while other measuring instruments are operated by current. Their deflection is directly proportional to the square of the voltage applied across their terminals and thus indicates rms value.When used for dc measurements the steady-state current is practically zero and therefore, the instrument has practically no power loss. When used for ac measurements, the current drawn by the instrument is dependent on supply frequency. The current increases with the increase in frequency. At very high supply frequency the current drawn by the instrument may be large enough to influence the loading of the circuit, voltage of which is under measurement. This is because the current drawn by the instrument is inversely proportional to the capacitive reactance and capacitive reactance at a very high frequency is quite small. At very high frequencies the instrument may also behave, due to leads inductance, like a resonant or partially resonant transmission line and thus, have standing wave resulting in non-uniform voltage distribution and the instrument indications may become erroneous. The electrostatic voltmeters have very small operating torque and limited over-voltage capacity. The electrostatic voltmeters are free from most of the errors, like waveform and frequency errors and hysteresis and eddy current errors, occurring in other measuring instruments.

Q. 130. Why are the rectifier instruments indispensable for measurements in communication circuits ?

Ans. The rectifier instruments are indispensable for measurements in communication circuits since because of their very high sensitivity, the power required for their operation is small enough to be within the capacities of the circuits.

Q. 131. Give the examples of dc, ac and dc/ac instruments.

Ans. The PMMC instruments are the examples of dc instruments, induction type instruments are the examples of ac instruments while moving iron, dynamometer, hot-wire, electrostatic instruments fall under the category of dc/ac instruments.

Q. 132. Which of the following voltmeters is most suitable for measurement of 200 V? Explain.

Voltmeter	P	:	200 V, 2 mA
	Q	:	200 V, 100 Ω/V
	R	:	5,000 Ω, 1 mA
	S	:	200 V, 1 mA

Ans. Resistances of voltmeters P, Q, R and S come out to be $\frac{200}{2\times10^{-3}}$, 200×100, 5000 and $\frac{200}{1\times10^{-3}}$ i.e. 100 kΩ, 20 kΩ, 5 kΩ and 200 kΩ respectively. The voltmeter S being of the largest resistance is most suitable.

Q. 133. What do you understand by ammeter shunt ?

Ans. An ammeter shunt is merely a low resistance that is placed across the coil circuit of the instrument in order to measure fairly large currents.

Q. 134. What are the main conditions that must be fulfilled by ammeter shunts so that readings independent of frequency and temperature are obtained ?

Ans. The shunt whether used with dc instruments or ac instruments, its temperature coefficient of resistance must be very low and as far as possible equal to that of the instrument coil so that multiplying power of the shunt shall be independent of temperature. In case of shunts employed in ac instruments the time constants of shunt and instrument must be same.

Q. 135. Name the materials usually used for ammeter shunts.

Ans. Manganin for dc circuits and constantan for ac circuits.

Q. 136. What do you understand by voltmeter multiplier ?

Ans. Voltmeter multiplier is a high non-inductive resistance connected in series with the voltmeter coil and is used for increasing the range of a voltmeter.

Q. 137. What are the main conditions that must be fulfilled by voltmeter multipliers ?

Ans. The main requirements of voltage multipliers to be used for dc measurements are that (*i*) resistance should not change with time of usage (*ii*) their temperature coefficient of resistance must be very low so that change in temperature may not affect their

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

resistance values and (*iii*) should have ample provision for cooling to dissipate the heat developed, as an appreciable amount of power is developed in such resistors.

Q. 138. How is range of an electrostatic voltmeter increased ?

Ans. The range of an electrostatic voltmeter is increased by employing a multiplier in the form of either a resistance or capacitor potential divider.

Q. 139. Use of resistance potential divider for extending the range of an electrostatic voltmeter is limited to a few thousand volts only. Why ?

Ans. Because for higher voltage the cost of resistance potential divider becomes high and wastage of power becomes excessive.

Q. 140. What is the advantage of using Ayrton or universal shunt in multirange ammeters ?

Ans. The advantage of using Ayrton or universal shunt is that it eliminates the possibility of the meter being in circuit without a shunt.

Q. 141. What is meant by an instrument transformer ?

Ans. Transformers used in conjunction with instruments for measurement are called instrument transformers.

Q. 142. How do instrument transformers differ from power transformers ?

Ans. The main difference between instrument and power transformers is that the instrument transformers are required to transform relatively small amounts (almost negligible) of power because their only loads, called burdens, constitute the delicate moving elements of instruments.

Q. 143. What are current transformers ? **[PTU December 2004]**

Ans. Current transformer is a device that is used in conjunction with the current measuring devices in order to stepdown the current from primary (main circuit) to secondary (the measuring device). In case of CTs, the load impedance or 'burden' is very small, so they operate under short-circuit conditions.

Q. 144. How does current transformer differ from a conventional transformer ?

Ans. The current transformer is usually a step-up transformer in terms of primary-secondary turn-ratio. The current transformer in operation slightly differs from that conventional transformer. In case of a CT, as the load impedance or 'burden' on the secondary is very small so the CT operates on short-circuit conditions. Also the current in secondary is not governed by load impedance on the secondary but depends upon the current flowing in the primary winding (i.e. main circuit current).

Q. 145. What do you understand by the term 'burden' of a CT ?

Ans. The product of voltage and current on the secondary side, when the CT is supplying the instrument with its maximum rated value of current, is known as rated burden and is expressed in volt-amperes.

Q. 146. What is ratio error in a current transformer ?

Ans. The ratio of primary current to secondary current is not constant, but depends upon the secondary loading (burden) of the transformer, i.e. upon the secondary current and power factor and upon the loss and magnetizing components of the exciting current. Thus error is introduced in current measurement. This error is ratio error and is defined by

$$\text{Ratio error} = \frac{\text{Nominal ratio-actual ratio}}{\text{Actual ratio}}$$

$$= \frac{K_n - K_C}{K_C} = \frac{K_T - K_C}{K_C}$$

Q. 147. What is meant by phase angle error of a CT ?

Ans. The angular phase displacement β between primary current I_p and reversed secondary current I_s is called the phase angle error of the CT.

Q. 148. What is meant by ratio correction factor of a CT ?

Ans. Ratio correction factor of a CT is defined as the ratio of actual ratio to nominal ratio of the CT

$$\text{i.e. } RCF = \frac{K_C}{K_n} = \frac{K_C}{K_T} = I_S + \frac{I_e}{K_T I_S}$$

Q. 149. What is usual current rating of CT's secondary ?

Ans. Usually 5 A.

Q. 150. Why the errors of a current transformer are usually greater with relatively small loads than at the rated current ?

Ans. At small loads, exciting current I_0 is a greater portion of primary current I_p owing to the curvature of B-H curve of the core material at low flux densities. Thus the ratio error is made more negative and phase angle error more positive normally. This means increased errors with relatively small loads than at the rated current.

Q. 151. What is meant by turn compensation and why is it done ?

Ans. The accuracy of a CT may be improved, at least with respect to transformation ratio, by modification of the ratio of turns. Correction can be made by a small reduction in secondary turns. The transformer so corrected may be marked as compensated.

Q. 152. Why in a CT design the reluctance of the magnetic path and magnetic flux density are kept low ?

Ans. The CT is designed with a view to minimize the current ratio and phase angle errors and for small errors it is necessary to keep magnetizing and energy components of exciting current small. Magnetizing component of the exciting current is made small by keeping reluctance of the magnetic path low while the energy or power loss component of exciting current is made small by employing relatively low values of flux density.

Q. 153. Why the secondary of current transformer is never kept open-circuited? **[U.P.S.C. I.E.S. E.E.-II 2000]**

Ans. If the secondary of a CT is open-circuited, while the primary carries the rated current, an extra-ordinary large magnetic flux and flux density are produced in the iron circuit because the opposing mmf (ampere-turns) set up by the secondary becomes zero. There are two serious objections to the increased core flux that results from the open-circuited secondary. Firstly, the large flux induces a high voltage in the secondary winding, and this voltage is usually so large that it causes a serious danger to the operator of the equipment. Secondly, the CT may also get damaged due to open-circuit condition.

Q. 154. How does PT differ from a conventional two-winding transformer ?

Ans. Potential transformer (PT) operates on the same principle as a conventional transformer. The PTs are always step-down transformers, since they are meant for reducing the voltage to a reasonable operating value. As a rule the PTs are of shell type because such a construction develop a high degree of accuracy.

In a step-down transformer, the primary or hv winding usually has a high voltage but of small current, while the secondary has heavy current at low voltage. The PTs, however, differ in that currents in both windings are comparatively small. This is because the load on a PT is an instrument having a high impedance (mostly resistance). Since only a very small current is required to operate the potential coil of the instruments, it is not necessary to design PTs for heavy currents. In other words, PTs behave as ordinary step-down two-winding transformers operating on no load.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 155. What is the usual rating of PT's secondary ?

Ans. 110 V.

Q. 156. Why does conventional type of potential transformer become expensive for the voltage above 100 kV (phase) ?

Ans. Because of insulation requirements.

Q. 157. What do you understand by the 'ratio error' of a potential transformer ?

Ans. The percentage ratio error of a PT is given by

$$\epsilon_r = \frac{\text{Actual ratio} - \text{turn ratio}}{\text{Actual ratio}} \times 100 = \frac{K_n V_S - V_P}{V_P} \times 100$$

where K_n = Nominal ratio = $\frac{\text{Rated primary voltage}}{\text{Rated secondary voltage}}$

Q. 158. What do you understand by the 'phase angle error' of a PT ?

Ans. The phase displacement between primary voltage V_P and reversed secondary voltage V_S is known as phase angle error of a PT.

Q. 159. How does change in secondary burden of potential transformer affect the ratio and phase angle errors ?

Ans. The increase in the load (burden) on the secondary side of a PT results in an increase in actual transformation ratio, $\frac{V_P}{V_S}$ i.e. the ratio error of a PT increases (becomes more negative) with the increase in secondary burden.

With the increase in the secondary burden, the secondary terminal voltage, V_S gets retarded in phase relative to main flux ϕ while the primary voltage V_P advances more in phase relative to main flux ϕ i.e. the phase angle error increases (becomes more negative) with the increase in secondary burden.

Q. 160. What is the effect of change in power factor of secondary burden on the ratio and phase angle errors of a PT ?

Ans. A change from unity to a lagging power factor of secondary burden tends to increase (negative) ratio error but to decrease the (negative) phase angle.

Q. 161. Why Silsbee method of testing of CTs is very useful, particularly for such purposes as workshop testing of constants of CTs during manufacture ?

Ans. The equipment required in Silsbee method of current transformer testing is not particularly bulky and the requirements of the standard are not severe.

Q. 162. What is meant by instrument 'wattmeter' ?

Ans. A wattmeter is essentially an inherent combination of an ammeter and a voltmeter and, therefore, consists of two coils known as current coil (CC) and potential coil (PC).

Q. 163. Explain why you cannot measure power in ac circuits by using an ammeter and voltmeter. **[A.M.I.E. Sec B. Summer 1996]**

Ans. Power in ac circuit is given by $P = VI \cos \phi$ where V and I are rms values of voltage and current respectively and ϕ is the phase angle between V and I. The fact that the power factor ($\cos \phi$) is involved in the expression for power, we cannot measure power in ac circuits by using an ammeter and a voltmeter.

Q. 164. State the nature of scale distribution for a dynamometer instrument used as wattmeter. **[A.M.I.E. Sec B. Winter 1998]**

Ans. Almost linear scale in the usual range of the instrument.

Q. 165. Enumerate the errors introduced by dynamometer type wattmeter.

Ans. The various errors introduced by dynamometer type wattmeter are:

(*i*) Error due to inductance of pressure coil (*ii*) error due to pressure coil capacitance (*iii*) error due to eddy currents (*iv*) error due to power loss in PC or CC (*v*) error due to friction (*vi*) error due to heating (*vii*) error due to mutual inductance effect (*viii*) error caused due to vibration of moving system (*ix*) error due to stray fields.

Q. 166. What is the drawback of suspended coil torsion-head dynamometer type wattmeter ?

Ans. The main drawback of suspended coil torsion-head dynamometer type wattmeter is that time is required for each reading.

Q. 167. What is the application of suspended coil, torsion-head dynamometer wattmeter ?

Ans. As standard wattmeters for calibration purposes in the test laboratories.

Q. 168. Why an ordinary electrodynamometer wattmeter is not suitable for measurement of power in low power-factor circuits ?

Ans. Ordinary electrodynamometer wattmeter is not suitable for measurement of power in low power factor circuits owing to (*i*) small deflecting torque on the moving system even when the current and pressure coils are fully excited and (*ii*) introduction of large error due to inductance of pressure coil at low power factor.

Q. 169. What is the need of providing copper shading bands on the pressure coil magnet of induction type wattmeter ?

Ans. In order to cause the resultant flux in shunt magnet to lag in phase by exactly 90° behind the applied voltage, one or more copper rings, known as copper shading bands, are provided on one limb of the shunt magnet.

Q. 170. How is electrostatic wattmeter superior to other types of wattmeters ?

Ans. Electrostatic wattmeter has got advantage of being free from errors on account of waveforms, frequency, and eddy currents.

Q. 171. In what respect 3-ammeter method is superior to 3-voltmeter method of power measurement in a single phase ac circuit ?

Ans. The drawbacks of 3-voltmeter method in comparison to 3-ammeter method are:

(*i*) Even small errors in measurement of voltages may cause serious errors in the value of power determined.

(*ii*) Supply voltage higher than normal voltage is required.

Q. 172. While measuring power in a balanced three-phase circuit, one of the wattmeters keeps showing zero as the load is varied. How do you account for it ? **[PTU May 2002]**

Ans. One of the two wattmeters, in a two-wattmeter method of measuring power in a balanced 3-phase circuit, will keep showing zero as the load is varied if and only if the power factor of the load remains constant at 0.5. The reading of other wattmeter will vary with the variation in load.

Q. 173. What is polyphase wattmeter ?

Ans. Polyphase wattmeter is a double element wattmeter consisting of two separate elements mounted one above the other in one and same case.

Q. 174. What is the difference between an energy meter and a wattmeter ?

Ans. The essential difference between an energy meter and a wattmeter is that the former is fitted with some type of registration mechanism whereby all the instantaneous readings of power are summed over a definite period of time whereas the latter indicates the value of power at particular instant when it is read.

Q. 175. Why the rotating system of the energy meter is made as small as possible ? **[Aligarh Univ. 1986]**

Ans. The rotating system of the energy meter is made as small as possible so that frictional torque is reduced to the minimum.

Q. 176. Why is it necessary that the strength of the brake magnet should remain constant during the use of the meter ?

Ans. Since the steady speed attained for a constant driving torque is directly proportional to the resistance of eddy current path and

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

inversely proportional to the square of the flux of the brake magnet, it is necessary that the strength of the brake magnet should remain constant during use.

Q. 177. Why use of aluminium disc is preferred over copper disc ?

Ans. An aluminium disc is usually preferred to a copper disc in order to have resistance per unit weight smaller.

Q. 178. How braking torque can be adjusted in motor meters ?

Ans. In motor meters, braking torque can be adjusted by adjusting the effective radius of the disc from its axis.

Q. 179. What is meant by 'compensating loop' with reference to induction energy meter ? [Aligarh Univ. 1986]

Ans. Copper shading bands, also called the power factor compensator or compensating loop, are provided on the central limb of the shunt magnet of the energy meter so that the phase displacement of 90° between the magnetic field set up by the shunt magnet and applied voltage is achieved by their adjustment.

Q. 180. What is meant by meter constant of an energy meter ?

Ans. The number of revolutions made by the aluminium disc for 1 kWh of energy consumption is called the meter constant of an energy meter.

Q. 181. What is creeping in motor type energy meters ?

Ans. In some energy meters, the disc continues rotating when the potential coils are excited but with no load current flow. This defect is known as creeping.

Q. 182. How creeping can be avoided in energy meters ?

Ans. Creeping error can be avoided by either cutting two holes (or slots) in the disc on the opposite sides of the spindle or attaching a small piece of iron wire to the edge of the disc.

Q. 183. What is the effect of bringing the shading band nearer to the disc on the speed of the disc?

Ans. The speed of the disc will decrease.

Q. 184. What is self braking torque? Why is it important on heavy loads ?

Ans. The disc rotates continuously in the series magnetic field under load conditions and so there is a dynamically induced emf in the disc which induces eddy currents. Due to interaction of eddy currents with the field of series magnet a braking torque proportional to the square of the energizing current is developed. The braking torque so developed is called the self braking torque.

The self braking torque assumes increasing importance with the increase in load current and thus at high values of load current the registration tends to be low.

Q. 185. Why the speed of the rotating disc in energy meter is kept as small as possible ?

Ans. The full-load speed of the rotating disc in energy meter is kept as small as possible so that the self braking action is reduced to minimum.

Q. 186. What will be the effect of moving brake magnet in the direction of spindle in an energy meter?

Ans. Braking torque will reduce.

Q. 187. How is compensation provided for variations in voltage in energy meters ?

Ans. Compensation for variations in supply voltage is provided by using a saturable magnet-shunt which diverts a larger proportion of flux into the active path when the supply voltage increases. Such compensation can be conveniently achieved by restricting the section of the closing members of the shunt magnet core, or sometimes by saturable pieces bridged across the main poles of this core.

Q. 188. How are clock meters superior to induction type energy meters ?

Ans. Clock meters can be used on both ac and dc systems. These are not affected by external stray magnetic field and are comparatively free from temperature, frequency and waveform errors. These meters are very accurate on small loads.

Q. 189. Why are clock meters not used as house service meters ?

Ans. Clock meters are not used as house service meters because of their somewhat complicated construction and high cost.

Q. 190. What type of meter is used for measuring kVARh ? [Pb. Univ. Nov. 1976]

Ans. Energy meter used for measuring kVARh are based on the energy meter element – almost invariably the induction type with an additional quadrature shift.

Q. 191. What is trivector meter ?

Ans. Trivector meter is an instrument which measures kVAh and also kVA of maximum demand. It consists of a kWh meter and a reactive kilovolt ampere-hour meter in the common case with a special summation between them.

Q. 192. What are prepayment meters ?

Ans. Prepayment meter is a special type of house supply meter, which itself is essentially a standard pattern energy element with the addition of a coin collector box and the prepayment mechanism geared to the recorder train.

Q. 193. What is the advantage of short-period testing of energy meters using a rotating substandard over long-period dial test ?

Ans. Short-period test has the advantage of less time required in comparison with long-period dial test.

Q. 194. Enumerate the most important methods of summation metering.

Ans. The most important methods of summation metering are:

1. By using multi-element meters, or meters coupled through suitable gearing to a common register.
2. By using a meter with several current coils.
3. By paralleling the secondaries of the CTs and connecting to a single meter.
4. By using a summation current transformer.
5. By using multi-circuit impulse summator.

Q. 195. How can the range of vibrating reed frequency meter be doubled ?

Ans. The range of vibrating reed frequency meter is doubled by polarizing its reeds.

Q. 196. On what principle does Weston frequency meter operate ?

Ans. Weston frequency meter is a moving iron instrument which operates on the principle of variation of impedance in an inductive circuit with the variation in supply frequency.

Q. 197. What is the advantage of saturable core frequency meter ?

Ans. Saturable core frequency meter has the advantage of wide range and it is well suited for use in tachometer systems.

Q. 198. Why is moving-iron power factor meter generally used ?

Ans. In moving iron power factor meters all the energizing coils are stationary and the moving element is free of electrical connections. Thus moving element can rotate through 360° giving scale extending over a full circle. The other advantage of this type of instrument is that it has got large working forces as compared with those of dynamometer type. Due to these advantages of moving iron type over dynamometer type, the former type is generally used

Q. 199. Why is moving iron power factor meter less accurate than dynamometer type ?

Ans. Moving iron power factor meter is less accurate than dynamometer type because of introduction of error owing to the losses in the iron parts of the instrument.

Q. 200. What is synchroscope and where is it used ?

Ans. The synchroscope is an instrument for indicating differences of phases and frequency between two voltages. It is essentially a split-phase motor in which torque is developed if the two voltages

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

applied differ in frequency. It is used for synchronisation of alternators.

Q. 201. Why is moving iron synchroscope more commonly used ?

Ans. Moving iron synchroscope is more commonly used as it is cheap in cost and simple in operation.

Q. 202. Name the factors that govern the choice of a suitable method of measuring resistance.

Ans. The choice of a suitable method of measuring resistance depends on several factors. Some of the more important are the range of resistance to be measured, required accuracy, the ease with which it can be made and whether the measurements are to be made with the item tested under its normal operating conditions or away from these.

Q. 203. What is meant by low, medium and high resistances ?

Ans. Resistances about 1 Ω or less are included in the category of low resistances while resistances of 100 kΩ and above are usually termed as high resistances. Resistances ranging from about 1 Ω to about 100 kΩ are considered as medium resistances.

Q. 204. Name the difficulty associated with the measurement of low resistances.

Ans. The difficulty associated with the measurement of low resistances is the effect of the resistance of connecting leads and contact resistances on the measurement results is liable to cause serious misjudgement when measuring low resistance.

Q. 205. Why the accuracy obtainable with the potentiometer method of measuring low resistance is high ?

Ans. The accuracy obtainable with the potentiometer method of measuring low resistance is high because the potentiometer has no shunting effect on the resistance under test.

Q. 206. Why is Kelvin's double bridge superior to the Wheatstone bridge for the purpose of low resistance measurement ?

Ans. Errors owing to contact resistance, resistance of leads and lack of sensitivity render the Wheatstone bridge unsuitable for the measurement of low resistances. Further, any method of low-resistance measurement must provide for the four terminal connections which is usually used for resistors of low-values. A network designed by Lord Kelvin's, called Kelvin double bridge, is an example of such a method.

Q. 207. What are the difficulties associated with the measurement of very high resistance ?

Ans. One of the main problem in high-resistance measurement is the leakage that occurs over and around the component or specimen under test, or over the binding post by which the component is attached to the instrument or within the instrument itself. Other problems are stray changes, absorption effects of insulating materials and variation in insulation resistance of insulating materials with the change in temperature.

Q. 208. Why normal methods of resistance measurements cannot be used for measurement of resistance of electrolytes ?

Ans. Owing to the fact that a polarization emf is set up whenever a current passes through an electrolyte, the usual methods of measuring resistance cannot be used for measuring resistance of electrolytes.

Q. 209. What is 'Megger' ?

Ans. The 'megger' is an instrument used for the measurement of high resistance and insulation resistance. Essentially the megger insulation tester consists of a hand-driven dc generator and a direct reading true ohmmeter.

Q. 210. Why is a megger provided with a slipping clutch ?

Ans. To avoid the effect of charging and discharging currents, which are due to a variation in applied voltage, a special type of slipping clutch is fitted to the handle of the megger so that the generator speed and output voltage remain constant even when the handle speed is variable.

Q. 211. What is a multimeter ?

Ans. The instrument, which contains a function switch to connect the appropriate circuits to the d'Arsonval movement, is often called a multimeter or ampere-volt-ohm (AVO) meter or volt-ohm-milliammeter (VOM).

Q. 212. Indicate the various quantities that can be measured with a multimeter.

Ans. Multimeter is used for measurement of current (dc as well as ac), voltage (dc as well as ac) and resistance. With the external source, high resistance (exceeding 1 MΩ), inductance and capacitance can be also measured with this instrument.

Q. 213. What are the shortcomings of multimeter ?

Ans. It may be noted that the ac sensitivity of a half-wave ac meter is only 45 percent of the dc sensitivity, therefore, the loading effect is greater while measuring ac voltages than that while measuring corresponding dc voltages.

The rectifying action depends upon the frequency to some extent due to capacitance effect and rectifier instruments show lower readings. Instrument indications may be in error by as much as 0.5% decrease for every 1 kHz rise in frequency.

Q. 214. What is the emf of the cell used for standardization of a dc potentiometer ?

Ans. The standard cell employed is usually the Weston standard cell, whose emf is 1.0183 V.

Q. 215. Why all the resistors used in a potentiometer, except the slide-wire, are usually made from manganin ?

Ans. All the resistors used in a potentiometer, except the slide-wire, are usually made of manganin owing to its high stability, low temperature coefficient and freedom from thermoelectric effect against copper.

Q. 216. Distinguish between dc and ac type potentiometers.

[A.M.I.E. Sec B. Summer 2001]

Ans. (*i*) In dc potentiometers only magnitude of unknown emf is measured whereas in ac potentiometers magnitude and phase of the unknown emf is measured.

(*ii*) AC potentiometer is a complicated instrument as compared to a dc potentiometer.

(*iii*) Accuracy of measurement of dc potentiometer is higher as compared to ac potentiometer.

Q. 217. On what basis ac potentiometers are classified ?

Ans. AC potentiometers are usually classified according to the manner in which the instrument dials (or scales) present the value of unknown voltage.

Q. 218. Name the commonly used detectors for ac bridges.

Ans. Commonly used detectors for ac bridges are telephone receivers are head phones, vibration galvanometer and tunable amplifier detectors.

Q. 219. Name the detector used for bridge measurements at radio frequencies.

Ans. For bridge measurements at radio frequencies detectors used are almost always some form of heterodyne receiver with an amplifier and a telephone.

Q. 220. What is meant by Q- factor of a coil ?

Ans. Q-factor of a coil, also known as quality factor or figure of merit of a coil, is the reciprocal of its power factor *i.e.*,

$$\text{Q-factor of a coil} = \frac{1}{\text{Cos}\phi} = \frac{Z}{R} = \frac{\omega L}{R}$$ because R is very small in comparson to inductive reactance.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 221. What is meant by time constant of a coil ?

Ans. Time constant of a coil $\tau = L/R$ is defined as the time required for the current to rise to its final steady value if it is continued to rise at the initial rate or it may also be defined as the time required for the current to attain 0.632 of its final steady value in an inductive (R – L) circuit.

Q. 222. Give the application of Maxwell's inductance-capacitance bridge.

Ans. Maxwell's inductance-capacitance bridge is very convenient and useful bridge for the determination of inductance having medium Q factor ($1 < Q < 10$).

Q. 223. For what purpose the Anderson bridge is used ?.

Ans. The Anderson bridge is used for precise measurement of inductance over a wide range.

Q. 224. Which bridge is preferred for measuremcnt of high Q-coil ?

[A.M.I.E. Sec B. Winter 2002]

Ans. Hay bridge is preferred for measurement of inductance of high-Q coils.

Q. 225. Why Hay bridge is not suited for the measurement of low-Q factor of the inductors ?

Ans. Hay bridge is not suited for the measurement of low Q-factor of the inductors because in that case it is required to know the bridge frequency to a very accurate limit and also with low value of Q-factor, it gives poor convergence in balancing.

Q. 226. How do you modify the capacitor symbol to accommodate the loss in the capacitor ?

Ans. An imperfect capacitor (*i.e.* a capacitor having dielectric loss) is represented diagrammatically as a perfect capacitor C in parallel or in series with a resistance R.

Q. 227. What is meant by the term dielectric loss in a dielectric ?

Ans. There is a definite amount of dissipation of energy when a dielectric is subjected to alternating voltage. It is this dissipation of energy that is called the dielectric loss.

Q. 228. What is meant by 'dissipation factor' of a leakage capacitor ?

Ans. In a leakage capacitor, the leakage current does not lead applied voltage by exactly 90° *i.e.*, the phase angle Φ is always less than 90°. The complementary angle δ ($\delta = 90° - \Phi$) is called the dielectric loss angle. Tangent of dielectric loss angle *i.e.*, $\tan\delta$ is called the dissipation factor.

Q. 229. Why a spark is connected across resistance arms in a Schering bridge ?

Ans. A spark is connected across resistance arms in order to prevent dangerous rises of voltage across the capacitor arm of a Schering bridge.

Q. 230. List the factors that may lead to inaccuracies in measurement by ac bridges ?

[U.P.S.C. I.E.S. 1995]

Ans. Factors leading to inaccuracies in measurements by ac bridges are:

1. Stray conductance effect due to imperfect insulation.
2. Mutual inductance effect due to magnetic coupling between various components of the bridge.
3. Stray capacitance effect due to electrostatic fields between conductors at different potentials.
4. Residual-in components, e.g. the existance of small amount of series inductance or shunt capacitance in nominally non-reactive resistors.

Q. 231. Why is screening of bridge elements required ?

Ans. If each component in a bridge has a defining screen connected to one end, a very high accuracy in measurement can be achieved by using *Wagner's earthing device* in the bridge circuit. This device removes all the earth capacitances from the bridge network.

Q. 232. Why are highly sensitive detectors undesirable for the operation of ac bridges ?

Ans. Ideally the sensitivity of the detector should be sufficient but not too high for whatever precision is required in the bridge balance. Too much sensitivity is not only economically unsound but is undesirable in that it increases the difficulty of the balancing operation, by requiring very close adjustments of the bridge parameters that are altered to balance the bridge. Also it frequently implies a troublesome degree of instability in the response to the bridge adjustment and in the operation of the detector.

Q. 233. Why is vibration galvanometer widely used as detector for operation of ac bridges ?

Ans. Vibration galvanometer is used for power frequency range and low range of audio frequency as it is very sensitive and selective for this frequency range.

Q. 234. What are the faults that are likely to occur in cables ?

Ans. The faults which are likely to occur in cables are open-circuit, short-circuit and ground faults.

Q. 235. What principle do Murray loop and Varley loop tests employ ?

Ans. Murray loop and Varley loop tests employ the principle of Wheatstone bridge.

Q. 236. What is the essential difference between Murray and Varley loop tests ?

[Pb. Univ. Nov. 1977]

Ans. The difference between Murray and Varley loop tests is that in Varley loop test provision is made for the measurement of total loop resistance instead of obtaining it from the relation $R = \rho\frac{l}{a}$.

Q. 237. In what way Varley loop test is advantageous over Murray loop test?

Ans. In Murray loop test sound cable resistance must be known whereas in Varley loop test it is not so.

Q. 238. What is the essential requirement for performing capacity tests on cables ?

Ans. The essential requirement for performing capacity tests on cables is that the core to be tested has a good insulation resistance.

Q. 239. What is the advantage of induction method of cable testing ?

Ans. Induction method of cable has the advantage of locating the ground fault directly, without going for any calculation.

Q. 240. Why induction method of cable testing is not suitable for cables having metallic sheath or armouring ?

Ans. In case of lead covered or armoured cable induction method does not work satisfactorily because of current flow in the sheath, connected to the cable at fault, and the magnetic shielding effect of steel armouring in the latter case.

Q. 241. Why magnetic measurements are not as accurate as other types of measurements in electrical engineering.

Ans. Magnetic measurements are not as accurate as other types of measurements in electrical engineering. This is mainly due to the fact that magnetic flux cannot be measured directly, by the mere insertion of instrument in a circuit as an electric current, voltage and power. The other difficulties arise from the fact that flux unlike current does not confine itself to a definite path. Magnetic materials are also not homogeneous and also there is no uniformity in magnetic properties between different batches of material even if such batches are nominally of the same composition.

Q. 242. What are the disadvantages of magnetometer method of measuring magnetic field strength?

Ans. The disadvantage of magnetometer method is that it is susceptible to the influence of external magnetic field and also that it requires

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

the samples under test to be in the form either of long, thin rods or of ellipsoids, owing to the demagnetizing effect of the ends of the bar-shaped samples.

Q. 243. Why are ring specimens preferred over rods or strips for magnetic testing ?

Ans. Ring specimens are preferred over rods or strip for magnetic testing since these give continuous pieces of the same material without air gap and have the same x-section throughout. The disadvantages of ring specimens are that they are more difficult to prepare than bar specimens and also more difficult to wind the magnetizing winding. But the results are more reliable with the use of ring specimens because of their freedom from self demagnetizing effects.

Q. 244. Why is the radial thickness of specimen used for magnetic tests kept fairly small compared with its diameter ?

Ans. The radial thickness of the specimen ring is kept fairly small compared with its mean diameter (about one-fifteenth of diameter of ring) otherwise flux density will be more near to the inner circumference and so distribution of flux density will not be uniform across the x-section of the ring and the results obtained for the B-H curve for the specimen will be incorrect.

Q. 245. Why fluxmeter is used for measurement of leakage factor in a dynamoelectric machinery rather a ballistic galvanometer ?

Ans. For measurement of leakage factor the fluxmeter is used, as ballistic galvanometer is unsuitable due to high inductance of the field system of the machine.

Q. 246. What are the components of power loss that occur in ferromagnetic materials when subjected to alternating magnetic fields ?

Ans. There are two components of power loss that occurs in ferromagnetic materials when subjected to alternating magnetic fields. These components are hysteresis loss and eddy current loss.

Q. 247. What are the various methods used for measuring iron losses ?

Ans. The most common methods used for measuring iron losses are wattmeter method, ac bridge methods, ac potentiometer method, and oscillographic method.

Q. 248. List out the advantages of using Lloyed-Fisher square over Epstein square for the measurement of iron losses.

[A.M.I.E. Sec B. Summer 2001]

Ans. If required corrections are made to the measured value of iron loss by Lloyed-Fisher square, then it gives results more reliable than those obtained by Epstein square. In Epstein square the value of flux density at the corners and in the sides of the square is not same and correction for this is difficult to make. The Epstein square is also inferior for tests on anisotropic materials as if the strip sides are parallel with the direction along which the magnetic properties are required. The flux at the corners must be at least partially at an angle to this direction.

Q. 249. Which method is used for testing laminated core material at low flux densities ?

Ans. The wattmeter is not sufficiently sensitive for testing laminated core material at low flux densities, so for such tests either an ac bridge or an ac potentiometer method is used.

Q. 250. Name the property of Bismuth wire that is used in instrument employed for measuring flux density of magnetic field.

Ans. The resistance of Bismuth wire increases when it is placed in a strong magnetic field. This property of Bismuth wire is used in instrument employed for measuring flux density of magnetic field.

Q. 251. Why underground cables meant for operation on ac systems are tested with direct current systems ?

Ans. If alternating current is employed for the tests, heavy charging current will be drawn by the cable and so the transformer required for the purpose would be of inconveniently large capacity and cause transportation difficulties of moving the testing transformer to the site of installation. In case, direct current is used for the tests the plant required would only be of small capacity and can be constructed in portable form.

Q. 252. Why is it considered advantageous to use cascade-connected transformers rather than a single transformer for obtaining high voltages ?

Ans. To obtain voltage more than 500 kV the connection of two or more transformers in cascade is more economical than the use of a single transformer of a high voltage rating.

Q. 253. What are the requirements for satisfactory voltage regulation for ht testing ?

Ans. The equipment for voltage regulation in high voltage testing should be such that it may give uniform and smooth regulation of voltage so that surges on the high voltage side of the transformer are avoided and accuracy in measurement of voltage is achieved. The most important requirement of voltage regulating equipment is that it should not cause any distortion in the voltage waveform.

Q. 254. What is the breakdown strength of insulating oil ?

Ans. The good oil, fit for use, should be able to withstand at least 40 kV for one minute. If oil is quite dry, it can withstand voltage as high as 50 kV or even 55 kV.

Q. 255. Why ordinary voltmeter cannot be used in electronic circuits ?

Ans. A moving coil voltmeter draws a large current, hence a large power from the test circuit during measurement. Generally current drawn by the voltmeter does not make much difference in electrical circuit but when measurement is involved in electronic circuits, current drawn by the voltmeter load the test circuit, and therefore, voltmeter shows an error in the reading.

Q. 256. What is VTVM ? **[PTU December 2005]**

Ans. VTVM is a vacuum tube voltmeter. It makes the use of vacuum tube(s) as active device.

Q. 257. Enlist the types of VTVMs.

Ans. Average reading, peak reading, slide back, logarithmic, balanced bridge and electrometer VTVMs are the different types of VTVM.

Q. 258. Enlist TVMs.

Ans.
1. TVM with cascaded transistor.
2. TVM with FET (field effect transistor).
3. Balanced bridge TVM.
4. Chopper amplifier.

Q. 259. Where is VTVM used ? **[PTU December 2004]**

Ans. VTVMs are used for the measurement of the dc and ac voltages.

Q. 260. What is difference between VTVM and TVM ?

Ans. Electronic voltmeter using vacuum tube is called a VTVM while that using a transistor is called a TVM.

Q. 261. In what respect TVM is inferior to VTVM?

Ans. The only disadvantage with TVM is its low input impedance which it offers in comparison to VTVM. But this shortcoming is overcome by using FET in input stage of voltmeter.

Q. 262. What are the advantages of TVM over VTVM ?

[PTU December 2005]

Ans. The advantages of TVMs over VTVMs are given below :
1. A TVM does not require any warm up time because of absence of heating element.
2. Use of transistor makes the instrument portable because of its light weight.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

3. A transistorized instrument can be operated on low voltage i.e. on battery so TVM is well suited for the field work where power source is not available.
4. VTVM cannot measure current directly because of its high resistance whereas TVM can do.
5. TVM consumes very less power because of absence of heating element.

Q. 263. What is the difference between dc voltmeter and ac voltmeter ?

Ans. Fundamentally, dc and ac voltmeters are not much diffcrent, dc voltmeter consists of a dc amplifier succeeded by a conventional dc meter while an ac voltmeter consists of an additional rectifier either before or after the amplifier.

Q. 264. Why is direct-coupled amplifier dc voltmeter commonly used ?

Ans. Because of its low cost.

Q. 265. What are the shortcomings of a direct-coupled dc voltmeter ?

Ans. The drawback of a direct-coupled dc voltmeter is that it has to work under specified ambient temperature to have the required accuracy otherwise excessive drift problem occurs during operation. It can be used only for measuring voltage of the order of millivolts owing to limited amplifier gain. The drift problem in direct-coupled dc amplifiers restricts the use of a number of stages required for a high gain.

Q. 266. What are the advantages of average reading ac voltmeters ?

Ans. Main advantages associated with average reading ac voltmeters are that they are simple in construction, have high input impedance, low power consumption and uniform scale.

Q. 267. How can an average reading VTVM be converted to an RMS reading voltmeter ?

Ans. The average reading voltmeter can be converted into an RMS reading voltmeter by calibrating its meter scale in terms of the rms value of a sinusoidal wave.

Q. 268. What are the disadvantages of average reading voltmeters ?

Ans. Main disadvantage of average reading voltmeters is that they operate in audio-frequency range. In radio-frequency range, distributed capacitance of the high resistance R introduces error in the readings. Another disadvantage of such a voltmeter is that due to nonlinear volt-ampere characteristic for lower voltage the readings of the voltmeter at lower voltage are not correct:

Q. 269. Why is dc amplifier associated with diode rectifier in peak reading ac voltmeters provided with stabilising means ?

Ans. The dc amplifier associated with diode rectifier should be provided with the stabilising means in order to prevent drift in the indication of the output meter.

Q. 270. For what type of measurement is true rms reading voltmeter required ?

Ans. For measuring rms value of non-sinusoidal waveform a true rms reading voltmeter is required. It gives a meter indication by sensing heating power of waveform which is proportional to the square of the rms value of the voltage.

Q. 271. Why two-wire sensing technique is used, while it causes large error in the measurement of unknown resistance?

Ans. Because of simplicity.

Q. 272. Why is four-wire sensing technique used in electronic analog ohmmeter considered superior to two-wire technique?

Ans. Because in four-wire sensing technique, the error due to voltage drop in both the source leads and sense leads is completely removed.

Q. 273. Why at high frequencies do bridge and other methods for measurement of inductance, capacitance and resistance yield erroneous results ?

Ans. At high frequencies bridge and other methods for measurement of inductance, capacitance and resistance yield erroneous results due to the fact that these methods do not take into consideration the effects which are inherent in any measurement at high frequencies. Some of these special effects, which are predominant at high frequencies are:

(*i*) High reactance due to stray series inductance and its variation with frequency ;
(*ii*) Low reactance due to stray shunt capacitance and its variation with frequency ;
(*iii*) Increase in resistance due to skin effects, proximity effects and due to production of eddy currents.
(*iv*) Variation in dielectric loss of capacitors with frequency.

The above effects make the measurements complex at high frequencies.

Q. 274. What are the factors for deciding selection of a voltmeter ? **[PTU December 2005]**

Ans. In selection of an analog voltmeter the factors to be considered are: Input impedance, voltage range, decibel scales, sensitivity *vs* bandwidth, battery operation, ac current measurement.

Q. 275. What is Q-meter ? **[A.M.I.E Sec B. Summer 2004; PTU December 2005]**

Ans. The Q-meter is an instrument designed for measurement of Q-factor of a coil as well as for the measurement of electrical properties of coils and capacitors.

Q. 276. On what principle does a Q-meter operate ?

Ans. The Q-meter operates on the principle of series resonance i.e., under resonant condition of an ac series circuit voltage across the capacitor is equal to the applied voltage times of Q of the circuit.

Q. 277. What is Q-factor of the coil ?

Ans. The ratio of the inductive reactance to the effective resistance of the coil is called the Q-factor of the coil.

Q. 278. What are the different parameters that can be measured using a Q-meter ? **[A.M.I.E. Sec B. Summer 1996]**

Ans. The Q-meter is used for measuring Q-factor, inductance, effective resistance, self capacitance, bandwidth and capacitance.

Q. 279. What are the factors which affect the measurement accuracy of Q-meter ? **[A.M.I.E. Sec B. Summer 1994]**

Ans. Factors affecting measurement accuracy are:

(*i*) Distributed capacitance or self capacitance of the coil.
(*ii*) Residual inductance of the instrument.
(*iii*) Conductance of voltmeter.
(*vi*) Shunt resistor of Q-meter.

Q. 280. Why the actual Q-factor of the coil is somewhat larger than the calculated Q-factor ?

Ans. Calculated value of Q-factor is somewhat smaller than its actual value because Q-factor measurement includes the losses of the resonating capacitor, voltmeter and the shunt resistance R_{sh}.

Q. 281. What is VOM ?

Ans. The volt-ohm-milliammeter (VOM) is another name of multimeter. It is also called AVO meter.

Q. 282. What are the different parameters that can be measured by a universal bridge ?

Ans. Different parameters than can be measured by a universal bridge are resistance, inductance, capacitance, dissipation factor and quality factor.

Q. 283. What are the main components that the universal bridge has ?

Ans. The universal bridge consists of signal sources (dc and 1 kHz). bridges (Wheatstone bridge, Maxwell's and Hay's bridges and De Sauty's bridge) imbalance amplifier and metered detector in addition to power supply.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 284. Where is LCR meter used ? [PTU December 2005]

Ans. LCR meters are used to measure the values of inductance (L), capacitance (C) and resistance (R) directly.

Q. 285. What is a bolometer ?

Ans. A Bolometer may be a short ultra thin wire having a positive temperature coefficient of resistance or a thin conducting film of semiconductor having a negative temperature coefficient of resistance or a thin conducting film of small dimensions.

Q. 286. What is cathode-ray oscilloscope (CRO) ?

Ans. A CRO is an electronic device with a CRT as its main component and other associated circuits consisting of a power supply unit, a saw-tooth wave generator, horizontal and vertical amplifiers.

Q. 287. How is CRO superior to ordinary measuring instruments ?

Ans. CRO is an electronic device that gives graphical representation of alternating quantities under examination.

The CRO gives very accurate measurements as it is free from the errors introduced by the moving parts. It is also free from damping mechanism and other inertia containing parts.

Q. 288. For what vertical and horizontal plates are provided in a CRO ?

Ans. Horizontal and vertical plates are provided between electron gun and screen to deflect the beam according to the input signal.

Q. 289. For what a triggering circuit is provided in a CRO ?

Ans. In a CRO, a triggering circuit is provided for synchronising two types of deflections so that horizontal deflection starts at the same point of the input vertical signal each time it sweeps.

Q. 290. What are the essential components of a CRT ?

Ans. The essential components of a CRT are electron gun, focusing and accelerating anodes, horizontal and vertical deflection plates, and evacuated glass envelope with phosphorescent screen.

Q. 291. For what electron gun assembly is provided in a CRT ?

Ans. The sole function of an electron gun assembly in a CRO is to provide a narrow and sharply focused electron beam which is accelerated towards the phosphor screen.

Q. 292. Why is the grid in a CRO provided with a hole in it ?

Ans. The hole in a grid of a CRO is provided to allow passage for electrons through it and concentrate the beam of electrons along the axis of the tube.

Q. 293. What is meant by the deflection sensitivity of a CRO ?

Ans. The deflection sensitivity of a CRO is defined as the vertical deflection of the beam on the screen per unit deflecting voltage.

Q. 294. What is meant by the deflection factor of a CRO ?

Ans. The deflection factor of a CRO is the reciprocal of the deflection sensitivity.

Q. 295. What is Astigmatism control ?

Ans. Astigmatism control is an adjustment that will provide sharp focus over the entire screen.

Q. 296. What is graticule ?

Ans. Graticule is a scale on transparent material that is fitted to the face of CRT for the purpose of measurement.

Q. 297. What is aquadag ?

Ans. Coating of a conducting material, known as aquadag, is provided over the interior surface of CRT in order to accelerate the electron beam after passing between the deflection plates and to collect the electrons produced by secondary emission when electron beam strikes the screen.

Q. 298. What is meant by retrace time ?

Ans. Retrace time is the time required by the electron beam to return to its original position on a CRT screen after being deflected to the right by a sawtooth waveform.

Q. 299. What is sweep time ?

Ans. Sweep time is time duration during which the beam is swept from left to right on the screen of a CRT by the linearly increasing sawtooth voltage.

Q. 300. For what an attenuator is used ?

Ans. An attenuator is used to reduce the signal level by a desired amount. The ordinary resistance voltage divider is one of the simplest type of attenuators.

Q. 301. What is a Lissajous pattern ?

Ans. Lissajous pattern is a pattern that results from applying periodic signals to the deflection plates of a CRO.

Q. 302. Enlist the applications of CRO.

Ans. The applications of CRO are given below :

1. Measurement of voltage and current.
2. Measurement of phase.
3. Measurement of frequency.
4. Comparison of two frequencies.

CRO is a versatile instrument that can be used for display, measurement, waveform analysis and other phenomenon in electrical and electronic circuits.

Q. 303. What are various focusing techniques ?

Ans. Two most commonly employed focusing techniques are :

1. Electrostatic focusing.
2. Electromagnetic focusing.

Q. 304. How is focusing achieved ?

Ans. Focusing is achieved by various sets of plates forming a sort of electronic lens. In general, there are three sets of plates. Voltages at anode 1 and 2 are kept fixed while it is variable on the third anode. By varying the voltage on the third anode, the spot may be focused.

Q. 305. What is a dual beam CRO ?

Ans. A dual beam CRO has got two electron beams that are controlled independently. The constructional features are almost the same as in the case of single beam CRO.

Q. 306. What is a dual trace oscilloscope ? [PTU December 2004]

Ans. Dual trace oscilloscope employs a single electron gun and provides two traces by switching the deflection plates from one input signal to another which implies that Y-channel is time shared by two signals. The display of the input is continuous and simultaneous to the eyes although it is sampled display.

Q. 307. What is the difference between a dual trace and dual beam CRO? [A.M.I.E. Sec. B. Summer 1994]

Ans. Dual beam CRO uses two separate electron beams and deflection systems mounted in the same CRT to display two different electron beams simultaneously whereas the dual trace oscilloscope alternately displays two signals on one screen by time sharing one electron gun and deflection system.

Q. 308. How is dual trace oscilloscope superior to dual beam oscilloscope?

Ans. Dual beam CROs are not as versatile as the dual trace CROs because the later can operate in a number of modes.

Q. 309. What is difference between analog storage oscilloscope and digital storage oscilloscope ?

Ans. Digital storage oscilloscope uses digital storage techniques whereas analog storage oscilloscope uses special CRT called the storage tube.

Q. 310. What is an oscilloscope probe ?

Ans. Probe is a means that connects the test circuit to the oscilloscope without altering, loading, or disturbing the test circuit.

Q. 311. Enumerate the passive probes.

Ans. The passive oscilloscope probes are : Direct probe, isolation probe and high impedance or 10 : 1 probe.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 312. What type of loading effects are introduced in measurement due to probes?

Ans. Probe loading effects are: Resistive loading effects, inductive loading effects and capacitive loading effects.

Q. 313. What effects are caused by resistive loading?

Ans. Resistive loading causes attenuation of the amplitude, dc offset drift, and change in circuit bias.

Q. 314. What is source of inductive loading and what is its effect on measurement?

Ans. The inductive loading is due to the inductance of the probe ground lead and it causes distortion of the signal under measurement.

Q. 315. Why capacitive loading becomes a matter of concern at high frequencies ?

Ans. With the increasing signal frequencies or transition speeds, the capacitive load becomes predominant and, therefore, capacitive loading becomes a matter of concern. In particular, capacitive loading affects the rise and fall times on fast-transition waveforms and also the amplitudes of high-frequency components in waveforms.

Q. 316. What are the parameters that are affected by capacitive loading?

Ans. The parameters effected by capacitive loading are:
1. Rise and fall times 2. Impedance 3. Bandwidth 4. Probe attenuation ratio.

Q. 317. What is attenuation factor of probe?

Ans. The attenuation factor is the amount by which the probe reduces the amplitude of the signal.

Q. 318. What are the typical attenuation factors for probes?

Ans. The typical attenuation factors for probes are 1, 10 and 100.

Q. 319. What is meant by CMRR of a differential probe?

Ans. Common mode rejection ratio (CMRR) is a differential probe's ability to reject any signal that is common to both test points in a differential measurement. CMRR is a key figure of merit for differential probes and amplifiers, and is given as

$$\text{CMRR} = \frac{\text{Voltage gain for the differential mode signal, } A_d}{\text{Voltage gain for the common-mode signal, } A_{CM}}$$

Q. 320. What are the limitations of oscilloscopes ?

Ans. The limitations of oscilloscopes are : Loading effect; Hum and noise pickup; Oscilloscope errors (reading error, parallax error, calibration error, frequency-response error, loading error).

Q. 321. Why is it preferable not to use CRO in direct sunlight or in a brightly lighted room ?

Ans. Because this will allow a low intensity setting.

Q. 322. What is a signal generator ?

Ans. A signal generator is a device that simulates RF signals of accurately known characteristics.

Q. 323. What is the purpose of using signal generators ?

[A.M.I.E. Sec B. Summer 2001]

Ans. Signal generator is used for testing amplifiers and radio receivers and transmitters. It is often used in measurement of gain, S/N ratio, BW, standing wave ratio and other properties of circuits.

Q. 324. How does a signal generator differ from an ordinary oscillator ?

Ans. The signal generator, like an ordinary oscillator, is a source of sinusoidal signals but it is also capable of modulating its sinusoidal output signal with other signals. This is the main difference between the signal generator and an ordinary oscillator.

Q. 325. Why use of regulated power supply is essential for signal generators ?

Ans. Frequency of output voltage from a signal generator changes with the change in supply voltage so use of regulated power supply is essential.

Q. 326. Why are buffer amplifiers used in signal generators ?

Ans. Buffer amplifiers are used in the signal generators for isolating the oscillator circuit from the output circuit so that any change in the circuit connected to the output does not affect the frequency and amplitude of the oscillator output.

Q. 327. Why are temperature compensating devices used in signal generators ?

Ans. In signal generators, oscillator output frequency varies with the variation in temperature, so temperature compensating devices are used.

Q. 328. Why in signal generators quartz crystal is used in place of an L-C oscillator ?

Ans. Q-factor of the L-C circuit for signal generator is required to be very high, say above 20,000. This can be achieved by using quartz crystal osciliator in place of L-C oscillator.

Q. 329. What is function generator? **[A.M.I.E. Sec B. Summer 1999]**

Ans. A function generator is a signal source that has capability of producing different types of waveforms as sine-waves, triangular waves and sawtooth waves. The frequency of such waveforms may be adjusted from a fraction of Hz to several kHz. In fact, the function generator is a very versatile instrument as it is capable of producing a wide variety of waveforms and frequencies.

Q. 330. What is sweep frequency generator?

Ans. A sweep frequency generator or sweeper is a special type of signal generator in which the output frequency is cyclically swept through a range of frequencies.

Q. 331. What is the basic difference between a square-wave generator and a pulse generator ? **[A.M.I.E. Sec B. Summer 1999]**

Ans. Square-wave generators can be considered to be a special class of pulse generators. If the pulse train has the property of being "on" 50% of the time period and "off" 50% of the time period, the waveform generated is called the square wave and the generators producing such waveforms are called the square-wave generators.

Q. 332. What is meant by duty ratio ? Give relationship between 'ON period' δ, pulse repetition period T and duty ratio.

Ans. Duty ratio is defined as the ratio of the 'ON' period δ to the pulse repetition period T and is denoted by symbol D.

$$\text{Duty ratio } D = \frac{\delta}{T}.$$

Q. 333. What are the requirements of pulse ? **[A.M.I.E Sec B. Summer 2004]**

Ans. The pulse should have minimum distortion, sufficient amplitude. At the same time, the attenuation range should be adequate to give small amplitude pulses in order to prevent over-driving of some test circuit. The range of frequency control of the pulse repetition rate (PRR) should meet the requirements of the experiment. The basic characteristics of the pulse are rise time, overshoot, ringing, sag, undershoot.

Q. 334. What is meant by time base ?

Ans. Time base is an axis that is used to represent time so that variations of quantities such as voltages, currents etc. can be plotted w.r.t. time. Normally x-axis is used as time base.

Q. 335. What is a linear time-base generator ?

Ans. A linear time base generator is one that provides an output waveform, a portion of which exhibits a linear variation of voltage or current with time.

Q. 336. Why sweep voltage should be a small fraction of the aiming potential or supply voltage ?

Ans. Sweep voltage should be a small fraction of the aiming potential so as to achieve good linearity in output waveform.

Downloaded From www.EasyEngineering.net

Q. 337. Which amplifier is used to generate Miller sweep ?

Ans. Amplifier with $-\infty$ gain is used in a Miller sweep circuit.

Q. 338. Which amplifier is used in Miller bootstrap time-base generator ?

Ans. Emitter follower (amplifier with unity gain) is used in Miller bootstrap time-base generator.

Q. 339. Give the applications of time base generators.

Ans. Basically time-base generators are employed to generate a waveform which is applied at time axis of various display devices. The various fields, where such display devices are used are communication (such as in Radar and in TV indicators), computer monitors, automatic control systems. CROs in laboratories, analog-digital (A/D) converters etc. They are also employed in precise time measurement and time modulation.

Q. 340. Why is electrostatic deflection not used in Radars and TV indicators ?

Ans. If electrostatic deflection is used in Radars and TV indicators inconveniently large deflection voltages would be required.

Q. 341. Which type of time-base generator is used in electromagnetic deflection system ?

Ans. Current time-base generators are used in electromagnetic deflection systems.

Q. 342. Which type of time-base generator is used in electrostatic deflection systems ?

Ans. Voltage time-base generators are used in electrostatic deflection systems.

Q. 343. What is meant by frequency spectrum of the signal ?

Ans. The distribution of frequency components of an electrical signal plotted as graph of amplitude (voltage or power) versus frequency is called the frequency spectrum of the signal.

Q. 344. How does an amplifier introduce harmonic distortion of a signal in the output ?

Ans. The distortion of signal takes place because of nonlinear characteristics of amplifier circuit elements such as tubes, transistors etc.

Q. 345. What is harmonic distortion ?

Ans. The distortion of signal caused due to nonlinear characteristics of amplifier is called the harmonic distortion.

Q. 346. What do you understand by total harmonic distortion ?

[A.M.I.E. Sec B. Winter 2001]

Ans. Total harmonic distortion or distortion factor of a signal is defined as the square root of the sum of squares of each harmonic distortion i.e.

$$D = \sqrt{D_2^2 + D_3^2 + D_4^2 + ... + D_n^2}$$

where $D_2 = \frac{V_2}{V_1}$, $D_3 = \frac{V_3}{V_1}$ ... $D_n = \frac{V_n}{V_1}$ where V_n represents the amplitude of nth harmonic and V_1 is the amplitude of fundamental

Q. 347. What is meant by wave analysis ?

Ans. The process of decomposing of a complex wave into its fundamental and harmonics is known as wave analysis.

Q. 348. The selectivity requirements in fundamental supperssion harmonic distortion analyzer are not severe. Why so ?

Ans. Because only the fundamental frequency component is to be suppressed.

Q. 349. What is wave analyzer ? **[U.P.S.C. I.E.S. 1997]**

Ans. A wave analyzer is an instrument designed for measuring the relative amplitudes of signal frequency components in a complex or distorted waveform. Basically the instrument acts as a frequency selective voltmeter which is tuned to the frequency of one signal component while rejecting all the other signal components.

Q. 350. How good frequency stability is achieved in a wave analyzer ?

Ans. Good frequency stability in a wave analyzer is achieved by using frequency synthesisers, which have high accuracy and resolution, or by automatic frequency control (AFC). In an automatic frequency control system the local oscillator locks to the signal, and so eliminates the drift between them.

Q. 351. What are the uses of a waveform analyzer.

[A.M.I.E. Sec B. Summer 2001]

Ans. A waveform analyzer is used to measure relative amplitude of signal frequency components in a complex waveform. These are applied industrially in the field of reduction of sound and vibrations generated by rotating electrical machines and apparatus.

Q. 352. How does a spectrum analyzer functionally differ from a wave analyzer ?

Ans. A wave analyzer is used to measure relative amplitudes of signal frequency components in a complex waveform while a spectrum analyzer is used to study energy distribution across the frequency spectrum of a given electrical signal.

Q. 353. What is meant by spectrum analyzer ?

Ans. The most common way of observing signals is to display them on an oscilloscope, with time as the x-axis (i.e. amplitude of the signal versus time). This is the *time domain*. It is also useful to display signals in the *frequency domain*. The instrument providing this frequency domain view is called the *spectrum analyzer*.

Q. 354. Why RF spectrum analyzers are more important than AF ones ?

Ans. The RF spectrum analyzers cover frequency range of 10 MHz to 40 GHz, and therefore, more important as they include the vast majority of communication, navigation, radar, and industrial instrumentation frequency bands.

Q. 355. What is meant by dynamic range of a spectrum analyzer ?

Ans. The dynamic range of a spectrum analyzer can be described as the range of signals between the smallest that can be detected above the system noise and the largest signal that does not cause any spurious signals greater than the smallest signal that can be seen.

Q. 356. What is MDS in a spectrum analyzer ?

Ans. Minimum detectable signal (MDS) is the spectrum analyzer noise level in dbm.

Q. 357. Why FFT spectrum analysis is limited to low frequency applications ?

Ans. The frequency range of the input to the FFT spectrum analyzer is restricted to not more than one-half of the sampling frequency to prevent the generation of spurious spectral components called aliases.

Q. 358. Why are digital instruments becoming popular ?

Ans. Digital instruments are becoming more and more popular because of their inherent advantages over analog instruments such as greater speed, increased accuracy, better resolution, reduction in operator errors, and ability to provide automatic measurements in system applications.

Q. 359. Why conversion of an analog signal into an equivalent digital signal is essential ?

Ans. Because most sensors have analog output while much data processing is accomplished with digital computers, analog-to-digital conversion is essential.

Q. 360. What is digital-to-analog conversion ?

Ans. Basically, D/A conversion is the process of taking a value represented in digital code (such as simply binary or BCD) and

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

converting it into a voltage or current which is proportional to the digital value.

Q. 361. What is A/D conversion ?

Ans. The A/D conversion is the process of converting an analog input voltage into an equivalent digital signal.

Q. 362. Mention the various types of analog to digital converters in the increasing order of speed of operation. [U.P.S.C. I.E.S. 2003]

Ans. A/D converters in the increasing order of speed of operation is given as dual slope type, successive approximation type, parallel-comparator type.

Q. 363. Give the advantages and disadvantages of an integrating type A to D converters under the following heads:
(*i*) speed of operation (*ii*) change in R-C values (*iii*) presence of periodic noise (*iv*) offset voltage of the op-amp.

Ans.
(*i*) Speed of operation — Slow.
(*ii*) Change in R-C values — The accuracy of this converter is independent of R-C values or any change in them.
(*iii*) Presence of periodic noise — This converter is very less sensitive to periodic noise.
(*iv*) Offset voltage of op-amp — Accuracy depends upon the offset values, therefore, the reference voltage should be precise.

Q. 364. What are the advantages of integrating type A/D converters over the non-integrating type ? [U.P.S.C. I.E.S. 1999]

Ans. The integrating type ADC has the following advantages :
(*i*) It is relatively simple and inexpensive.
(*ii*) Conversion accuracies obtainable are very good.
(*iii*) Capacitors and resistors need not have high precision.
(*iv*) Errors due to propagation delay times are eliminated.
(*v*) Accuracy depends only on the stability of the reference voltage V_{REF}.
(*vi*) The comparator offset voltage and current are automatically compensated as the input signals cross zero voltage twice.

Q. 365. What is resolution for a DAC ?

Ans. Resolution of a DAC defines the smallest increment in the voltage that can be discerned. Resolution is primarily a function of the number of bits in the digital input signal i.e. the smallest increment output voltage is determined by the LSB.

Q. 366. What is frequency counter ?

Ans. A frequency counter is a digital instrument that can measure and display the frequency of any periodic waveform.

Q. 367. What is the use of electronic counter ?

Ans. Electronic counter can be used to measure (*i*) Time interval (*ii*) Time period (*iii*) Ratio of two frequencies etc.

Q. 368. What is digital instrument ?

Ans. A digital instrument indicates the measured value in the form of decimal digits.

Q. 369. What is the important equipment in digital instruments ?

Ans. Important equipment used in digital instruments are A/D converter at the input and D/A converter at the output.

Q. 370. What is a digital voltmeter (DVM) ?

Ans. A digital voltmeter displays the value of ac or dc voltages being measured directly as discrete numerals in the decimal number system.

Q. 371. What are the advantages of a digital voltmeter (DVM) ?

Ans. A digital voltmeter displays the value of ac or dc voltage in decimal number system thus eliminating the errors due to parallax and observational errors. The use of DVMs increases the speed with which the readings can be taken. Also the output of DVMs can be fed to memory devices for future purpose which is not available in electronic voltmeter. On account of development of IC technology, it has been possible to reduce the size, cost of DVM. In fact DVM is less costly than analog type.

Q. 372. What is the principle of operation of a DVM ?

Ans. A DVM comprises of a clock generator, a circuit that converts the voltage to be measured into pulses and a digital frequency counter.

Q. 373. Name the different types of DVMs.

Ans. Digital voltmeters may be (*i*) Ramp type DVM (*ii*) Integrating type DVM (*iii*) Successive approximation type DVM (*iv*) Dual slope integrating type DVM.

Q. 374. Why is dual slope ADC preferred in a digital voltmeter ?

Ans. Dual slope ADC is preferred in a DVM because it has low cost and high accuracy.

Q. 375. What are the typical operating and performance characteristics of DVMs ?

Ans. 1. Absolute accuracy as high as ± 0.005 percent of the reading.
2. Resolution : The μV can be read on the 0–1 V input range.

Q. 376. What is meant by resolution of a digital instrument ?

Ans. Resolution of a digital instrument is defined as the number of digit positions or simply the number of digits used in a meter. For example a three-digit meter display on the digital meter for 0–1 V range will be able to indicate from 000 to 999 mV, with the smallest increment (resolution) of 1 mV.

Q. 377. What is meant by 'sensitivity' of a digital instrument ?

Ans. Sensitivity of a digital meter is the smallest change in input which the meter is able to detect. Thus, it is the full-scale value of the lowest range multiplied by the resolution of the meter.
It is given as $S = (f_s)_{min} \times R$
where $(f_s)_{min}$ is the lowest full-scale value of the digital meter and R is the resolution in decimal.

Q. 378. What is difference between 3-digit and $3\frac{1}{2}$-digit digital meters ?

Ans. A three-digit digital meter has a resolution of $\frac{1}{1,000}$ th of the range and has a maximum display of 999. In contrast, the $3\frac{1}{2}$-digit digital meter has resolution of $\frac{1}{2,000}$ th of the range, and the maximum value displayed is 1999

Q. 379. What is DMM ?

Ans. DMM (digital multimeter) is basically a digital voltmeter and may be used for the measurement of voltage, current (dc or ac) and resistance.

Q. 380. What will be the resolution of three digit 0–1 V digital voltmeter ? [PTU December 2004]

Ans. $\frac{1}{10^3}$

Q. 381. What is IEEE 488 bus system ? [A.M.I.E. Sec B. Summer 1996]

Ans. For a set of instruments to be interfaced with a single computer, a general purpose bus system called the IEEE 488 bus system, has been developed to which a number of instruments can be attached so that communication between the computer and the instruments are possible over a common cable.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. Deflection methods of direct measurements are most widely used as these are
(a) most simple. (b) most accurate.
(c) least time consuming.
(d) most simple and least time consuming.

2. Comparison methods are used
(a) because these are most simple.
(b) because these are inexpensive.
(c) because these take least time in measurement.
(d) when a high accuracy of measurement is required.

3. The main advantage of the null balance technique of measurement is that
(a) it does not load the medium.
(b) it gives a centre zero value at its input.
(c) it gives quick measurement.
(d) it is not affected by temperature variation
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

4. Consider the following statements in connection with deflection and null type instruments:
1. Null type instrument is more accurate than the deflection type one.
2. Null type of instrument can be highly sensitive as compared with deflection type instrument.
3. Under dynamic conditions, null type instrument is not preferred to deflection type instrument.
4. Response is faster in null type instrument as compared to deflection type instrument.
Which of these statements are correct?
(a) 1, 2 and 3 only. (b) 1, 2 and 4 only.
(c) 2, 3 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2011]

5. The region between the limits within which a quantity is measured received or transmitted, expressed by stating the lower and upper limits is called the
(a) range. (b) span.
(c) range limit. (d) none of these.

6. The span of a zero-centred voltmeter having a scale from – 10 V to + 10 V is
(a) 0 V (b) – 10 V (c) 10 V (d) 20 V

7. If two meters X and Y require 40 mA and 50 mA respectively, to give full scale deflection, then
(a) X is more sensitive. (b) Y is more sensitive.
(c) both X and Y are equally sensitive.
(d) it would not be possible to assess the sensitivity on the basis of the given data. [U.P. S.C. I.E.S E.E.-II, 1993]

8. A meter having a sensitivity of 2 kΩ/V is used for the measurement of voltage across a circuit having an output resistance of 1 kΩ and an open circuit voltage of 8 V. What is the reading of the meter at its 10 V scale ?
(a) 5.72 V (b) 6.51 V (c) 7.62 V (d) 7.91 V
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

9. The smallest change in a measured variable to which an instrument will respond is
(a) accuracy. (b) resolution.
(c) precision. (d) sensitivity.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

10. Resolution of an instrument is
(a) the minimum quantity it can measure.
(b) the maximum quantity it can measure.
(c) the maximum nonlinearity.
(d) ability to distinguish polarity.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

11. Hysteresis in an instrument means
(a) the change in same reading when input is first increased and then reduced.
(b) the reliability of the instrument.
(c) the repeatability of the instrument.
(d) the inaccuracy due to change in temperature.

12. The static error band of an instrument implies the
(a) accuracy of the instrument.
(b) irrepeatability of the instrument.
(c) error caused when the pen is stopped at some deflection.
(d) error introduced in low varying inputs.

13. The static error band of an instrument does not include
(a) nonlinearity. (b) electrical drift.
(c) hysteresis in the instrument. (d) none of the above.

14. The fact as to how closely the instrument reading follows the measured variables is called the
(a) accuracy. (b) precision.
(c) fidelity. (d) sensitivity.

15. An higher scale ammeter is used to measure too low current. The measurement would have low
(a) precision. (b) accuracy.
(c) resolution. (d) all of these.

16. Thermal zero-shift in an instrument refers to
(a) maximum variation in pen zero due to temperature variation.
(b) inaccuracy in measurement due to temperature variation.
(c) shift in zero adjustment due to expansion of springs due to temperature variation.
(d) none of the above.

17. In which part of the scale does the pointer indicate most accurately?
(a) In the first third of the scale. (b) In the first half of the scale.
(c) In about middle of the scale. (d) In the last third of the scale.

18. When reading is taken at half scale in the instrument, the error is
(a) exactly equal to half of full-scale error.
(b) equal to full-scale error.
(c) less than full-scale error. (d) more than full-scale error.
[U.P.S.C. I.E.S. E.E.-I, 2006]

Answers: **1.** (d), **2.** (d), **3.** (a), **4.** (a), **5.** (a), **6.** (d), **7.** (a), **8.** (c), **9.** (b), **10.** (a), **11.** (a), **12.** (c), **13.** (b), **14.** (c), **15.** (d), **16.** (a), **17.** (c), **18.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

19. The reliability of a measuring instrument means
(a) the life of the instrument.
(b) the extent over which the characteristics remain linear.
(c) degree to which repeatability continues to remain within specified limits.
(d) all of these.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

20. Undesirable characteristics of a measurement system are
(a) accuracy and repeatability. (b) static error.
(c) drift and dead zone. (d) both (b) and (c).
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

21. The efficiency of an instrument is defined as the ratio of the measured quantity at full scale to the power taken by the instrument at
(a) one-fourth scale. (b) half scale.
(c) three-fourth scale. (d) full scale.
[A.M.I.E. Sec B. Winter 1994]

22. Dead time of the instrument is
(a) the time required by an instrument to begin to respond to a change in the measurand.
(b) the time required by an instrument to warm up initially.
(c) the largest change of input quantity for which there is no output of the instrument.
(d) none of the above.

23. Dead zone of an instrument is
(a) the time required by an instrument to warm up initially.
(b) the largest change of input quantity for which there is no output of the instrument.
(c) the time required by an instrument to begin to respond to a change in measurand.
(d) the unmeasured quantity which exceeds the maximum range of the instrument.
(e) none of the above.

24. Torque/weight ratio of an instrument indicates
(a) selectivity. (b) accuracy.
(c) fidelity (d) sensitivity.
[U.P.S.C. I.E.S. E.E.-I, 2003]

25. Which of the following statements is true for a measuring instrument ?
(a) If it is precise, it is accurate.
(b) If it is linear, it is sensitive.
(c) If it has a digital display, it is accurate.
(d) If it uses null balance technique, it has a high input impedance.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

26. A first order instrument is characterized by
(a) time constant only.
(b) static sensitivity and time constant.
(c) static sensitivity and damping coefficient.
(d) static sensitivity, damping coefficient and natural frequency of oscillations.
[U.P.S.C. I.E.S. E.E.-I, 2003]

27. An indicating instrument is more sensitive if its torque to weight ratio is
(a) much larger than unity. (b) of the order of unity.
(c) much less than unity. (d) made deflection dependent.
[U.P.S.C. I.E.S. E.E.-I, 1998]

28. Which one of the following decides the time of response of an indicating instrument ?
(a) Deflecting system. (b) Controlling system.
(c) Damping system. (d) Pivot and jewel bearings.
[U.P.S.C. I.E.S. E.E.-I, 2004]

29. The difference between the indicated value and the true value of a quantity is
(a) gross error. (b) absolute error.
(c) dynamic error. (d) relative error.
[U.P.S.C. I.E.S. E.E.-I, 2003]

30. The errors introduced by an instrument fall in which category ?
(a) Systematic errors. (b) Random errors.
(c) Gross errors. (d) Environmental errors.
[U.P.S.C. I.E.S. E.E.-I, 2008]

31. To measure 5 volts, if one selects a 0-100 V range voltmeter which is accurate within ±1%, then the error in this measurement may be up to
(a) ±1.5% (b) ±2.5% (c) ±7.5% (d) ±20%
[U.P.S.C. I.E.S. E.E.-I, 2005]

32. A 0–100 V voltmeter has an accuracy of 1 per cent at full-scale reading. What will be the error if it reads 50 V?
(a) 1 per cent. (b) 2 per cent.
(c) 0.5 per cent. (d) 4 per cent.
[U.P.S.C. I.E.S. E.E.-I, 2011]

33. A 0–250 V voltmeter has a guaranteed accuracy of 2 per cent of full-scale reading. The voltage measured by this voltmeter is 150 volts. The limiting error in percentage is
(a) 2.5% (b) 0.05% (c) 3.33% (d) 5.0%
[U.P.S.C. I.E.S. E.E.-I, 2010]

34. A 0–25 Amp ammeter has a guaranteed accuracy of 1 per cent of full-scale reading. The current measured by this ammeter is 10 Amp. The limiting error in percentage for this instrument is
(a) 2.5% (b) 0.5% (c) 0.25% (d) 0.025%
[U.P.S.C. I.E.S. E.E.-I, 2010]

35. A 0 to 300 V voltmeter has an error of ±2% of fsd. What is the range of readings if true voltage is 30 V?
(a) 24 V–36 V (b) 20 V–40 V
(c) 29.4 V–30.6 V (d) 20 V–30 V
[U.P.S.C. I.E.S. E.E.-I, 2009]

36. The pressure in a tank varies from 20 psi to 100 psi. Further pressure in the tank is desired to be kept at 50 psi. The full-scale error, when pressure inside the tank is 30 psi, is given by
(a) – 62.5% (b) 25%
(c) 80% (d) – 2.5%
[U.P.S.C. I.E.S. E.E.-I, 2010]

37. The measured value of a capacitor is 205.5 μF; whereas its true value is 202.4 μF.
The relative error is
(a) 1.87% (b) 1.94% (c) 1.53% (d) 1.73%
[U.P.S.C. I.E.S. E.E.-I, 2011]

38. A standard cell of 1.085 volts used with a simple potentiometer balances at 50 cm. The percentage error in the voltmeter which balances at 60 cm when reading 1.2 V is
(a) 1.8 % low. (b) 3.6 % low.
(c) 1.8 % high. (d) 3.6 % high.
[U.P.S.C. I.E.S. E.E.-I, 1993]

39. A 150 V moving iron voltmeter of accuracy class 1.0 reads 75 V when used in a circuit under standard conditions. The maximum possible percentage error in the reading is
(a) 0.5. (b) 1.0. (c) 2.0. (d) 4.0.
[U.P.S.C. I.E.S. E.E.-I, 1993]

40. A thermometer is calibrated from 150° to 200°C. The accuracy specified is ± 0.25%. The maximum static error in measurement is
(a) ± 0.5°C. (b) 0.375°C.
(c) ± 0.125°C. (d) ± 0.0125°C.
[A.M.I.E. Sec B. Instrumentation & Control, Winter 1995]

Answers: **19.** (b), **20.** (d), **21.** (d), **22.** (a), **23.** (b), **24.** (d), **25.** (d), **26.** (b), **27.** (a), **28.** (c), **29.** (b), **30.** (a), **31.** (d), **32.** (b), **33.** (c), **34.** (a), **35.** (a), **36.** (a), **37.** (c), **38.** (a), **39.** (c), **40.** (c),

41. A Wheatstone bridge requires a change of 6 Ω in the unknown arm of the bridge to produce a change in deflection of 3 mm of the galvanometer. The sensitivity of the instrument is
(a) 0.5% (b) 2%
(c) 0.5 mm /Ω (d) 2.0 Ω/mm
[U.P.S.C. I.E.S. E.E.-I, 1992]

42. Threshold of sensitivity in reference to instruments is
(a) the smallest signal that causes detectable output.
(b) the largest signal which can be measured.
(c) the value of sensitivity on the highest scale.
(d) the value of sensitivity on the lowest scale.

43. Sensitivity inaccuracy of a recording instrument means the
(a) degree to which the instrument is not sensitive enough to repeat readings.
(b) maximum error in sensitivity displayed by a pen.
(c) smallest signal required to give detectable output.
(d) amount of input needed to give unit pen deflection.

44. Sensitivity of a voltmeter is given as
(a) Ω/V
(b) reciprocal of full-scale deflection current.
(c) both (a) and (b). (d) none of these.

45. Accuracy is defined as the
(a) measure of the consistency or reproducibility of the measurement.
(b) closeness with which an instrument reading approaches the true value of the quantity being measured.
(c) smallest measurable input change.
(d) ratio of the change in output signal of an instrument to a change in the input. [U.P.S.C. I.E.S. E.E.-I, 1993]

46. The degree of reproducibility among several independent measurements of same true value under reference conditions is known as
(a) accuracy. (b) precision. (c) linearity. (d) calibration.
[A.M.I.E. Sec B. Winter 1994]

47. Which one of the following statements is not correct ?
(a) It is not possible to have precise measurements which are not accurate.
(b) Correctness in measurements requires both accuracy and precision.
(c) Reproducibility and consistency are expressions that best describe precision in measurements.
(d) An instrument with 2% accuracy is better than another with 5% accuracy. [U.P.S.C. I.E.S. E.E.-I, 1996]

48. A resistance of 105 ohms is specified using significant figures as indicated below :
1. 105 ohms 2. 105.0 ohms 3. 0.000105 MΩ
Among these
(a) 1 represents greater precision than 2 and 3.
(b) 2 represents greater precision but 1 and 3 represent same precision.
(c) 2 and 3 represent greater precision than 1.
(d) 1,2 and 3 represent same precision.
[U.P.S.C. I.E.S. E.E.-I, 1994; 2010]

49. A resistance of 108 Ω is specified using significant figures as indicated below:
1. 108 Ω
2. 108.0 Ω
3. 0.000108 MΩ
Among these
(a) 1 represents greater precision than 2 and 3.
(b) 2 represents greater precision but 1 and 3 represent same precision.
(c) 2 and 3 represent greater precision than 1.
(d) 1, 2 and 3 represent the same precision.
[U.P.S.C. I.E.S. E.E.-I, 2011]

50. The value of a quantity and its uncertainty are given as 26455 ± 3754 without rounding off. Only two significant digits are relevant for error. Value of error rounded off to two significant figures is
(a) 26500 ± 3800 (b) 26400 ± 3800
(c) 26460 ± 3750 (d) 26400 ± 3700
[U.P.S.C. I.E.S. E.E.-I, 2011]

51. Which one of the following statements is correct ?
The application of the instrument in wrong manner in the procedure of measurement results in a/an
(a) systematic error. (b) random error.
(c) gross error. (d) instrument error.
[U.P.S.C. I.E.S. E.E.-I, 2004]

52. What are the causes of gross error in the instruments?
1. Misreading of instruments.
2. Incorrect adjustment of instruments.
3. Errors due to defective instrument.
4. Errors due to effect of environment on the instrument.
(a) 1 and 2. (b) 2 and 3. (c) 3 and 1. (d) 2 and 1.
[U.P.S.C. I.E.S. E.E.-I, 2011]

53. Systematic errors are
(a) instrumental errors. (b) environmental errors.
(c) observational errors. (d) all of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2000]

54. Consider the following:
1. Human errors.
2. Improper application of instruments.
3. Error due to worn parts of an instrument.
4. Errors due to effects of environment.
Which of the above come under the type of systematic errors?
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2009]

55. Which of the following types of errors come under systematic errors?
1. Irregular spring tension.
2. Improper readings of an instrument.
3. Loading effects.
4. Error due to the presence of electric field or magnetic field.
(a) 1 and 2. (b) 2 and 3. (c) 3 and 1. (d) 4 and 1.
[U.P.S.C. I.E.S. E.E.-I, 2011]

56. Which one of the following statements correctly represents the systematic error ?
(a) These errors can be calculated from the details of the instruments.
(b) These are the residual errors.
(c) These errors may occur under controlled conditions.
(d) These are the errors committed by the experimenters.
[U.P.S.C. I.E.S. E.E.-I, 2004]

57. A set of observations has a wide range so it has
(a) low accuracy. (b) low precision.
(c) high accuracy but low precision.
(d) high precision but low accuracy.

58. Two capacitances, $C_1 = 150 \pm 2.4\ \mu F$ and $C_2 = 120 \pm 1.5\ \mu F$ are connected in parallel. What is the limiting error of the resultant capacitance C ?
(a) 0.9 μF (b) 1.95 μF (c) 3.9 μF (d) 4.8 μF
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

Answers: **41.** (c), **42.** (a), **43.** (b), **44.** (c), **45.** (b), **46.** (b), **47.** (a), **48.** (b), **49.** (b), **50.** (a), **51.** (c), **52.** (a), **53.** (d), **54.** (c), **55.** (c), **56.** (a), **57.** (b), **58.** (c),

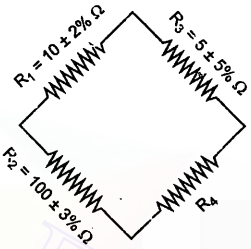
59. A variable w is related to three other variables x, y, z as $w = xy/z$. The variables are measured with meters of accuracy ±0.5% reading, ±1% of full scale value and ±1.5% reading. The actual readings of the three meters are 80,20 and 50 with 100 being the full scale value for all three. The maximum uncertainty in the measurement of w will be
(a) ±0.5% rdg (b) ±5.5% rdg
(c) ±6.7 rdg (d) ±7.0 rdg [GATE E.E. 2006]

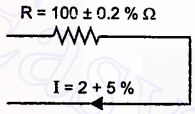
60. Resistances R_1 and R_2 have, respectively nominal values of 10 Ω and 5 Ω and tolerances of ± 5% and ± 10%. The range of values for the parallel combination of R_1 and R_2 is
(a) 3.077 Ω to 3.636 Ω. (b) 2.805 Ω to 3.371 Ω.
(c) 3.237 Ω to 3.678 Ω. (d) 3.192 Ω to 3.435 Ω.
[GATE E.E. 2001]

61. The limiting errors of measurement of power consumed by and the current passing through a resistance are ± 1.5 % and ± 1% respectively. The limiting error of measurement of resistance will then be
(a) ± 0.5%. (b) ± 1.0%. (c) ± 2.5 %. (d) ± 3.5%.
[U.P.S.C. I.E.S. E.E.-I, 2004]

62. The arms of a Wheatstone bridge are shown in the given figure. For the balanced condition, the least tolerance value of R_4 will be
(a) 50 ± 2% Ω.
(b) 50 ± 3% Ω.
(c) 50 ± 5% Ω.
(d) 50 ± 10% Ω.
[U.P.S.C. I.E.S. E.E.-I, 1994]



63. In the circuit given in the figure, the limiting error in the power dissipation '$I^2 R$' in the resistor R is
(a) 1.2%. (b) 5.2%.
(c) 10.2%. (d) 25.2%.
[U.P.S.C. I.E.S. E.E.-I, 1995]



64. A set of independent current measurements taken by four observers was recorded as : 117.02 mA, 117.11 mA, 117.08 mA and 117.03 mA. What is the range of error ?
(a) ±0.045 (b) ±0.054 (c) ±0.065 (d) ±0.056
[U.P.S.C. I.E.S. E.E.-I, 2005]

65. Two equal resistances, each of 100 Ω ± 1 % (standard deviation) are connected in parallel. The standard deviation of the parallel combination will be
(a) 0.5% (b) $\frac{1}{\sqrt{2}}$ % (c) $\sqrt{2}$ % (d) 2%.
[U.P.S.C. I.E.S. E.E.-I, 1993]

66. A temperature probe having a first order response with a time constant of 1 second is given a step input from 50° to 0 °C. The temperature in °C after 0.6 second is
(a) 18.4 (b) 25 (c) 27.4 (d) 45
[A.M.I.E. Sec B. Instruments & Control Winter 1994]

67. The total current $I = I_1 + I_2$ in a circuit is measured as $I_1 = 150 \pm 1$A and $I_2 = 250 \pm 2$ A where the limits of error are given as standard deviations. It is measured as
(a) (400 ± 3) A (b) (400 ± 2.4) A
(c) (400 ± 1.5) A (d) (400 ± 1) A
[U.P.S.C. I.E.S. E.E.-I, 2002]

68. To reduce the effect of noise level, 100 sets of data are averaged. The averaged data set will have a noise level reduced by a factor of
(a) 10 (b) $10\sqrt{2}$ (c) $50\sqrt{2}$ (d) 100
[U.P.S.C. I.E.S. E.E.-I, 2002]

69. A measurement was conducted with $\pm 2\sigma$ error (σ^2 = mean square deviation). The approximate percentage measurements falling within this accuracy is
(a) 99% (b) 95% (c) 75% (d) 50%
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2003]

70. A zero mean random signal is uniformly distributed between limits $-a$ and $+a$ and its mean square value is equal to its variance. Then the rms value of the signal is
(a) $\frac{a}{\sqrt{3}}$ (b) $\frac{a}{\sqrt{2}}$ (c) $a\sqrt{2}$ (d) $a\sqrt{3}$
[GATE E.E., 2011]

71. The voltage of a standard cell is monitored daily over a period of one year. The mean value of voltage for every month shows a standard deviation of 0.1 mV. The standard deviation of the set constituted by the monthly mean values will be
(a) zero (b) $\frac{0.1}{12}$ (c) $\frac{0.1}{\sqrt{12}}$ (d) 0.1
[U.P.S.C. E.E.-I, 1999]

72. The units whose size cannot be chosen independently are called
(a) absolute unit. (b) fundamental unit.
(c) derived unit. (d) auxiliary fundamental unit.
[A.M.I.E. Sec B Measurements and Control Summer 2005]

73. What is the prefix tera equivalent to ?
(a) 10^3 (b) 10^6 (c) 10^9 (d) 10^{12}
[U.P.S.C. I.E.S. E.E.-I, 2008]

74. A coherent system of units is to be evolved which has N kinds of quantities to evaluate and M independent physical equations expressing relationship between them, we can independently choose the sizes of
(a) N + M quantities. (b) N quantities.
(c) M quantities. (d) N – M quantities.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

75. Identify the one which is not a fundamental unit in SI system.
(a) Ampere. (b) Kelvin. (c) Metre. (d) Joule.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

76. The unit of temperature measurement is
(a) mole. (b) Kelvin. (c) lumen. (d) pascal.
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

77. For defining the standard metre, wavelength of which material is considered ?
(a) Neon. (b) Krypton. (c) Helium. (d) Xenon.
[U.P.S.C. I.E.S. E.E.-I, 2006]

78. What is the unit of measurement of surface / sheet resistivity ?
(a) ohm / metre. (b) ohm metre.
(c) ohm / sq. metre. (d) ohm.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

79. The quantity $\frac{1}{\sqrt{\epsilon_0 \mu_0}}$ in SI units has the
(a) value of 330 m/s. (b) value 1.73×10^4.
(c) dimensions LT^{-1}. (d) None of the above.
[U.P.S.C. I.E.S. E.E.-I, 1992]

80. Which of the following does not have the same units as the others? The symbols have their usual meanings.
(a) $\frac{L}{R}$. (b) R C. (c) $\sqrt{LC}$. (d) $\frac{1}{\sqrt{LC}}$.
[U.P.S.C. I.E.S. E.E.-I, 1992]

81. If the practical units of voltage and current were each made 20 times as large as they are at present, what would be the consequent alteration in the size of the unit of capacitance ?

Answers: **59.** (d), **60.** (a), **61.** (d), **62.** (d), **63.** (c), **64.** (a), **65.** (d), **66.** (c), **67.** (b), **68.** (a), **69.** (b), **70.** (a), **71.** (c), **72.** (c), **73.** (d), **74.** (d), **75.** (d), **76.** (b), **77.** (b), **78.** (c), **79.** (c), **80.** (d), **81.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 200 times. (b) 60 times.
(c) 20 times. (d) nil. [U.P.S.C. I.E.S. E.E.-I, 1994]

82. In the SI system, the dimension of emf is
(a) $ML^3T^{-3}I$ (b) $ML^3T^{-3}I^{-1}$
(c) $ML^2T^{-3}I^{-1}$ (d) $M^{-1}L^2T^3I$
[U.P.S.C. I.E.S. E.E.-I, 1999]

83. A circuit draws a current of I when a single phase ac voltage V is applied to it. If the power factor is cos ϕ, then the dimensions of VI cos ϕ would be
(a) ML^3T^{-2} (b) ML^2T^3 (c) ML^3T^3 (d) ML^2T^{-3}
[U.P.S.C. I.E.S. E.E.-I, 1997]

84. The dimensional equation of resistance is
(a) $L^2MT^{-2}I^{-4}$ (b) $L^2MT^{-2}I^{-2}$
(c) $L^2M^2T^{-3}I^{-2}$ (d) $L^2MT^{-3}I^{-2}$
[U.P.S.C. I.E.S. E.E.-I, 1998]

85. The absolute measurement of resistance involves the measurement of
(a) length and time. (b) length and mass.
(c) velocity. (d) acceleration.
(e) either (a) or (c).

86. Consider the following statements.
The absolute value of current can be measured by
1. dynamometer type moving coil ammeters.
2. tangent galvanometers. 3. current balance instruments.
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 1 and 3 are correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1996]

87. What precaution(s) is/are required for absolute measurement of current by Rayleigh current balance ?
1. Precision balance of special form must be used for the accuracy of measurement.
2. The flexible leads, used for taking current into the moving coil, must not exert appreciable torque upon the moving system.
Select the correct answer using the code given below :
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

88. The most stable primary atomic standard for frequency is
(a) hydrogen maser standard. (b) ceasium beam standard.
(c) quartz standard. (d) rubidium standard.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

89. The modern standard of time is
(a) a second defined as 1/86,400 of a mean solar day.
(b) a second defined as time constant of an RC series circuit having R = 2 MΩ, C = 500 pF.
(c) A second which is duration of 9192631770 periods of radiation corresponding to the transition between the two hyperfine levels of the fundamental state of atom cesium 133.
(d) a second defined as $\frac{1}{31556925.9747}$ of the time required by the earth to orbit the Sun in the year 1900.
[U.P.S.C. I.E.S. E.E.-I, 2001]

90. For time and frequency, the working standard is
(a) microwave oscillator. (b) crystal controlled oscillator.
(c) LASER. (d) A RF oscillator.
[U.P.S.C. I.E.S. E.E.-I, 2003]

91. Which of the following is / are primary standard(s) for voltage maintained by National Standards Laboratories ?
1. Zener diode with 1.5 V output at 20°C.
2. Nickel cadmium rechargeable cell of 1.25 V output at 20°C.
Select the correct answer using the code given below :
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.E.-I, 2008]

92. Standard cell
(a) will have precise and accurate constant voltage when current drawn from it is few microamperes only.
(b) will have precise and accurate constant voltage when few milliamperes are drawn from it.
(c) will continue to have constant voltage irrespective of loading conditions.
(c) can supply voltages up to 10 V. [U.P.S.C. I.E.S. E.E.-I, 2003]

93. The emf of a saturated Weston cell drops by increase in temperature at a rate
(a) 40 mV/°C (b) 4 mV/°C
(c) 40 μV/°C (d) 4 μV/°C
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

94. The internal resistance of a standard Weston cell is of the order of
(a) a few ohms. (b) a few hundred ohms.
(c) a few thousand of ohms. (d) a fraction of an ohm.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

95. The materials to be used in the manufacture of a standard resistance should be of
(a) high resistivity and low temperature coefficient.
(b) low resistivity. (c) high temperature coefficient.
(d) low resistivity and high temperature coefficient.
[U.P.S.C. I.E.S. E.E.-I, 2006]

96. In resistors two wires side by side in opposite directions are wound in order to
(a) give high mechanical strength.
(b) make it more stable. (c) reduce the coil inductance.
(d) increase the resistance.

97. Which one of the following techniques reduces the residual inductance of standard resistance ?
(a) Using high resistivity material.
(b) Using material of low temperature coefficient of resistance.
(c) Using proper shielding.
(d) Making a bifilar winding on a card. [U.P.S.C. I.E.S. E.E.-I, 2007]

98. Wire-wound resistors are unsuitable for use at high frequencies because
(a) they are likely to melt under excessive eddy current.
(b) they exhibit unwanted inductive and capacitive effects.
(c) they create more electrical noise.
(d) they consume more power. [U.P.S.C. I.E.S. E.E.-I, 2003]

99. If R, L and C are the parameters of a resistor, what is the condition for the resistor to be non-inductive ?
(a) $L = CR$ (b) $L = CR^2$ (c) $C = LR^2$ (d) $C = R/L$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

100. The resistance element having least resistance temperature coefficient is
(a) nickel. (b) platinum.
(c) manganese. (d) alumel.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

101. Which one of the following passive components has the most precise and accurate standard ?
(a) Resistance. (b) Inductance.
(c) Capacitance. (d) Conductance.
[U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **82.** (c), **83.** (d), **84.** (d), **85.** (e), **86.** (d), **87.** (c), **88.** (a), **89.** (c), **90.** (b), **91.** (c), **92.** (a), **93.** (c), **94.** (d), **95.** (a), **96.** (c), **97.** (d), **98.** (b), **99.** (b), **100.** (c), **101.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

102. Commonly used standard capacitor is
(a) concentric sphere type. (b) parallel plate type.
(c) concentric cylinder type with guard ring.
(d) multiple parallel plate type.
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

103. Which one of the following meters is an integrating type instrument?
(a) Ammeter. (b) Voltmeter.
(c) Wattmeter. (d) Energy meter.
[R.G.P.V. Basic E.E. June 2007]

104. The _____ is an integrating type instrument.
(a) moving iron ammeter (b) moving coil voltmeter
(c) dynamometer wattmeter (d) induction type energy meter
[G.B.T.U. E.E. Even Semester 2010-11]

105. Industrial measuring instruments are of accuracy classes
(a) 0.5 and 1. (b) 0.5, 1, 1.5, 2.5 and 5.
(c) 1, 1.5, 2.5 and 5. (d) 1.0, 0.2 and 0.5.

106. The most suitable material for use as spring material for most of the applications, except in low resistance instruments, is
(a) platinum silver. (b) phosphor-bronze.
(c) silicon bronze. (d) hard-rolled silver.

107. Ideally, the damping torque should be
(a) proportional to the velocity of moving system and operating current.
(b) proportional to the velocity of the moving system but independent of operating current.
(c) independent of the velocity of the moving system and proportional to the operating current.
(d) independent of the velocity of the moving system and operating current.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

108. To achieve the optimum transient response, the indicating instruments are so designed as to
(a) be critically damped. (b) be undamped.
(c) providing damping which is slightly more than the critical value.
(d) providing damping which is slightly less than the critical value.
[U.P.S.C. I.E.S. E.E.-II, 2000]

109. The damping torque must operate only when the moving system of the indicating instrument is
(a) actually moving. (b) stationary.
(c) just starting to move. (d) near its full deflection.

110. In eddy current damping systems, the disc employed should be of
(a) conducting and magnetic material.
(b) conducting but nonmagnetic material.
(c) magnetic but nonconducting material.
(d) non-conducting and nonmagnetic material.

111. For a sensitive galvanometer, the type of support used is
(a) suspension. (b) taut suspension.
(c) unipivot suspension. (d) none of these.

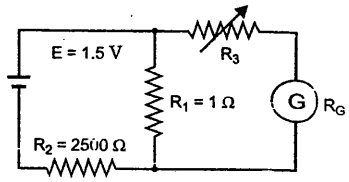
112. Preferred material for permanent magnet is
(a) stainless steel. (b) alnico.
(c) tungsten steel. (d) soft iron.

113. Due to which one of the following reasons bearings of PMMC instrument are made of Jewel ?
(a) To avoid wear and tear of the moving system.
(b) To provide a small support.
(c) It can be easily replaced. (d) To make the system robust.
[U.P.S.C. I.E.S. E.E.-I, 2008]

114. What is the 'swamping' resistance which is connected in series with the working coil of a voltmeter to drastically reduce the error in measurement caused due to variation in temperature, made of ?
(a) Constantan. (b) Eureka.
(c) Manganin. (d) Nichrome.
[U.P.S.C. I.E.S. E.E.-I, 2008]

115. The galvanometer is protected during transport by
(a) connecting critical damping resistance across the galvanometer terminals.
(b) shorting the galvanometer terminals.
(c) keeping the galvanometer terminals open-circuited.
(d) connecting a capacitor across the galvanometer terminals.

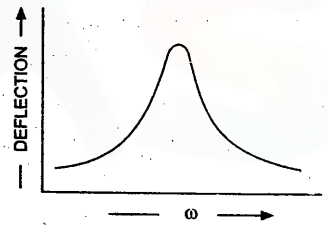
116. A galvanometer is tested in the circuit where E = 1.5 V, R_1 = 1.0 Ω, R_2 = 2,500 Ω and R_3 is variable. With R_3 set at 450 Ω, the galvanometer deflection is 140 mm and with R_3 set at 950 Ω, the galvanometer deflection is 70 mm. The resistance of the galvanometer is



(a) 99 Ω (b) 49 Ω (c) 25 Ω (d) 10 Ω
[U.P.S.C. I.E.S. E.E.-I, 1993]

117. The response of a galvanometer is independent of its
(a) controlling torque. (b) number of turns.
(c) circuit resistance. (d) none of these.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

118. The frequency response shown in the figure corresponds to a



(a) D'Arsonval galvanometer.
(b) Ballistic galvanometer.
(c) Vibration galvanometer. (d) Flux meter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1999]

119. The reflecting mirror mounted on the moving coil of a vibration galvanometer is replaced by a bigger size mirror. This will result in
(a) lower frequency of resonance and lower amplitude of vibration.
(b) lower frequency of resonance but the amplitude of vibration is unchanged.
(c) higher frequency of resonance and lower amplitude of vibration.
(d) higher frequency of response but the amplitude of vibration is unchanged.
[U.P.S.C. I.E.S. E.E.-I, 2002]

120. In a ballistic galvanometer, the inertia of the moving system is large so that
(a) it is practically stationary during the period the electricity is passing through the coil.
(b) it is accelerating fast as soon as the coil is energised.
(c) the amplitude of oscillations is small.
(d) the frequency of oscillation is large.

121. Why is damping of a ballistic galvanometer kept small ?
(a) To get minimum overshoot.
(b) To make the system critically damped.

Answers: **102.** (c), **103.** (d), **104.** (d), **105.** (c), **106.** (b), **107.** (b), **108.** (d), **109.** (a), **110.** (b), **111.** (a), **112.** (b), **113.** (a), **114.** (c), **115.** (a), **116.** (b), **117.** (c), **118.** (c), **119.** (a), **120.** (a), **121.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) To make the system oscillatory.
(d) To get first deflection large. [U.P.S.C. I.E.S. E.E.-I, 2007]

122. A PMMC instrument can be used as a fluxmeter by
(a) using a low resistance shunt.
(b) removing the control springs.
(c) making the control springs of large moment of inertia.
(d) using a high series resistance.

123. Flux meter is a special type of ballistic galvanometer provided with which one of the following ?
(a) Heavy electromagnetic damping and very small controlling torque.
(b) Heavy electromagnetic damping and large controlling torque.
(c) Small electromagnetic damping and controlling torque.
(d) Large controlling torque and small electromagnetic damping.
[U.P.S.C. I.E.S. E.E.-I, 2007]

124. In a flux meter, the controlling torque is
(a) produced by weight attached to the moving coil.
(b) produced by spring. (c) not provided at all.
(d) provided by crossed-coil mechanism. [U.P.S.C. I.E.S. E.E.-I, 1998]

125. What is connected across a flux meter for its effective functioning to measure magnetic flux density and also to compare the strengths of permanent magnets ?
(a) A resistor. (b) A capacitor.
(c) A transformer. (d) A search coil.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

126. Analog panel meters basically measure.
(a) voltage. (b) current.
(c) power. (d) depends upon parameter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

127. Consider the following statements :
In a measuring instrument,
1. linearity is more important than sensitivity.
2. high precision indicates high accuracy.
3. accuracy cannot be better than resolution.
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1997]

128. A moving coil galvanometer is made into a dc ammeter by connecting
(a) a low resistance across the meter.
(b) a high resistance in series with the meter.
(c) a pure inductance across the meter.
(d) a capacitor in series with the meter. [GATE E.E. 1998]

129. Consider the following statements about the D'Arsonval movement :
1. It is best suited for dc current measurement.
2. It responds to the average value of current.
3. It measures the rms value of ac currents.
4. It could be used for power measurements.
Which of these statements is/are correct ?
(a) Only 1. (b) 1 and 2. (c) 2 and 3. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2002]

130. The internal resistance of the milliammeter must be very low for
(a) high sensitivity. (b) high accuracy.
(c) maximum voltage drop across the meter.
(d) minimum effect on the current in the circuit.
[A.M.I.E. Sec B. Instrumentation & Control Winter 1996]

131. A very accurate voltmeter gives inaccurate reading when used for measuring voltage across a low resistance because
(a) the meter sensitivity is too low.
(b) the meter sensitivity is too high.
(c) the voltmeter is taking too low current.
(d) the higher scale has been selected.

132. The effect of stray magnetic fields on the actuating torque of a portable instrument is maximum when the operating field of the instrument and the stray fields are
(a) perpendicular. (b) paraliel.
(c) inclined at 60°. (d) inclined at 30°. [GATE E.E. 2003]

133. Which one of the following statements is correct ?
Spiral springs are used in instruments to
(a) provide controlling torque.
(b) provide damping torque.
(c) lead the current to moving coil as well as to provide the controlling torque.
(d) provide linear deflection. [U.P.S.C. I.E.S. E.E.-I, 2004]

134. If the instrument has square law response, it can be used for the measurement of
(a) ac only. (b) both ac and dc.
(c) dc only. (d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

135. A manganin swamp resistance is connected in series with a moving coil ammeter consisting of a milliammeter and a suitable shunt in order to
(a) minimise the effect of temperature variation.
(b) obtain large deflecting torque.
(c) reduce the size of the meter.
(d) minimise the effect of stray magnetic fields. [GATE E.E. 2003]

136. A 35 V dc supply is connected across a resistance of 600 Ω in series with an unknown resistance R. A voltmeter having a resistance of 1.2 kΩ is connected across the 600 Ω resistance and reads 5V. The value of resistance R will be
(a) 120 Ω (b) 500 Ω (c) 1.7 kΩ (d) 2.4 kΩ
[U.P.S.C. I.E.S. E.E.-I, 1993, 1994]

137. If two 300V full-scale voltmeters V_1 and V_2 having sensitivities of 100 kΩ/V and 150 kΩ/V are connected in series to measure 500 V, then
(a) V_1 and V_2 will read 250 V each.
(b) V_1 will read 200 V and V_2 will read 300 V.
(c) V_1 will read 300 V and V_2 will read 200 V.
(d) V_1 and V_2 will read 0 V each. [U.P.S.C. I.E.S. E.E.-I, 1994]

138. The voltmeter of choice for measuring the emf of a 100 V dc source would be
(a) 100 V, 1 mA. (b) 100 V, 2 mA.
(c) 100 V, 10 kΩ/V. (d) 100 V, 100 Ω/V.
[U.P.S.C. I.E.S. E.E.-I, 1996]

139. A dc voltmeter has a sensitivity of 1000 Ω/volt. When it measures half full scale in 100 V range, the current through the voltmeter is
(a) 100 mA. (b) 1 mA. (c) 0.5 mA. (d) 50 mA.
[GATE E.E. 1998]

140. A dc circuit can be represented by an internal voltage source of 50 V with an output resistance of 100 kΩ. In order to achieve accuracy better than 99% for voltage measurement across its terminals, the voltage measuring device should have a resistance of at least
(a) 10 MΩ (b) 1 MΩ (c) 10 kΩ (d) 1 kΩ
[U.P.S.C. I.E.S. E.E.-I, 2001]

141. Three dc voltmeters are connected in series across a 120 V dc supply. The voltmeters are specified as follows:

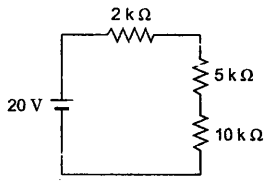
Answers: **122.** (b), **123.** (a), **124.** (c), **125.** (a), **126.** (d), **127.** (a), **128.** (a), **129.** (b), **130.** (d), **131.** (a), **132.** (b), **133.** (c), **134.** (b), **135.** (a), **136.** (d), **137.** (b), **138.** (c), **139.** (d), **140.** (a), **141.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

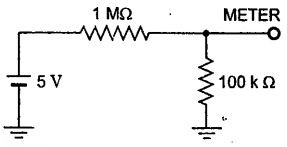
Voltmeter A : 100 V, 5 mA.
Voltmeter B : 100 V, 250 Ω/V.
Voltmeter C : 10 mA, 15,000 Ω.
The voltages read by the meters A, B and C are respectively
(a) 40, 50 and 30 V. (b) 40, 40, and 40 V.
(c) 60, 30 and 30 V. (d) 30, 60, and 30 V.
[U.P.S.C. I.E.S. E.E.-I, 2003]

142. Consider the network shown in the given figure. If a voltmeter of internal resistance 10 kΩ read V_1 and V_2 respectively when connected across 5 kΩ and 10 kΩ in turns, then



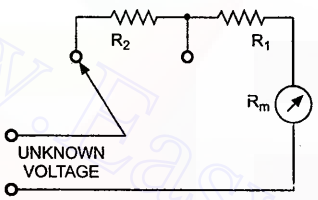
(a) $V_1 > \frac{V_2}{2}$ (b) $V_1 < \frac{V_2}{2}$
(c) $V_1 = \frac{V_2}{2}$ (d) $V_1 = 6.67$ V
[U.P.S.C. I.E.S. E.E.-I, 1999]

143. What voltage would a voltmeter with impedance of 20,000 Ω and range 0–1 V shown in the circuit given below ?



(a) 82 mV. (b) 100 mV.
(c) 118 mV. (d) 5 V.
[U.P.S.C. I.E.S. E.E.-I, 1997]

144. For the voltmeter circuit shown in the given figure, the basic D'Arsonval meter used has full-scale current of 1 mA and meter resistance (R_m) of 100 Ω. The values of series resistance R_1 and R_2 required for 10 V range and 50 V range will be



(a) 9.9 kΩ and 40 kΩ (b) 10 kΩ and 50 kΩ
(c) 20 kΩ and 30 kΩ (d) 200 kΩ and 250 kΩ
[U.P.S.C. I.E.S. E.E.-I, 1997]

145. Consider the following statements associated with moving iron instruments:
1. These can be used in dc as well as ac circuits.
2. The scale is non-uniform.
3. The moving iron is placed in a field of permanent magnet.
Which of these statements are correct ?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2002]

146. Eddy current damping cannot be used for moving iron instruments because
(a) weight of the instrument will increase.
(b) size of the instrument will increase.
(c) presence of permanent magnet will distort the magnetic field produced by the instrument and hence will affect its readings.
(d) eddy currents will pass through the iron thereby cause losses.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

147. The deflecting torque of a moving iron instrument is
(a) $I^2 \frac{dL}{d\theta}$ (b) $\frac{1}{2} I^2 \frac{dL}{d\theta}$
(c) $I \frac{dL}{d\theta}$ (d) $\frac{1}{2} I \frac{dL}{d\theta}$
[A.M.I.E. Sec B. Summer 1993]

148. The moving iron instruments
(a) indicate the same values of measurand for both ascending and descending values.
(b) indicate higher value of measurand for descending values.
(c) indicate lower value of measurand for ascending values.
(d) may indicate any of the higher or lower value of measurand for ascending or descending values.

149. Hysteresis error, in moving iron instruments, may be reduced by using
(a) mumetal or permalloy. (b) stainless steel.
(c) silver coating. (d) high speed steel.

150. An unshielded moving iron voltmeter is used to measure the voltage in an ac circuit. If a stray dc magnetic field having a component along the axis of the meter coil appears, the meter reading would be
(a) unaffected. (b) decreased.
(c) increased.
(d) either decreased or increased depending on the direction of the dc field. [GATE E.E. 1992]

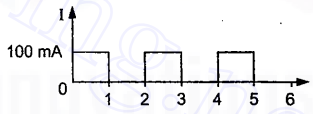
151. A spring-controlled moving iron voltmeter draws a current of 1 mA for full-scale value of 100 V. If it draws a current of 0.5 mA, the meter reading is
(a) 25 V (b) 50 V (c) 100 V (d) 200 V
[U.P.S.C. I.E.S. E.E.-I, 2002]

152. The inductance of a certain moving iron ammeter is expressed as $L = 10 + 3\theta - \theta^2/4$ μH, where θ is the deflection in radians from the zero position. The control spring torque is 25×10^{-6} Nm/radian. The deflection of the pointer in radians when the meter carries a current of 5 A, is
(a) 2.4 (b) 2.0 (c) 1.2 (d) 1.0
[GATE E.E. 2003]

153. A moving iron ammeter produces a full-scale torque of 240 μNm with a deflection of 120° at a current of 10 A. The rate of change of self inductance (μH/radian) of the instrument at full scale is
(a) 2.0 μH/radian. (b) 4.8 μH/radian.
(c) 12.0 μH/radian (d) 114.6 μH/radian.
[GATE E.E. 2004]

154. One of the control springs of a permanent magnet moving coil ammeter is broken. If connected in a circuit, the meter would read
(a) zero.
(b) half the correct value of the current.
(c) twice the correct value of the current.
(d) an indefinite figure. [U.P.S.C. I.E.S. E.E.-I, 1993]

155. A waveform shown in the figure, is fed to a dc ammeter. What is the reading shown by the meter?



(a) Zero (b) 50 mA
(c) 75 mA (d) 100 mA
[U.P.S.C. I.E.S. E.E.-I, 2008]

156. A PMMC 0–10 A ammeter is not provided with any controlling mechanism and the moving parts are free to rotate. If a current of 1 A dc is passed through the moving coil the instrument
(a) will read 1 A. (b) will read 10 A.
(c) pointer will continuously rotate.
(d) pointer will remain stationary.
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

157. An advantage of a PMMC instrument is that it is
(a) free from friction error.
(b) has high (torque/weight of the moving parts) ratio.
(c) has low (torque/weight of the moving parts) ratio.
(d) can be used on both ac and dc. [GATE E.E. 1996]

Answers: **142.** (a), **143.** (a), **144.** (a), **145.** (b), **146.** (c), **147.** (b), **148.** (b), **149.** (a), **150.** (d), **151.** (a), **152.** (c), **153.** (b), **154.** (a), **155.** (b), **156.** (b), **157.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

158. The term artificial aging in instrument is associated with
(a) springs. (b) permanent magnets.
(c) controlling torques. (d) damping.
[U.P.S.C. I.E.S. E.E.-I, 1992]

159. A PMMC voltmeter is connected across a series combination of a dc voltage source $V_1 = 2$ V and an ac voltage source $V_1 = 2$ V and an ac voltage source $V_2(t) = 3 \sin(4t)$ volts. The meter reads
(a) 2 V (b) 5 V
(c) $\left(2+\frac{\sqrt{3}}{2}\right)$V (d) $\frac{\sqrt{17}}{2}$ V [GATE E.E. 2005]

160. Moving iron and PMMC instruments can be distinguished from each other by looking at
(a) pointer. (b) terminal size.
(c) scale. (d) scale range.

161. The disadvantage of PMMC instrument is
(a) high power consumption.
(b) high cost relative to moving iron instruments.
(c) low torque/weight ratio.
(d) absence of effective and efficient eddy current damping.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

162. A high frequency ac signal is applied to a PMMC instrument. If the rms value of *ac* signal is 2V, the reading of the instrument will be
(a) zero. (b) 2 V. (c) $2\sqrt{2}$ V (d) $4\sqrt{2}$ V.
[U.P.S.C. I.E.S. E.E.-I, 1998]

163. In a PMMC instrument, if the control spring is replaced by another one having a higher spring constant, then the natural frequency and damping ratio will
(a) decrease.
(b) increase and decrease respectively.
(c) decrease and increase respectively.
(d) increase.
[U.P.S.C. I.E.S. E.E.-I, 2000]

164. A moving coil of a meter has 100 turns, and a length and depth of 10 mm and 20 mm respectively. It is positioned in a uniform radial flux density of 200 mT. The coil carries a current of 50 mA. The torque on the coil is
(a) 200 μNm. (b) 100 μNm.
(c) 2 μNm. (d) 1 μNm. [GATE E.E. 2004]

165. A sinusoidal voltage of 1 Vrms value at 10 Hz is applied across the two terminals of a PMMC type of voltmeter. What is the deflection of the pointer ?
(a) zero volt. (b) 1 V (c) $\sqrt{2}$ V
(d) The pointer oscillates around zero volt.
[U.P.S.C. I.E.S. E.E.-I, 2006]

166. Which of the following factors limit the deflection of the pointer of a PMMC instrument of about 90° ?
1. Its damping mechanism.
2. Linearity of the magnetic field in which the coil moves.
3. Control spring arrangement.
4. Shape of the pole shoe of the horseshoe magnet.
Select the correct answer using the code given below :
Code:
(a) Only 1 and 3. (b) Only 2 and 4.
(c) Only 2 and 3. (d) Only 1 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2006]

167. In a PMMC instrument, the central spring stiffness and the strength of the magnet decreases by 0.04% and 0.02% respectively due to a rise in temperature by 1°C. With a rise in temperature of 10°C, the instrument reading will
(a) increase by 0.2%. (b) decrease by 0.2%.
(c) increase by 0.6%. (d) decrease by 0.6%.
[U.P.S.C. I.E.S. E.E.-I, 1999]

168. A PMMC type ammeter and a moving iron type ammeter are connected in series in a resistive circuit fed from output of a half wave rectifier voltage source. If the moving iron type reads 5A, the PMMC type instrument is likely to read
(a) zero (b) 2.5 A (c) 3.18 A (d) 5 A
[U.P.S.C. I.E.S. E.E.-I, 1995]

169. The scale of a dynamometer type instrument marked in terms of rms value would be
(a) uniform through out.
(b) nonuniform crowded near full scale.
(c) nonuniform crowded at the beginning.
(d) nonuniform crowded around midscale.
[A.M.I.E. Sec B. Winter 1994]

170. In an electrodynamometer type instrument an astatic movement is provided in order to
(a) eliminate error owing to stray magnetic fields.
(b) provide damping torque.
(c) increase the instrument operating torque.
(d) eliminate temperature error.

171. In a dynamometer type moving coil instrument a swamping resistance is provided in order to
(a) control the deflecting torque.
(b) reduce the bulk of the moving system.
(c) reduce the current flowing through the moving coil.
(d) provide equal time constant for moving coil and fixed coil, when used for ac measurement.

172. Electrodynamometer type of instruments can be used to measure
(a) ac only. (b) dc only.
(c) both ac and dc. (d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

173. When a current $i(t) = 5 + 10 \cos 314\ t$ is measured by an electrodynamic ammeter, the meter will read
(a) $\sqrt{5+10^2}$ (b) $\sqrt{5^2+\frac{10^2}{2}}$
(c) $\sqrt{5^2+\left(\frac{10^2}{2}\right)^2}$ (d) $\sqrt{\frac{5^2+10^2}{2}}$
[U.P.S.C. I.E.S. E.E.-I, 1999]

174. Which one of the following statements is correct ?
The deflection of hot-wire instrument depends on
(a) rms value of the ac current. (b) rms value of the ac voltage.
(c) average value of the ac current.
(d) average value of the ac voltage. [U.P.S.C. I.E.S. E.E.-I, 2004]

175. The current flowing in a 20 Ω resistor is given by
$$i = 2 + 4 \sin 314t$$
This current is measured by a hot wire ammeter. What is the measured value ?
(a) 2 A (b) 3.46 A (c) 4 A (d) 2.83 A
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

176. Consider the following statements about hot-wire instruments:
1. They read equally well on dc and/or ac circuits.
2. They are simple and robust in construction and power consumption is low.
3. They are quite suitable for measurement of currents at very high frequencies.

Answers: **158.** (b), **159.** (a), **160.** (c), **161.** (b), **162.** (a), **163.** (b), **164.** (a), **165.** (d), **166.** (b), **167.** (a), **168.** (c), **169.** (c), **170.** (a), **171.** (d), **172.** (c), **173.** (b), **174.** (a), **175.** (b), **176.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Which of the above statements are correct?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

177. Which of the following statements is not correct for thermocouple measuring instruments ?
(a) They are very useful as transfer instruments.
(b) They are incapable of taking any overload.
(c) Power losses are very low.
(d) Their calibration does not change with time or temperature.

178. Which of the following are the characteristics of a thermocouple type of indicating instrument ?
1. Its accuracy is very high, as high as about 1 percent.
2. It has a linear scale because a d'Arsonval movement is used for measuring the output.
3. It is an RF instrument and can be used for frequency up to about 50 MHz.
4. It cannot be damaged by overloads.
Select the correct answer from the codes given below.
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2001]

179. Consider the following statements in respect of the thermoelectric instruments.
1. They indicate the rms value of current or voltage.
2. They suffer from waveform errors.
3. They can be used for frequency ranges of the order of MHz.
4. They have a low overload capacity.
Which of these statements are correct ?
(a) 1, 3, 4. (b) 1, 2 and 4.
(c) 1, 2 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

180. A thermocouple ammeter gives full scale deflection at 10A. When the meter reads one fifth of the scale, the current will be
(a) 2 A (b) 4 A (c) 4.47 A (d) 5.78 A
[U.P.S.C. I.E.S. E.E.-I, 1994]

181. A current of $[2 + \sqrt{2}\ \sin(314\,t + 30°) + 2\sqrt{2}\ \cos(942\,t + 45°)]$ is measured with a thermocouple type, 5A full-scale, class 1 meter. The meter reading would lie in the range
(a) 5 A ± 1% (b) $(2 + 3\sqrt{2})$ A ± 1%
(c) 3A ± 1.7% (d) 2A ± 2.5% [GATE E.E. 1999]

182. Rectifier moving coil instruments respond to
(a) peak value, irrespective of the nature of the waveform.
(b) average value, for all waveforms.
(c) rms value for all waveforms.
(d) rms value, for symmetrical square waveforms.
[U.P.S.C. I.E.S. E.E.-I, 1995]

183. An ac voltmeter using full-wave rectification and having a sinusoidal input has an ac sensitivity equal to
(a) 1.414 times dc sensitivity. (b) dc sensitivity.
(c) 0.9 times dc sensitivity. (d) 0.707 times dc sensitivity.
[U.P.S.C. I.E.S. E.E.-I, 2001]

184. A rectifier instrument is used to measure an alternating square wave of amplitude 100 V. What is the meter reading ?
(a) 100 V (b) 70.7 V (c) 111 V
(d) None of the above. [U.P.S.C. I.E.S. E.E.-I, 2006]

185. A 100 kV, 50 Hz supply is fed to a rectifier ammeter (using a bridge rectifier) through capacitor. The PMMC ammeter of the rectifier instrument reads 45×10^{-3} Amp. What is the value of the capacitor?
(a) 15.90×10^{-10} F (b) 15.90×10^{-12} F
(c) 17.66×10^{-9} F (d) 17.66×10^{-11} F
[U.P.S.C. I.E.S. E.E.-I, 2009]

186. The developed torque of an electrostatic voltmeter is given by
(a) $\frac{1}{2}I^2\frac{dL}{d\theta}$ (b) $I^2\frac{dM}{d\theta}$ (c) $\frac{1}{2}V^2\frac{dC}{d\theta}$ (d) $VI\frac{dC}{d\theta}$
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2003]

187. Which of the following meters does not exhibit square law response?
(a) Moving coil. (b) Moving iron.
(c) Electrodynamometer. (d) Hot wire instrument.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

188. Which one of the following instruments is commonly used to measure primary current of a transformer connected to mains ?
(a) Electrostatic meter. (b) Current transformer.
(c) Moving coil type meter. (d) Moving iron meter.
[U.P.S.C. I.E.S. E.E.-I, 2008]

189. A current of $-8 + 6\sqrt{2}\ (\sin \omega t + 30°)$ A is passed through three meters. They are a centre zero PMMC meter, a true rms meter and a moving iron instrument. The respective readings (in A) will be
(a) 8, 6, 10 (b) 8, 6, 8
(c) –8, 10, 10 (d) –8, 2, 2 [GATE E.E. 2006]

190. In an electrometer, the movable plate is 11cm in diameter. When 12 kV is applied between the movable plate and the fixed plate, the force is 0.006 N. The change in capacitance for 1.5 mm movement of the movable plate is
(a) 0.44×10^{-12} F (b) 0.37×10^{-6} F
(c) 0.125×10^{-12} F (d) 12.5×10^{-12} F
[U.P.S.C. I.E.S. E.E.-I, 2008]

191. For a given frequency, the deflecting torque of an induction ammeter is directly proportional to
(a) current^2. (b) current^3.
(c) $\sqrt{\text{current}}$. (d) current. [GATE E.E. 1996]

192. Induction type instruments are not usually used as ammeters and voltmeters because
(a) their indications are affected by stray magnetic field considerably.
(b) variation in supply frequency and temperature may cause serious errors unless compensating device is used.
(c) these instruments are costlier and consume more power in comparison to other instruments.
(d) both (b) and (c).

193. Decibel scale is useful while measuring voltages covering
(a) wide frequency ratio. (b) wide voltage ratio.
(c) narrow frequency range. (d) narrow voltage range.
[U.P.S.C. I.E.S. E.E.-I, 2003]

194. Error due to hysteresis is predominant in
(a) moving oil instruments. (b) moving iron instruments.
(c) hot-wire instruments.
(d) electrodynamometer instruments.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

195. To measure currents in the MHz range, we use instrument of
(a) moving iron type. (b) thermocouple type.
(c) electrodynamometer type. (d) rectifier type.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

196. Which one of the following types of instruments can be used to determine the rms values of *ac* voltage of high magnitude (10kV) and of any waveshape ?
(a) Moving iron instruments.
(b) Dynamometer type instruments.

Answers: **177.** (c), **178.** (d), **179.** (a), **180.** (c), **181.** (c), **182.** (b), **183.** (c), **184.** (a), **185.** (a), **186.** (c), **187.** (a), **188.** (d), **189.** (c), **190.** (c), **191.** (a), **192.** (d), **193.** (a), **194.** (b), **195.** (b), **196.** (d),

(c) Induction instruments. (d) Electrostatic instruments.
[U.P.S.C. I.E.S. E.E.-I, 2004]

197. Which of the following indicating instruments has/have linear scale ?
1. Moving iron meter. 2. PMMC meter.
3. Thermocouple meter. 4. Rectifier type meter.
Select the correct answer using code given below :
Code:
(a) Only 1 and 2 (b) Only 2 and 3
(c) Only 3 and 4 (d) Only 2
[U.P.S.C. I.E.S. E.E.-I, 2006]

198. Which of the following instruments will have poorest overloading capacity ?
(a) Moving coil instruments. (b) Induction type instruments.
(c) Permanent magnet instruments.
(d) Hotwire instruments.
[A.M.I.E. Sec B Instrumentation & Control Winter 1996]

199. Which of the following instrument is free from hysteresis and eddy current errors ?
(a) Moving iron instrument. (b) Electrostatic instrument.
(c) Moving coil permanent magnet type instrument.
(d) Moving coil dynamometer type instrument.
[U.P.S.C. I.E.S. E.E.-I, 1992]

200. Which voltmeter would you select for measuring 50,000 V direct current ?
(a) Moving coil voltmeter. (b) Hot wire voltmeter.
(c) Electrodynamometer. (d) Electrostatic voltmeter.
[U.P.S.C. I.E.S. E.E.-I, 1992]

201. What is the correct sequence of the following types of ammeters and voltmeters with increasing accuracy ?
1. Moving iron.
2. Moving coil permanent magnet.
3. Induction.
Select the correct answer using the codes given below.
Codes:
(a) 1, 3, 2 (b) 1, 2, 3 (c) 3, 1, 2 (d) 2, 1, 3
[U.P.S.C. I.E.S. E.E.-I, 2002]

202. To increase current measurement range of an ammeter, it is
(a) shunted by a high resistance.
(b) put in series with a high resistance.
(c) put in series with a low resistance.
(d) shunted by a low resistance.
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

203. How can a milliammeter be used as a voltmeter ?
(a) By connecting a low resistance in parallel with the instrument.
(b) By connecting a high resistance in parallel with the instrument.
(c) By connecting a low resistance in series with the instrument.
(d) By connecting a high resistance in series with the instrument.
[U.P.S.C. I.E.S. E.E.-I, 2008]

204. A moving coil instrument gives full-scale deflection for 1 mA and has a resistance of 5 Ω. If a resistance of 0·55 Ω is connected in parallel to the instrument, what is the maximum value of current it can measure ?
(a) 5 mA (b) 10 mA (c) 50 mA (d) 100 mA
[U.P.S.C. I.E.S. E.E.-I, 2006]

205. A galvanometer with a full-scale current of 10 mA has a resistance of 1000 Ω. The multiplying power (the ratio of measured current to galvanometer current) of a 100 Ω shunt with this galvanometer is
(a) 110 (b) 100 (c) 11 (d) 10
[GATE E.E. 2004]

206. A dc ammeter has a resistance of 0·1 Ω and its current range is 0–100 A. If the range is to be extended to 0–500 A, then meter requires the following shunt resistance
(a) 0·010 Ω (b) 0·011 Ω (c) 0·025 Ω (d) 1·0 Ω
[GATE E.E. 2005]

207. A D'Arsonavai galvanometer, 1 mA, 50 ohm to be converted to a 5 Amp-ammeter. What is the value of the shunt resistor, R_{sh} ?
(a) 10 ohm. (b) 1 ohm.
(c) 0.01 ohm. (d) 100 ohm.
[U.P.S.C. I.E.S. E.E.-I, 2009]

208. A 1 mA meter movement with an internal resistance of 100 Ω is to be converted into (0–100) mA. To achieve this, value of shunt resistance R_{sh} is given by
(a) 1 kΩ (b) 200 Ω (c) 1.01 Ω (d) 1.01 kΩ
[U.P.S.C. I.E.S. E.E.-I, 2010]

209. The value of a shunt resistance required to convert an ammeter of 1 mA with 100 Ω internal resistances into 0–100 mA ammeter is
(a) 2.2 Ω (b) 1.01 Ω (c) 1.2 Ω (d) 1.1 Ω
[U.P.S.C. I.E.S. E.E.-I, 2011]

210. An ammeter has a current range of 0–5 A, and its internal resistance is 0.2 Ω. In order to change the range to 0–25 A, we need to add a resistance of
(a) 0.8 Ω in series with the meter.
(b) 1.0 Ω in series with the meter.
(c) 0.04 Ω in parallel with the meter.
(d) 0.05 Ω in parallel with the meter. [GATE E.E. 2010]

211. The sensitivity of 200 μA meter movement when it is used as a dc voltmeter is given by
(a) 500 Ω/mV (b) 5 Ω/V
(c) 0.5 Ω/mV (d) 5 Ω/mV
[U.P.S.C. I.E.S. E.E.-I, 2010]

212. What is the series resistance required to extend the 0–100 V range of a 20,000 Ω/V meter to 0-1000 V ?
(a) 10 MΩ (b) 16 MΩ (c) 18 MΩ (d) 20 MΩ
[U.P.S.C. I.E.S. E.E.-I, 2006]

213. The value of the multiplier resistance for a dc voltmeter, having 50 V range with 5 kΩ/V sensitivity, employing a 200 μA meter movement and having internal resistance of 100 Ω, is given by
(a) 249.9 kΩ (b) 200 Ω
(c) 200 kΩ (d) 2.5 kΩ
[U.P.S.C. I.E.S. E.E.-I, 2010]

214. A basic D'Arsonval movement with a full scale deflection of 50 μA and internal resistance of 500 Ω is used as voltmeter. The value of the multiplier resistance needed to employ this meter to measure a voltage range of (0–10) V is given by
(a) 100 kΩ (b) 500 kΩ
(c) 199.5 kΩ (d) 2×10^5 kΩ
[U.P.S.C. I.E.S. E.E.-I, 2010]

215. A moving coil ammeter having a resistance of 1 ohm gives full-scale deflection when a current of 10 mA is passed through it. The instrument can be used for the measurement of voltage up to 10 V by
(a) connecting a resistance of 999 ohm in series with the instrument.
(b) connecting a resistance of 999 ohm parallel to the ammeter.
(c) connecting a resistance of 999 ohm parallel to the load.
(d) connecting a resistance of 1000 ohm in series with the load.
[U.P.S.C. I.E.S. E.E.-I, 2010]

216. A d'Arsonval movement with internal resistance R = 100 Ω and full-scale current of 1 mA is to be converted into (0–10 V) range. What is the required resistance ?

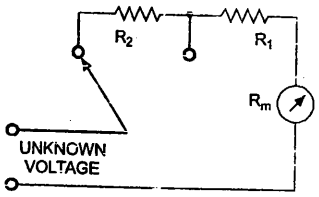
Answers: **197.** (d), **198.** (d), **199.** (b), **200.** (d), **201.** (c), **202.** (d), **203.** (d), **204.** (b), **205.** (c), **206.** (c), **207.** (c), **208.** (c), **209.** (b), **210.** (d), **211.** (d), **212.** (c), **213.** (a), **214.** (c), **215.** (a), **216.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 10 kΩ (b) 10,100 Ω
(c) 9,900 Ω (d) 12,000 Ω
[U.P.S.C. I.E.S. E.E.-I, 2004]

217. For the voltmeter circuit shown in the given figure, the basic D'Arsonval meter used has full-scale current of 1 mA and meter resistance (R_m) of 100 Ω. The values of series resistance R_1 and R_2 required for 10 V range and 50 V range will be



(a) 9.9 kΩ and 40 kΩ (b) 10 kΩ and 50 kΩ
(c) 20 kΩ and 30 kΩ (d) 200 kΩ and 250 kΩ
[U.P.S.C. I.E.S. E.E.-I, 1997]

218. The value of multiplier resistor for a 10 V_{rms} (ac) range on a voltmeter with an ideal diode and a PMMC meter of full-scale deflection 1 mA and a resistance of 200 Ω
(a) 430 Ω (b) 4300 Ω (c) 450 Ω (d) 4500 Ω
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

219. The primary current in a CT is dictated by
(a) the secondary burden. (b) the core of the transformer.
(c) the load current. (d) none of the above.
[GATE E.E. 1997]

220. The secondary of a CT is never left open-circuited because otherwise
(a) heat dissipation in the core will be very large.
(b) the core will be saturated and permanently magnetised rendering it useless.
(c) dangerously high emfs will be induced in the secondary.
(d) all of the above.

221. Consider the following statements regarding the causes of error in current transformers.
1. Some exciting mmf is required by the primary winding to produce a flux.
2. The flux density in the core is not a linear function of the magnetising force.
3. There is some magnetic leakage in the secondary winding.
4. There is significant power consumption in the metering circuit.

Of these statements
(a) 1 and 2 are correct. (b) 1, 2 and 3 are correct.
(c) 2 and 4 are correct. (d) 1, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1995]

222. Consider the following statements :
A current transformer is used for measurement of large currents to
1. isolate the instrument from a high voltage bus bar.
2. increase the accuracy of measurement.
3. decrease the cost of measuring arrangements.
4. extend the range of measurement of a conventional ammeter on ac.

Which of these statements are correct ?
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-I, 1999]

223. Instrument transformers are known to introduce magnitude and phase errors in measurements. These are primarily due to
(a) improper connections on the primary side.
(b) measurement errors inherent in the meter connected to the transformer secondary
(c) open and short circuit parameters of the instrument transformers.
(d) none of the above. [GATE E.E. 2000]

224. A current transformer has a phase error of 3°. The phase angle between the primary and secondary currents is
(b) 3° (b) 177° (c) 180° (d) 183°
[U.P.S.C. I.E.S. E.E.-I, 1997]

225. A 500/5 A, 50 Hz current transformer has a bar primary. The secondary burden is a pure resistance of 1 Ω and it draws a current of 5 A. If the magnetic core requires 250 AT for magnetization the percentage ratio error is
(a) 10.56 (b) −10.56 (c) 11–80 (d) −11-80
[GATE E.E. 2003]

226. A 200/1 Current Transformer (CT) is wound with 200 turns on the secondary on a toroidal core. When it carriers a current of 160 A on the primary, the ratio and phase errors of the CT are found to be −0.5% and 30 minutes respectively. If the number of secondary turns is reduced by 1 the new ratio error (%) and phase error (min) will be respectively
(a) 0.0, 30 (b) −0.5, 35 (c) −1.0, 30 (d) −1.0, 25
[GATE E.E. 2006]

227. A 50 Hz, bar primary CT has a secondary with 500 turns. The secondary supplies 5 A current into a purely resistive burden of 1 Ω. The magnetizing ampere turns is 200. The phase angle between the primary and secondary currents is
(a) 4.6° (b) 85.4° (c) 94.6° (d) 175.4°
[GATE E.E. 2004]

228. The core flux in the CT of problem 203, under the given operating condition is
(a) 0 (b) 45.0 μWb
(c) 22.5 mWb (d) 100.0 mWb [GATE E.E. 2004]

229. What is clamp-on ammeter used for ?
(a) Low ac current. (b) High ac current.
(c) Low dc current. (d) High dc current.
[U.P.S.C. I.E.S. E.E.-I, 2008]

230. In case of a PT with the increase in load on secondary side
(a) both of the ratio error and phase angle increase.
(b) the ratio error increases but phase angle decreases.
(c) the ratio error decreases but phase angle increases.
(d) both of the ratio error and phase angle error decrease.

231. The moving coil in a dynamometer wattmeter is connected
(a) in series with the fixed coil. (b) across the supply.
(c) in series with the load. (d) across the load.
[GATE E.E. 1993]

232. Dynamometer type wattmeters are suitable for
(a) both ac and dc circuits. (b) only ac circuits.
(c) only dc circuits. (d) only high voltage ac circuits.
[A.M.I.E. Sec B. Measurements and Control Winter 2006]

233. The pressure coil of a dynamometer type wattmeter is
(a) highly inductive. (b) highly resistive.
(c) purely resistive. (d) purely inductive.
[GATE E.E. 2009]

234. In a statement "the wattmeter commonly used for power measurement at commercial frequencies is of the X type. This meter consists of two coil systems, the fixed system being the Y coil and the moving system being the Z coil " X, Y and Z stand respectively for
(a) dynamometer, voltage and current.
(b) dynamometer, current and voltage.
(c) induction, voltage and current.
(d) induction, current and voltage. [U.P.S.C. I.E.S. E.E.-I, 1994]

235. A dynamometer type wattmeter responds to the
(a) average value of active power.
(b) average value of reactive power.

Answers: **217.** (a), **218.** (b), **219.** (c), **220.** (d), **221.** (d), **222.** (d), **223.** (c), **224.** (b), **225.** (b), **226.** (a), **227.** (a), **228.** (b), **229.** (b), **230.** (a), **231.** (b), **232.** (a), **233.** (b), **234.** (b), **235.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

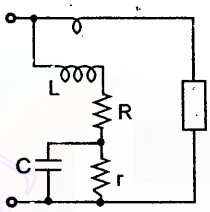
(c) peak value of active power.
(d) peak value of reactive power. [GATE E.E. 1997]

236. Which one of the following is the correct statement ?
Due to inductance in the pressure coil the dynamometer wattmeter
(a) reads low on lagging pf and high on leading pf.
(b) reads high on lagging pf and low on leading pf.
(c) reading is not affected at all.
(d) always reads low. [U.P.S.C. I.E.S. E.E.-I, 2007]

237. Due to the effect of inductance in the pressure coil, a dynamometer type wattmeter
(a) reads low on lagging power factor and high on leading power factor.
(b) reads high on lagging power factor and low on leading power factor.
(c) reading is independent of the power factor.
(d) always reads lower than the actual value.
[U.P.S.C. I.E.S. E.E.-I, 2011]

238. In a low pf wattmeter the compensating coil is connected
(a) in series with the current coil.
(b) in series with the pressure coil.
(c) across the current coil. (d) across the potential coil.

239. Electrodynamic pressure coil is compensated for error caused by inductance of pressure coil by means of a capacitor connected in parallel with a portion of series resistance as shown in the figure. The condition for making the pressure coil circuit non-inductive is



(a) $L = C R^2$ (b) $C = L r^2$
(c) $L = C r^2$ (d) $C = L R^2$ [U.P.S.C. I.E.S. E.E.-I, 1993]

240. A capacitor is connected across a portion of resistance of the multiplier in order to make the pressure coil circuit of the wattmeter non-inductive. The value of this resistance is r while the total resistance and inductance of the pressure circuit are respectively R_p and L. The value of the capacitance C is

(a) $\frac{L}{R_p^2}$ (b) $\frac{0.41L}{r^2}$ (c) $\frac{L}{r^2}$ (d) $\frac{0.41L}{R_p^2}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

241. Consider the following statements:
(i) The compensating coil of a low power factor wattmeter compensates the effect of the impedance of the current coil.
(ii) The compensating coil of a low power factor wattmeter compensates the effect of the impedance of the voltage coil circuit.
(a) (i) is true but (ii) is false. (b) (i) is false but (ii) is true.
(c) both (i) and (ii) are true. (d) both (i) and (ii) are false.
[GATE E.E. 2011]

242. In a low power factor wattmeter, why is a compensating coil employed ?
(a) To neutralize the capacitive effect of pressure coil.
(b) To compensate for inductance of pressure coil.
(c) To compensate for the error caused by power loss in the pressure coil.
(d) To compensate for the error caused by eddy currents.
[U.P.S.C. I.E.S. E.E.-I, 2007]

243. The error caused by pressure coil inductance in a wattmeter is compensated by connecting a
(a) capacitor across a part of series resistance in the pressure coil circuit.
(b) capacitor in series with the series resistance in the pressure coil circuit.
(c) capacitor across a part of a series inductor in the pressure coil circuit.
(d) capacitor in series withe the series inductor in the pressure coil circuit.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

244. Electrodynamic type wattmeter have large errors while measuring power in ac circuits at low power factor conditions, since the voltage across and the current through the
(a) current coil are not in phase.
(b) current coil are not in quadrature.
(c) pressure coil are not in phase.
(d) pressure coil are not in quadrature. [GATE E.E. 1999]

245. The current and potential coils of a wattmeter were accidentaly interchanged while connecting. After energising the circuit, it was observed that the wattmeter did not show the reading. This could be due to
(a) damage to the potential coil. (b) damage to the current coil.
(c) damage to both potential and current coils.
(d) loose contact. [U.P.S.C. I.E.S. E.E.-I, 1993]

246. The current and potential coils of a dynamometer type wattmeter were accidentally interchanged while connecting. After energizing the circuit, it was observed that the wattmeter did not show the reading. This could be due to the
(a) damage to potential coil.
(b) damage to current coil.
(c) damage to both the potential and current coil.
(d) loose contacts. [U.P.S.C. I.E.S. E.E.-I, 2011]

247. The magnetic field responsible for the production of the deflecting torque in an accurate dynamometer type wattmeter, being very weak, the accuracy of the measurement can be increased by providing a
(a) Magnetic shield around the instrument.
(b) Compensating winding along with the pressure coil.
(c) Astatic arrangement to the moving system of the instrument.
(d) Capacitance shunt across a portion of the pressure coil.
[U.P.S.C. I.E.S. E.E.-I, 2011]

248. Which one of the following methods decreases the error due to connections in a dynamometer type wattmeter ?
(a) Using bifilar compensating winding in place of current coil.
(b) Using non-inductive pressure coil circuit.
(c) Using a capacitor across a part of high resistance of pressure coil circuit.
(d) Using a swamping resistance. [U.P.S.C. I.E.S. E.E.-I, 2004]

249. How can the power supplied to a frequency heating system be measured?
(a) By dynamometer wattmeter.
(b) By induction wattmeter.
(c) By thermocouple type wattmeter.
(d) By moving iron ammeter and voltmeter.
[U.P.S.C. I.E.S. E.E.-I, 2009]

250. Two types of connections of wattmeter pressure coil are shown in the figures.
The value of the wattmeter current coil resistance r, which makes the connection error the same in the two cases is

Answers: **236.** (b), **237.** (b), **238.** (b), **239.** (c), **240.** (c), **241.** (b), **242.** (c), **243.** (a), **244.** (c), **245.** (b), **246.** (b), **247.** (c), **248.** (a), **249.** (c), **250.** (c),

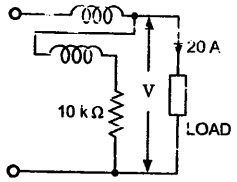
TYPE I

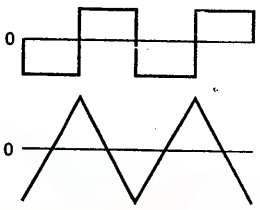


TYPE II

(a) 00.5 Ω (b) 0.1 Ω (c) 0.01 Ω (d) 0.125 Ω
[U.P.S.C. I.E.S. E.E.-I, 2002]

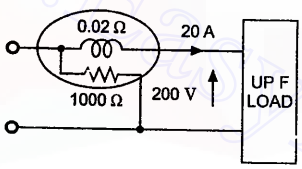
251. The expression for mean torque T of an electrodynamic wattmeter can be expressed as $T \alpha M^a V^b Z^c$, where M is mutual inductance between fixed and moving coils, V is applied voltage and Z is impedance of coil. What are the values of the constants a, b and c?
(a) $a = 1, b = 2$ and $c = -2$ (b) $a = 1, b = 1$ and $c = -1$
(c) $a = 1, b = -2$ and $c = 2$ (d) $a = 2, b = 2$ and $c = -1$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

252. A sampling wattmeter (that computes power from simultaneously sampled values of voltage and current) is used to measure the average power of a load. The peak to peak voltage of the square wave is 10 V and the current is a triangular wave of 5A p-p as shown in the figure. The period is 20 ms. The reading in W will be



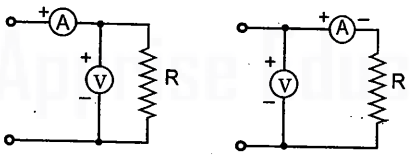
(a) 0 W (b) 25 W (c) 50 W (d) 100 W
[GATE E.E. 2006]

253. The circuit given in the figure is used to measure the power consumed by the load. The current coil and the voltage coil of the wattmeter has 0.02 Ω and 1000 Ω resistances respectively. The measured power compared to the load power will be



(a) 0.4% less. (b) 0.2% less.
(c) 0.2% more. (d) 0.4% more. [GATE E.E. 2004]

254. The power in a resistor R is estimated by measuring the voltage and current using the volt-ammeter method. Two different arrangements can be used as shown in circuits I and II. Less erroneous results are obtained by adopting.



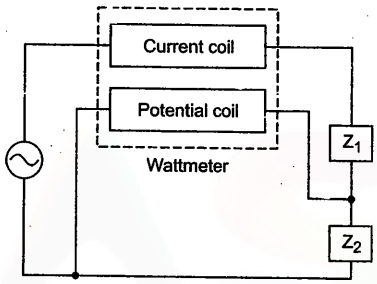
(a) circuit I for low value of R. (b) circuit II for low value of R.
(c) circuit I for high value of R.
(d) circuit II for low and high values. [U.P.S.C. I.E.S. E.E.-I, 1993]

255. Consider the following statements regarding measurement of power in single phase ac circuits :
It is possible to measure power without using a wattmeter by
1. using one voltmeter and one ammeter.
2. using two voltmeters and two ammeters.
3. using three voltmeters. 4. using three ammeters.
Of these statements
(a) 1 and 2 are correct. (b) 2 and 3 are correct.
(c) 3 and 4 are correct. (d) 1 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

256. Three voltmeters, used for a single phase power measurement, gave the following readings :
$V_1 = 200$ V across an inductive load, $V_2 = 180$ V across non-inductive resistor and $V_1 = 300$ V across the two in series. What is the factor of the load ?
(a) 0.3 (b) 0.246 (c) 0.8 (d) 0.75
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

257. In the power measurement by ammeter-voltmeter method, if the voltmeter is connected across the load, then the value of the power will be
(a) the power consumed by the load.
(b) the sum of power consumed by the load and ammeter.
(c) the sum of power consumed by the load and voltmeter.
(d) the sum of power consumed by the load, ammeter and voltmeter. [U.P.S.C. I.E.S. E.E.-I, 2011]

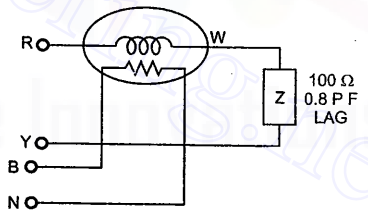
258. A wattmeter is connected as shown in the figure. The wattmeter reads



(a) zero always.
(b) total power consumed by Z_1 and Z_2.
(c) power consumed by Z_1.
(d) power consumed by Z_2. [GATE E.E. 2010]

259. The current through the current coil of a wattmeter is given by $i = (1 + 2\sin \omega t)$ A and the voltage across the pressure coil is $v = (2 + 3 \sin 2\omega t)$ V. The wattmeter will read
(a) 8.00 W (b) 5.05 W (c) 2.0 W (d) 1.0 W
[U.P.S.C. I.E.S. E.E.-I, 1998]

260. A single-phase load is connected between R and Y terminals of a 415 V, symmetrical 3-phase, 4-wire system with phase sequence RYB. A wattmeter is connected in the system as shown in the figure. The power factor of the load is 0.8 lagging. The wattmeter will read



(a) − 795 W (b) − 597 W
(c) + 597 W (d) + 795 W [GATE E.E. 2004]

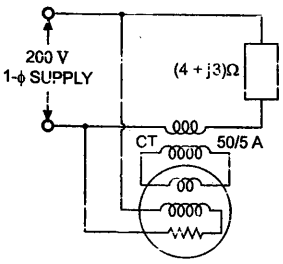
261. In calibration of dynamometer wattmeter by potentiometer, phantom loading arrangement is used because
(a) the arrangement gives accurate results.
(b) the power consumed in calibration work is minimum.
(c) the method gives quick results.
(d) the on site calibration is possible. [U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **251.** (a), **252.** (a), **253.** (c), **254.** (a), **255.** (c), **256.** (b), **257.** (c), **258.** (d), **259.** (c), **260.** (b), **261.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

262. In the circuit shown in the given figure, the wattmeter reading will be



(a) 480 W (b) 640 W
(c) 800 W (d) 1000 W

[U.P.S.C. I.E.S. E.E.-I, 1999]

263. The minimum number of wattmeter(s) required to measure 3-phase 3-wire balanced or unbalanced power is

(a) 1 (b) 2 (c) 3 (d) 4

[GATE E.E. 2001]

264. The two wattmeter method is used to measure active power on a three-phase, three-wire system. If the phase voltage is unbalanced, then the power reading is

(a) affected by both negative sequence and zero sequence voltages.
(b) affected by negative sequence voltages but not by zero sequence voltages.
(c) affected by zero sequence voltages but not by negative sequence voltages.
(d) not affected by negative or zero sequence voltages.

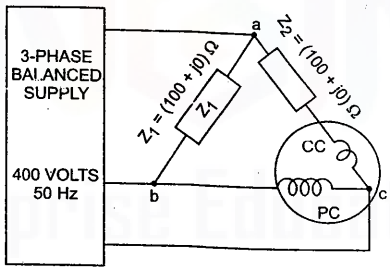
[GATE E.E. 2000]

265. In the case of power measurements by the two wattmeter method in a balanced 3-phase system with a pure inductive load,

(a) both the wattmeters will indicate the same value but of opposite sign.
(b) both the wattmeters will indicate zero.
(c) both the wattmeters will indicate the same value and of the same sign.
(d) one wattmeter will indicate zero and the other will indicate some non zero value.

[U.P.S.C. I.E.S. E.E.-I, 1997]

266. The figure shows a three-phase delta connected load supplied from a 400 V, 50 Hz, 3-phase balanced source. The pressure coil (PC) and current coil (CC) of a wattmeter are connected to the load as shown, with the coil polarities suitably selected to ensure a positive deflection. The wattmeter reading will be



(a) 0 (b) 1,600 W
(c) 800 W (d) 400 W [GATE E.E. 2009]

267. If the power factor is below 0.5 in two wattmeter method of power measurement

(a) one of the wattmeter will give negative deflection.
(b) both the wattmeters will give negative deflection.
(c) both the wattmeters will give positive deflection.
(d) both the wattmeters will not give any deflection.

[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

268. Consider the following statements regarding measurement of 3-phase power by two-wattmeter method; one of the wattmeter reads negative implying:

1. Power factor is less than 0.5.
2. Power flow is in the reverse direction.
3. Load power factor angle is greater than 60°.
4. Load is unbalanced.

Which of the above statements are correct?

(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2010]

269. In the measurement of power on balanced load by two-wattmeter method in a 3-phase circuit, the readings of the wattmeters are 3 kW and 1 kW respectively, the latter being obtained after reversing the connections of the current coil. The pf of the load is

(a) 0.277 (b) 0.554 (c) 0.625 (d) 0.866

[U.P.S.C. I.E.S. E.E.-I, 2002]

270. If the readings of the two wattmeters are equal and positive in two wattmeter method, the load pf in a balanced 3-phase 3-wire circuit will be

(a) zero (b) 0.5 (c) 0.866 (d) unity

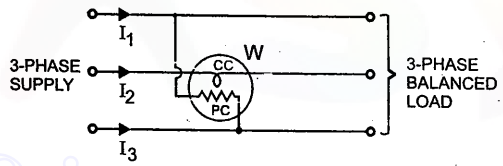
[U.P.S.C. I.E.S. E.E.-I, 1999]

271. The power of a three-wire balanced system was measured by two wattmeter method. The reading of one of the wattmeter was found to be double that of the other. What is the *pf* of the system ?

(a) 1.0 (b) 0.866 (c) 0.707 (d) 0.5

[U.P.S.C. I.E.S. E.E.-I, 2004]

272. An electrodynamometer type wattmeter is connected (as shown in the given figure) in a 3-phase supply and having a 3-phase balanced load, E and I are the values of phase voltage and current and Φ is the phase angle between them. The wattmeter reading will be



(a) proportional to EI sin Φ. (b) proportional to EI cos Φ.
(c) proportional to EI tan Φ. (d) zero. [U.P.S.C. I.E.S. E.E.-I, 1996]

273. A wattmeter reads 400 W when its current coil is connected in the R phase and its pressure coil is connected between this phase and the neutral of a symmetrical 3-phase system supplying a balanced star connected 0.8 pf inductive load. The phase sequence is RYB. What will be the reading of this wattmeter if its pressure coil alone is reconnected between the B and Y phases, all other connections remaining as before ?

(a) 400.0 (b) 519.6 (c) 300.0 (d) 692.8

[GATE E.E. 2002]

274. The voltage coil of a single phase house energy meter

(a) is highly resistive. (b) is highly inductive.
(c) is highly capacitive.
(d) has a phase angle equal to load power factor angle.

[U.P.S.C. I.E.S. E.E.-I, 2006]

275. Consider the following statements associated with an energy meter:

1. It is an integrating type instrument.
2. It is an induction type instrument.
3. It uses a permanent magnet for rotation of aluminium disc.
4. It employs a high control torque.

Which of these statements are correct?

(a) 1, 2, 3 and 4. (b) 1 and 2 only.
(c) 2 and 3 only. (d) 3 and 4 only.

[U.P.S.C. I.E.S. E.E.-I, 2011]

Answers: **262.** (b), **263.** (b), **264.** (d), **265.** (a), **266.** (c), **267.** (a), **268.** (c), **269.** (a), **270.** (d), **271.** (b), **272.** (a), **273.** (b), **274.** (b), **275.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

276. Holes are drilled on the opposite sides of the disc of an induction type energy meter to
(a) avoid creep on no load. (b) balance the disc.
(c) dissipate the energy due to eddy currents.
(d) increase the deflecting torque. [U.P.S.C. I.E.S. E.E.-I 1994]

277. Which one of the following is the main cause of creeping in the induction type energymeters ?
(a) Friction compensation. (b) Lag/Lead compensation.
(c) Overload compensation.
(d) Braking torque producing system. [U.P.S.C. I.E.S. E.E.-I, 2007]

278. In a single-phase induction type energy meter, the lag adjustment is done to ensure that
(a) current coil flux lags the applied voltage by 90°.
(b) pressure coil flux lags the applied voltage by 90°.
(c) pressure coil flux is in phase with the applied voltage.
(d) current coil flux lags the pressure coil flux by 90°.
[U.P.S.C. I.E.S. E.E.-I, 2000]

279. If an induction type energy meter runs fast, it can be slowed down by
(a) lag adjustment. (b) light load adjustment.
(c) adjusting the position of braking magnet and moving it closer to the centre of the disc.
(d) adjusting the position of the braking magnet and moving it away from the centre of the disc. [U.P.S.C. I.E.S. E.E.-I, 2001]

280. The speed of the meter disc on full load is kept the lowest possible in order to
(a) reduce friction error. (b) reduce eddy current loss.
(c) reduce self braking torque. (d) all of the above.

281. The braking torque provided by a permanent magnet in a single phase induction type energy meter can be varied by
(a) changing the position of the magnetic shunt provided for this purpose.
(b) changing the position of brake magnet with respect to the meter disc.
(c) both (a) and (b). (d) none of the above.

282. Consider following statements :
A 'phantom' load used while testing a high capacity energy meter
1. consists of inductances and capacitances so that there is no energy loss during testing.
2. saves energy during testing because its value changes very rapidly from the highest to the lowest, thus enabling quick measurement.
3. involves supplying the voltage circuit with the required voltage and the current circuit from a separate low voltage supply.
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 1 and 3 are correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1996]

283. A dc A–h meter is rated for 15 A, 250 V. The meter constant is 14.4 A–s/rev. The meter constant at rated voltage may be expressed as
(a) 3750 rev/kWh. (b) 3600 rev/kWh.
(c) 1000 rev/kWh. (d) 960 rev/kWh. [GATE E.E. 2004]

284. A single phase energy meter is operating on 230 V, 50 Hz supply with a load of 20 A for 2 hours at unity power factor. The meter makes 1,380 revolutions in that period. The meter constant is
(a) 695 rev/kWh. (b) 150 rev/kWh.
(c) 0.15 rev/kWh. (d) $\frac{1}{150}$ rev/kWh.
[U.P.S.C. I.E.S. E.E.-I 1996]

285. If an energy meter disc makes 10 revolutions in 100 seconds when a load of 450 W is connected to it, the meter constant (in rev/kWh) is
(a) 1000 (b) 500 (b) 1600 (d) 800
[GATE E.E. 2001]

286. A 230 V, 10 A single phase energy meter makes 90 revolutions in 3 minutes at half load, rated voltage and unity pf. If the meter constant is 1,800 revolutions per kWh, then its error at half load will be
(a) 13.04% slow. (b) 13.04% fast.
(c) 15% slow. (d) 15% fast.
[U.P.S.C. I.E.S. E.E.-I, 1997]

287. An energy meter having a meter constant of 1,200 rev per kWh is found to make 5 revolutions in 75 seconds. The load power is
(a) 500 W (b) 100 W (c) 200 W (d) 1,000 W
[U.P.S.C. I.E.S. E.E.-I, 2002]

288. The disc of a house service energy meter of 230 V, 1 ϕ, 5 A, 2400 rev per kWh creeps at 1 rev per min. The creep error (in percent) of full load unity pf is
(a) $+\frac{60}{2400}\times 100$ (b) $-\frac{60}{2400}\times 100$
(c) $+\frac{60}{115\times 2400}\times 100$ (d) $\frac{-60}{115\times 2400}\times 100$
[U.P.S.C. I.E.S. E.E.-I, 1999]

289. The voltage-flux adjustment of a certain 1-phase 220 V induction watt-hour meter is altered so that the phase angle between the applied voltage and the flux due to it is 85° (instead of 90°). The errors introduced in the reading of this meter when the current is 5A at pf of unity and 0.5 lagging are respectively
(a) 3.8 mW, 77.4 mW (b) – 3.8 mW, –77.4 W
(c) – 4.2 W, – 85.1 W (d) 4.2 W, 85.1 W
[GATE E.E. 2003]

290. An energy meter connected to an immersion heater (resistive) operating on an ac 230 V, 50 Hz, ac single phase source reads 2.3 units (kWh) in one hour. The heater is removed from the supply and now connected to a 400 V peak-to-peak square wave source of 150 Hz. The power in kW dissipated by the heater will be
(a) 3.478 (b) 1.739 (c) 1.540 (d) 0.870
[GATE E.E. 2006]

291. A Merz price demand indicator indicates
(a) average maximum demand over a specified period of time.
(b) maximum demand.
(c) maximum energy consumption.

292. In a vibrating reed type frequency meter, all the reeds
(a) are of identical dimensions and weight.
(b) have different natural frequencies.
(c) have the same natural frequencies.
(d) are not placed closed to an electromagnet.
[U.P.S.C. I.E.S. E.E.-I, 2011]

293. Which one of the following frequency meter is suitable for measuring radio frequency ?
(a) Vibrating reed frequency meter.
(b) Weston frequency meter.
(c) Electrical resonance frequency meter.
(d) Heterodyne frequency meter. [U.P.S.C. I.E.S. E.E.-I, 2005]

294. Which one of the following is used for the measurement of 3-phase power factor?
(a) Power factor meter. (b) Crossed-coil power factor meter.
(c) Phase-angle watt hour meter.
(d) Polarised-vane power factor meter. [U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **276.** (a), **277.** (a), **278.** (b), **279.** (d), **280.** (c), **281.** (c), **282.** (d), **283.** (c), **284.** (b), **285.** (d), **286.** (c), **287.** (c), **288.** (c), **289.** (c), **290.** (b), **291.** (a), **292.** (b), **293.** (d), **294.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

295. Which of the following statements are correct in case of a power factor meter ?
1. The deflection is proportional to the phase angle between field coil and crossed coil.
2. The restoring torque is provided by a controlling torque.
3. It consists of two coils mounted at right angles to each other.

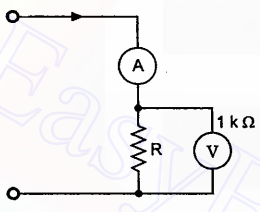
Select the correct answer using the code given below :
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

296. Consider the following statements regarding the controlling torque:
1. It is not present in power factor meter.
2. It opposes the deflecting torque.
3. It is provided by air friction or by fluid friction.

Which of these statements are correct?
(a) 1, 2 and 3. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2011]

297. Which of the following statements is correct?
(a) Dynamometer type synchroscope is more commonly used as it is more accurate than moving iron type.
(b) The moving iron synchroscope is more commonly used as it is cheap in cost, robust in construction and suitable for continuous operation.
(c) Weston type synchroscope is more commonly used as it is cheap in cost and robust in construction.
(d) none of the above.

298. In the circuit shown in the figure, if the ammeter indicates 1 A, and the voltmeter having an internal resistance of 1 kΩ indicates 100 V, then the value of R would be



(a) 111.11 Ω (b) 105.2 Ω
(c) 100 Ω (d) 90.9 Ω
[U.P.S.C. I.E.S. E.E.-I, 1998]

299. Low resistors are provided with four terminals in order to
(a) eliminate the thermoelectric emf effect.
(b) facilitate the connection of current and voltage circuits.
(c) make the resistance value definite irrespective of the nature of contacts at the current terminals.
(d) eliminate the effect of connecting leads.

300. R_1 and R_4 are the opposite arms of a Wheatstone bridge as are R_3 and R_2. The source voltage is applied across R_1 and R_3. Under balanced conditions which one of the following is true?

(a) $R_1 = \frac{R_3 R_4}{R_2}$ (b) $R_1 = \frac{R_2 R_3}{R_4}$

(c) $R_1 = \frac{R_2 R_4}{R_3}$ (d) $R_1 = R_2 + R_3 + R_4$

[GATE E.E. 2006]

301. For low resistance (from few micro ohms to one ohm) measurement, which bridge is used ?
(a) Wheatstone bridge. (b) Kelvin bridge.
(c) Guarded Wheatstone bridge.
(d) Maxwell bridge. [U.P.S.C. I.E.S. E.E.-I, 2008]

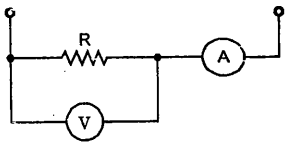
302. Which one of the following bridges will be used for the measurement of very low resistance?
(a) Kelvin bridge. (b) Maxwell's bridge.
(c) Wheatstone bridge. (d) Hay's bridge.
[U.P.S.C. I.E.S. E.E.-I, 2009]

303. The accuracy of Kelvin's double bridge for the measurement of low resistance is high because the bridge
(a) uses two pairs of resistance arms.
(b) has medium value resistances in the ratio arms.
(c) uses a low resistance link between standard and test resistances.
(d) uses a null indicating galvanometer. [U.P.S.C. I.E.S. E.E.-I, 2002]

304. In a Kelvin's double bridge two sets of readings are taken when measuring low resistance, one with current in one direction and the other with direction of current reversed. This is done to
(a) eliminate the effect of contact resistance.
(b) eliminate the effect of resistance of leads.
(c) correct for the effect of changes in battery voltage.
(d) eliminate the effect of thermoelectric emfs.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

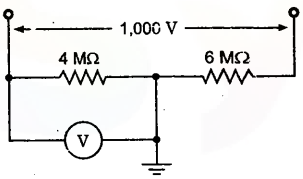
305. A resistor R is measured using the V-I method, with V read as 10.14 V and I as 5.07 mA. Which one of the following expresses the value of resistance ?
(a) 2 kΩ (b) 2.00 kΩ (c) 2000 Ω (d) 2.0 kΩ
[U.P.S.C. I.E.S. E.E.-I, 2004]

306. The set-up in the figure is used to measure resistance R. The ammeter and voltmeter resistances are 0·01 Ω and 2,000 Ω respectively. The readings are 2 A and 180 V respectively, giving a measured resistance of 90 Ω. The percentage error in the measurement is



(a) 2.25% (b) 2.35% (c) 4.5% (d) 4.71%
[GATE E.E. 2005]

307. A 1,000 V dc supply has two 1-core cables as its positive and negative leads; their insulation resistance to earth are 4 MΩ and 6 MΩ, respectively as shown in the figure. A voltmeter with resistance 50 kΩ is used to measure the insulation of the cable. When connected between the positive core and earth, then voltmeter reads



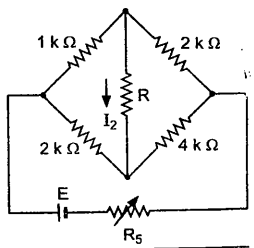
(a) 8 V (b) 16 V (c) 24 V (d) 40 V
[GATE E.E. 2005]

308. A Wheatstone bridge cannot be employed for measurement of very low resistance as it introduces error on account of
(a) contact resistance. (b) resistance of connecting leads.
(c) thermoelectric emfs. (d) all of the above.

309. In measurement of resistance by Carey Foster bridge no error is introduced due to
(a) contact resistance. (b) connecting leads.
(c) thermoelectric emfs. (d) all of these.

310. The sensitivity of a Wheatstone bridge depends upon
(a) galvanometer current sensitivity.
(b) galvanometer resistance.
(c) bridge supply voltage. (d) all of the above.

311. A bridge is shown in the given figure. If the resistance R_5 is increased from 2 kΩ to 2.5 kΩ, the current I_2 will
(a) increase. (b) decrease.
(c) not change.
(d) increase or decrease depending on the polarity of E.
[U.P.S.C. I.E.S. E.E.-II, 1999]



Answers: **295.** (c), **296.** (d), **297.** (b), **298.** (a), **299.** (d), **300.** (b), **301.** (b), **302.** (a), **303.** (a), **304.** (d), **305.** (b), **306.** (d), **307.** (a), **308.** (d), **309.** (d), **310.** (d), **311.** (c),

Downloaded From : www.EasyEngineering.net

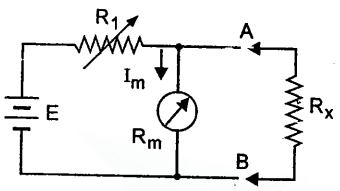
Downloaded From : www.EasyEngineering.net

312. High resistances are provided with a guard terminal in order to
(a) protect the resistance against stray electrostatic field.
(b) bypass the leakage current.
(c) protect the resistance against overloads.
(d) protect the resistance against stray electromagnetic field.
[U.P.S.C. I.E.S. E.E.-I, 2000]

313. A high resistance cannot be measured by simple ammeter-voltmeter principle because
(a) voltmeter rating will be too high.
(b) ammeter rating will be too low.
(c) leakage current cannot be neglected.
(d) power loss will be high.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2003]

314. When a capacitor was connected to the terminal of an ohmmeter the pointer indicated a low resistance initially and then slowly came to infinity position. This shows that the capacitor is
(a) short-circuited. (b) all right.
(c) open-circuited. (d) weak.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2000]

315. A shunt type ohmmeter is shown in the figure. With R_X disconnected, the meter reads full scale. S represents the meter current as a fraction of full scale current with R_X connected such that

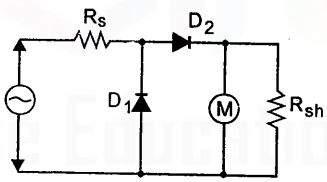


$$S = \frac{R_X}{R_X + R_P}$$

The value of R_p is given by
(a) R_m. (b) $R_1 + R_m$.
(c) $\frac{R_1 R_X}{R_1 + R_m}$. (d) $\frac{R_1 R_m}{(R_1 + R_m)}$.
[U.P.S.C. I.E.S. E.E.-I, 1993]

316. The shunt type ohmmeter is not suitable for high resistance measurements because
(a) very low resistance of the meter would short the high unknown resistance.
(b) scale is highly cramped for high resistance values.
(c) full scale value of the meter may be exceeded.
(d) battery cannot supply the necessary current for proper meter deflection.
[U.P.S.C. I.E.S. E.E.-i, 1993]

317. In the multimeter circuit shown in the figure for ac voltage measurement the function of diode D_1 is to



(a) provide half-wave rectification.
(b) make the rectifier D_2 perform full-wave rectification.
(c) bypass reverse leakage current of D_2 in the negative cycle of the input.
(d) short-circuit over-range voltages. [U.P.S.C. I.E.S. E.E.-I, 1993]

318. Which one of the following is measured by the loss of charge method ?
(a) Low R. (b) High R. (c) Low L. (d) High L.
[U.P.S.C. I.E.S. E.E.-I, 2004]

319. Megger is used for the measurement of high value of
(a) current. (b) power. (c) insulation resistance.
(d) voltage. [A.M.I.E. Sec B. Design of Electrical Power Systems Winter 2005]

320. Low resistance from few ohms down to one micro-ohm is measured using which one of the following statements ?
(a) Ohmmeter. (b) A series type ohmmeter.
(c) A shunt type ohmmeter. (d) A voltmeter and an ammeter.
[U.P.S.C. I.E.S. E.E.-I, 2004]

321. The resistance of a shunt for a precision grade ammeter can be best measured by
(a) De Sauty bridge. (b) Schering bridge.
(c) Maxwell bridge. (d) Kelvin double bridge.
[U.P.S.C. I.E.S. E.E.-I, 1998]

322. The Wheatstone bridge method of resistance measurement is ideally suitable for the measurement of resistance values in the range of
(a) 0.001 Ω to 1 Ω (b) 0.1 Ω to 100 Ω
(c) 100 Ω to 10 kΩ (d) 100 kΩ to 10 MΩ
[U.P.S.C. I.E.S. E.E.-I, 1995]

323. The maximum sensitivity of a Wheatstone bridge is achieved when the bridge
(a) uses dc supply. (b) uses ac supply.
(c) has unity arm ratio. (d) has 1 : 2 arm ratio.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

324. The potentiometer is standardised for making it
(a) accurate. (b) precise.
(c) accurate and direct reading. (d) accurate and precise.

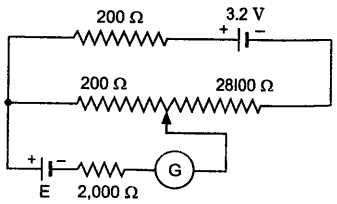
325. In dc potentiometer measurements, a second reading is often taken after reversing the polarities of dc supply and the unknown voltage, and the average of the two readings is taken. This is with a veiw to eliminate the effects of
(a) ripples in the dc supply. (b) stray magnetic fields.
(c) stray thermal emfs. (d) erroneous standardisation.
[GATE E.E. 1992]

326. Consider the following statements.
DC potentiometer is the best means available for measurement of dc voltages because
1. The precision in measurement is independent of the type of detector used.
2. It is based on null-balance technique.
3. It is possible to standardize before a measurement is undertaken.
4. It is possible to measure dc voltages ranging in value from mV to hundreds of volts.

Of these statements
(a) 2 and 3 are correct. (b) 1 and 4 are correct.
(c) 2 and 4 are correct. (d) 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1995]

327. A dc potentiometer is designed to measure up to about 2 V with a slide wire of 800 mm. A standard cell of emf 1.18 V obtains balance at 600 mm. A test cell is seen to obtain balance at 680 mm. The emf of the test cell is
(a) 1.00 V (b) 1.34 V (c) 1.50 V (d) 1.70 V
[GATE E.E. 2004]

328. In the potentiometer circuit shown in the given figure, the value of unknown voltage 'E' under balanced condition will be



(a) 200 mV (b) 2.8 V
(c) 3 V (d) 3.2 V
[U.P.S.C. I.E.S. E.E.-I, 2000]

Answers: **312.** (b), **313.** (c), **314.** (b), **315.** (d), **316.** (b), **317.** (c), **318.** (b), **319.** (c), **320.** (d), **321.** (d), **322.** (b), **323.** (c), **324.** (c), **325.** (c), **326.** (c), **327.** (b), **328.** (a),

329. A slide-wire potentiometer has 10 wires of 1 m each. With the help of a standard voltage source of 1.018 V it is standardized by keeping the jockey at 101.8 cm. If the resistance of the potentiometer wire is 1000 Ω, then the value of the working current is

(a) 0.1 A (b) 0.5 mA (c) 1 m A (d) 10 mA

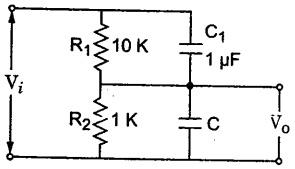
[U.P.S.C. I.E.S. E.E.-I, 1996]

330. Which one of the following is not the criterion used to select potentiometer in a control system?

(a) Accuracy. (b) Noisc.
(c) Time response. (d) Frequency response.

[U.P.S.C. I.E.S. E.E.-I, 2009]

331. A RC potentiometer to measure ac voltage, it is desired that $\frac{V_o}{V_i}$ should be independent of frequency. The value of C should be



(a) 10 μF (b) 11 μF (c) 0.1 μF (d) 0.09 μF

[U.P.S.C. I.E.S. E.E.-I, 2011]

332. At a measuring frequency of 10^{12} Hz, the dielectric constant of a material will be due to

(a) electronic polarization. (b) ionic polarization.
(c) electronic and ionic polarization.
(d) electronic, ionic and orientational polarization.

[U.P.S.C. I.E.S. E.E.-I, 2010]

333. For measuring an ac voltage by an ac potentiometer, it is desirable that the supply for the potentiometer is taken from

(a) the same source as the unknown voltage.
(b) a battery.
(c) a source other than the source of unknown voltage.
(d) any of the above.

334. Which one of the following instruments is used for standardization of a Drysdale ac potentiometer?

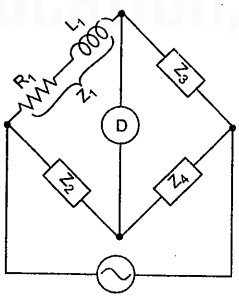
(a) Rectifier type ammeter. (b) PMMC ammeter.
(c) precision type electrodynamometer.
(d) Thermocouple ammeter. [U.P.S.C. I.E.S. E.E.-I, 2007]

335. The stator of a phase shifting transformer for use in conjunction with an ac potentiometer usually a _____ winding.

(a) single phase (b) two phase
(c) three phase (d) six phase

[A.M.I.E. Sec B, Measurements and Control Winter 2005]

336. Consider the following statements regarding the balanced ac bridge shown in the given figure for measurement of a coil Z_1.



1. $Z_2 = R_2$ in series with L_2, $Z_3 = R_3$, $Z_4 = R_4$.
2. $Z_2 = R_2$, $Z_3 = R_3$ and $Z_4 = R_4$ in parallel with L_4.
3. $Z_2 = R_2$, $Z_3 = R_3$ and $Z_4 = R_4$ in series with L_4.
4. $Z_2 = R$ in parallel with L_2, $Z_3 = R_3$ and $Z_4 = R_4$.

Which of these statements are correct ?

(a) 1 and 4. (b) 1 and 2. (c) 2 and 3. (d) 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 1999]

337. The equations under conditions for balance for a bridge measuring resistance R_1 and inductance L_1 of a choke coil are

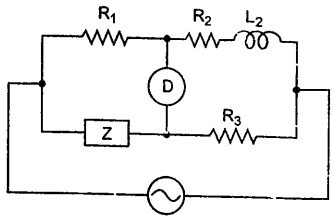
$$R_1 = \frac{R_2 R_3}{R_4} \text{ and } L_1 = R_2 R_3 C_4$$

In order to achieve convergence of balance

(a) R_2 and R_3 should be chosen as variables.
(b) R_2 and C_4 should be chosen as variables.
(c) R_4 and C_4 should be chosen as variables
(d) R_3 and C_4 should be chosen as variable.

[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

338. The ac bridge shown in the given figure will remain balanced if impedance Z consists of



(a) resistance and inductance in series.
(b) resistance and capacitance in parallel.
(c) capacitance only.
(d) inductance only.

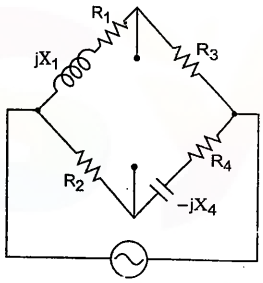
[U.P.S.C. I.E.S. E.E.-I, 2000]

339. Inductance comparison bridge uses

(a) one L and one C. (b) one L.
(c) one C. (d) none of the above.

[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

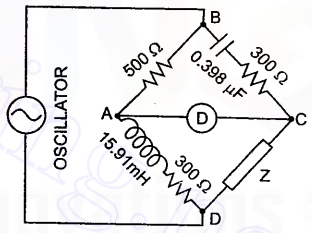
340. A bridge circuit is shown in the figure. Which one of the sequence given below is most suitable for balancing the bridge?



(a) First adjust R_4, and then adjust R_1
(b) First adjust R_2, and then adjust R_3
(c) First adjust R_2, and then adjust R_4
(d) First adjust R_4, and then adjust R_2

[GATE E.E. 2007]

341. The ac bridge shown in the figure is used to measure the impedance Z.
If the bridge is balanced for oscillator frequency $f = 2$ kHz, then the impedance Z will be



(a) $(260 + j0)\ \Omega$
(b) $(0 + j200)\ \Omega$
(c) $(260 + j200)\ \Omega$
(d) $(260 + j200)\ \Omega$

[GATE E.E. 2008]

342. Consider the following equations which can be derived from the ac bridges shown in the figure I and figure II by assuming $\Delta L/L = 0.1$ and $R = \omega L$.

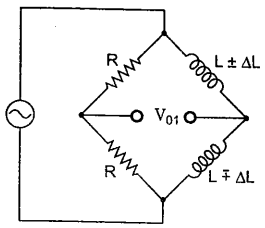


Fig. I

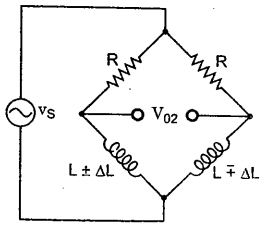

Fig. II

Answers: **329.** (d), **330.** (b), **331.** (a), **332.** (a), **333.** (a), **334.** (c), **335.** (b), **336.** (a), **337.** (c), **338.** (b), **339.** (c), **340.** (a), **341.** (a), **342.** (c),

Downloaded From : www.EasyEngineering.net

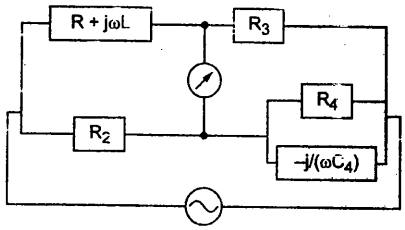
Downloaded From : www.EasyEngineering.net

1. $v_{01} = v_{02}$ 2. $v_{01} = 0.05v_s$
3. $v_{01} = 0.1v_s$ 4. $v_{02} = 0.05v_s$
5. $v_{02} = 0.1v_s$

The correct derived equations from these figures of *ac* bridges are
(a) 1, 3 and 4. (b) 2, 4 and 5.
(c) 2 and 5. (d) 1, 3 and 5.

[U.P.S.C. I.E.S. E.E.-I, 2001]

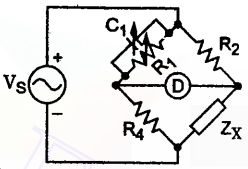
343. The Maxwell's bridge shown in the figure is at balance. The parameters of the inductive coil are



(a) $R = R_2 R_3/R_4$, $L = C_4R_2R_3$
(b) $L = R_2R_3/R_4$, $R = C_4R_2R_3$
(c) $R = R_4/R_2 R_3$, $L = 1/(C_4R_2R_3)$
(d) $L = R_4/R_2R_3$, $R = 1/(C_4R_2R_3)$

[GATE E.E. 2010]

344. The bridge circuit shown in the figure below is used for the measurement of an unknown element Z_X. The bridge circuit is best suited when Z_X is a



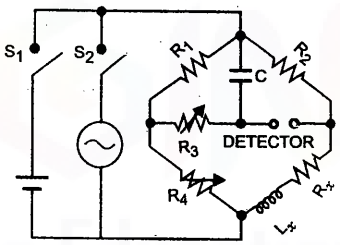
(a) low resistance. (b) high resistance.
(c) low Q inductor. (d) lossy capacitor.

[GATE E.E. 2011]

345. Maxwell inductance bridge is used for coils of Q value
(a) less than 1. (b) less than 10.
(c) greater than 1 and less than 10.
(d) more than 100.

[A.M.I.E. Sec B. Measurements and Control Summer 2006]

346. The bridge network shown in the figure is connected up with a view to estimate the increase in the resistance of a coil due to skin effect. The procedure involves the following steps, not necessarily in that order:

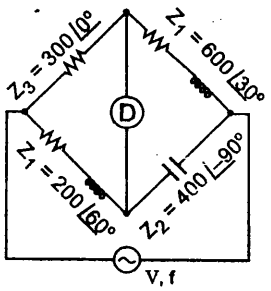


1. Switch on S_2 with S_1 off 2. Switch on S_1 with S_2 off
3. Adjust R_4 4. Adjust R_3

The correct sequence of these steps (a step could be repeated) is
(a) 1, 3, 2, 4, 3. (b) 2, 4, 1, 4, 3.
(c) 1, 4, 2, 3, 4. (d) 2, 3, 1, 3, 4.

[U.P.S.C. I.E.S. E.E.-I, 1993]

347. In the ac bridge shown in the given figure, the impedances Z_1, Z_2, Z_3 and Z_4 in ohms at the supply frequency are as indicated. Z_3 is a variable impedance. The bridge
(a) is balanced with the indicated values of impedances.
(b) can be balanced if $Z_3 = 400 \angle 0°$.



(c) can be balanced if $Z_4 = 600 \angle 60°$.
(d) cannot be balanced with the given configuration.

[U.P.S.C. I.E.S. E.E.-I, 1995]

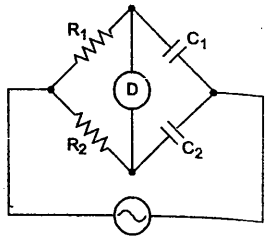
348. In an Anderson bridge, the unknown inductance is measured in term of known
(a) resistance. (b) capacitance.
(c) inductance and resistance. (d) resistance and capacitance.

[A.M.I.E. Sec B. Measurements and Control Winter 2005]

349. Hay's bridge is suitable for the measurement of which one of the following ?
(a) Inductance with $Q < 10$. (b) Inductance with $Q > 10$.
(c) Capacitance with high dissipating factors.
(d) Capacitance with low dissipating factors.

[U.P.S.C. I.E.S. E.E.-I, 2007]

350. Which one of the following is represented by the circuit shown below:



(a) De Sauty bridge.
(b) Anderson bridge.
(c) Heaviside-Campbell bridge.
(d) Hay bridge.

[U.P.S.C. I.E.S. E.E.-I, 2006]

351. Which of the following bridges can be used for inductance measurement ?
1. Maxwell bridge. 2. Hay's bridge.
3. Wein bridge. 4. Wheatstone bridge.

Select the correct answer uing the code given below:
(a) 1 and 2 (b) 2 and 3
(c) 3, 4 and 5 (d) 1 and 4

[U.P.S.C. I.E.S. E.E.-I, 2005]

352. Inductance is measured by which one of the following?
(a) Wien bridge. (b) Schering bridge.
(c) Maxwell bridge. (d) Owen bridge.

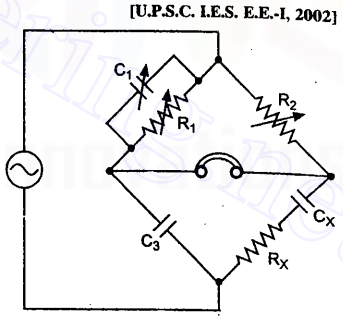
[U.P.S.C. I.E.S. E.E.-I, 2008]

353. An imperfect capacitor is represented by a capacitance C in parallel with a resistance R. The value of the dissipation factor tan δ is

(a) ωCR (b) ω^2CR (b) $\frac{1}{\omega^2 CR}$ (c) $\frac{1}{\omega CR}$

[U.P.S.C. I.E.S. E.E.-I, 2002]

354. For the bridge shown in the given figure. At the balance the values of R_x, C_x and Q_x will be



(a) $R_x = \frac{C_1R_2}{C_3}$;
$C_x = \frac{R_1C_3}{R_1}$;
$Q_x = \omega C_1R_1$

(b) $R_x = \frac{C_1R_2}{C_3}$; $C_x = \frac{R_1C_3}{R_2}$; $Q_x = \frac{1}{\omega C_1R_1}$

(c) $R_x = \frac{C_1R_1}{C_3}$; $C_x = \frac{R_2C_3}{R_1}$; $Q_x = \frac{1}{\omega C_1R_1}$

(d) $R_x = \frac{C_1R_1}{C_3}$; $C_x = \frac{R_2C_3}{R_1}$; $Q_x = \omega C_1R_1$

[U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **343.** (a), **344.** (c), **345.** (c), **346.** (d), **347.** (d), **348.** (d), **349.** (b), **350.** (a), **351.** (a), **352.** (c), **353.** (a), **354.** (a),

Downloaded From : www.EasyEngineering.net

355. Which bridge is used to determine frequency?
(a) Anderson bridge. (b) De Sauty bridge.
(c) Wien bridge. (d) Campbell bridge.
[U.P.S.C. I.E.S. E.E.-I, 2008]

356. Which one of the following is a frequency sensitive bridge?
(a) De-Sauty bridge. (b) Schering bridge.
(c) Wien's bridge. (d) Maxwell's bridge.
[U.P.S.C. I.E.S. E.E.-I, 2009]

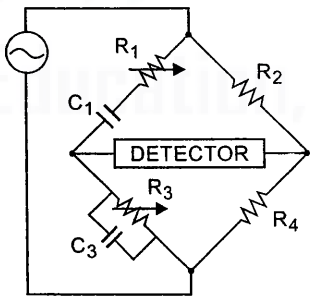
357. Which of the following bridges can be used to construct a harmonic distortion analyzer ?
1. Maxwell bridge. 2. Hay bridge.
3. Schering bridge. 4. Wien bridge.
Select the correct answer using the code given below
Code :
(a) Only 1 and 2 (b) Only 2 and 3.
(c) Only 3 and 4. (d) Only 4.
[U.P.S.C. I.E.S. E.E.-I, 2006]

358. Consider the following statements in respect of a Wien bridge.
1. It is suitable for measurement of capacitance.
2. It is not affected by harmonics present in the applied voltage.
3. It is suitable for measurement of frequency.
Which of these statement are correct ?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1999]

359. A Wien-bridge is used to measure the frequency of the input signal. However, the input signal has 10% third harmonic distortion. Specifically the signal is $2 \sin 400\pi t + 0.2 \sin 1200\pi t$ (with t in sec). With this input the balance will
(a) lead to a null indication and setting will correspond to a frequency of 200 Hz.
(b) lead to a null indication and setting will correspond to 260 Hz.
(c) lead to a null indication and setting will correspond to 400 Hz.
(d) not lead to null indication. [U.P.S.C. I.E.S. E.E.-I, 2003]

360. In Wien bridge
(a) balanced conditions are independent of frequency.
(b) balanced conditions are dependent on frequency.
(c) capacitance is measured in terms of standard inductance.
(d) frequency is measured in terms of resistance and capacitance values.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1999]

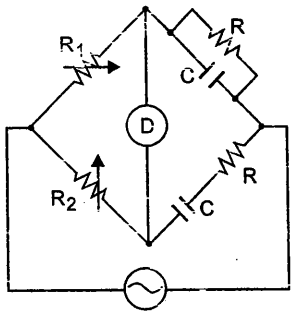
361. Which of the following conditions are to be satisfied so that the common variable shaft of resistances R_1 and R_3 can be graduated in frequency to measure the frequency of E under balanced condition ?



1. $R_1 = R_3$
2. $C_1 = C_3$
3. $R_2 = 2R_4$
4. $R_2 = R_4$

Select the correctanswer using the codes given below :
(a) 1 and 4. (b) 1 and 2. (c) 2 and 4. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1993]

362. The given figure shows Wien bridge connection for frequency measurement. C and R are variables and ganged together. For balanced condition, the expression for frequency is $f = \frac{1}{2\pi CR}$ when



(a) $R_1 = R_2$ (b) $R_1 = 2R_2$
(c) $R_1 = R_2/2$ (d) $R_1 = 3R_2$
[U.P.S.C. I.E.S. E.E.-I, 1994]

363. Schering bridge can be used to measure which one of the following?
(a) Q of a coil. (b) Inductance and its Q-value.
(c) Very small resistance.
(d) Capacitance and its power factor. [U.P.S.C. I.E.S. E.E.-I, 2008]

364. Schering bridge is suitable for measurement of
(a) Q of a coil. (b) L of a coil.
(c) capacitance. (d) dissipation factor.
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

365. Dissipation factor, tan δ, of a capacity measured by which bridge?
(a) Anderson bridge. (b) Hay bridge.
(c) Schering bridge. (d) Wien bridge.
[U.P.S.C. I.E.S. E.E.-I, 2009]

366. The dielectric loss of a capacitor can be measured by which one of the following?
(a) Wien bridge. (b) Owen bridge.
(c) Schering bridge. (d) Maxwell bridge.
[U.P.S.C. I.E.S. E.E.-I, 2008]

367. The imperfect capacitance which is shunted by a resistance can be measured by which one of the following ?
(a) Carey Foster bridge. (b) Owen bridge.
(c) Schering bridge. (d) Wien bridge.
[U.P.S.C. I.E.S. E.E.-I, 2008]

368. Which one of the following bridges is used for measurement of dielectric loss and power factor of a capacitor ?
(a) Maxwell's bridge. (b) Anderson bridge.
(c) De Sautty's bridge. (d) Schering bridge.
[U.P.S.C. I.E.S. E.E.-I, 2007]

369. Which of the following is used to measure the leakage resistance of a capacitor ?
(a) Megger. (b) Schering bridge.
(c) Potentiometer. (d) Loss of charge method.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

370. The capacitance and loss angle of a given capacitor specimen are best measured by
(a) Wheatstone bridge. (b) Maxwell bridge.
(c) Anderson bridge. (d) Schering bridge.
[U.P.S.C. I.E.S. E.E.-I, 2003]

371. AC bridges:
(a) have leakage error and eddy current errors only.
(b) have residual errors, frequency errors and waveform errors only.
(c) both (a) and (b). (d) are free from errors.
[A.M.I.E. Sec B. Winter 1993]

372. Wagner Earth devices in ac bridge circuits are used for
(a) Shielding all the bridge elements from external magnetic field.
(b) Eliminating the effect of stray capacitance.

Answers: **355.** (c), **356.** (c), **357.** (d), **358.** (d), **359.** (d), **360.** (b), **361.** (d), **362.** (c), **363.** (d), **364.** (d), **365.** (c), **366.** (c), **367.** (c), **368.** (d), **369.** (b), **370.** (d), **371.** (c), **372.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Minimizing the effect of intercomponent capacitance.
(d) Eliminating all the node to earth capacitances.
[U.P.S.C. I.E.S. E.E.-I, 2005]

373. What should be the main characteristic(s) of the null detector in a bridge measurement ?
1. Accuracy. 2. Precision.
3. Sensitivity. 4. Resolution.
Select the correct answer using the code given below :
Code :
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 3 and 4. (d) Only 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

374. Which of the following factors decide the accuracy in a bridge measurement ?
1. Accuracy of the null indicator.
2. Accuracy of the bridge components.
3. Sensitivity of the null indicator.
4. Applied voltage to the bridge system.
Select the correct answer using the code given below
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2005]

375. A bridge circuit works at a frequency of 2 kHz. Which detector can be used for detecting the null conditions in the bridge ?
(a) Vibration galvanometer and head phones.
(b) Head phones and tunable amplifiers.
(c) Vibration galvanometer and tunable amplifiers.
(d) Vibration galvanometer, head phones and tunable amplifiers.
[A.M.I.E. Sec B. Measurements and Control Summer 2005]

376. Vibration galvanometers, tuneable amplifiers and head phones are used in
(a) dc bridges. (b) ac bridges.
(c) both dc and ac bridges. (d) Kelvin double bridge.
[U.P.S.C. I.E.S. E.E.-I, 2003]

377. In the loop tests performed for localizing the earth fault in cables the fault resistance
(a) affects the balance conditions.
(b) affects the sensitivity of the bridge.
(c) affects the value of cable resistance.
(d) all of the above.

378. Permeameters are essentially pieces of apparatus constructed for testing of
(a) magnetic specimens in the form of bars.
(b) magnetic specimens in the form of rings.
(c) magnetic specimens both in the form of bars and rings.
(d) none of the above.
[A.M.I.E. Sec B. Measurements and Control Winter 2006]

379. Ballistic tests are used in magnetic measurements for determination of
(a) B-H curve of a specimen.
(b) hysteresis loop of a specimen.
(c) flux density, magnetic force of B-H curve and hysteresis loop of the specimen.
(d) finding out losses in the specimen.
[A.M.I.E. Sec B. Measurements and Control Summer 2005]

380. Iron losses in a magnetic specimen can be measured by using
(a) Campbell bridge method. (b) Anderson bridge method.
(c) Hay bridge method. (d) Schering bridge method.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

381. Sphere gap is used for measurement of
(a) peak value of radio frequency voltage.
(b) insulation resistance in capacitance divider.
(c) peak value of power frequency voltages.
(d) fast rising transient voltage.
[A.M.I.E. Sec B. Measurements and Control Summer 2005]

382. Impulse voltages are characterized by
(a) polarity. (b) peak value.
(c) time of half the peak value. (d) all of the above.
[A.M.I.E. Sec B. Measurements and Control Summer 2005]

383. Which of the following statements about impulse voltage is true ?
(a) An impulse voltage is a unidirectional voltage.
(b) In chopped impluse voltage, flash-over does not occur.
(c) Time taken to rise is exactly equal to the time taken to fall.
(d) RMS value of impulse voltage is always less than 50% of average value. [U.P.S.C. I.E.S. E.E.-I, 1992]

384. The insulating oil, fit for use, should withstand
(a) at least 20 kV for two minutes.
(b) at least 40 kV for one minute.
(c) at least 100 kV for one minute.
(d) at least 200 kV for half minute.

385. A Schering bridge used for testing of a porcelain insulator should be shielded by a metallic screen so that
(a) no crack develops in the insulator during testing.
(b) Earth's magnetic field does not affect it.
(c) it is safe for the operator.
(d) external electrostatic field does not affect it.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

386. Illumination is measured using which one of the following ?
(a) Millivoltmeter. (b) Stroboscope.
(c) Luxmeter. (d) pH meter.
[U.P.S.C. I.E.S. E.E.-I, 2008]

387. The sensitivity of a photodiode depends upon
(a) light intensity and depletion region width.
(b) depletion region width and excess carrier life time.
(c) excess carrier life time and forward bias current.
(d) forward bias current and light intensity.
[U.P.S.C. I.E.S. E.E.-II, 2000]

388. A photocell is illuminated by a small-bright source placed 1 m away. When the same source of light is placed 2 m away, the electrons emitted by the photocathode
(a) each carry one-quarter of their previous energy.
(b) each carry one-quarter of their previous moments.
(c) are half as numerous.
(d) are one quarter as numerous. [U.P.S.C. I.E.S. E.E.-I, 1992]

389. Which one of the following statements is correct ?
An electronic voltmeter is more reliable as compared to multimeter for measuring voltages across low impedance because
(a) its sensitivity is high. (b) it offers high input impedance.
(c) it does not alter the measured voltage.
(d) its sensitivity and input impedance are high and do not alter the measured value. [U.P.S.C. I.E.S. E.E.-I, 2004]

390. The essential elements of an electronic instrument is a/an
(a) transducer. (b) signal conditioner.
(c) indicating device. (d) all of the above.
[G.B.T.U. Electronics Engg. Even Semester 2010-11]

391. Electronic voltmeter provides more accurate readings in high resistance circuits as compared to non-electronic voltmeter because of its
(a) high V/ohm ratings. (b) high ohm/V ratings.
(c) low meter resistance. (d) high resolution.
[U.P.S.C. I.E.S. E.E.-I, 1997]

Answers: **373.** (d), **374.** (c), **375.** (b), **376.** (b), **377.** (b), **378.** (a), **379.** (c), **380.** (a), **381.** (c), **382.** (d), **383.** (a), **384.** (b), **385.** (d), **386.** (c), **387.** (a), **388.** (d), **389.** (d), **390.** (c), **391.** (b),

Downloaded From : www.EasyEngineering.net

392. An advantage which a VTVM has over a non-electronic voltmeter is
(a) low power consumption. (b) low input impedance.
(c) the ability to measure wider ranges of voltage and resistance.
(d) greater portability. [U.P.S.C. I.E.S. E.E.-I, 1995]

393. VTVM can be used to measure
(a) dc voltage. (b) ac voltage of high frequency.
(c) dc voltage and ac voltage upto the order of 5 MHz frequency.
(d) ac voltage of low frequency.

394. Which of the following are the advantages of a balanced bridge vacuum tube voltmeter in comparison with a conventional VTVM?
1. Higher input impedance.
2. Effect of changes due to variation in valve characteristics is minimized.
3. Power supply fluctuations have less effect on measurement.
Select the correct answer using the code given below :
(a) 1 and 2. (b) 2 and 3. (c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

395. A dc VTVM can be used for measuring voltages of frequency up to about 250 MHz with the help of
(a) rectifier. (b) RF probe.
(c) R C circuit. (d) LC circuit.

396. An average response rectifier type electronic ac voltmeter has a dc voltage of 10 V applied to it. The meter reading will be
(a) 7.1 V (b) 10 V (c) 11.1 V (d) 22.2 V
[U.P.S.C. I.E.S. E.E.-I, 1995]

397. In modern electronic multimeters, a FET or MOSFET is preferred over BJT, because
(a) its input resistance is high.
(b) its input resistance is high and does not vary with the change of range.
(c) its input resistance is low. (d) it is cheaper.
[U.P.S.C. I.E.S. E.E.-I, 1994]

398. The function of input attenuators in measuring instruments like VTVM, CRO etc. is to
(a) increase the input impedance.
(b) attenuate the frequency range.
(c) attenuate the input signal amplitude without altering the frequency contents.
(d) attenuate the input impedance. [U.P.S.C. I.E.S. E.E.-I, 1993]

399. The effective value of a complex waveform should be measured with a voltmeter which responds to
(a) peak. (b) true rms.
(c) average. (d) peak-to-peak value.
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

400. Chopper stabilized dc amplifier type electronic voltmeter overcomes the effect of
(a) Amplifier CMRR. (b) Amplifier sensitivity.
(c) Amplifier drift. (d) Electromagnetic interference.
[U.P.S.C. I.E.S. E.E.-I, 2005]

401. True rms responding voltmeters use
(a) thermistors. (b) RTDs.
(c) LVDTs. (d) thermocouples.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

402. Measuring and balancing thermocouples are used in a
(a) peak responding voltmeter.
(b) peak-to-peak responding voltmeter.
(c) average responding voltmeter.
(d) rms responding voltmeter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

403. An analogue electronic circuit that measures rms value of the input voltage by averaging the square of the instantaneous voltage level, responds slowly to the changes in the input signal due to
(a) the "square" function built into the circuit.
(b) the "square-root" function built into the circuit.
(c) the averaging function built into the circuit.
(d) none of the above. [GATE E.E. 2009]

404. In an electronic ohmmeter, an op-amp is used as a
(a) summer. (b) multiplier.
(c) buffer amplifier. (d) integrator.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2000]

405. Electronic null detectors are
(a) less sensitive. (b) more sensitive.
(c) more expensive.
(d) of excellent sensitivity, rugged construction and fairly expensive.

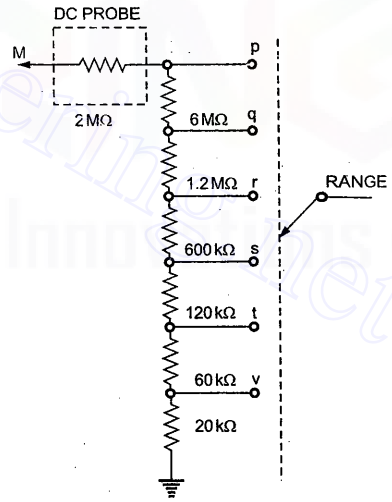
406. Which one of the following multirange voltmeters has high and constant input impedance ?
(a) PMMC voltmeter. (b) Electronic voltmeter.
(c) Moving iron voltmeter. (d) Dynamometer type voltmeter.
[U.P.S.C. I.E.S. E.E.-I, 2003]

407. The battery cells in an electronic multimeter are required to measure which one of the following ?
(a) Resistance. (b) Voltage.
(c) Current. (d) Power.
[U.P.S.C. I.E.S. E.E.-I, 2004]

408. Which one of the following is basically a current sensitive instrument?
(a) PMMC instrument. (b) CRO.
(c) Electrostatic instrument.
(d) FET input electronic voltmeter. [U.P.S.C. I.E.S. E.E.-I, 2004]

409. A voltage in the range of 0-10 mV with an output resistance of 1 MΩ can be measured by a meter of type
(a) thermal. (b) moving iron.
(c) PMMC. (d) electronic.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1999]

410. Figure shows the input attenuator of a multimeter. The meter reads full scale with 12 V at M, with the range switch at position '*q*'. What is the required voltage at M to obtain full scale deflection with the range switch at position '*s*' ?



(a) 1 V
(b) 150 V
(c) 120 V
(d) 147 V
[GATE E.E. 1998]

411. Which amplifier is used in an electronic multimeter ?
(a) Power amplifier. (b) Buffer amplifier.
(c) Differential amplifier. (d) Wideband amplifier.
[U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **392.** (a), **393.** (c), **394.** (d), **395.** (b), **396.** (c), **397.** (a), **398.** (c), **399.** (b), **400.** (c), **401.** (d), **402.** (d), **403.** (c), **404.** (c), **405.** (d), **406.** (b), **407.** (a), **408.** (a), **409.** (d), **410.** (c), **411.** (c),

412. Modern electronic multimeters measure resistance by
(a) using a bridge circuit.
(b) using an electronic bridge compensator for nulling.
(c) forcing a constant current and measuring the voltage across the unknown resistor.
(d) applying a constant voltage and measuring the current through the unknown resistor. [U.P.S.C. I.E.S. E.E.-I, 1997]

413. A multimeter is used for the measurement of the following :
1. Both ac and dc voltage. 2. Both ac and dc current.
3. Resistance. 4. Frequency.
5. Power.
Select the correct answer using the codes given
(a) 1, 2 and 4. (b) 1, 2, and 5.
(c) 1, 3 and 5. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2003]

414. A symmetrical square wave voltage is read on an average response electronic voltmeter whose scale is calibrated in terms of rms value of a sinusoidal wave. The error in the reading is
(a) – 3.9% (b) + 3.9% (c) – 11% (d) + 11%
[U.P.S.C. I.E.S. E.E.-I, 2003]

415. Consider the following statements:
1. Amplifier gain and phase shift.
2. Filter transfer functions.
3. Two port network parameters.
4. Power gain in a two port circuit.
Which of the above quantities can be measured using a vector voltmeter?
(a) 1 and 3 only. (b) 1, 2 and 4.
(c) 1, 2 and 3. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2009]

416. The Q-meter works on the principle of
(a) mutual inductance. (b) self inductance.
(c) series resonance. (d) parallel resonance.
[GATE E.E. 2005]

417. Consider the following statements regarding the sources of error in a Q-meter.
1. If a coil with a resistance R is connected in the direct measurement mode and if the residual resistance of Q-meter is 0.1 R, then the measured Q of the coil would be 1.1 times the actual Q.
2. If the inductance to be measured is less than 0.1 μH, the error due to presence of residual inductance connot be neglected.
3. The presence of distributed capacitance in a coil modifies the effective Q of the coil.
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1995]

418. In measurements made using a Q-meter, high impedance elements should preferably be connected in
(a) star. (b) delta. (c) series. (d) parallel.
[U.P.S.C. I.E.S. E.E.-I, 1994]

419. If the Q-factor of a coil is measured by varying the frequency, then
(a) the plot between Q and frequency is linear.
(b) the value of Q initially decreases with increase of frequency and afterwards it will increase with increase of frequency.
(c) the value of Q initially increases with increase of frequency and afterwards it will decrease with increase of frequency.
(d) the Q-factor remains constant irrespective of the frequency.
[U.P.S.C. I.E.S. E.E.-I, 2001]

420. In a Q-meter. a small resistance R is added to the series resonance circuit to inject the oscillatory voltage to the circuit. If R_S is the apparent series resistance of the circuit at resonance, then the value of the actual Q will be equal to
(a) observed $Q\frac{1}{1+\frac{R}{R_s}}$ (b) observed $Q\left(1+\frac{R}{R_S}\right)$
(c) observed $Q\frac{1}{1+\frac{R_S}{R}}$ (d) observed $Q\left(1+\frac{R_S}{R}\right)$
[U.P.S.C. I.E.S. E.E.-I, 1999]

421. A Q-meter is supplied with an oscillator having a 500 mV output voltage. While testing an unknown inductor, the voltage across the variable capacitor of the Q-meter, measured by a VTVM, is obtained as 10 V. The Q-factor of the inductor is
(a) 5 (b) 10 (c) 20 (d) 100
[U.P.S.C. I.E.S. E.E.-I, 1996]

422. In a Q-meter measurement to determine the self-capacitance of a coil, the first resonance occurred at f_1 with $C_1 = 300$ pF. The second resonance occurred at $f_2 = 2f_1$ with $C_2 = 60$ pF. The self capacitance of the coil works out to be
(a) 240 pF (b) 60 pF (c) 360 pF (d) 20 pF
[U.P.S.C. I.E.S. E.E.-I, 2003]

423. A reading of 120 is obtained when a standard inductor was connected in the circuit of a Q-meter and the variable capacitor is adjusted to a value of 300 pF. A lossless capacitor of unknown value C_x is then connected in parallel with the variable capacitor and the same reading was obtained when the variable capacitor is readjusted to a value of 200 pF. The value of C_x in pF is
(a) 100 (b) 200 (c) 300 (d) 500
[GATE E.E. 2003]

424. Oscilloscope is basically a
(a) voltmeter. (b) ammeter.
(c) wattmeter. (d) energy meter.
[G.B.T.U. Elec. Engineering Even Semester 2010-11]

425. Beam of electrons in a cathode ray tube eminates because of
(a) secondary emission. (b) thermionic emission.
(c) diffusion. (d) post acceleration.
[U.P.S.C. I.E.S. E.E.-I, 2005]

426. What is the approximate input impedance of a CRO ?
(a) Zero (b) 1 MΩ (c) 10 Ω (d) 10 μΩ
[U.P.S.C. I.E.S. E.E.-I, 2007]

427. Which one of the following measuring devices has minimum loading effect on the quantity under measurement ?
(a) PMMC. (b) CRO. (c) Hot wire.
(d) Electrodynamometer. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

428. In CRT aquadag carries
(a) aqueous solution of graphite.
(b) sweep voltage. (c) secondary emission electrons.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-I, 1992]

429. The purpose of providing acquadag in CRT is to
(a) increase fluorescence. (b) increase phosphorescence.
(c) protect burning of screen.
(d) remove electrostatic charge accumulation.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1999]

430. The Miller sweep circuit normally used in a CRO is basically
(a) a voltage to current converter circuit.
(b) a current to voltage converter circuit.
(c) an integrator circuit. (d) a differentiator circuit.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1994]

Answers: **412.** (c), **413.** (d), **414.** (d), **415.** (c), **416.** (c), **417.** (c), **418.** (d), **419.** (a), **420.** (d), **421.** (c), **422.** (d), **423.** (a), **424.** (a), **425.** (b), **426.** (b), **427.** (b), **428.** (a), **429.** (d), **430.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

431. In a CRO, the time-base generators supply ramp voltage to
(a) horizontal deflecting plates. (b) vertical deflecting plates.
(c) both horizontal and vertical deflecting plates.
(d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

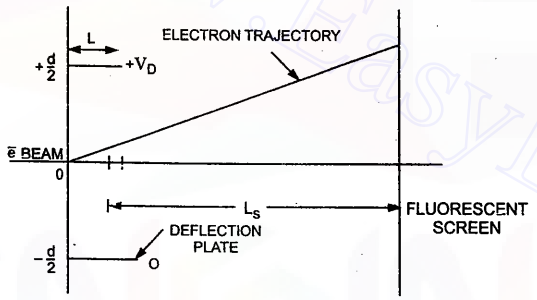
432. In a CRT the highest positive potential is given to
(a) focusing electrodes. (b) cathode
(c) vertical deflection plates.
(d) post deflection acceleration anode. **[A.M.I. E. Summer 1996]**

433. Post-deflection is required in CRO, if input signal frequency is
(a) less than 1 kHz. (b) less than 1 MHz.
(c) below 10 MHz. (d) above 10 MHz.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

434. In a CRO astigmatism is
(a) a source of generating fast electrons.
(b) a medium for absorbing secondary emission electrons.
(c) an additional focus control.
(d) a time-delay control in the vertical deflection system.
[U.P.S.C. I.E.S. E.E.-I, 2008]

435. The purpose of the synchronising control in a CRO is to
(a) focus the spot on the screen,
(b) lock the display of signal.
(c) adjust the amplitude of display.
(d) control the intensity of the spot.

436. Figure shows the electrostatic vertical deflection system of CRT. Given that V_A is the accelerating voltage, the deflection sensitivity (deflection/volt) is proportional to



(a) $\frac{LL_s}{dV_A}$ (b) $\frac{LL_sV_D}{dV_A}$ (c) $\frac{LL_s}{d}V_A$ (d) $\frac{dL_s}{LV_A}$
[GATE E.E. 1998]

437. It is desired to make accurate measurement of voltage using a CRO. Which of the following items should be taken into consideration in this measurement ?
1. Electrostatic deflection type CRT.
2. Magnetic deflection type CRT.
3. Small deflection for measurement at the center of the screen.
4. Large deflection to cover the entire screen.
Select the correct answer using the code given below :
(a) 1 and 4. (b) 2 and 3. (c) 2 and 4. (d) 1 and 3.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

438. Which one of the following statements correctly represents the post acceleration in a CRT ?
(a) It provides deflection of the beam.
(b) It increases the brightness of the trace if the signal frequency is higher than 10 MHz.
(c) It accelerates the beam before deflection.
(d) It increases the brightness of the trace of low frequency signal.
[U.P.S.C. I.E.S. E.E.-I, 2001]

439. A CRO is operated with X and Y settings of 0.5 ms/cm and 100 mV/cm. The screen of the CRO is 10 cm × 8 cm (X and Y). A sine wave of frequency 200 Hz and rms amplitude of 300 mV is applied to the Y-input. The screen will show
(a) one cycle of the undistorted sine wave.
(b) two cycles of the undistorted sine wave.
(c) one cycle of sine wave with clipped am-plitude.
(d) two cycle of the sine wave with clipped amplitude.
[U.P.S.C. I.E.S. E.E.-I, 2003]

440. Lissajous pattern obtained on the screen of a CRO can be used to determine
(a) phase shift. (b) amplitude distortion.
(c) voltage amplitude. (d) none of the above.
[G.B.T.U. Electronics Engg. Even Semester 2009-10]

441. The X- and Y-inputs of a CRO are respectively V sin ωt and – V sin ωt. The resulting Lissajous pattern will be
(a) a straight line. (b) a circle.
(c) an ellipse. (d) a figure of eight.
[U.P.S.C. I.E.S. E.E.-I, 1998]

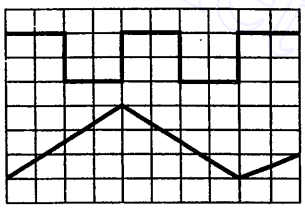
442. The sine wave output of a function generator is fed to both the horizontal (X) and vertical (Y) inputs of a CRO. What will be the pattern on the cathode ray screen ?
(a) A circle. (b) An ellipse.
(c) A straight line with 45° slope.
(d) Sinusoidal. **[U.P.S.C. I.E.S. E.T.E.-I, 2006]**

443. Two in-phase, 50 Hz sinusoidal waveforms of unit amplitude are fed into channel 1 and channel 2 respectively of an oscilloscope. Assuming that the voltage scale, time scale and other settings are exactly the same for both the channels, what would be observed if the oscilloscope is operated in X-Y mode ?,
(a) A circle of unit radius. (b) An ellipse.
(c) A parabola.
(d) A straight line inclined at 45° with respect to the x-axis.
[GATE E.E. 2002]

444. Which of the following measurements can be made using Lissajous figures ?
1. Frequency 2. Phase difference
3. Time interval between pulses.
4. Pulse width,
5. Fundamental and higher harmonic components.
Select the correct answer using the code given below :
(a) 1 and 2 (b) 2 and 3 (c) 3 and 4 (d) 4 and 5
[U.P.S.C. I.E.S. E.E.-I, 2005]

445. One cycle of a square wave signal observed on an oscilloscope is found to occupy 6 cm at a scale setting of 30 μs/cm. What is the signal frequency ?
(a) 1.8 kHz (b) 5.55 kHz (c) 18 kHz (d) 55.5 kHz
[U.P.S.C. I.E.S. E.E.-I, 2006]

446. The time/div and voltage/division axes of an oscilloscope have been erased. A student connects a 1 kHz, 5 V_{p-p} square wave calibration pulse to channel 1 of the scope and observes the screen to be as shown in the upper trace of the figure. An unknown signal is connected to channel 2 (lower trace) of the scope. If the time/div and V/div on both channels are the same, the amplitude (*p-p*) and period of unknown signal are respectively.



(a) 5 V, 1 ms (b) 5 V, 2 ms
(c) 7.5 V, 2 ms (d) 10 V, 1 ms **[GATE E.E. 2006]**

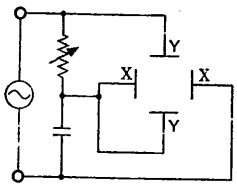
Answers: **431.** (a), **432.** (d), **433.** (d), **434.** (c), **435.** (b), **436.** (a), **437.** (a), **438.** (b), **439.** (a), **440.** (a), **441.** (a), **442.** (c), **443.** (d), **444.** (a), **445.** (b), **446.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

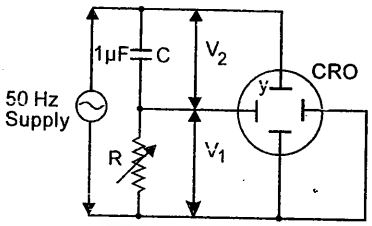
447. A circle is found on the screen of a CRO when 2 time varying signals of same frequency and same magnitude are applied to X and Y plates of the CRO. What is the relative phase difference ?
(a) 0° (b) 90° (c) 180° (d) 45°
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

448. In the CRO plate connections shown in the given figure, the supply frequency is 500 Hz and the capacitance 'C' is $\frac{0.2}{\pi}$ μF. The value of resistance 'R' required to obtain a circle on the CRO screen (X and Y plates have equal sensitivities) is



(a) 2 kΩ (b) 5 kΩ (c) 7 kΩ (d) 10kΩ
[U.P.S.C. I.E.S. E.E.-I, 2000]

449. Two voltages V_1 and V_2 are connected to the X and Y plates of a CRO as shown in the given figure. To get a circular pattern on the screen of CRO, R should be adjusted to a value of



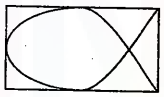
(a) 1 kΩ (b) 1.6 kΩ (c) 2.35 kΩ (d) 3.18 kΩ
[U.P.S.C. I.E.S. E.E.-I, 1996]

450. A Lissajous pattern on an oscilloscope has 5 horizontal tangencies and 2 vertical tangencies. The frequency of the horizontal input is 1,000 Hz. What is the frequency of the vertical input ?
(a) 400 Hz (b) 2,500 Hz
(c) 4,000 Hz (d) 5,000 Hz
[U.P.S.C. I.E.S. E.E.-I, 1994]

451. The Lissajous pattern on a CRO screen is shown in the given figure:

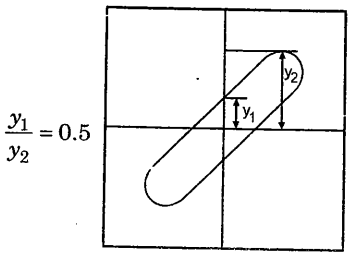
The frequency ratio of the vertical signal to the horizontal one is
(a) 3 : 2 (b) 5 : 1 (c) 1 : 5 (d) 2 : 3
[U.P.S.C. I.E.S. E.E.-I, 1995]

452. A Lissajous pattern, as shown in the figure, is observed on the screen of a CRO when voltages of frequencies are applied to the X and Y plates respectively. $f_x : f_y$ is then equal to



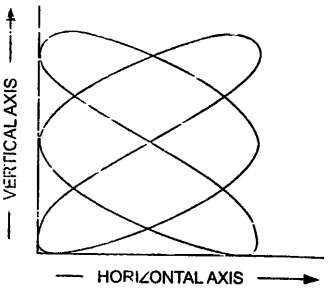
(a) 3 : 2 (b) 1 : 2 (c) 2 : 3 (d) 2 : 1
[GATE E.E. 1994]

453. Two sine waves of the same frequency are impressed on the X and Y plates of a CRO and the Lissajous figure seen is shown in the diagram. The phase difference between the signals is



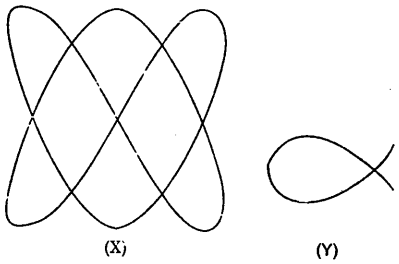
(a) 30° or 330° or 150° or 210° (b) 30° or 330° or 150°
(c) 30° or 330° (d) 30°
[U.P.S.C. I.E.S. E.E.-I, 1993]

454. A screen pattern oscillogram, shown in the given figure, is obtained when sine wave signal of unknown frequency is connected to the vertical input terminals, and at the same time, a 600 Hz sine-wave voltage is connected to the horizontal input terminal, of an oscilloscope. What is the value of unknown frequency ?



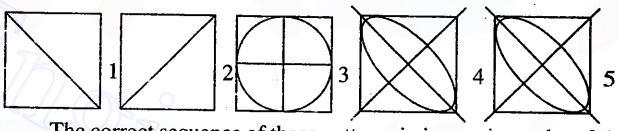
(a) 300 Hz (b) 400 Hz (c) 600 Hz (d) 900 Hz
[U.P.S.C. I.E.S. E.E.-I, 2002]

455. In an oscilloscope, two Lissajous figures (X) and (Y) are observed. This indicates that ratio of vertical input signal frequency to that of horizontal input frequency are



(a) $\frac{5}{3}$ for X and $\frac{3}{2}$ for Y. (b) $\frac{3}{2}$ for X and $\frac{5}{3}$ for Y.
(c) $\frac{5}{3}$ for X and $\frac{5}{3}$ for Y. (d) $\frac{3}{2}$ for X and $\frac{3}{2}$ for Y.
[U.P.S.C. I.E.S. E.E.-I, 2002]

456. Horizontal deflection in a CRO is due to E sin ωt while vertical deflection is due to E sin (ωt + θ) with a positive θ. Consider the following patterns obtained in the CRO.



The correct sequence of these patterns in increasing order of the values of θ is
(a) 3, 2, 5, 1, 4 (b) 3, 2, 4, 5, 1.
(c) 2, 3, 5, 1, 4 (d) 2, 3, 5, 4, 1.
[U.P.S.C. I.E.S. E.E.-I, 1997]

457. When the horizontal deflection plates of a CRO are kept at the ground potential and a 30 V dc is applied to the vertical deflecting plates, the bright spot moves 1 cm away from the centre. If with the same setting a 30 V ac is applied to the vertical deflecting plates, then the picture observed on the screen would be
(a) spot approximately 3 cm away from the centre.
(b) a vertical line 2 cm long.
(c) a vertical line approximately 3 cm long.
(d) two spots 2 cm vertically above each other.
[U.P.S.C. I.E.S. E.E.-I, 1993]

458. The two inputs of a CRO are fed with two stationary periodic signals. In the X-Y mode, the screen shows a figure which changes from ellipse to circle and back to ellipse with its major axis changing orientation slowly and repeatedly. The following inference can be made from this.
(a) The signals are not sinusoidal.
(b) The amplitudes of the signals are very close but not equal.
(c) The signals are sinusoidal with their frequencies very close but not equal.
(d) There is a constant but small phase difference between the signals.
[GATE E.E. 2009]

Answers: **447.** (b), **448.** (b), **449.** (d), **450.** (b), **451.** (b), **452.** (b), **453.** (c), **454.** (b), **455.** (d), **456.** (d), **457.** (c), **458.** (c),

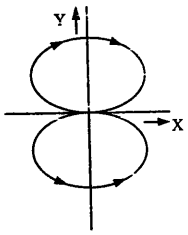
459. The simultaneous application of signals $x(t)$ and $y(t)$ to the horizontal and vertical plates, respectively, of an oscilloscope, produces a vertical figure-of-8 display. If P and Q are constants, and $x(t) = P \sin(4t + 30)$, then $y(t)$ is equal to
(a) $Q \sin(4t - 30)$ (b) $Q \sin(2t + 15)$
(c) $Q \sin(8t + 60)$ (d) $Q \sin(4t + 30)$
[GATE E.E. 2005]

460. Two sinusoidal signals $p(\omega_1, t) = A \sin \omega_1 t$ and $q(\omega_2 t)$ are applied to X and Y inputs of a dual channel CRO. The Lissajous figure displayed on the screen is shown below :

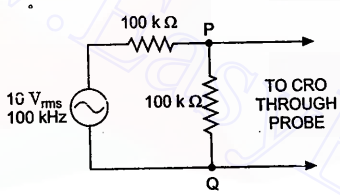


The signal $q(\omega_2 t)$ will be represented as
(a) $q(\omega_2 t) = A \sin \omega_2 t$, $\omega_2 = 2\omega_1$
(b) $q(\omega_2 t) = A \sin \omega_2 t$, $\omega_2 = \omega_1/2$
(c) $q(\omega_2 t) = A \cos \omega_2 t$, $\omega_2 = 2\omega_1$
(d) $q(\omega_2 t) = A \cos \omega_2 t$, $\omega_2 = \omega_1/2$
[GATE E.E. 2008]

461. A CRO screen has 10 divisions on the horizontal scale. If a voltage signal $5 \sin(314t + 45°)$ is examined with a line base setting of 5 ms/division, the number of cycles of signal displayed on the screen will be
(a) 0.5 cycle (b) 2.5 cycles (c) 5 cycles. (d) 10 cycles.
[GATE E.E. 1993]

462. A non-triggered oscilloscope
(a) has a continuously running time-base generator.
(b) has no sweep generator.
(c) cannot produce a stable stationary screen display.
(d) can display a portion of the input signal waveform.

463. A CRO probe has an impedance of 500 kΩ in parallel with a capacitance of 10 pF. The probe is used to measure the voltage between P and Q as shown in the figure. The measured voltage will be



(a) 3.53 V (b) 4.37 V (c) 4.54 V (d) 5.00 V
[GATE E.E. 2004]

464. The oscilloscope has an input capacitance of 50 pF and a resistance of 2 MΩ and the voltage divider ratio (k) of 10. What are the parameters of a high-impedance probe?
(a) $C_1 = 5.55$ pF and $R_1 = 9$ MΩ.
(b) $C_1 = 5.55$ pF and $R_1 = 18$ MΩ.
(c) $C_1 = 3.33$ pF and $R_1 = 9$ MΩ.
(d) $C_1 = 1.11$ pF and $R_1 = 18$ MΩ. [U.P.S.C. I.E.S. E.E.-I, 2009]

465. In a dual beam oscilloscope
(a) there are two separate vertical inputs and two separate horizontal inputs.
(b) there are two separate vertical inputs and there is only one set of horizontal deflection plates.
(c) there is only one vertical input but there are two separate horizontal deflection plates.
(d) there is only one vertical and one horizontal input.
[U.P.S.C. I.E.S. E.E.-I, 1992]

466. A dual trace oscilloscope is set to operate in the alternate mode. The control input of the multiplexer used in the y-circuit fed with a signal having a frequency equal to
(a) the highest frequency that the multiplexer can operate properly.
(b) twice the frequency of the time base (sweep) oscillator.
(c) the frequency of the time base (sweep) oscillator.
(d) half the frequency of the time base (sweep) oscillator.
[GATE E.E. 2011]

467. Which of the following statements is NOT correct for a storage type oscilloscope ?
(a) The storage target is a conductive mesh covered with magnesium fluoride.
(b) Secondary emission electrons etch a positively charged pattern.
(c) The flood guns used for display, emit high velocity electrons.
(d) The flood guns are placed between the deflection plates and storage target. [U.P.S.C. I.E.S. E.E.-I, 2002]

468. If the transients during switching of power supply are to be studied, which oscilloscope will be preferred ?
(a) An ordinary oscilloscope with high frequency sweep generator.
(b) Dual beam oscilloscope.
(c) Dual trace oscilloscope. (d) Storage oscilloscope.
[U.P.S.C. I.E.S. E.E.-I, 1992]

469. Which of the following A/D converter is used in a Digital Storage Oscilloscope (DSO) ?
(a) Ramp type.
(b) Successive approximation type.
(c) Dual slope type. (d) Parallel type.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

470. A single channel digital storage oscilloscope uses a 12 bit, 10^8 samples per second ADC. For a 10 kHz sine wave input, what is the number of samples taken per cycle of input ?
(a) 10^{12} (b) 10^8 (c) 10^4 (d) 10^2
[U.P.S.C. I.E.S. E.E.-I, 2005]

471. A single channel digital storage oscilloscope uses a 10 bit 10^7 samples per second analog-to-digital converter. For a 100 kHz sine wave input, the number of samples taken per cycle of the input will be
(a) 10^7 (b) 10^4 (c) 10^3 (d) 10^2
[GATE E.E. 1999]

472. Sampling oscilloscopes are specially designed to measure
(a) very low frequency. (b) very high frequency.
(c) microwave frequency. (d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2004]

473. In dc coupling mode, CRO can measure
(a) ac voltage only. (b) dc voltage only.
(c) both ac and dc voltages.

474. The best method for testing waveforms of a TV receiver is to use an oscilloscope with
(a) open test leads. (b) a shielded test cable.
(c) a low capacitance probe. (d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2000]

475. Which one of the following is the correct statement ?
Active probe used in a CRO
(a) is bulkier than passive ones.
(b) cannot measure small signals.
(c) cannot couple high frequency signals.
(d) can attenuate more. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

476. A compensated probe of a CRO contains which of the following?
1. An amplifier 2. R-C network
3. Only resistive network 4. Only capacitive network
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 2 only.
(c) 3 only. (d) 4 only.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

Answers: **459.** (b), **460.** (d), **461.** (b), **462.** (a), **463.** (a), **464.** (b), **465.** (b), **466.** (d), **467.** (c), **468.** (d), **469.** (a), **470.** (c), **471.** (d), **472.** (b), **473.** (c), **474.** (b), **475.** (a), **476.** (d),

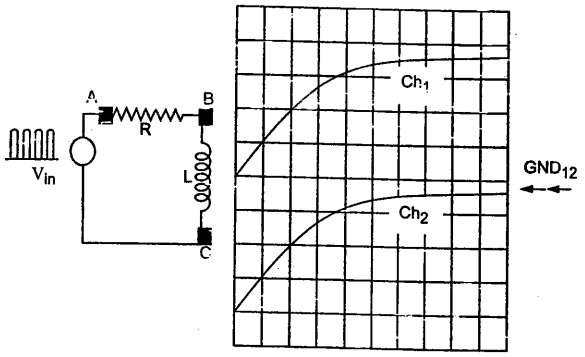
477. The probes of a non-isolated, two channel oscillocope are clipped to points A, B and C in the circuit of the adjacent figure. V_{in} is a square wave of a suitable low frequency. The display on Ch_1 and Ch_2 are as shown on the right. Then the "Signal" and "Ground" probes S_1, G_1 and S_2, G_2 of Ch_1 and Ch_2 respectively are connected to points :



(a) A, B, C, A (b) A, B, C, B
(c) C, B, A, B (d) B, A, B, C [GATE E.E. 2007]

478. If the bandwidth of an oscilloscope is given as direct current to 10 MHz, what is the fastest rise time a sine wave can have to be produced accurately by the oscilloscope?
(a) 35 nsec. (b) 10 nsec.
(c) 3.5 nsec. (d) 0.035 nsec.
[U.P.S.C. I.E.S. E.E.-I, 2009]

479. In distortion factor meter, the filter is used to suppress
(a) dc component. (b) odd harmonics.
(c) even harmonics (d) fundamentals.
[U.P.S.C. I.E.S. E.E.-I, 1998]

480. The level range of harmonic analyzer using crystal filter is from
(a) – 90 dB to 32 dB (b) 20 dB to 10 dB
(c) 40 dB to 90 dB (d) 90 dB to 180 dB
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

481. A wave analyzer is basically a superheterodyne receiver covering the following range of frequency with an IF of 100 kHz.
(a) 20 Hz to 50 kHz (b) 100 kHz to 1 MHz
(c) 5 MHz to 5 GHz (d) 100 kHz to 100 GHz
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2000]

482. Spectrum analyzer is a combination of
(a) narrowband superheterodyne receiver and CRO.
(b) signal generator and CRO.
(c) oscillator and wave analyzer. (d) VTVM and CRO.
[U.P.S.C. I.E.S. E.E.-I, 2001]

483. Which one of the following truely represents the output on the screen of spectrum analyzer when an amplitude modulated wave is connected to it ?
(a) Single vertical lines on the screen.
(b) Two vertical lines on the screen.
(c) Three vertical lines with amplitude.
(d) Three vertical lines out of which two have equal magnitude.
[U.P.S.C. I.E.S. E.E.-I, 2001; 2003]

484. The dynamic range of a spectrum analyzer with a third order incept point of + 25 dB and a noise level of – 85 dB is
(a) 110 dB (b) – 60 dB (c) + 25 dB (d) 73 dB
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

485. Which of the following units are present in a spectrum analyzer ?
1. Mixer. 2. Sawtooth generator.
3. Local oscillator.
Select the correct answer using the codes given below:
Codes:
(a) 1, 2 and 3. (b) 1 and 2.
(c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1997]

486. The harmonic distortion percentage is accurately measured by
(a) VTVM. (b) CRO.
(c) harmonic distortion analyzer. (d) VOM.

487. Which of the following instruments are useful in measuring the signal levels of individual harmonics in an unknown waveform?
1. Distortion analyzer 2. Wave analyzer
3. Spectrum analyzer
Select the correct answer using the codes given below:
Codes :
(a) 1 and 2. (b) 2 and 3.
(c) 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1993]

488. The highly selective fixed frequency filters are used in a
(a) resonant wave analyzer. (b) heterodyne wave analyzer.
(c) distortion analyzer. (d) Q-meter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

489. The study of energy distribution across the frequency spectrum of a given electrical signal is done by a
(a) distortion meter. (b) wave analyzer.
(c) spectrum analyzer. (d) Q-meter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

490. Which of the following electronic instruments (or equipment) can be used to measure correctly the fundamental frequency component of a waveform and its higher harmonics ?
1. CRO. 2. VTVM.
3. Spectrum analyzer. 4. Distortion factor meter.
Select the correct answer from the codes given below:
(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2001]

491. A voltage of $\{200\sqrt{2}\ \sin 314\,t + 6\sqrt{2}\ \sin(942\,t + 30°) + 8\sqrt{2}\ \cos(1570\,t + 30°)\}$ V is given to a harmonic distortion meter. The meter will indicate a total harmonic distortion of approximately
(a) 4.5% (b) 6.5% (c) 7.5% (d) 8.5%
[U.P.S.C. I.E.S. E.E.-I, 2000]

492. Consider the following statements:
1. The main drawback of digital system is that the real world is mainly analog.
2. The major advantage of digital instruments over analog instruments is higher accuracy and better resolution.
3. Digital instruments are ordinarily used for the measurement of both analog and digital quantities.
Which of the above statements is/are correct?
(a) 1, 2 and 3. (b) 1 and 3 only.
(c) 2 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

493. A DVM measures
(a) peak value. (b) rms value.
(c) peak-to-peak value. (d) average value.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

494. Accuracy of DVM is specified as
(a) percentage of the actual reading.
(b) percentage of the full-scale reading.
(c) number of least significant digits.
(d) all of these.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2001]

Answers: **477.** (b), **478.** (a), **479.** (d), **480.** (a), **481.** (b), **482.** (a), **483.** (d), **484.** (a), **485.** (a), **486.** (c), **487.** (b), **488.** (a), **489.** (c), **490.** (c), **491.** (a), **492.** (a), **493.** (d), **494.** (b),

Downloaded From : www.EasyEngineering.net

495. The following statements are related to a DVM. Which of them is true ?
(a) Common mode rejection is the same for *ac* and *dc* voltages.
(b) Its accuracy depends on source impedance.
(c) It does not have series mode error.
(d) Use of shunts for dc current measurements increases its accuracy.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

496. The circuit generally used in digital instruments to convert sine waves into rectangular pulses is a
(a) sawtooth generator. (b) differential amplifier.
(c) sample and hold circuit. (d) Schmitt trigger.
[U.P.S.C. I.E.S. E.E.-I, 2001]

497. Integrating principle in the digital measurement is the conversion of
(a) voltage to time. (b) voltage to frequency.
(c) voltage to current. (d) current to voltage.
[U.P.S.C. I.E.S. E.E.-I, 2003]

498. Which one of the following decides the precision of integrating digital voltmeter ?
(a) Reference voltage of analog comparator.
(b) Slope of the generated ramp.
(c) Width of the generated pulses.
(d) Electronic counter. [U.P.S.C. I.E.S. E.E.-I, 2004]

499. Which one of the following is not true of digital instruments ?
(a) Loading of the circuit under measurement is less.
(b) Accuracy is better.
(c) Free from observational errors.
(d) Can present the reading in overall context of range.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

500. A 7-bit successive approximation DVM will convert the analog input into digital output in a period of
(a) 7 clock pulses. (b) 8 clock pulses.
(c) $\frac{\text{Input signal amplitude}}{\text{Full-scale output amplitude}} \times 7$ clock pulses.
(d) $\frac{\text{Input signal amplitude}}{\text{Full-scale output amplitude}} \times 8$ clock pulses.
[U.P.S.C. I.E.S. E.E.-I, 1997]

501. The conversion of a voltage value to a time interval is carried out by comparing the unknown voltage with a voltage ramp in a
(a) ramp type DVM. (b) integrating type DVM.
(c) continuous type DVM.
(d) successive approximation type DVM.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2002]

502. An integrating DVM measures
(a) peak value of input voltage
(b) rms value of input voltage
(c) true average of the input voltage
(d) variance of the input voltage
[A.M.I.E. Sec B. Design of Electronic Devices & Circuits Summer 2006]

503. Consider the following elements :
1. Buffer. 2. Differentiator.
3. Integrator. 4. Comparator.
Which of the above is/are components in a dual slope integrating type voltmeter ?
(a) 1, 3 and 4. (b) 1 and 2.
(c) 3 and 4. (d) 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2005]

504. Consider the following statements:
The A to D converter used in a digital instrument could be
1. Successive approximation converter type.
2. Flash converter type.
3. Dual slope converter type.
The correct sequence in the increasing order of the conversion time taken by these types is
(a) 1, 2 and 3. (b) 2, 1 and 3.
(c) 1, 3 and 2. (d) 2, 3 and 1.
[U.P.S.C. I.E.S. E.E.-I, 2010]

505. The precision of a ramp type digital voltmeter depends on
(a) frequency of the generator and slope of the ramp.
(b) frequency of the generator.
(c) slope of the ramp.
(d) switching time of the gate. [U.P.S.C. I.E.S. E.E.-I, 2010]

506. Which one of the following digital voltmeters is most suitable to eliminate the effect of period noise ?
(a) ramp type digital voltmeter.
(b) integrating type digital voltmeter.
(c) successive approximation type digital voltmeter.
(d) servotype digital voltmeter. [U.P.S.C. I.E.S. E.E.-I, 2005]

507. A DVM has
(a) no auto ranging facility and no overload protection.
(b) a resolution of 1 part in 10^6.
(c) an input resistance of 1 MΩ and an input capacitance of 1 μF.
(d) an accuracy of about ± 2%.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2001]

508. To eliminate 50 Hz pick-up in a dual slope DVM, the minimum period of integration of the input signal is
(a) 1 ms (b) 20 ms (c) 1 s (d) 100 s
[U.P.S.C. I.E.S. E.E.-I, 2000]

509. An average-reading digital multimeter reads 10 V when fed with a triangular wave, symmetric about the time-axis. For the same input an rms-reading meter will read
(a) $20/\sqrt{3}$ (b) $10/\sqrt{3}$ (c) $20\sqrt{3}$ (d) $10\sqrt{3}$
[GATE E.E. 2009]

510. What is the range for a 3-1/2 digit digital voltmeter ?
(a) 0 to 1999 (b) 0 to 1500
(c) 0 to 999 (d) 0 to 19999
[U.P.S.C. I.E.S. E.E.-I, 2006]

511. For a dual slope ADC type 3-1/2 digit DVM, the reference voltage is 100 mV and the first integration time is set to 300 ms. For some input voltage, the "deintegration" period is 370.2 ms.
The DVM will indicate
(a) 123.4 (b) 199.9 (c) 100 (d) 1.414
[GATE E.E. 1999]

512. A digital voltmeter uses a 10 MHz clock and has a voltage controlled generator which provides a width 10 μs/V of unit signal. 10 V of input signal would correspond to a pulse count of
(a) 500 (b) 750 (c) 1000 (d) 1500
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 2003]

513. In a digital voltmeter, the oscillator frequency is 400 kHz. The ramp voltage falls from 8 V to 0 V in 20 ms. What is number of pulses counted by the counter?
(a) 8,000 (b) 4,000 (c) 3,200 (d) 1,600
[U.P.S.C. I.E.S. E.E.-I, 2009]

514. In a digital voltmeter, 'over-ranging' implies that
(a) the next four digits are switched-on.
(b) 1/2 digit is switched off. (c) 1/2 digit is switched on.
(d) an over-range indicator starts glowing.
[U.P.S.C. I.E.S. E.E.-I, 1996]

Answers: **495.** (a), **496.** (d), **497.** (b), **498.** (a), **499.** (d), **500.** (b), **501.** (a), **502.** (c), **503.** (a), **504.** (b), **505.** (a), **506.** (d), **507.** (b), **508.** (c), **509.** (a), **510.** (a), **511.** (a), **512.** (c), **513.** (a), **514.** (c),

Downloaded From : www.EasyEngineering.net

515. A digital voltmeter has 4 1/2 digit display. The 1 V range can read up to
(a) 1.000 (b) 1.111 (c) 1.999 (d) 1999
[U.P.S.C. I.E.S. E.E.-I, 1994]

516. A digital voltmeter has a read-out range from 0 to 9999. When full-scale reading is 9.999 V, the resolution of the full scale reading is
(a) 0.001 (b) 1000 (c) 3 digit (d) 1 mV
[U.P.S.C. I.E.S. E.E.-I, 1992]

517. The full-scale input voltage to an ADC is 10 V. If the resolution required is 5 mV, the minimum number of bits required for ADC is
(a) 8 (b) 10 (c) 11 (d) 12
[U.P.S.C. I.E.S. E.E.-I, 2011]

518. A 4-digit DVM (digital voltmeter) with a 100 mV lowest full-scale range would have a sensitivity of how much value while resolution of this DVM is 0.0001?
(a) 0.1 mV (b) 0.01 mV
(c) 1.0 mV (d) 10 mV
[U.P.S.C. I.E.S. E.E.-I, 2010]

519. A $4\frac{1}{2}$ digit DMM has the error specification as: 0.2% of reading +10 counts. If a dc voltage of 100 V is read on its 200 V full scale, the maximum error that can be expected in the reading is
(a) ± 0.1% (b) ± 0.2% (c) ± 0.3% (d) ± 0.4%
[GATE E.E. 2011]

520. What is a reading of 0.5245 on 1 V range in four and a half digit voltmeter displayed as ?
(a) 0.5245 (b) 00.524 (c) 000.52 (d) 0000.5
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

521. An ADC normally used in a 31/2 digit multimeter is of
(a) dual slope integration type.
(b) voltage to-frequency converter type.
(c) flash (or parallel) type.
(d) successive approximation type. [U.P.S.C. I.E.S. E.E.-I, 2000]

522. A signal of 10 mV at 75 MHz is to be measured. Which of the following instrument can be used ?
(a) VTVM. (b) Cathode ray oscilloscope.
(c) Moving iron voltmeter. (d) Digital multimeter.
[U.P.S.C. I.E.S. E.E.-I, 1992]

Answers: **515.** (c), **516.** (d), **517.** (c), **518.** (b), **519.** (c), **520.** (a), **521.** (c), **522.** (b).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

1. (A): Comparison methods of direct measurements are most widely used in electrical engineering practice.
(R): Comparison methods of direct measurements give high accuracy. [U.P.S.C. I.E.S. E.E.-I, 2010]

2. (A): A precision instrument is always accurate.
(R): A precision instrument is one where the degree of reproducibility of the measurement is very good.
[U.P.S.C. I.E.S. E.E.-I, 2008]

3. (A): The precision instruments are always accurate.
(R): Precision indicates the degree of agreement within a set of measurements of the same quantity by the instrument, and accuracy refers to the degree of closeness to true value of the quantity to be measured. [U.P.S.C. I.E.S. E.E.-I, 2007]

4. (A): A variance is dependent on the mean value of the set of data.
(R): Variance is the difference of the mean squared values and the square of the mean value of the set of data.
[U.P.S.C. I.E.S. E.E.-I, 1998]

5. (A): It is theoretically impossible to make a perfect measurement of a measurand quanity.
(R): A measuring instrument always extracts energy from the measured medium. [U.P.S.C. I.E.S. E.E.-I, 1995]

6. (A): Rayleigh current balance is considered to be the most satisfactory method for absolute measurement of current.
(R): Rayleigh current balance method of absolute measurement of current does not need accurate measurements of dimensions, measurement of earth magnetic field horizontal component and determination of the tension constant of a suspension wire.

7. (A): Normally mica is used as dielectric in laboratory capacitance standards.
(R): Air capacitors are not compact in size and parafinned paper capacitors are not reliable.

8. (A): It is always desirable to take the reading of an indicating instrument very close to the full-scale reading.
(R): Accuracy of an indicating instrument is maximum at the full-scale deflection and error increases as reading comes closer to the beginning of the scale. [U.P.S.C. I.E.S. E.E.-I, 2006]

9. (A): It is always desirable to take measurements as close to the full-scale as possible.
(R): The magnitude of the limiting error is a fixed quantity based on the full-scale reading of the meter and error increases as reading decreases. [U.P.S.C. I.E.S. E.E.-I, 2011]

10. (A): Random errors can be minimized by statistical methods.
(R): These are caused by arithmetic error while taking readings.
[U.P.S.C. I.E.S. E.E.-I, 2009]

11. (A): The sensitivity of a voltmeter is often expressed in terms of ohm per volt.
(R): High sensitivity voltmeter use a basic d'Arsonval meter which has high sensitivity. [U.P.S.C. I.E.S. E.E.-I, 2009]

12. (A): The mechanical systems of analog indicating instruments are critically damped.

Answers: **1.** (a), **2.** (d), **3.** (d), **4.** (c), **5.** (a), **6.** (a), **7.** (a), **8.** (c), **9.** (a), **10.** (c), **11.** (b), **12.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): It is desirable that the pointer of an indicating instrument overshoots a little above its equilibrium position quickly. [U.P.S.C. I.E.S. E.E.-I, 1999]

13. (A): In portable instruments pointer and scale need not to have the boldness and contrast as required in case of switchboard and panel instruments.
(R): In portable instruments readings are always taken from short distance.

14. (A): Attraction type voltmeters are accurate over a wide range of frequency and there is a greater possibility of using shunts with attraction type ammeters.
(R): An attraction type instrument usually have a lower inductance than the corresponding repulsion type instrument.

15. (A): Moving iron voltmeters are not used for measuring ac voltages exceeding 750 V.
(R): For measurement of ac voltages exceeding 750 V it is not practicable to use higher ohmic value resistors.

16. (A): The flux densities used in PMMC instruments vary from 0.1 T to 1.0 T.
(R): The power requirement for PMMC movement to give full scale deflection is small ranging from 25 μW to 200 μW. [U.P.S.C. I.E.S. E.E.-I, 2005]

17. (A): A PMMC instrument is used for reading both dc and ac signals.
(R): The deflecting torque in a PMMC instrument is directly proportional to the current in the moving coil. [U.P.S.C. I.E.S. E.E.-I, 2008]

18. (A): The electrodynamometer type instruments have high power consumption.
(R): The current under measurement has to provide the field flux. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

19. (A): The dynamometer type instruments are not usually used as ammeters and voltmeters for general laboratory and shop measurements at power frequency.
(R): Moving iron instruments are sturdier, cheaper and sufficiently accurate for general laboratory and shop measurements at power frequency.

20. (A): A thermocouple type of indicating instrument measures the true rms value of the current that passes through it.
(R): It uses a PMMC type of indicating instrument to measure the current. [U.P.S.C. I.E.S. E.E.-I, 2010]

21. (A): Thermocouple instruments are used for measurements of currents from power frequencies to 100 MHz.
(R): In thermocouple instruments the upper limit of frequency is determined by skin effect and stray capacitance errors and depends on whether the instrument is used as an ammeter or a voltmeter and its current rating.

22. (A): Rectifier instruments are indispensable for measurements in communication circuits.
(R): Rectifier instruments can be used at frequencies well above the range of other ac instruments of the ordinary type (from about 20 Hz to 20 kHz).

23. (A): A full-wave rectifier type ac voltmeter reads the true rms value of the input waveform.
(R): The full wave rectifier type ac voltmeter has a rectifier unit first which feeds its output to the PMMC indicating instrument. [U.P.S.C. I.E.S. E.E.-I, 2002]

24. (A): To increase the range of an ammeter to measure high currents, it is required to connect a high resistor in shunt across the ammeter.
(R): The shunt resistor will divert the excess current and allow only the rated of current to pass through the deflecting system of the ammeter. [U.P.S.C. I.E.S. E.E.-I, 2009]

25. (A): The opening of the secondary circuit of a current transformer results in a very high voltage in the secondary winding with consequent severe strain on the insulation and danger to the operator.
(R): The high magnetic forces acting on the core, if suddenly removed, may leave behind considerable residual magnetism in the core. [U.P.S.C. I.E.S. E.E.-I, 2000]

26. (A): General purpose dynamometer type wattmeter cannot indicate the correct value of power at low power factors.
(R): The presence of self-inductance in the pressure coil circuit introduces an error in the indicated value which increases appreciably with decrease in power factor. [U.P.S.C. I.E.S. E.E.-I, 2006]

27. (A): Electrodynamometer wattmeter is not suitable for low power factor power measurement.
(R): Many wattmeters are compensated for errors caused by inductance of voltage coil by means of a capacitor connected in parallel with a portion of multiplier series resistance. [U.P.S.C. I.E.S. E.E.-I, 2011]

28. (A): The rotating disc in an energy meter is made up of a magnetic material.
(R): Braking takes place due to eddy current generated by the braking magnet. [U.P.S.C. I.E.S. E.E.-I, 2006]

29. (A): A good energy meter should be provided with a low load friction compensation loop arrangement.
(R): Due to heavier moving system of the instrument, at low load, the frictional force at the bearings of the spindle will cause large error unless a friction compensation arrangement is provided. [U.P.S.C. I.E.S. E.E.-II, 1993]

30. (A): Rotating disc of an energy meter is made of aluminium.
(R): Aluminium is light in weight, good conductor of electricity and is indigenously available.

31. (A): The dynamometer type power factor meter is commonly used.
(R): The dynamometer type power factor meter is more accurate than moving iron one.

32. (A): The shunt type ohmmeter cannot be used for measurement of high resistances.
(R): The scale of ohmmeter is highly cramped for high values.

33. (A): AC bridge methods are the best and most usual methods for the precise measurement of self- and mutual inductances and capacitances.
(R): It is generally more difficult to obtain accuracy with deflection methods.

34. (A): AC bridge methods are the best and most usual methods for the precise measurement of self- and mutual inductances and capacitances.
(R): Wagner earthing device is used in ac bridge for eliminating the effect of the earth capacitance. [U.P.S.C. I.E.S. E.E.-I, 2011]

35. (A): The measurement of an impedance by bridge method is more accurate than the direct method using indicating instruments.
(R): The accuracy of the detector does not affect the accuracy of measurement in a bridge method. [U.P.S.C. I.E.S. E.E.-I, 1999]

36. (A): The accuracy of the null detector does not play any role in a bridge measurement.
(R): Under balanced condition of the bridge, no current flows through the null detector. [U.P.S.C. I.E.S. E.E.-I, 2007]

Answers: **13.** (a), **14.** (a), **15.** (a), **16.** (b), **17.** (d), **18.** (b), **19.** (a), **20.** (a), **21.** (a), **22.** (b), **23.** (d), **24.** (d), **25.** (b), **26.** (a), **27.** (b), **28.** (d), **29.** (a), **30.** (a), **31.** (d), **32.** (a), **33.** (a), **34.** (b), **35.** (a), **36.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

37. (A): In a bridge type of measurement, it is required that the indicator used to show the balance condition of the bridge should have very high sensitivity.
(R): The accuracy of the null-indicator does not play any role in a bridge measurement. **[U.P.S.C. I.E.S. E.E.-I, 2009]**

38. (A): To determine the leakage factor in a dc generator, a flux meter is NOT used.
(R): When a voltage is impressed across the field winding of a dc generator, the flux changes very slowly due to the high inductance. **[U.P.S.C. I.E.S. E.E.-I, 1993]**

39. (A): Impulse test is necessary for testing the insulation of power system.
(R): Voltage surges produced by switching or lightning strokes may damage the insulation of the power system equipment.

40. (A): Electrostatic voltmeters cannot be designed for measurement of extra high voltages.
(R): Corona and electrostatic fields produced by extra high voltages introduce considerable errors in the measurement of extra high voltages by the electrostatic voltmeters.

41. (A): A Schering bridge used for testing of a porcelain insulator is shielded by a metallic screen.
(R): Earth's magnetic field is blocked by a metallic screen. **[U.P.S.C. I.E.S. E.E.-I, 2003]**

42. (A): An electronic voltmeter measures the voltage across a high resistance more accurately as compared to an ordinary multimeter.
(R): The electronic voltmeter consists of a voltage amplifier which is not present in an ordinary multimeter. **[U.P.S.C. I.E.S. E.E.-I, 2004]**

43. (A): An electronic millivoltmeter used to read very low ac voltages at high frequencies is an amplifier-rectifier type of meter.
(R): The diodes cannot rectify low ac voltages of millivolt order. **[U.P.S.C. I.E.S. E.E.-I, 2009]**

44. (A): VTVM gives more accurate reading compared to the accuracy of PMMC type of indicating instrument used in it, while measuring voltages across high resistances.
(R): The electronic circuits used in VTVM make it more accurate by increasing its sensitivity. **[U.P.S.C. I.E.S. E.T.E.-I, 2008]**

45. (A): The VTVM is a balanced bridge voltmeter.
(R): TVM is the transistorised version of VTVM. **[U.P.S.C. I.E.S. E.E.-I, 1996]**

46. (A): The basic principle of operation of a Q-meter is based on the property of a series-resonant circuit.
(R): If a fixed voltage is applied to a series resonant circuit, the voltage developed across its capacitor is Q times the applied voltage. **[U.P.S.C. I.E.S. E.E.-I, 2000]**

47. (A): The Q-meter measures the Q-factor of a coil when the circuit is in resonance.
(R): The Q-factor of a coil depends only on its inductance and not on its resistance.

48. (A): Q-meter cannot be used with a capacitance element.
(R): The Q value of a coil is the ratio of ωL to its resistance. **[U.P.S.C. I.E.S. E.E.-I, 1995]**

49. (A): The vertical deflecting plates of a CRT are kept farther away from the screen as compared to horizontal deflecting plates.
(R): This improves accuracy in measurements. **[U.P.S.C. I.E.S. E.E.-I, 1998]**

50. (A): Cathode ray oscilloscopes using CRT employing electrostatic deflection are used in laboratories for scientific measurements.
(R): CRT using electrostatic deflection systems have more deflection sensitivity as compared to CRT employing magnetic deflecting system. **[U.P.S.C. I.E.S. E.E.-I, 2004]**

51. (A): A dual trace CRO can display two input signals simultaneously.
(R): A dual trace CRO uses a CRT having two electron guns to generate two electron beams simultaneously. **[U.P.S.C. I.E.S. E.E.-I, 2004]**

52. (A): Electron beam switch is used in a multitrace CRO.
(R): Electron beam switch synchronizes the input signal and gives a steady waveform on the CRO screen. **[U.P.S.C. I.E.S. E.E.-I, 2009]**

53. (A): Instrument probes are used in conjunction with measuring instruments to improve frequency response.
(R): A probe introduces attenuation. **[U.P.S.C. I.E.S. E.T.E.-I, 2006]**

54. (A): Dual slope ADC is the most preferred digital conversion approach in digital multimeters.
(R): Dual slope ADC provides high accuracy in A/D conversion which at the same time suppressing the hum effect on the input signal. **[U.P.S.C. I.E.S. E.E.-I, 1995, 2007]**

55. (A): A spectrum analyzer is an instrument which displays the spectrum of the input waveform with respect to the frequency.
(R): A spectrum analyzer consists of an internal sweep voltage generator connected to the X-deflecting plate of the CRT. **[U.P.S.C. I.E.S. E.E.-I, 2000]**

56. (A): A spectrum analyzer displays the frequency spectrum of a signal on the CRT screen.
(R): It uses a sweep voltage generator to sweep the electron beam as well as the input signal. **[U.P.S.C. I.E.S. E.E.-I, 2002]**

Answers: **37.** (c), **38.** (d), **39.** (a), **40.** (a), **41.** (c), **42.** (b), **43.** (a), **44.** (a), **45.** (d), **46.** (a), **47.** (c), **48.** (d), **49.** (a), **50.** (c), **51.** (c), **52.** (a), **53.** (c), **54.** (a), **55.** (a), **56.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Terms)	List 2 (Meanings)
A. Precision.	1. The smallest change in the input quantity which can be detected with its certainty.
B. Accuracy.	2. Closeness of the reading with its true value.
C. Resolution.	3. Measure of reproducibility of the measurements.

Answers: **1.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

D. Static sensitivity. 4. Ratio of infinitesimal change in output to infinitesimal change in input.

Codes :	A	B	C	D
(a)	2	3	1	4
(b)	3	2	4	1
(c)	3	2	1	4
(d)	2	3	4	1 [U.P.S.C. I.E.S. E.E.-I, 2001]

2.

List 1 (Term)	List 2 (Statement)
A. Relative error.	1. The ability of the device to give identical output when repeat measurements are made with the same input signal.
B. Precision.	2. The ratio of difference between measured value and the true value to the true value of the measurand.
C. Calibration.	3. The smallest increment in measurand that can be detected with certainty by the instrument.
D. Resolution.	4. The process of making adjustments on the scale so that the instrument readings conform to an accepted standard.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	4	3	2	1
(d)	2	1	4	3 [U.P.S.C. I.E.S. E.T.E.-I, 2008]

3.

List 1 (Error Parameters)	List 2 (Values)
A. Precision index.	1. 0.67σ
B. Probable error.	2. 3σ
C. Error limit.	3. $0.39/\sigma$
D. Peak probability density of error.	4. $0.71/\sigma$

Codes :	A	B	C	D
(a)	4	2	1	3
(b)	4	1	2	3
(c)	3	1	2	4
(d)	3	2	1	4 [U.P.S.C. I.E.S. E.E.-I, 2001]

4.

List 1 (Quantity)	List 2 (Dimensions)
A. Resistance.	1. $[M^{-1}L^{-2}T^{4}I^{2}]$.
B. EMF.	2. $[M^{-1}L^{-2}T^{2}I^{-2}]$.
C. Capacitance.	3. $[ML^{2}T^{-3}I^{-1}]$.
	4. $[ML^{2}T^{-3}I^{-2}]$.

Codes :	A	B	C
(a)	1	2	3
(b)	4	2	1
(c)	3	4	2
(d)	4	3	1 [U.P.S.C. I.E.S. E.E.-I, 2001]

5.

List 1 (Standard)	List 2 (Quantity)
A. Atomic clock.	1. Oscillator frequency.
B. Four terminal.	2. Time device.
C. Quartz crystal.	3. Inductance.
D. Ceramic core toroid shape device.	4. Resistance.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	2	4	1	3
(d)	3	4	1	2 [A.M.I.E. Sec B Winter 1993]

6.

List 1 (Accuracy)	List 2 (Type of Standard)
A. Least accurate.	1. Primary.
B. More accurate.	2. Secondary.
C. Much more accurate.	3. Working.
D. Highest possible accurate.	4. International.

Codes :	A	B	C	D
(a)	3	4	1	2
(b)	1	4	3	2
(c)	3	2	1	4
(d)	1	2	3	4 [U.P.S.C. I.E.S. E.E.-I, 2004]

7.

List 1 (Type of Instrument)	List 2 (Example)
A. Indicating	1. Wattmeter.
B. Absolute	2. Tangent galvanometer.
C. Recording	3. Aneroid barometer.
D. Integrating	4. Energy meter.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	4	2	3	1
(c)	1	3	2	4
(d)	4	3	2	1 [U.P.S.C. I.E.S. E.E.-I, 2007]

8.

List 1 (Name of Instrument)	List 2 (Classification)
A. Ohmmeter.	1. Absolute.
B. Watthour meter.	2. Indicating.
C. Null balance recorders.	3. Recording.
D. Rayleigh current balance.	4. Integrating.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	4	3	1
(c)	2	4	1	3
(d)	1	2	4	3 [U.P.S.C. I.E.S. E.E.-I, 2007]

9.

List 1 (Material Used in Instruments)	List 2 (Purpose)
A. Phosphor-bronze.	1. Coils.
B. Manganin.	2. Discs.
C. Aluminium.	3. Control Springs.
D. Eureka.	4. Shunts.
	5. Multipliers.

Codes :	A	B	C	D
(a)	3	5	2	4
(b)	2	4	1	5
(c)	3	4	2	5
(d)	2	5	1	4 [U.P.S.C. I.E.S. E.E.-I, 2005]

10.

List 1 (Property)	List 2 (Type of Instrument)
A. Linear scale.	1. Thermocouple type.
B. True rms up to RF range.	2. Rectifier type.
C. RMS only for sinusoidal input.	3. Moving iron type.
D. Reads rms value using square law scale.	4. Permanent magnet moving coil type.

Codes :	A	B	C	D
(a)	1	4	3	2
(b)	4	1	2	3
(c)	4	1	3	2
(d)	1	4	2	3 [U.P.S.C. I.E.S. E.E.-I, 2007]

Answers: **2.** (d), **3.** (c), **4.** (d), **5.** (c), **6.** (c), **7.** (a), **8.** (b), **9.** (c), **10.** (b),

(c)	1	3	2
(d)	3	1	2

[U.P.S.C. I.E.S. E.E.-I, 1996]

12.

List 1 (Specifications of Voltages to be Measured)	List 2 (Type of Most Suitable Instrument)
A. 0—10 mV from a source of internal resistance of 1 MΩ.	1. Thermal.
B. Thermo-emf ranging up to 5 mV from a thermocouple.	2. Moving iron.
C. Supply voltage of 230 V, 50 Hz.	3. Permanent magnet moving coil.
D. RMS value of a voltage containing dc and ripples of 50 Hz and harmonic.	4. Electronic.
	5. Ballistic galvanometer.

Codes :	A	B	C	D
(a)	2	3	5	1
(b)	4	1	2	3
(c)	2	1	5	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I. 2005]

13.

List 1	List 2
A. Moving iron and hot wire type.	1. Air friction.
B. Galvanometer.	2. Electromagnetic.
C. PMMC type.	3. Fluid friction.
D. Electrostatic type.	4. Eddy current.

Codes :	A	B	C	D
(a)	1	4	2	3
(b)	3	4	2	1
(c)	1	2	4	3
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-I, 2011]

14.

List 1	List 2
A. Electrostatic	1. Power at 50 Hz only.
B. Induction	2. Power at frequencies ranging from dc to RF.
C. Dynamometer	3. Power at unity power factor and at high values.
D. Thermal	4. Power at frequencies ranging from dc to 150 Hz.

Codes :	A	B	C	D
(a)	3	1	4	2
(b)	2	1	4	3
(c)	3	4	1	2
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-I, 2010]

15.

List 1 (Readings Obtained While Measuring Power By Two Wattmeter Method)	List 2 (Power Factor of Load)
A. Both the wattmeters read equal values of power but of opposite sign.	1. Unity
B. Both the wattmeters read equal values of power and both are of positive sign.	2. Zero
C. One wattmeter reads zero and the other reads the complete power.	3. 0.5
	4. 0.866

Codes :	A	B	C
(a)	2	3	4
(b)	3	1	2
(c)	1	4	3
(d)	2	1	3

[U.P.S.C. I.E.S. E.E.-I, 2000]

16.

List 1 (Instrument)	List 2 (Error)
A. PMMC voltmeter.	1. Eddy current error.
B. AC ammeter.	2. Phase angle error.
C. Current transformer.	3. Braking system error.
D. Energy meter.	4. Temperature error.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	2	1	4	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 2006]

17.

List 1 (Parameter to be Measured)	List 2 (Instrument to be Used)
A. Average value of current.	1. Self-balancing bridge.
B. RMS value of current.	2. Wien bridge.
C. Frequency of a wave.	3. PMMC ammeter.
D. Strain gauge resistance.	4. Moving iron ammeter.

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	2	1	3	4
(c)	3	1	2	4
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-I, 2006]

18.

List 1	List 2
A. Average value of current.	1. Self-balancing bridge.
B. Frequency of a waveform.	2. Wien's bridge.
C. Strain-gauge resistance.	3. PMMC ammeter.

Codes :	A	B	C
(a)	2	1	3
(b)	3	1	2
(c)	1	2	3
(d)	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 2011]

19.

List 1 (Meter)	List 2 (Type)
A. Reed frequency meter.	1. Moving iron.
B. Weston frequency meter.	2. Vibrating.
C. Weston synchroscope.	3. Moving coil.
D. Ohm meter.	4. Electrodynamic.

Codes :	A	B	C	D
(a)	2	1	4	3
(b)	3	1	4	2
(c)	2	3	4	1
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-I, 2010]

Answers: **11.** (c), **12.** (d), **13.** (c), **14.** (a), **15.** (d), **16.** (b), **17.** (a), **18.** (d), **19.** (a),

20.

List 1	List 2
A. Hay bridge.	1. Medium resistance.
B. Wheatstone bridge.	2. Frequency.
C. Wien bridge.	3. Capacitance.
D. Schering bridge.	4. High Q-inductance.

Codes :	A	B	C	D
(a)	4	2	1	3
(b)	3	2	1	4
(c)	4	1	2	3
(d)	3	1	2	4

[U.P.S.C. I.E.S. E.E.-I, 2011]

21.

List 1 (Bridge)	List 2 (Quantity)
A. Wheatstone bridge.	1. Capacitance.
B. Wien bridge.	2. Very low resistance.
C. Kelvin double bridge.	3. Resistance.
D. Schering bridge.	4. Frequency.

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	2	1	3	4
(c)	3	1	2	4
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

22.

List 1 (Type of Measurements)	List 2 (Bridges Available)
A. Resistance in the milli-Ohm range.	1. Wheatstone Bridge.
B. Low values of capacitance.	2. Kelvin Double Bridge.
C. Comparison of resistances which are nearly equal.	3. Schering Bridge.
D. Inductance of a coil with a large time constant.	4. Wien's Bridge.
	5. Hay's Bridge.
	6. Carey-Foster Bridge.

Codes :	A	B	C	D
(a)	2	3	6	5
(b)	2	6	4	5
(c)	2	3	5	4
(d)	1	3	2	6

[GATE E.E. 2003]

23.

List 1 (Bridges)	List 2 (Quantity Measured)
A. Anderson bridge.	1. Frequency.
B. Kelvin Double bridge.	2. Resistance.
C. Schering bridge.	3. Inductance.
D. Wien bridge.	4. Capacitance.

Codes :	A	B	C	D
(a)	3	2	1	4
(b)	3	2	4	1
(c)	2	1	3	4
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.E.-I, 1996]

24.

List 1 (Bridges)	List 2 (Quantity to be Measured)
A. Wien bridge	P Measurement of resistance.
B. Maxwell bridge	Q High Q-inductors.
C. Schering bridge	R Measurement of frequency.
D. Anderson bridge	S High voltage capacitors.
E. Blumleim bridge	T Low Q inductors.
	U Insensitive to stray electro-static fields.

[GATE E.E. 1995]

Codes:	A	B	C	D	E
(a)	R	Q	S	T	U
(b)	P	Q	R	S	T
(c)	Q	R	S	T	U
(d)	R	T	S	Q	U

25.

List 1 (Device/network)	List 2 (Application)
A. Twin-T network.	1. For use in accurate ac bridge.
B. Shielded decade capacitance box.	2. For realising frequency capacitance box.
C. Wagner earthing arrangement.	3. To match impedance and block dc noise in ac bridge.
D. Interbridge transformer.	4. For minimising earth capacitance leakage.

Codes :	A	B	C	D
(a)	2	1	4	3
(b)	3	4	1	2
(c)	2	4	1	2
(d)	3	1	4	2

[U.P.S.C. I.E.S. E.E.-I, 2002]

26.

List 1	List 2
A. Iron loss of a choke carrying ac current at 50 Hz along with dc	1. Electrostatic wattmeter.
B. Calibration of a dynamometer type wattmeter.	2. Oscilloscope.
C. Dielectric loss of a capacitor at 20 Hz	3. DC potentiometer.
D. Power loss of an insulator testing at high voltages.	4. AC potentiometer.

Codes :	A	B	C	D
(a)	3	1	4	2
(b)	2	1	4	3
(c)	3	4	1	2
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-I, 2010]

27.

List 1 (Type of Electronic Voltmeter)	List 2 (Important Characteristics)
A. Amplifier rectifier.	1. Wide input signal, dynamic range.
B. Rectifier amplifier.	2. High sensitivity, limited band-width.
C. True RMS.	3. Limited sensitivity, large bandwidth.
D. Logarithmic.	4. Capability to read non-sinusoi-dal ac.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	4	1	2
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-I, 1993; 2007]

28.

List 1 (Name of Instrument)	List 2 (Frequency Range)
A. Telephone detector.	1. 200 Hz
B. Vibration galvanometer.	2. 100 Hz
C. Tunable amplifier.	3. 1 kHz
D. D'Arsonval galvanometer.	4. DC

Codes :	A	B	C	D
(a)	3	4	2	1
(b)	2	1	3	4
(c)	3	1	2	4
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-I, 2007]

Answers: **20.** (c), **21.** (a), **22.** (a), **23.** (b), **24.** (d), **25.** (a), **26.** (b), **27.** (b), **28.** (c),

29.

List 1 (Instruments)	List 2 (Application)
A. Dynamometer instrument.	1. True rms value meter.
B. Thermocouple based instrument.	2. Transfer instrument between ac and dc.
C. Ramp generator.	3. Time base of CRO.
D. Weston Standard Cell.	4. Standard of Electromotive force (emf).

Codes :	A	B	C	D
(a)	4	1	3	2
(b)	4	3	1	2
(c)	2	1	3	4
(d)	2	3	1	4

[U.P.S.C. I.E.S. E.E.-I, 2004]

30.

List 1 (CRO Type)	List 2 (Characteristic)
A. High frequency CRO.	1. Servosystem analysis.
B. Sampling CRO.	2. Long term memory.
C. Low frequency CRO.	3. Pulse testing.
D. Storage CRO.	4. Time domain reflectrometry.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	2	3	4	1
(c)	3	4	1	2
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.E.-II, 1993]

31.

List 1 (Type of CRO)	List 2 (Appropriate Use)
A. Storage.	1. Voltage and current transient studies.
B. Electrostatic deflection.	2. Comparison of waveforms in time domain.
C. Magnetic deflection.	3. Television receiver.
D. Multitrace.	4. Accurate voltage measurements.

Codes:	A	B	C	D
(a)	4	1	2	3
(b)	1	4	2	3
(c)	4	1	3	2
(d)	1	4	3	2

[U.P.S.C. I.E.S. E.E.-I, 2000]

32.

List 1	List 2
A. Digital Counter.	1. Measurement of harmonics.
B. Schering Bridge.	2. Measurement of frequency.
C. Megger.	3. Measurement of dielectric loss.
D. Spectrum Analyzer.	4. Measurement of insulation resistance.

Codes :	A	B	C	D
(a)	1	3	4	2
(b)	2	4	3	1
(c)	1	4	3	2
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.E.-I, 1992, 2006]

33.

List 1 (Type of Digital Voltmeter)	List 2 (Construction Features)
A. Basic ramp type DVM.	1. Uses D/A converter.
B. Staircase-ramp type DVM.	2. True average value of input voltage using voltage/Frequency converter.
C. Integrating type DVM.	3. Servodriven potentiomerer is commonly used.
D. Continuous balance type DVM.	4. Does not use D/A converter.

Codes :	A	B	C	D
(a)	1	2	3	4
(b)	4	1	2	3
(c)	1	2	4	3
(d)	4	1	3	2

[U.P.S.C. I.E.S. E.E.-I, 2007]

34.

List 1 (Type of DVM)	List 2 (Sub-component in ADC)
A. Ramp type.	1. DAC.
B. Dual-slope.	2. Voltage to time converter.
C. Servo-type.	3. Pulse-generator.
D. Successive approximation.	4. Potentiometer.
	5. Capacitor.

Codes :	A	B	C	D
(a)	2	1	4	5
(b)	4	5	3	1
(c)	2	5	4	1
(d)	4	1	3	5

[U.P.S.C. I.E.S. E.E.-I, 2005]

35. List 1 represents the figures obtained on a CRO screen when the voltage signals $V_x = V_{xm} \sin \omega t$ and $V_y = V_{ym} \sin (\omega t + \Phi)$ are given to its X and Y plates respectively and Φ is changed. Choose the correct value of Φ from List I to match with the corresponding figure of List 2.

List 1

A. $\Phi = 0$

B. $\Phi = \pi/2$

C. $\pi < \Phi < 3\pi/2$

D. $\Phi = 3\pi/2$

List 2

1. 2. 3. 4.
5. 6. 
Codes :	A	B	C	D
(a)	1	3	6	5
(b)	2	6	4	5
(c)	2	3	5	4
(d)	1	5	6	4

[GATE E.E. 2003]

Answers: 29. (c), **30.** (c), **31.** (d), **32.** (d), **33.** (b), **34.** (c), **35.** (d).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. The dimensional equations help in derivation of equations for physical quantities.
2. Without unit the number of measure has no physical meaning.
3. Measurements of electrical quantities in terms of the units of mass, length and time are called the absolute measurements.
4. The capacitance of compressed gas capacitance standards is in the range of 10–200 μF.
5. Saturated and unsaturated cadmium cells have same properties and applications.
6. Standard resistor is made from phosphor bronze.
7. An ideal inductor should have zero winding resistance.
8. The standard capacitors should have low dielectric losses and high insulation resistance.
9. The unit of voltage at the International Bureau of Weights and Measures and the legal voltages of most industrial nations are now maintained through zener diodes.
10. It is not possible to have precise measurements which are not accurate. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1995]
11. A precise measurement guarantees accuracy of the measured quantity. [GATE 1994]
12. Random errors are the result of chance or accidental events.
13. Random errors are of variable magnitude and sign and do not obey any known law.
14. Deflection instruments are more accurate than the null type instruments. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1995]
15. D'Arsonval galvanometer is an absolute instrument.
16. Eddy current damping can be provided in instruments having metallic parts.
17. The ratio of frictional torque to deflecting torque is a measure of reliability of the instrument indications and of the inherent quality of the design.
18. The torque-weight ratio of an instrument is a useful criterion of the mechanical performance to be expected from the instrument.
19. Megohm sensitivity is reciprocal of current sensitivity.
20. The galvanometer selected should be of sensitivity highest possible.
21. The internal resistance of an ammeter is very low and the meter is always connected in parallel with the circuit. [G.G.S.I.P. Delhi Univ. May-June 2006]
22. Swamping resistance is connected in series with a voltmeter coil in order to reduce the full-scale current.
23. Voltmeter should be of very high resistance so that loading effect is reduced.
24. Moving iron instruments are suitable for measurement of ac up to 1 MHz.
25. Permalloy core is used in moving iron instruments to increase their sensitivities.
26. Moving iron instruments are free from ageing errors.
27. The deflection of pointer in moving iron instruments is directly proportional to the square of the rms value of operating current. [G.G.S.I.P. Delhi Univ. May-June 2006]
28. Permanent magnet moving coil instrument is the most accurate and useful for dc measurements.
29. The scale of moving coil instruments is uniformly calibrated. [G.G.S.I.P. Delhi Univ. May-June 2006]
30. In a hot wire instrument the sensitive wire is made of phosphor bronze.
31. In hot wire instruments, eddy current damping is provided by means of an aluminium disc rotating between the poles of a permanent magnet.
32. Hot wire instruments are free from errors due to frequency, waveform and stray magnetic fields.
33. Thermocouple instruments may be converted into voltmeters by using low-current thermoelements and suitable series resistors.
34. The main advantage of the rectifier type voltmeter is that it is highly sensitive in comparison to other types of voltmeters used for measuring ac voltages.
35. The circuit to the instrument should never be opened while the rectifier is connected to the line.
36. A rectifier voltmeter calibrated for sinusoidal wave is used for measuring square wave. The voltmeter reading will be high.
37. Induction type instruments are mostly used as wattmeters or energy meters.
38. The range of a dc milliammeter can be extended by using a shunt of high resistance.
39. An ammeter can be used as a voltmeter by using a shunt of high resistance.
40. The shunts are made of material such as manganin which has negligible temperature coefficient of resistance.
41. The standard VA burden ratings for CTs are 2.5, 5, 7.5, 15 and 30.
42. High ac voltages are usually measured with voltmeters, in conjunction with potential transformers.
43. Dynamometer type wattmeter is equally accurate on dc as well as ac circuits.
44. The fixed coil of an electrodynamometer wattmeter is used as potential coil.
45. The resistance in the circuit of the moving coil of dynamometer type wattmeter should be almost zero.
46. Electrodynamometer type wattmeter can be used for power measurement on supply frequencies up to 500 Hz.
47. Induction type wattmeter can be used for both dc as well as ac.
48. The motor meter for the measurement of energy is basically a dc or ac motor.
49. If the voltage supply to the energy meter is more than rated value, the energy meter will run fast.
50. Errors introduced by temperature variations, in single-phase induction energy meters, are usually small.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (F), **5.** (F), **6.** (F), **7.** (T), **8.** (T), **9.** (F), **10.** (F), **11.** (F), **12.** (T), **13.** (T), **14.** (F), **15.** (F), **16.** (F), **17.** (T), **18.** (T), **19.** (T), **20.** (F), **21.** (F), **22.** (F), **23.** (T), **24.** (F), **25.** (T), **26.** (F), **27.** (T), **28.** (T), **29.** (T), **30.** (F), **31.** (T), **32.** (T), **33.** (T), **34.** (T), **35.** (T), **36.** (T), **37.** (T), **38.** (F), **39.** (F), **40.** (T), **41.** (T), **42.** (T), **43.** (T), **44.** (F), **45.** (F), **46.** (T), **47.** (F), **48.** (T), **49.** (F), **50.** (T),

51. Resistances can be measured with the help of ohmmeters and resistance bridges.
52. Resistance of a shunt can be measured by high resistance voltmeter.
53. A 100 kΩ resistance can be measured by ammeter-voltmeter method.
54. Kelvin's double bridge is a modified version of Wheatstone bridge.
55. An ohmmeter is basically an ammeter.
56. An ohmmeter is a PMMC instrument with an internal battery and standard resistors.
57. The accuracy of an ohmmeter is usually high.
58. A megger consists of an emf source and a voltmeter.
59. A megger is a portable deflection instrument commonly used for checking the insulation resistance.
60. Control spring is not a component of megger.
61. Megger is, essentially, a megohmmeter.
62. For measurement of a resistance by a potentiometer standardisation of the potentiometer is not necessary at all.
63. A self-balancing potentiometer is employed in laboratories only.
64. The potentiometer is usually calibrated by means of a standard cell.
65. Potentiometer is one of the most useful instruments for accurate measurement of voltage, current and resistance.
66. For audio-frequency measurements electronic oscillators and amplifiers are used.
67. If an inductance is connected in one arm of the bridge and resistances in the remaining three arms, the bridge can be balanced.
68. Maxwell-Wien bridge is very convenient and useful bridge for the determination of inductance having Q-factor very low (Q<1).
69. Hay's bridge is quite suitable for measurement of low Q-factor of the inductors.
70. Anderson bridge can be used for precise measurement of inductances over a wide range.
71. A low Q-factor coil has a low power loss.
72. To avoid the effect of stray magnetic field in ac bridges magnetic screening can be used.
73. The low value of insulation resistance between two cores of an underground cables, with far ends isolated from the load, indicates open-circuit fault.
74. The essential requirement for performing capacity tests for locating open-circuit faults in underground cables is that the core under test has a good insulation resistance.
75. B-H curves can be used for determination of hysteresis losses and eddy current losses.
76. Hall effect is used nowadays, in modern instrumentation for measurement of flux density.
77. Campbell's bridge method is used to measure iron loss.
78. In Vande Graaf generators output voltage is controlled by controlling the corona source voltage.
79. Vacuum insulation is used in EHT of colour TV.
80. Vacuum insulation is not used in X-rays and field emission tubes.
81. Hall effect generators can be used for the measurement of high ac voltages.
82. In an electrostatic voltmeter the moving disc is surrounded by a fixed guard ring.
83. For indication VTVM uses PMMC.
84. A CRO is an instrument which presents signal waveforms visually.
85. The cathode of a CRO is usually coated with copper oxide.
86. A CRO can operate up to 50 Hz.
87. An electron gun produces a stream of electrons.
88. In a CRO mostly we use electromagnetic deflection.
89. In a CRO, higher the bandwidth, higher will be the anode voltage.
90. In a CRO higher the voltage range, higher will be the anode voltage.
91. If we give negative potential to the upper vertical deflection plate with respect to lower one of the CRT, the spot on the screen moves upwards. **[U.P. Technical Univ. First Semester 2008-09]**
92. A multimeter can be used for measuring both dc as well as ac quantities.
93. Digital multimeter is basically a digital ammeter.
94. A vector voltmeter cannot be used for measurement of Q-factor of a circuit.
95. Harmonic distortion is due to nonlinear behaviour of circuit elements.
96. In a distortion factor meter, the filter is used to suppress even harmonics.
97. Spectrum analyzer is a combination of VTVM and CRO.
98. Spectrum analyzer is used across the frequency spectrum of a given signal to study the voltage distribution.
99. Mixer, sawtooth generator and local oscillator are constituents of a spectrum analyzer.
100. Digital voltmeter has negligible loading effect on the circuit under test because its input resistance is very high. **[U.P. Technical Univ. Second Semester 2009-10]**

Answers: **51.** (T), **52.** (F), **53.** (F), **54.** (T), **55.** (T), **56.** (T), **57.** (F), **58.** (T), **59.** (T), **60.** (T), **61.** (T), **62.** (T), **63.** (F), **64.** (T), **65.** (T), **66.** (T), **67.** (F), **68.** (F), **69.** (F), **70.** (T), **71.** (F), **72.** (T), **73.** (F), **74.** (T), **75.** (F), **76.** (T), **77.** (T), **78.** (T), **79.** (F), **80.** (F), **81.** (F), **82.** (T), **83.** (T), **84.** (T), **85.** (F), **86.** (F), **87.** (T), **88.** (F), **89.** (T), **90.** (F), **91.** (F), **92.** (T), **93.** (F), **94.** (T), **95.** (T), **96.** (F), **97.** (F), **98.** (T), **99.** (T), **100.** (T).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. The ratio of maximum displacement deviation to full scale deviation of the instrument is called the _____ .
(linearity/accuracy/precision)
2. A resistor is specified by a magnitude of 200 Ω with a limiting error of ±20 Ω. The fractional error is _____ . (0.1/0.2/0.5/10)
3. Accuracy of meter is ±5%. When the meter is used to measure current of the order of half the meter rating, the percentage error in the reading may be _____ %. (2.5/5/10/0.5)
4. The errors mainly caused by human mistakes are _____ errors.
(gross/systematic/relative)

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

5. Zero error of an instrument is __ _____ error.
(gross/systematic/random)

6. Indication of the precision of the measurement is obtained from the number of _____ figures in which it is measured.
[A.M.I.E. Sec B. Winter 1995]

7. The number 1.5×10^5 has _____ significant figures.

8. _____ errors are due to inherent shortcomings in the instruments.
[A.M.I.E. Sec B. Summer 1993]

9. In a Wheatstone bridge, the known resistances are correct to within ±0.25%. The accuracy to which an unknown resistance can be measured will be ± _____ percent.

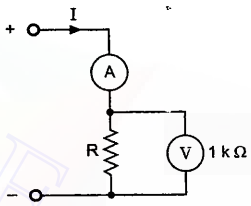
10. A set of independent current measurements was taken by four observers and recorded as 12.8, 12.2, 12.5 and 13.1. The average deviation is _____. [A.M.I.E. Sec B. Winter 1994]

11. The _____ is the difference between greatest and least value of the data. [A.M.I.E. Sec B. Winter 1995]

12. An error that always follows the same definite mathematical or physical law is called the _____ error.

13. Changes in atmospheric temperature, humidity, stray electric and magnetic fields, altitude etc. cause _____ errors.

14. In the circuit shown in figure for measuring resistance 'R' if the ammeter indicates 1 A and the voltmeter indicates 100 V, then the value of R is _____ ohms and the error in measurement using ratio V/I is _____ percent.
[GATE E.E. 1997]



15. Null balance technique of measurement is employed to avoid _____ of the source.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

16. The dimensions of surface tension is _____.

17. The concept or dimensions necessary to have a complete system of dimensions and units are _____.

18. In RMKSA system $I^{-2}ML^3T^{-3}$ is the dimension of _____.
(resistance/resistivity/conductance)

19. The units whose size cannot be chosen independently, are known as _____ units.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

20. The number of basic units recognized by the General Conference of Weights and Measures are _____.

21. The system of units, which is comprehensive logical, coherent and designed for use in all branches of engineering and technology is _____.

22. _____ is the basic SI unit of temperature.
[A.M.I.E. Sec B. Winter 1996]

23. _____ is the basic SI unit of luminous intensity.
[A.M.I.E. Sec B. Winter 1994]

24. In MKS system the fourth unit, besides metre, kg and second as fundamental mechanical units is _____.

25. Coulomb is the unit of_____. [A.M.I.E. Sec B. Summer 1993]

26. The value of permittivity for free space, ε_0 in mks system can be determined from the relation _____ where C is the velocity of light.

27. The dimensions of magnetic flux in SI system are _____.

28. The dimensions of magnetic field strenght in RMKSA system is _____. [A.M.I.E. Sec B. Winter 1993]

29. The dimensions of capacitance in SI system are _____.

30. One international ohm is equal to _____ absolute ohm.
[A.M.I.E. Sec B. Winter 1995]

31. The method of absolute measurement of resistance is _____ method.

32. Weston cell is a _____ reference.

33. The saturated Weston cell has a temperature coefficient of about _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

34. Electrolyte solution used in a standard saturated Weston cell is _____.

35. The best material for use for standard resistor is _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

36. The standard resistance is made 'Bifiliar' type to eliminate _____ effect. (inductive/skin/temperature)

37. The dielectric used in primary standards of capacitance is _____.

38. If two inductances of values L_1 and L_2 henry are physically kept perpendicular to each other at a reasonable distance apart and are connected in series, the mutual inductance between them will be _____ henry. [A.M.I.E. Sec B. Winter 1996]

39. _____ standards are the basic reference standards used in industrial measurement laboratories.

40. Secondary standard capacitors have capacitance of value up to about _____ as compared to _____ in the case of primary standard capacitors.

41. Laboratory standard capacitors (fixed) have capacitance in the range of 0.01 to _____ μF.

42. The algebraic difference between the upper and lower range values is called the ____.

43. _____ of an instrument is the ratio of the magnitude of the output signal to the magnitude of the input signal.
[A.M.I.E. Sec B. Winter 1994]

44. The smallest input signal to the instrument which produces detectable output of the instrument is termed as _____
[A.M.I.E. Sec. B. Instrumentation & Control Winter 1996]

45. _____ is a measure of the reproducibility of the measurement.
[A.M.I.E. Sec B. Summer 1994]

46. The least interval between two adjacent discrete details, which can be distinguished one from the other, is called the _____.

47. Measurement should be taken on instruments as close to full scale as possible to ensure nearness to guaranteed _____ error.
[A.M.I.E. Sec B. Winter 1994]

48. The instrument having their uses merely confined within standardising laboratories are _____ type instruments.

49. Wattmeter may be classified as a/an _____ instrument.

50. Energy meter (kWh meter) may be classified as a/an _____ instrument.

51. In electrical measuring instruments electrical energy is converted into _____ energy.

52. A torque produced in an indicating instrument by utilizing magnetic, electrodynamic, chemical or electrostatic effect is known as _____ torque. (controlling/damping/deflecting)

53. The controlling torque in a spring-controlled instrument is proportional to _____. ($\theta/1/\theta$, θ^2, $\sin\theta$)

54. The controlling torque in a gravity-controlled meter is proportional to _____. (θ, $\sin\theta$, $\cos\theta$, $\tan\theta$)

55. In portable instruments, the controlling torque is provided by _____.

56. Direct methods of measurements are of two types namely deflection methods and _____ methods.

57. The most common absolute instrument is _____ galvanometer.

58. The force responsible for reduction of oscillations of a pointer in an ammeter is _____ force.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

59. The damping system should be such that it produces damping torque only when the moving system is in _____.
[A.M.I.E. Sec B. Summer 1993]

60. The damping usually provided in indicating instruments having weak magnetic field is_____.

61. If an instrument is _____ damped, the moving system will oscillate about the final steady position. [A.M.I.E. Sec B. Winter 1994]

62. A portable instrument is likely to be provided with _____ damping.

63. When the instrument is overdamped, it will become _____ and _____.

64. The moving system in an indicating instrument, is usually mounted on a spindle of _____ steel, having the ends conical and highly polished to form pivots.

65. Suspension type of instruments can only be used in _____ position. [A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

66. The full-scale current of a basic D' Arsonval movement is 1mA. Its sensitivity is _____ Ω/V.
[A.M.I.E.Sec. B. Instrumentation & Control Winter 1994]

67. A sensitive galvanometer produces long deflection for a _____ value of current.

68. A _____ is provided for adjusting the position of the coil and also for zero setting in a galvanometer. [A.M.I.E. Sec B. Winter 1994]

69. The shunt resistance to be used with a d' Arsonval movement should have _____ thermal electromotive force.
[A.M.I.E.Sec B. Summer 1996]

70. Generally speaking, a _____ resistance galvanometer is used in high resistance circuit and _____ resistance galvanometer is used in low resistance circuit.

71. _____shunt eliminates the possibility of having the meter in the circuit without shunt. [A.M.I.E. Sec B. Summer 1994]

72. The resistance required in the circuit to cause a deflection of one scale division impressing 1 V is called the _____ sensitivity.

73. A D'Arsonval basic meter movement is converted into a voltmeter by connecting a _____ resistance with it.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

74. In case of ballistic galvanometer, time period should be _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

75. The induced emf in the search coil, of area A m^2 and N turns when suddenly placed perpendicular to a field of B tesla in dt seconds in a ballistic galvanometer is given by _____.

76. A flux meter is a special type of _____ galvanometer.
[A.M.I.E. Sec. B. Winter 1996]

77. A fluxmeter does not have any _____ torque.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

78. Swamping resistance is used to compensate the error due to _____ variations.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

79. _____ resistance is connected in series with a voltmeter coil and have a lowest temperature coefficient of resistance in order to reduce temperature error.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

80. Swamp resistor is usually made of _____.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996

81. A voltmeter contains a _____ resistance in series.
[A.M.I.E. Sec B Winter 1993]

82. An ammeter can be converted into a voltmeter by connecting _____ in series. [A.M.I.E. Sec B Winter 1994]

83. An ammeter is nothing but galvanometer with _____ resistance.

84. Low torque/weight ratio of an instrument gives _____ sensitivity.

85. If the instrument has square law response, it can be used for the measurement of _____ quantities. (dc/ac/both dc and ac)

86. A low voltage is measured on a higher scale of voltmeter. The measurement will have low _____.
(accuracy/precision/resolution)

87. A voltmeter having a sensitivity of 1000 Ω / V reads 100 V on its 150 V scale. The meter takes a current of _____ mA.
(0.67/1.35/1.5/10)

88. (Moving coil/Moving iron) type instrument may be used to measure both ac and dc currents. [G.G.S.I.P. Univ. Delhi May 2010]

89. The graduation of scale of _____ instrument is not uniform throughout. [A.M.I.E.Sec. B. Winter 1995]

90. A current $i = (10 + 10 \sin t)$ A is passed through an ideal moving-iron ammeter, its reading would be _____ amperes.
[A.M.I.E. Summer 1996]

91. In moving iron instruments, the deflection is proportional to _____. [A.M.I.E. Sec B. Summer 1996]

92. A rectangular coil of 25 mm × 20 mm having 40 turns and carrying a current of 15 mA through it is placed in a radial magnetic field of 0.1 T, the torque acting on the moving coil will be _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

93. If a PMMC voltmeter reads ____V for full scale deflection the reading corresponding to half scale is 125 V.
[A.M.I.E. Sec B. Summer 1994]

94. The PMMC meter can measure only _____ quantities.
(dc/ac/both dc and ac)

95. Two 100 V full scale PMMC type dc voltmeters having figure of merits (FOM) of 10 kΩ/V and 20 kΩ/Vare connected in series. The series combination can be used to measure a maximum dc voltage of _____. [GATE E.E. 1995]

96. In electrodynamometer type instruments, _____ type of damping is used.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

97. A dynamometer type ammeter has _____ scale.
[A.M.I.E. Sec. B. Instrumentation & Control Summer 1996]

98. A dynamometer type instrument is mostly used in _____ measurement. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1996]

99. Electrodynamometer types of meters are used for both _____ and _____ measurements. [A.M.I.E. Sec B. Summer 1993]

100. The power consumption of the dynamometer instrument is comparatively_____ and its sensitivity is _____.
[A.M.I.E. Sec B. Summer 1994]

101. Electrodynamometer meters have _____ torque/weight ratio and thus have low sensitivity. [A.M.I.E. Sec B. Summer 1994]

102. Electrical energy is converted into _____ energy in the heating element in thermoelectric instruments. [A.M.I.E. Sec B. Winter 1994]

103. In a thermocouple element, heat energy transferred to the hot junction is converted back to electrical energy by _____ effect.
(Seebeck/Thomson/Faraday)

104. A current of 10 sin 314t is passed through a thermocouple ammeter. It will read _____ A.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

105. In rectifier instruments, there is a variation of the resistance of rectifying element with _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

106. The basic _____ movement is often called d' Arsonval movement. [A.M.I.E. Sec B. Summer 1994]

107. _____ instrument is used for dc measurements only, whereas _____ instruments are used for ac measurements only.
[A.M.I.E. Sec. B. Instrumentation & Control Winter 1995]

108. Shunts are used for increasing the range of an _____.
[A.M.I.E. Sec B. Summer 1993]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

109. Measuring range of a voltmeter can be extended by using a _____ resistance.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

110. A moving coil ammeter has a full-scale deflection of 50 μA and a coil resistance of 100 Ω. The value of shunt resistance required for the instrument to be converted to read a full-scale reading of 1 A will be _____. [Mahamaya Technical Univ. Second Semester 2010-11]

111. The series resistance to be used to extend the 0–200V range of 20,000 Ω/V voltmeter to a 0–2000 V range is _____MΩ.
[A.M.I.E. Sec B. Winter 1993]

112. A meter movement having full–scale deflection current 50 μA and internal resistance of 40 Ω is used to measure currents up to 50 mA. The value of shunt resistance would be _____ Ω.
[A.M.I.E. Summer 1995]

113. A moving coil instrument gives full-scale deflection with 20 mA. The resistance of coil is 4 Ω. The value of series resistance needed for the instrument to read up to 30 V is _____.
[U.P. Technical Univ. First Semester 2009-10]

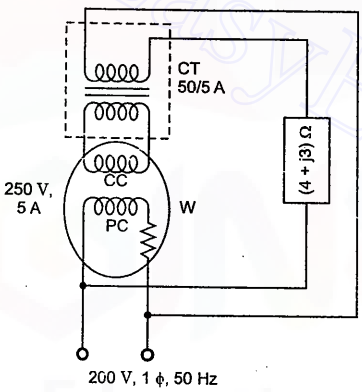
114. The usual ranges of ammeters and voltmeters for use with instrument transformers are 0– _____A and 0– _____V respectively.

115. In CTs turn compensation is provided mainly to reduce the _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

116. Due to effect of inductance in the pressure coil, the dynamometer type wattmeter reads _____ on lagging power factors and _____ on leading power factors.

117. If the maximum scale reading of a 5 A/10 A, 120 V/240 V dynamometer type wattmeter is 600 W, it can have a maximum multiplication factor of ____ ____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

118. For the circuit shown in figure the wattmeter reading will be _____ W and the power dissipated in the load is _____ W.
[GATE 1997]



119. If W_1, W_2 and W_3 are the readings of three wattmeters used to measure the power in 3-phase, 4-wire circuit, the total power of load circuit will be _____.
[U.P. Technical Univ. 2008-09]

120. Readings of two wattmeters in 3-phase unity power factor load would be _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

121. The electrodynamometer used to measure power with a full-scale reading of 100 W will have its one quarter scale reading of _____W.
[A.M.I.E. Sec B. Winter 1993]

122. Low power factor wattmeters are designed with a _____ controlling torque to give full scale deflection for power factors as low as 0.1.
[A.M.I.E. Sec B. Winter 1994]

123. Laboratory wattmeters are _____ type.

124. Most common type of ac meters found in every day domestic and industrial installations are _____single-phase energy meters.

125. A dc ampere-hour meter registers_____ if connected to voltage lower than rated.
[A.M.I.E. Summer 1996]

126. An instrument that measures electrical energy is an _____ type meter.
[A.M.I.E. Winter 1996]

127. In an induction type energy meter in order to have correct registration it is essential that the shunt magnetic flux lags behind the applied voltage by _____.

128. Induction type energy meters are free from _____ errors.

129. In induction type energy meters light load adjustments are usually done at _____% of full-load current.

130. Two holes are provided in the energy meter rotating disc to avoid _____ _____.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

131. Maximum demand indicator operates on the principle of _____.

132. Reed frequency meter is, essentially a _____ measuring system.

133. Power factor meter has _____ control spring(s).

134. In a single-phase power factor meter the phase difference between the currents in the two pressure coils is _____.

135. In the measurement of low resistance by Kelvins double bridge two sets of readings are taken, one with the current in one direction and the other with direction of current reversed. This is done to eliminate the effect of _____
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

136. _____ bridge is a modification of the Wheatstone bridge and provides greatly increased accuracy in the measurement of very low value resistance, generally below 1Ω.
[A.M.I.E. Sec B. Summer 1994]

137. Shunt type ohmmeters are suitable for measurement of _____ resistances.

138. _____ is an instrument used for measurement of high resistance and insulation resistance.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

139. A megger, when not in operation, indicates a resistance of _____.

140. For determination of surface resistivity the instrument usually used is_____.

141. The resistance of an earthing electrode is expected to be _____.

142. The simple dc potentiometer consists of a German silver or _____ wire.

143. A direct current can be measured by a simple dc potentiometer in conjunction with a _____.

144. In an ac coordinate potentiometer, the currents in the phase and quadrature potentiometers are adjusted to be out of phase by _____.

145. The most commonly used null detector in _____ bridge measurement is vibration galvanometer. [A.M.I.E. Sec B. Summer 1994]

146. Maxwell's bridge is used for measurement of _____.
(resistance/inductance/capacitance)

147. Maxwell's inductance bridge measures an inductance by comparison with a _____
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

148. Anderson bridge is used for the measurement of _____.
(resistance/inductance/capacitance/frequency)

149. Hay bridge is a modification of _____ bridge.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

150. In Wien bridge, the output frequency is determined by _____ combination. (R-C/R-L/R-L-C)

151. De Sauty bridge is used for the measurement of _____ and _____.
[A.M.I.E. Sec B. Summer 1993]

152. Schering bridge is widely used for _____ and _____measurements. [A.M.I.E. Sec B. Winter 1994]

153. Electronic null detectors have _____ sensitivity.

154. The shielding of bridge elements is done to reduce the effects of _____.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

155. Core loss in a magnetic material is due to hysteresis and _____ currents. [A.M.I.E. Sec B. Summer 1993]

156. The leakage factor in a magnetic circuit is given by the ratio of _____ to _____. [A.M.I.E. Sec B. Winter 1993]

157. The magnetic potentiometer is used to measure _____ potential difference between two points. [A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

158. Campbell bridge method is one of the best methods for _____ loss measurement by bridge network in a ring specimen. [A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

159. An electrostatic voltmeter cannot be used for measurement of _____ voltage. [A.M.I.E. Sec B. Winter 1993]

160. Sphere gap voltmeter when measuring ac voltage measures _____ value.

161. _____ occurs when the voltage gradient at the surface of high voltage conductor exceeds the breakdown strength of air. [A.M.I.E. Sec B. Winter 1996]

162. Cascade-connected transformers are normally used when testing voltage required exceeds _____ kV. (50/100/500/2000)

163. Advantage of instrumentation amplifier is high _____. [A.M.I.E. Winter 1994]

164. The D'Arsonval meter movement can be converted into an audio-frequency ac ammeter by adding a _____ to it.

165. TVM is a transistorized version of _____. [A.M.I.E. Sec B. Summer 1993]

166. Nonsinusoidal waveforms when applied to an average responding voltmeter will cause the meter to read high or low depending upon the _____ of the waveform. [A.M.I.E. Sec B. Summer 1994]

167. Vector impedance meter measures _____ and _____ over a wide frequency range. [A.M.I.E. Sec B. Summer 1993]

168. The Q-factor of a coil is given by _____. [A.M.I.E. Sec B. Summer 1996]

169. For a series R-L-C circuit, the value of Q at resonance is equal to the voltage across the capacitance to the _____. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1996]

170. The power consumption of a dc voltmeter using a direct-coupled amplifier when measuring a voltage of 0.5 V and having an input impedance of 10 MΩ is a few _____. (watt/mW/μW/nW)

171. Parallel connection of Q-meter is used to measure _____ impedance component. (high/low/both low and high)

172. The deflection _____ of a CRT is defined as the deflection of the screen per unit deflection voltage. [A.M.I.E. Sec B. Winter 1995]

173. In CRT, the source of focussed and accelerated electron beam is the _____. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1996]

174. In a CRT, the phosphor absorbs the _____ energy of the bombarding electrons and re-emits energy at a lower frequency in the visual spectrum. [A.M.I.E. Sec B. Summer 1993]

175. The _____ assembly produces a sharply focussed beam of electrons which are accelerated to high velocity. [A.M.I.E. Sec B. Summer 1993]

176. The _____ is focussed by the focusing anode in a CRO. [A.M.I.E. Sec B. Winter 1994]

177. In a CRO, _____ produces a sharply focused beam of electrons which are accelerated to high velocity later on. [A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

178. It is desirable to greatly accelerate the electron beam to help observe fast occurring events, but the deflection sensitivity is reduced by a higher accelerating voltage. This problem is avoided in a CRT by providing _____. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1994]

179. The time-base of an oscilloscope is developed by _____ waveform. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

180. For delineating a sinusoidal waveform on the screen of a CRO, the required time base voltage waveform must be _____.

181. A sawtooth waveform is applied to the _____ deflection plates of a CRO from its sweep generator. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

182. Retrace period for an ideal sawthooth waveform is _____ second. (0/∞/10 m)

183. Dual trace CROs use _____ electron gun. [A.M.I.E. Sec B. Summer 1996]

184. A normal CRO uses a horizontal input voltage which is an internally generated ramp voltage and is called _____. [A.M.I.E. Sec B. Winter 1995]

185. The _____ in a CRO generates the correct voltage to supply to CRT to deflect the spot at a constant time dependent rate. [A.M.I.E. Sec B. Summer 1994]

186. A square wave signal when observed on the CRO has one cycle measured as 6 cm at a scale setting of 30 μs/cm. The signal frequency is _____ kHz. [A.M.I.E. Sec B. Winter 1993]

187. The sweep time setting on a CRO is 2 ms/cm. Two similar points on a periodic wave are seen to be 5 cm apart. The frequency is _____ Hz. [A.M.I.E. Sec B. Winter 1994]

188. A CRO with a time base setting of 5 ms/cm will have adjacent same sign peaks of a 50 Hz signal separated by _____ [A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

189. The voltage $V_m \sin \omega t$ is fed to both X and Y input of CRO. The Lissajous pattern will be a straight line with _____ degree slope. [A.M.I.E. Sec B. Winter 1993]

190. Lissajous patterns obtained on a CRO screen can be used to determine _____. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

191. If the Lissajous pattern of two signals of the same frequency displayed on a CRT is a circle, the phase angle between them is _____. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

192. With the phase shift between the same frequency and equal amplitude signals applied to both the horizontal and vertical plates of a CRO is 90°, then the figure displayed on its screen will be _____. [A.M.I.E. Sec. B. Instrumentation & Control Winter 1995]

193. An oscilloscope is operated in the X-Y mode. The figure 8 is displayed on oscilloscope screen. If the frequency of X-input in 1 kHz, the Y-input frequency is _____. [GATE E.E. 1995]

194. When the time base is switched off and the sinusoidal voltage is applied to vertical deflection plates, then one sees a _____ on the screen. [A.M.I.E. Winter 1994]

195. The length of the trace (sweep) on the CRT screen is controlled by _____ control. [A.M.I.E. Summer 1995]

196. To produce a steady signal voltage trace on the screen of a CRO, the frequency of the sweep voltage must be exact _____ of the frequency of the signal voltage. [A.M.I.E. Winter 1996]

197. Dual trace CRO uses _____ beam(s)

198. A double beam oscillscope has _____ electron guns.

199. A measure of distortion represented by a particular harmonic is the ratio of _____ of harmonic to that of fundamental. [A.M.I.E. Sec B. Winter 1994]

200. Complex waveforms are most accurately measured with an _____ voltmeter. [A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1998]

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

201. A ____ ____ analyzer is an instrument which is used to measure relative amplitudes of single frequency components in a complex waveform.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1993, 1994, 1997]

202. The instrument that displays voltage or energy of a signal as a function of frequency is known as _____ analyzer.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1998]

203. Digital instruments have input impedance of the order of _____. [A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 1999]

204. In a digital voltmeter, the oscillator frequency is 500 kHz, the ramp voltage falls from 5 V to 0 in 15 ms. The number of pulses counted by the counter is _____.

205. In the above problem, if the oscillator frequency falls to 480 kHz, a measurement of exactly 5 V dc would give a display of _____.

206. The resolution of a DVM with 4 digit display is _____ __.

207. The resolution of a 3 digit 0–1 V DVM is _____.

208. The resolution of a $3\frac{i}{2}$ digit display on a 1 V range will be _____ and 10 V range will be ____ .
[C.B. Technical Univ. Odd Semester 2010-11]

209. In a dual slope integrating type digital voltmeter the first integration is carried out for 10 periods of the supply frequency of 50 Hz. If the reference voltage used is 2 V, the total conversion time for an input 1 V is __ _____ second. [GATE E.E. 1992]

210. The resolution of a digital ammeter with 3 digital display is _____.

CHAPTER 19

Electrical and Electronic Instrumentation

Short Answer Type Questions With Answers

Q. 1. What is a recorder ?

Ans. A recorder is an instrument that displays a time-varying signal in a form of easy to re-examine, perhaps long after the original signal has ceased to exist.

Q. 2. What is the necessity of the recorders ? **[Pb. Technical Univ. December 2004]**

Ans. Recorders are required to keep a permanent record of the state of phenomenon under investigation and for continuous monitoring of the condition, state, or value of process variables such as force, pressure, temperature, flow, voltage, current etc.

Q. 3. What is the main recording requirement ?

Ans. The main requirement of the recording is that the recording method should be in consistence with the type of system. For dealing with a wholly analog system, the analog recording technique should be used while for dealing with a system having digital output, digital recording device should be used.

Q. 4. What are strip-chart recorders ? **[PTU December 2005]**

Ans. Strip chart recorders are recording instruments. It records one or more variables with respect to time. So it is also known as the *x-t* recorder.

Q. 5. Why are strip chart recorders also called the *x-t* recorders ?

Ans. Strip-chart recorders record one or more variables with respect to time, so these recorders are also called the *x-t* recorders.

Q. 6. Why is it essential to use large moving coil and strong magnetic field in a galvanometer type strip-chart recorder ?

Ans. As the friction torque in a recorder is high due to large weight of the moving system and friction between the pen and the chart, so the large deflecting torque is required. Obviously the controlling torque required will also be large. So in such recorders large moving coil and strong magnetic field are required.

Q. 7. Why is it necessary to use critically damped galvanometer in galvanometer type strip-chart recorder ?

Ans. Galvanometer used in galvanometer type strip-chart recorder is made critically damped to avoid overshoot.

Q. 8. What is *x-y* recorder and how is it different from *x-t* to *y-t* recorder ?

Ans. The *x-y* recoders are employed where it is desired to plot the relationship between two variables, $y = f(x)$ instead of plotting each variable separately as a function of time. So these recorders have a special capability of displaying two separately varying quantities on the X- and Y-axes of cartesian coordinates. In such a recorder one of the variables is applied to the X-input and the other to the Y-input, and the recorder plots their variations against one another. An *x-y* recorder closely resembles and functions like a single pen recorder except that the chart (Y-axis) is moved in response to changes in a variable instead of a uniform time rate. In such recorders chart remains fixed in its position and the pen moves simultaneously in both the X and Y directions in response to electrical signals applied to its two input terminals. As most of the *x-y* recorders also have a time base, so they can be employed to plot the variation of one variable against time as well. Thus such recorders carry out some measurements in the same way as the strip-chart recorders do.

Q. 9. Where are strip-chart recorders used ? **[PTU December 2004]**

Ans. There are thousands of applications of recorders. Few of most important applications are (*i*) temperature recording (*ii*) sound level recording (*iii*) recording of amplifier drift.

Q. 10. What do you understand by oscillographic recorders ?

Ans. Oscillographic recorders are instruments which record informations on paper or film with ink, powder, electrostatic charge, liquid, electric arc or light. Though galvanometer recorders, pen recorders, *x-y* recorders, strip-chart recorders and CRT recorders, all may be considered oscillographic recorders, but here word 'oscillograph' implies either a galvanometer or a CRT recorder—the recorders having bandwidths more than 20 kHz.

Downloaded From : www.EasyEngineering.net

Q. 11. What is an input device ?

Ans. The physical quantity under measurement, called the measurand, in an instrumentation system, makes its first contact with the input device. The input device may consist of a primary sensing element and a transducer. In some cases the transducer may be the only element in the input device, as in case of temperature measurement with thermistor.

Q. 12. What is meant by elastic deformation pressure element or force summing device ?

Ans. The mechanical devices, that change shape when force or load is applied, are called the elastic deformation pressure elements or force summing devices. The majority of such devices utilize one or another form of diaphragms or bellows, or bourdon tubes.

Q. 13. What is transducer ?

Ans. Basically transducer is defined as a device that converts energy or information from one form to another. These are widely used in measurement work because not all quantities that need to be measured can be displayed as easily as others.

Q. 14. What is the need of a transducer ?

Ans. Mostly quantities to be measured are non-electrical such as temperature, pressure displacement, humidity, fluid flow, speed etc., but these quantities cannot be measured directly. Hence such quantities are required to be sensed and changed into some other form for easy measurement. Electrical quantities such as current, voltage, resistance, inductance and capacitance etc., can be conveniently measured, transferred and, stored and therefore, for measurement of non-electrical quantities these are to be converted into electrical quantities first and then measured. The function of converting non-electrical quantity into electrical one is accomplished by a device called the *electrical transducer.*

Q. 15. What is an electrical transducer ? **[U.P.S.C. I.E.S. 2003]**

Ans. Basically an electrical transducer is a sensing device by which a physical, mechanical or optical quantity to be measured is transformed directly, with a suitable mechanism, into an electrical signal, current, voltage or frequency.

Q. 16. Give three basic requirements of a transducer. **[PTU 2005-06]**

Ans. Three basic requirements of a transducer are as follows :

1. **Ruggedness :** It should be capable of withstanding overloads and some safety arrangement should be provided for overload protection.
2. **Linearity :** The input-output characteristics should be linear and it should produce these characteristics in symmetrical way.
3. **No Hysteresis :** It should not give any hysteresis during measurement while input signal is varied from its low value to high value and vice-versa.

Q. 17. Distinguish between active and passive transducers. **[U.P. Technical Univ. 2003-04]**

Ans. Self generating type transducers i.e. the transducers, which develop their output in the form of electrical voltage or current without any auxiliary source, are called the active transducers. On the other hand the transducers in which electrical parameters (resistance, inductance or capacitance) changes with the change in input signal are called the passive transducers.

Q. 18. What is the difference between analog and digital transducers ?

Ans. Analog transducers convert input signal into output signal, which is a continuous function of time such as thermistors, strain gauge, LVDT etc. On the other hand digital transducers convert input signal into the output signal of the form of pulse e.g. discrete output.

Q. 19. How does inverse transducer differ from a transducer ? **[Pb. Technical Univ. 2005-06]**

Ans. Transducer is defined as a device that converts a non-electrical signal into an electrical quantity while an inverse transducer is defined as a device that converts electrical quantity into a non-electrical quantity.

Q. 20. Enumerate the points that are to be considered in the selection of a transducer for a specific measurement ?

Ans. The points to be considered in determining a transducer suitability for a specific measurement are: Range, sensitivity, electrical output characteristics, physical environment errors.

Q. 21. What is strain gauge ? **[U.P.S.C. I.E.S. 2003]**

Ans. The strain gauge is basically a device used for measuring mechanical surface strain and is one of the most extensively used electrical transducers. Its working is based on the fact that when stress is applied on the metal conductor its resistance changes owing to change in length and cross-sectional area of the conductor. Resistance of the conductor under stress is also changed due to change in resistivity of the conductor. Strain gauges on the basis of operating technique used, may be mechanical, optical or electrical.

Q. 22. Where is strain gauge used ? **[Pb. Technical Univ. 2004-05]**

Ans. Electrical strain gauges are used for a variety of applications, mainly because of ease in instrumentation, high accuracy and excellent reliability.

1. Strain gauge transducers are extensively used for analyzing the dynamic strains in complex structures, such as the stress and strain in bridges, automobiles, roads etc. where the output of the bridge can be recorded with the help of oscillograph calibrated to read the instantaneous stress or strains.
2. Strain gauge transducers are used for measuring tension, torque, force, stresses in structures. They are particularly useful where a minimum disturbance due to presence of transducer is required as in wind tunnel measurements.
3. Strain gauge transducers are also used for measurement of force by the strain produced in load rings.

Q. 23. Why are strain gauges called the piezo-resistive strain gauges ?

Ans. Resistance of a conductor under stress is also changed due to change in resistivity of the conductor, this property is called the piezo-resistive effect and the strain gauges are called the piezo-resistive.

Q. 24. What are Rosettes ? **[U.P. Technical Univ. 2002-03]**

Ans. Cluster of strain gauges is called the Rosettes and are used for specific stress analysis or transducer applications.

Q. 25. Why is platinum considered most suitable material for RTDs for most laboratory work and for industrial material measurements of high accuracy ?

Ans. Platinum is the most suitable material for RTDs for most laboratory work and for industrial measurements of high accuracy as it has optimum characteristics for service over a wide temperature range. Platinum is commercially available in a pure form, is relatively stable under different enviromental conditions, and its resistance-temperature curve is simple and holds over a wide range of temperature (–263°C to + 545°C) with high precision. Its resistivity tends to increase less rapidly

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

at higher temperatures than for the other metals – – a unique quality. It can withstand high temperatures while maintaining excellent stability. The common value of resistance for a platinum resistance thermometer ranges from 10 Ω for the bird cage model to several thousand ohms for the film of RTD. The most common value is 100 Ω at 0°C with a temperature coefficient of resistance of 0.00391 per °C.

Q. 26. What are thermistors ? [U.P.S.C. I.E.S. 2001]

Ans. Thermistors are also called the thermal resistors and the name is derived from thermally sensitive resistors, as the resistance of a thermistor varies as a function of temperature.

Thermistors are essentially semiconductor devices, that behave as resistors with high negative temperature coefficient (usually – 0.04 per °C) and are at least 10 times as sensitive as the platinum resistance thermometer.

Q. 27. Why is thermistor well suited to precision temperature measurement, control and compensation ?

Ans. Because thermistors are rugged in construction, cheaper in cost and highly sensitive devices.

Q. 28. Where is LVDT used ? [Pb. Technical Univ. 2004-05]

Ans. LVDTs are suitable for use in applications where the displacements are too large for strain gauges to handle. For example, LVDTs can be employed for measurement of displacements that range from a fraction of a mm to a few cm. If LVDT is to be employed for measurement of mechanical displacement greater than 25 mm, an appropriate mechanical ratioing (gearing) must be used.

Since the LVDTs can also be connected to other transducers, whose outputs are mechanical displacements, these are often employed together with other transducers for measurement of force, weight, pressure etc.

Q. 29. Why is the frequency of excitation of primary winding of an LVDT kept very high as compared to the frequency of the signal being detected.

Ans. Frequency of excitation is kept high in order to avoid low-frequency noises.

Q. 30. What are resolvers ? [U.P.S.C. I.E.S. 1996]

Ans. Resolver is a synchro whose rotor is mechanically driven to translate rotor angle into electrical information corresponding to the sine and cosine of rotor angle. It can interchange rectangular and polar coordinates. It is also called a sine-cosine generator and synchro-resolver.

Q. 31. What are the common materials used for piezoelectric transducers ?

Ans. Materials used for piezoelectric transducers are of three types namely *natural crystals* such as quartz and Rochelle salt; *synthetic crystals* such as lithium sulphate, ammonium dihydrogen phosphate; and *polarized ceramics* such as barium titanate etc.

Natural quartz is considered most suitable material for piezoelectric transducers.

Q. 32. Why is natural quartz considered most suitable material for piezoelectric transducer ?

Ans. Because natural quartz has lower temperature sensitivity and a higher resistivity (of the order of 10^{12} Ω-m) thus providing an inherently long time constant which allows static calibrations. Further, it exhibits linearity over a wide range of stress levels with very low hysteresis.

Q. 33. What are the three major classes of digital displacement transducers ? [U.P. Technical Univ. 2002-03]

Ans. The digital transducers or encoders may be classified into three classes namely tachometer, incremental and absolute encoders.

Q. 34. Why is the Gray code preferred to binary code in commercial encoders ? [U.P. Technical Univ. 2002-03]

Ans. The main drawback of the binary and 8421 coding systems is that two or more bits have to change simultaneously during a single position change. This drawback is overcome by a binary coded decimal (BCD) system, such as the 'gray code', wherein only one-bit change takes place in transition between any two consecutive numbers.

Q. 35. Why are electrical methods preferred for measurement of non-electrical quantities ?

Ans. Electrical methods are preferred for measurement of non-electrical quantities as they make it possible to measure continuously practically any non-electrical quantity, transmit the obtained data over any distance and characterised by high accuracy and sensitivity.

Q. 36. Why ballast circuit cannot be used for measurement of static strains ?

Ans. The sensor connected to the output terminals of the gauge must sense a change of 6 μV in a range of 6 V i.e. change of 0.0001%. This is the stringent requirement and that is why the ballast circuit cannot be used for measurement of static strain.

Q. 37. Why the null method of Wheatstone bridge is unsuitable for the measurement of dynamic strain ?

Ans. The null method of Wheatstone bridge requires that the balancing resistor must be adjusted to have zero indication on the meter before a reading can be noted. This adjustment takes considerable time if done manually; even when an instrument servo-mechanism makes the adjustment automatically, the time required is much longer than is permissible for measuring rapidly changing variables. So this method is not suitable for measurement of dynamic strains.

Q. 38. How does the humidity affect the strain measurement by strain gauges ?

Ans. Humidity causes errors in two ways (*i*) it causes breakdown of insulation between the gauge and the ground point and (*ii*) it causes electromechanical corrosion of gauge wire owing to electrolysis whereby the gauge resistance tends to increase considerably and a zero drift occurs.

Q. 39. What is a load cell and what for it is used ?

Ans. A load cell is an electromechanical device that converts weight or force into an electrical signal and is widely used for measurement of static and dynamic forces.

Q. 40. What is meant by vacuum pressure ?

Ans. Vacuum pressures are those which are below atmospheric pressure.

Q. 41. How does Pirani gauge differ from thermocouple gauge in operating principle ?

Ans. The principle of operation of Pirani vacuum gauge is the same as that of a thermocouple vacuum gauge. Main difference between the two is that in a thermocouple gauge pressure is measured by sensing he variations in temperature of the heater element but in a Pirani gauge pressure is measured by sensing the variations in resistance of the heater element since the resistance of the heater element varies with the variation in its

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

temperature. In this type of gauge, the function of heating and temperature measurement are combined in single element.

Q. 42. How is moving-magnet type transducer superior to moving-coil velocity pickup ?

Ans. Moving-magnet type devices are simple, robust and inexpensive and provide a sufficient high voltage output as they permit a quite lot of windings. Another advantage is that the connections to the leads do not suffer any motion so maintenance requirements are negligible.

Q. 43. How an ac tachometer is superior to dc tachometer ?

Ans. AC tachometer does not cause any maintenance problem of commutator and brushes.

Q. 44. Why is bimetallic strip unsuitable for measurement of temperature in industrial applications ?

Ans. The bimetallic strip is unsuitable for measurement of temperature in industrial applications because it gives small deflection and so low sensitivity.

Q. 45. Why are quartz crystal thermometers ideally suited for temperature measurements in the limited range of 223 to 423 K and preferred over platinum resistance thermometers and thermocouples ?

Ans. A piezoelectric quartz crystal thermometer is a novel and unique device for measuring temperature with good accuracy and high stability. This type of thermometer makes use of a quartz crystal property in which the change in resonance frequency for a given change in temperature is highly linear with excellent repeatability in the range of 193-523 K. The linearity obtained is considerably better than that of the platinum resistance thermometer, thermocouple or thermistor.

Q. 46. What is telemetry ?

Ans. Telemetry may be defined as the science of measuring at a distance and is used in industrial, commercial, military and space operations.

Q. 47. What are the different methods of data transmission ?

[U.P.S.C. I.E.S. 1996; 2000]

Ans. The method used for data transmission depends upon the type of data to be transmitted and the distance over which the data is to be transmitted.

Hydraulic and *pneumatic methods* of data transmission are used only for short distances and, therefore, their scope is very limited.

Electrical and *electronic* methods of data transmission can be used for long distances and, therefore, these methods are extensively used in instrumentation and measurement systems.

Q. 48. Why is microwave channel most widely used ?

Ans. Microwave channel is most widely used because of heavy requirement in industries like power and gas transmission and due to the overcrowding of lower radio-frequency spectrum. The initial cost on transmitter and receiver is high in this system but cost of additional channels is small.

Q. 49. What is major difference between current and voltage telemetering systems ?

Ans. Major difference between the two systems is that in the current telemetering system the current in the communication circuit is maintained at a measurable value, irrespective of line conditions, whereas the ideal voltage telemetering system draws from the circuit a current so small that the resistive drop in the line is negligible. Thus in voltage telemetering system voltage at the measuring end is measured by a null or balance method in order to keep the line current zero at the time of measurement.

Q. 50. Why is it necessary to protect transmission channel from sources of interferences in voltage telemetering system ?

Ans. In order to make signal-to-noise ratio high, which is essential in voltage telemetering system, it is necessary to protect transmission channel from sources of interferences which are of the same order as that of signal.

Q. 51. Is modulation required in telemetry ? If so why ?

[Pb. Univ. June 1993]

Ans. Yes modulation is required in telemetry. It is because the data available is in the form of current or voltage which is usually very weak for such transmission.

Q. 52. What are the different modulation techniques for digital data transmission ? **[U.P.S.C. I.E.S. 1998]**

Ans. The data to be transmitted are quantized and transmitted serially as data words in pulse code, this is called pulse code modulation (PCM). It consists of sending analog information by transforming it into a series of binary digits. Other techniques of data transmission are pulse width modulation (PWM) and pulse-position modulation.

Q. 53. Distinguish between analog pulse telemetry and digital telemetry (pulse code modulation). **[U.P.S.C. I.E.S. 1994]**

Ans. In *analog pulse telemetry*, unknown signal is converted into a train of pulses. The pulses are dc or ac voltages of constant amplitude. The width of the pulses is small, or is a function of unknown quantity (rectangular pulses). There are many methods of modulation of a carrier by the pulses. The four basic methods of analog telemetry are : (*i*) Pulse amplitude modulation system (*ii*) Pulse frequency method (*iii*) Pulse duration modulation system, and (*iv*) pulse duration phase modulation.

In *digital telemetry*, the data to be transmitted are quantized and transmitted serially as data words in pulse code. It consists of sending analog information by transforming into a series of binary digits.

Q. 54. What do you understand by pulse duration modulation (PDM) and pulse position modulation (PPM) system of telemetry ?

Ans. In pulse duration modulation (PDM), the amplitude of all the pulses is constant but duration of the pulses varies. In PDM one edge of the pulse is fixed in time sequence and the other edge varies in proportion, to the magnitude of information. Pulse position modulation (PPM) system is quite similar to PDM system with the exception that a short pulse is used in place of variable pulse width. This can be accomplished by differentiating and rectifying a PDM waveform.

Q. 55. What is the advantage of PPM system ? **[U.P.S.C. I.E.S. 1994]**

Ans. The advantage of PPM system is that the same information can be transmitted with much less average power than PDM, as the transmitter is 'on' for a much shorter time duration.

Q. 56. How is PPM system different from PDM system ? Why is the former preferred over the latter ?

Ans. The PPM system is quite similar to PDM system with the exception that a short pulse is used in place of variable pulse width. This can be accomplished by differentiating and rectifying a PDM waveform. The same information can be transmitted by PPM with much less average power than PDM, as the transmitter is on for a much shorter time. However, the narrow pulses require wider bandwidth for transmission.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 57. Compare AM versus FM telemetry. **[PTU 2005-06]**

Ans. The outstanding advantage of FM over AM telemetry is noiseless operation. Other advantages of FM over AM telemetry are : Quite large operating range; Almost nil adjacent channel interference; No restriction on modulation index; Lower power requirement.

The drawbacks of FM are : Requirement of much wider channel (7 to 15 times as large as required in case of AM); Small area of reception; Requirement of complex and expensive transmitting and receiving equipment.

Q. 58. What is multiplexing in telemetering system ? **[U.P.S.C. I.E.S. 1995]**

Ans. Transmission of two or more messages at the same time over a single interconnecting link is called the multiplexing in telemetering system i.e. multiplexing is a method of transmitting more than one measurement over a single *transmission channel.*

Q. 59. Explain the purpose of multiplexer, demultiplexer in telemetry system. **[PTU 2005-06]**

Ans. Multiplexing is a technique in which several resources make use of a single channel for transmission of respective information without any conflict. **Multiplexer** (or data selector) is a logic circuit that accepts several data inputs and allows only one of them at a time to get through the output. That is why multiplexer is also known as "Many-to-one" device. **Demultiplexer** performs the reverse operation i.e. it takes a single input and distributes it over several outputs. That is why demultiplexer is also known as "one-to-many" device.

Q. 60. What do you understand by "Time division multiplexing" and "Frequency division multiplexing" ? **[U.P.S.C. I.E.S. 1996, 2000]**

Ans. In TDM, samples of different measurements are transmitted serially one after the other on the same communication channel in a predetermined sequence and in this way cycle repeats itself again and again. So samples of each measurand are transmitted after a fixed period of time and the time period between two samples of a measurand should be sufficiently small so that the magnitude of measurand does not change considerably during this time.

In frequency division multiplexing (FDM), several informations can be simultaneously transmitted using different carrier frequencies and employing usual modulation techniques. Each of the method makes use of specific frequency band for the modulation of the frequency by the signal under measurement. By suitable choice of the magnitudes of the different carrier frequencies, several data may simultaneously be transmitted over a communication link.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. A recorder
(a) is an indicating instrument which displays a time varying signal.
(b) is a device whose function is to record the value of quantity as it is being measured.
(c) records electrical and non-electrical quantities as a function of time or relates two signals to each other.
(d) both (b) and (c).

2. Strip-chart recorders have the advantage(s) of
(a) long period run. (b) more actually usable width.
(c) possibility of change in chart speed simply by lever actions.
(d) uniform resolution. (e) all of the above.

3. The zero-suppression in recorders implies
(a) recording signals with reference to a point other than the zero.
(b) removing the static component so that rest of the signal is displayed with more expansion.
(c) providing inertialess components to improve transient response.
(d) designing the recorder for zero error. [U.P.S.C.I.E.S. E.E.-II, 1994]

4. Galvanometer type recorders use
(a) vibration galvanometer. (b) ballistic galvanometer.
(c) D'Arsonval galvanometer.
(d) tangent galvanometer. [U.P.S.C. I.E.S. E.E.-I, 1996]

5. Galvanometer used in recorders is
(a) an ordinary D'Arsonval galvanometer.
(b) somewhat different from the ordinary D'Arsonval galvanometer.
(c) a D'Arsonval galvanometer with large moving coil, strong magnetic field and critical damping.
(d) a D'Arsonval galvanometer with large moving coil, weak magnetic field and critical damping.
(e) both (b) and (c).

6. Null type recorders are _____ recorders.
(a) potentiometric (b) bridge
(b) LVDT (d) any of the above

7. The potentiometric recorders have the advantage(s) of
(a) very high input impedance.
(b) high sensitivity.
(c) high response to rapidly changing quantities.
(d) both (a) and (b).

8. The main drawback of balancing recorders is that
(a) their ability to respond to rapidly changing quantities is quite limited.
(b) low input impedance. (c) low input sensitivity.
(d) none of these.

9. The advantages of $x-y$ recorders are that
(a) they are economical to operate.
(b) they are easy and convenient to use.
(c) they are cheaper than strip-chart recorders.
(d) they can be conveniently used for continuous recording.
(e) both (a) and (b).

10. The recorders used for plotting B-H curves for magnetic materials, current-voltage curves for transistors and speed-time curves for electric motors are _____ recorders.
(a) LVDT type (b) circular chart
(c) x–y (d) potentiometer type

11. An x-y recorder has x-input and y-input as $1 \sin 314t$ and $1 \sin\left(314t + \frac{\pi}{2}\right)$ respectively. The trace generated is a
(a) straight line. (b) parabola.
(c) circle. (d) ellipse.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

12. The recording head in a magnetic tape responds to
(a) electrical signal and creates a magnetic signal.
(b) thermal signal and creates a magnetic signal.
(c) magnetic signal and creates an electrical signal.
(d) thermal signal and creates an electrical signal.
[U.P.S.C. I.E.S. E.E.-I, 1998]

13. Consider the following statements regarding magnetic tape recorders.
1. They have a wide frequency range.
2. They have low distortion.
3. The storage of data is volatile.
Of these statements
(a) 1,2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

14. In a magnetic tape blanks are provided at the
(a) start of the tape. (b) middle of the tape.
(c) end of the tape. (d) start and end of the tape.

15. The main drawback of direct recording is
(a) complicated circuitry. (b) poor signal-to-noise ratio.
(c) poor reliability.
(d) limited high frequency response.

16. The direct recording is mainly used
(a) for recording the speech and music.
(b) for recording voltages from the pressure, force and acceleration transducers.
(c) for multiplexing in instrumentation.
(d) for simultaneous recording of a large number of slowly changing variables.

17. The advantages of FM magnetic tape recording are
(a) it can record from dc to several kHz.
(b) it is free from dropout effects.
(c) it is independent of amplitude variations and reproduces the waveform of the input signal accurately.
(d) all of the above.

18. The digital tape recording has the advantage(s) of
(a) giving highly accurate results.
(b) insensitivity to speed of tape.

Answers: **1.** (d), **2.** (e), **3.** (b), **4.** (c), **5.** (e), **6.** (d), **7.** (d), **8.** (a), **9.** (e), **10.** (c), **11.** (c), **12.** (a), **13.** (b), **14.** (d), **15.** (b), **16.** (a), **17.** (d), **18.** (e),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) need of a simple data conditioner.
(d) feeding information directly to digital computers for processing and control.
(e) all of the above. [U.P.S.C. I.E.S. E.E.-I, 1993]

19. Continuous recording of a signal is not possible in a
(a) magnetic tape recorder. (b) strip chart recorder.
(c) X-Y recorder. (d) Galvanometric recorder.
[U.P.S.C. I.E.S. E.E.-I, 2008]

20. The sensitivity of an ECG is typically
(a) 1 cm/V. (b) 0.1 cm/V. (c) 10 mm/mV.
[A.M.I.E. Sec. B. Instrumentation & Control Winter 1994]

21. The main shortcomings of diaphragms are that
(a) they are difficult to repair.
(b) they are prone to shock vibrations.
(c) poor stability and reliability.
(d) high hysteresis and creep. (e) both (a) and (b).

22. Consider the following statements:
1. The main shortcomings of diaphragms are that they are prone to shock vibrations.
2. Diaphragms have the advantages of high accuracy and good dynamic response.
3. Selection of material for diaphragms mainly depends upon temperature range and chemical nature of fluid coming in contact with diaphragm during pressure measurement.

Which of the above statements is/are correct?
(a) 1, 2 and 3. (b) 2 and 3 only.
(c) 1 only. (d) 1 and 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

23. If the number of bellows elements is made double and the thickness of the bellows element is made half, the displacement of the element for the same applied pressure would be the
(a) 16 times. (b) 4 times.
(c) same. (d) one-fourth.

24. Bourdon tubes are made of
(a) copper. (b) aluminium.
(c) metal alloys. (d) phosphorus.
[A.M.I.E. Winter 1993]

25. Rotameter is used for measuring
(a) flow. (b) viscosity.
(c) specific gravity. (d) none of these.

26. The meter measuring total flow in a liquid makes use of
(a) planti meter. (b) variable area meter.
(c) square root extractor. (d) none of the above.

27. Consider the following units for the measurement of pressure directly:
1. Rolta meter. 2. Bourdon tube.
3. Planti meter. 4. Vanes.

Of these, the pressure can be measured by
(a) 1 and 2 only. (b) 3 and 4 only.
(c) 2 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

28. The instrumentation amplifiers are used principally to amplify signals from which of the following?
(a) Transducers. (b) Active flitters.
(c) Choppers. (d) D/A converters.
[U.P.S.C. I.E.S. E.E.-I, 2008]

29. Self-generating type transducers are ____ __ transducers.
(a) active (b) passive (c) secondary (d) inverse

30. Which one of the following is ***not*** a self-generating type transducer?
(a) Thermocouple and thermopile.
(b) Piezoelectric pick-up.
(c) Photovoltaic cell.
(d) Magnetostriction gauge. [U.P.S.C. I.E.S. E.E.-I, 2011]

31. The transducer that converts the input signal into the output signal, which is a continuous function of time, is known as _____ transducers.
(a) active (b) passive (c) analog (d) digital

32. A transducer that converts measurand into the form of pulse is called the _____ transducers.
(a) active (b) analog (c) digital (d) pulse

33. Which one of the following is a passive transducer ?
(a) Piezoelectric. (b) Thermocouple.
(c) Photovoltaic cell. (d) LVDT.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

34. Which one of the following transducers is an active transducer ?
(a) Piezoelectric pressure transducer.
(b) Metallic strain gauge. (c) Semiconductor strain gauge.
(d) Platinum resistance thermometer. [U.P.S.C. I.E.S. E.E.-I, 2007]

35. The lower limit of useful working range of a transducer is determined by
(a) minimum useful input level. (b) transducer error and noise.
(c) cross-sensitivity. (d) dynamic response.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

36. Which of the following transducers is classified as an active transducer ?
(a) Metallic strain gauge. (b) Capacitive microphone.
(c) LVDT. (d) Piezoelectric transducer.
[U.P.S.C. I.E.S. E.E.-I, 2002]

37. Pair of active transducers is
(a) Thermistor, Solar cell. (b) Thermocouple, Thermistor.
(c) Thermocouple, Solar cell. (d) Solar cell, LVDT.
[U.P.S.C. I.E.S. E.E.-I, 2003]

38. Consider the following transducers :
1. LVDT. 2. Piezoelectric.
3. Thermocouple. 4. Photovoltaic cell.
5. Strain gauge.

Which of these are active transducers ?
(a) 1, 2 and 5. (b) 1, 3 and 4.
(c) 2, 3 and 5. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 1999]

39. In a resistance potentiometer, the nonlinearity
(a) decreases with the increase in ratio of potentiometer to load resistance.
(b) increases with the increase in ratio of potentiometer to load resistance.
(c) is independent of the ratio of potentiometer to load resistance.
(d) none of the above.

40. Resolution of a potentiometric transducer depends on
(a) diamter of wire (b) length of wire.
(c) material of wire. (d) excitation voltage.
[A.M.I.E. Summer 1998]

41. High value pot resistance leads to
(a) low sensitivity. (b) high sensitivity.
(c) low nonlinearity. (d) less error.

Answers: **19.** (a), **20.** (c), **21.** (e), **22.** (a), **23.** (a), **24.** (c), **25.** (a), **26.** (a), **27.** (c), **28.** (a), **29.** (a), **30.** (d), **31.** (c), **32.** (c), **33.** (d), **34.** (a), **35.** (b), **36.** (d), **37.** (c), **38.** (d), **39.** (b), **40.** (a), **41.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

42. The resolution of a potentiometer should be
(a) infinite. (b) very high. (c) medium. (d) zero.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

43. Which one of the following statements for a potentiometric transducer is correct ?
(a) It is a zero order displacement transducer.
(b) It is a first order displacement transducer.
(c) It is a zero order temperature transducer.
(d) It is a second order displacement transducer.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

44. A strain gauge is passive transducer and is employed for converting
(a) mechanical displacement into a change of resistance.
(b) pressure into a change of resistance.
(c) force into displacement. (d) none of the above.

45. Which one of the following gives gauge factor of a strain gauge ?
(a) $\frac{\Delta L}{L}\Big/\frac{\Delta R}{R}$ (b) $\frac{\Delta R}{R}\Big/\frac{\Delta L}{L}$
(c) $\frac{\Delta R}{R}\Big/\frac{\Delta D}{D}$ (d) $\frac{\Delta R}{R}\Big/\frac{\Delta \rho}{\rho}$
[U.P.S.C. I.E.S. E.E.-I, 2004]

46. The sensitivity factor of strain gauge is normally of the order of
(a) 1 to 1.5 (b) 1.5 to 2.0
(c) 0.5 to 1 (d) 5 to 10
[A.M.I.E. Sec B. Instrumentation & Control Winter 1996]

47. A strain gauge with a nominal resistance of 120 Ω and gauge factor of 2 undergoes a strain of 10^{-5}. What is the change in resistance in response to the strain ?
(a) 240 Ω (b) 24 Ω
(c) 2.4×10^{-3} Ω (d) 2.4×10^{-2} Ω
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

48. A resistance strain gauge of gauge factor 2 is used as a transducer element. Neglecting piezoresistive effects, what is the value of Poisson's ratio ?
(a) 0.5 (b) 1 (c) 1.6 (d) 2
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

49. A strain gauge with a resistance of 250 Ω undergoes a change of 0.150 Ω during a test. The strain is 1.5×10^{-4}. Then the gauge factor is
(a) 2.0 (b) 3.0 (c) 4.0 (d) 100
[U.P.S.C. I.E.S. E.E.-I, 2003]

50. The strain gauge with a resistance of 250 ohm undergoes a change of 0.15 ohm. During a test the strain is 1.5×10^{-4}. What is the gauge factor?
(a) 4.7 (b) 4.0 (c) 3.5 (d) 2.0
[U.P.S.C. I.E.S. E.E.-I, 2009]

51. A strain gauge having a resistance of 500 ohm and a gauge factor 3.0 is bonded on a member of structure undergoing tensile stress. If the change in resistance of the gauge is accurately measured as 1.5 ohm, what is the value of strain suffered by the member?
(a) 0.01 (b) 0.001 (c) 0.1 (d) 0.003
[U.P.S.C. I.E.S. E.E.-I, 2009]

52. A resistance strain gauge with gauge factor (S_f) of 2 is bonded to a steel member, which is subjected to a strain of 1×10^{-6}. The original resistance value of this strain gauge is 120 Ω. The change in resistance due to the applied strain is
(a) 60 Ω (b) 240×10^{-6} Ω
(c) 240 Ω (d) 60×10^{-6} Ω
[U.P.S.C. I.E.S. E.E.-I, 2010]

53. A resistance strain gauge is fastened to a beam subjected to a strain of 1×10^{-6}, yielding a resistance change of 240 μΩ if the original resistance of the strain gauge is 120 Ω, the gauge factor would be
(a) 5 (b) 2 (c) 1 (d) 0.2
[U.P.S.C. I.E.S. E.E.-I, 2000]

54. In wire wound strain gauges, the change in resistance under strained condition is mainly on account of
(a) change in diameter of wire. (b) change in length of wire.
(c) change in both length and diameter of wire.
(d) change in resistivity.

55. Bonded strain gauges are
(a) exclusively used for construction of transducers.
(b) exclusively used for stress analysis.
(c) used for both stress analysis and for construction of transducers.
(d) none of the above.

56. Over wire strain gauges foil strain gauges have the advantages of
(a) higher heat dissipation capacity and better bonding.
(b) superior mechanical stability under prolonged strained and high temperature conditions, low hysteresis and creeping effects.
(c) excellent reproducibility and longer life.
(d) all of the above.

57. Which of the following is not an advantage of semiconductor gauges as compared to conventional strain gauges.
(a) Excellent hysteresis characteristics.
(b) Least sensitive to temperature changes.
(c) High fatigue life. (d) Smaller size.
[U.P.S.C. I.E.S. E.E.-I, 1992]

58. In semiconductor strain gauges, what happens when a tensile strain is applied?
(a) Resistance increases in N-type of materials.
(b) Resistance increases in P-type of materials.
(c) Resistance increases in both P and N-type of materials.
(d) Resistance decreases in both P and N-type of materials.
[U.P.S.C. I.E.S. E.E.-I, 2009]

59. The drawbacks of strain gauges are
(a) low fatigue life.
(b) that they are expensive, brittle, highly sensitive to temperature variations.
(c) poor linearity.
(d) that they are prone to hysteresis and creep effects.
(e) both (b) and (c).

60. Semiconductor of strain gauges are made of
(a) Silicon. (b) gold. (c) silver. (d) nickel.
[A.M.I.E. Summer 1998]

61. The wire material of strain gauges should have
(a) high resistivity and high thermo-emfs.
(b) low resistivity and high thermo-emfs.
(c) low resistivity and low thermo-emfs.
(d) high resistivity and low thermo-emfs. [A.M.I.E. Summer 1998]

62. The strain gauges should have low
(a) gauge factor.
(b) resistance temperature coefficient.
(c) resistance. (d) all of the above.

63. The carrier material employed with strain gauges at room temperature is
(a) impregnated paper. (b) bakelite.
(c) epoxy. (d) aluminium foil.

Answers: **42.** (c), **43.** (a), **44.** (a), **45.** (b), **46.** (b), **47.** (c), **48.** (a), **49.** (c), **50.** (b), **51.** (b), **52.** (b), **53.** (b), **54.** (c), **55.** (c), **56.** (d), **57.** (b), **58.** (b), **59.** (e), **60.** (a), **61.** (d), **62.** (b), **63.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

64. A rosette gauge is used to determine
(a) principal stress direction only.
(b) principal strain direction only.
(c) principal stress or strain direction and magnitude.
(d) principal strain direction and magnitude.

65. Rosette gauges are employed for measuring
(a) strain in a direction. (b) variable strain.
(c) strain in more than one direction.
(d) small strains.

66. Platinum is the commonly used metal for resistance-temperature detectors (RTDs) because
(a) it is commercially available in pure form at reasonable rates.
(b) it is relatively stable under various environment conditions.
(c) it has wide operating temperature range.
(d) all of the above.

67. RTDs have
(a) positive temperature coefficient.
(b) negative temperature coefficient.
(c) either type of temperature coefficient.
(d) high tolerance.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

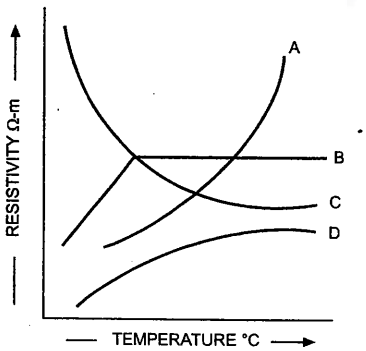
68. The V-I characteristics of a thermistor exhibits a negative resistance region. This statement is
(a) true. (b) false.
(c) true for NTC thermistor (negative temperature coefficient).
(d) true for PTC thermistor (positive temperature coefficient.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

69. Consider the following statements in connection with measurement of temperature :
1. A thermistor is highly sensitive as compared with platinum resistance thermometer.
2. The resistance of a thermistor is solely a function of its absolute temperature whether the source of heat is external, internal or both.
3. A thermistor has linear resistance temperature characteristics.
4. Most thermistors exhibit negative resistance temperature coefficient.

Which of these statements are correct ?
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) 2, 3 and 4. (d) 1, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2001]

70. Which one of the following is the most sensitive device ?
(a) Thermocouple (b) RTD
(c) Thermistor (d) Pyrometer
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

71. Which curve in the given figure represents resistance temperature characteristics of a thermistor ?
(a) Curve A.
(b) Curve B.
(c) Curve C.
(d) Curve D.
[U.P.S.C. I.E.S. E.E.-I, 2002]



72. Which of the following closely represents the temperature (T)–Resistance R characteristics of a thermistor ?
(a) $R_T = a R_0 e^{b/T}$ (b) $R_T = a R_0 e^{-b/T}$
(c) $-a R_0 e^{-b/T}$ (d) $R_T = -a R_0 e^{b/T}$
[U.P.S.C. I.E.S. E.E.-I, 1992]

73. The resistance of a thermistor is 500 Ω and its resistance temperature coefficient is 0.04/°C. A measurement with a lead resistance of 10 Ω will cause an error of
(a) 0.05 °C. (b) 0.01 °C. (c) 0.4 °C. (d) 0.8 °C.
[U.P.S.C. I.E.S. E.E.-I, 1994]

74. For a certain thermistor, the material constant (β) is 3,000 Kelvin and its resistance at 27°C is 1,050 ohm. What is the temperature coefficient of resistances for this thermistor?
(a) 0.033×10^{-3} ohm/ohm/°C.
(b) – 0.033 ohm/ohm/°C.
(c) – 3.33 ohm/ohm/°C.
(d) – 3.0 ohm/ohm/°C.
[U.P.S.C. I.E.S. E.E.-I, 2009]

75. Which of the following should be incorporated in the RTD to make a temperature sensing bridge most sensitive to temperature?
(a) Platinum. (b) Nickel.
(c) Thermistor. (d) Copper.
[A.M.I.E. Sec B. Summer 1994]

76. Consider the following statements :
The causes of error in the measurement of temperature using a thermistor are
1. Self heating. 2. Poor sensitivity.
3. Non-linear characteristics.
Of these statements.
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1997]

77. A fixed resistor of suitable value is usually connected across a thermistor to
(a) decrease its resistance. (b) increase its sensitivity.
(c) compensate its self-heating effect.
(d) improve linearity.
[U.P.S.C. I.E.S. E.E.-I, 1999]

78. Thermocouples
(a) are most commonly employed for indication of rapidly changing temperature and for use in localized and in otherwise accessible positions.
(b) need reference junction compensation.
(c) have a low output voltage level.
(d) all of the above.

79. The drawbacks of thermocouples are that
(a) they are less accurate than RTDs and thermistors.
(b) they need compensating leads.
(c) reference junction compensation is required in thermocouples.
(d) all of the above.

80. For a thermocouple pair (A, B) the extension wires (C, D)
(a) should be identical pair elements.
(b) should be identical temperature emf relationship.
(c) can be of any two dissimilar materials.
(d) should have very small temperature emf sensitivity.
[U.P.S.C. I.E.S. E.E.-I, 1997]

81. Which one of the following thermocouples has the highest temperature measuring range ?
(a) Copper-Constantan. (b) Iron-Constantan.
(c) Alumel-Chromel. (d) Platinum Rhodium-Platinum.
[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **64.** (c), **65.** (c), **66.** (d), **67.** (a), **68.** (c), **69.** (b), **70.** (c), **71.** (c), **72.** (a), **73.** (a), **74.** (b), **75.** (c), **76.** (d), **77.** (d), **78.** (d), **79.** (d), **80.** (a), **81.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

82. The measurement junction of a thermocouple is taken from an environment of 300°C to 600°C. If the time constant of the thermocouple is 1 s, temperature indicated by it after 1 s will be nearly
(a) 300°C. (b) 400°C. (c) 500°C. (d) 600°C.
[U.P.S.C. I.E.S. E.E.-I, 2000]

83. The emf is measured for a junction temperature difference of 20°C by the thermocouples made from materials A, B and C. The pair A-B gives an emf of 165 μV, with end of A being positive. The pair B-C gives 100 μV with the end of C being positive. The pair A-C will give
(a) 265 μV with the end of A being positive.
(b) 265 μV with the end of C being positive.
(c) 65 μV with the end of A being positive.
(d) 65 μV with the end of C being positive.
[U.P.S.C. I.E.S. E.E.-i, 1999, 2007]

84. A thermocouple arrangement is to be used to measure temperature in the range of 700–800°C. Point out the pair that would be most suitable for this application.
(a) Copper-constantan. (b) Iron-constantan.
(c) Chromel-alumel. (d) Platinum-platinum rhodium.
[A.M.I.E. Sec B. Winter 1993; U.P.S.C. I.E.S. E.E.-I, 2007]

85. A thermocouple with its reference junction exposed to room temperature of 20 °C gives an open-circuit voltage of 5 mV. If the thermocouple has temperature sensitivity of 50 μV/°C, the measured temperature is
(a) 100 °C. (b) 120 °C. (c) 80 °C. (d) 20 °C.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

86. A thermocouple temperature indicator with reference junction at room temperature has a time constant of 1 s. It is dipped in a hot bath of 120 °C. If the room temperature is 20 °C, the thermocouple type temperature indicator will read after 1 s
(a) 120 °C. (b) 100 °C. (c) 63.2 °C. (d) 140 °C.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

87. For surface temperature measurement one can use
(a) strain gauge. (b) diaphragm.
(c) RTD. (d) thermocouple.
[A.M.I.E. Winter 1994]

88. What is a differential transformer ?
(a) Constant pressure transducer.
(b) Variable pressure transducer.
(c) Constant displacement transducer.
(d) Variable inductance transducer. [U.P.S.C. I.E.S. E.E.-I, 2008]

89. Inductive transducers are employed in differential configurations because differential outputs are less affected by
(a) external magnetic fields. (b) temperature variations.
(c) variations of bridge supply voltage and frequency.
(d) all of the above.

90. LVDT can be used for
(a) vibration measurement. (b) angular velocity measurement.
(c) force measurement in a beam.
(d) load measurement on a column. [A.M.I.E. Winter 1994]

91. The principle of operation of LVDT is based on variation of
(a) self-inductance. (b) mutual inductance.
(c) reluctance. (d) permeance.
[U.P.S.C. I.E.S. E.E.-II, 1994]

92. LVDT has following advantage(s)
(a) infinite resolution, high sensitivity and very high output.
(b) low hysteresis, good repeatability and capability of tolerating shock and vibrations.
(c) good dynamic response. (d) both (a) and (b).

93. Consider the following statements about LVDT as a transducer.
1. The relationship between input displacement and output voltage is almost linear.
2. The range of displacement that can be measured is wide.
3. It does not form a loading on the mechanical system.
Of these statements
(a) 1, 2 and 3 are correct. (b) 2 and 3 are correct.
(c) 1 and 2 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

94. A linear variable differential transformer (LVDT) has
1. One primary winding.
2. two exactly similarly secondary windings.
3. A toroidal magnetic core.
Of these statements
(a) 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 1 and 3 are correct. (d) 1, 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1993]

95. In an LVDT, there are two secondary coils which are connected for a single output. Which one of the following is correct ?
(a) The coils are in series and in phase opposition.
(b) The coils are in parallel and in phase opposition.
(c) The coils are in series and in the same phase condition.
(d) The coils are in parallel and in the same phase condition.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

96. An ac LVDT is given 6.3 V input and produces 5.2 V for a range of ±0.25 inch. When the core is –0.25 inch from the centre, what is the output produced ?
(a) –2.0 V (b) +2.0 V (c) –2.6 V (d) +2.6 V
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

97. In a LVDT, the two secondary voltages
(a) are independent of the core position.
(b) vary unequally depending on the core position.
(c) vary equally depending on the core po-sition.
(d) are always in phase quadrature. [GATE E.E. 1997]

98. Sensitivity of LVDT is mainly due to
(a) magnetic shielding of the core.
(b) permeability of the core.
(c) exact cancellation of secondary voltages.
(d) insulation used in the winding. [U.P.S.C. I.E.S. E.E.-I, 2003]

99. In an LVDT, the output quantity
(a) is algebraically summed to zero.
(b) is difference of the two currents flowing in the two secondaries.
(c) depends upon its rating.
(d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

100. For applications requiring large torques and high accuracies we use
(a) torque transmission type servosystems.
(b) control or error detecting type synchros.
(c) either (a) or (b). (d) none of the above.

101. Consider the following statements regarding constructional features of synchros :
1. Synchro repeater has a three phase stator and a three phase rotor.
2. Disc shaped rotor of the synchro control transformer offers a low resistance to the magnetic path.
3. Synchro transmitter has a frictionless bearing.
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 alone is correct.
(c) 2 alone is correct. (d) 2 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1998]

Answers: **82.** (b), **83.** (c), **84.** (b), **85.** (b), **86.** (a), **87.** (d), **88.** (d), **89.** (d), **90.** (c), **91.** (b), **92.** (d), **93.** (a), **94.** (b), **95.** (a), **96.** (c), **97.** (b), **98.** (c), **99.** (b), **100.** (b), **101.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

102. A synchrotransmitter consists of a
(a) salient pole rotor winding excited by an ac supply and a 3-phase balanced rotor winding.
(b) three phase balanced stator winding excited by a three phase balanced ac signal and rotor connected to a dc voltage source.
(c) salient pole, rotor winding excited by a dc signal.
(d) cylindrical rotor winding and a stepped stator excited by pulses. [U.P.S.C. I.E.S. E.E.-I, 2001]

103. A synchro is used to
(a) accelerate a rotating shaft.
(b) convert an angular position of a shaft into an electrical signal.
(c) convert linear motion into angular position.
(d) amplify low frequency signals. [U.P.S.C. I.E.S. E.E.-I, 1992]

104. Synchros and resolvers have the following advantages
(a) infinite resolution. (b) much operating speeds.
(c) high reliability and accuracy.
(d) all of the above.

105. Which of the following statements is NOT true ?
(a) Potentiometric linear displacement can give high output signal.
(b) LVD transformer has low output impedance.
(c) Synchros and resolvers have low accuracy.
(d) Eddy current proximity transducers are non-contact type transducers. [U.P.S.C. I.E.S. E.E.-I, 2002]

106. Capacitive transducers have the advantages of
(a) very high input impedance, excellent frequency response, high sensitivity, and not being affected by stray magnetic fields.
(b) very high output impedance.
(c) both (a) and (b). (d) none of the above.

107. The dynamic characteristics of capacitive transducers are similar to those of
(a) low pass filter. (b) high pass filter.
(c) notch filter. (d) band stop filter.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

108. A capacitive transducer is made of two concentric cylindrical electrodes. The outer diameter of the inner cylindrical electrode is 4 mm and dielectric medium is air. The inner diameter of the outer electrode is 4.1 mm. When 150 V is applied across the electrodes, what is the electric field intensity ?
(a) 1,500 V/mm. (b) 3,000 V/mm.
(c) 4,500 V/mm. (d) 6,000 V/mm.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

109. Quartz and Rochelle salt belong to
(a) natural group of piezoelectric materials.
(b) synthetic group of piezoelectric materials.
(c) natural or synthetic group of piezoelectric materials provided they are properly polarized.
(d) none of the above. [A.M.I.E. Sec B. Elec. Measurements Winter 1996]

110. Which one of the following materials is not used as a piezoelectric transducer ?
(a) Rochelle salt. (b) Lithium sulphate.
(c) Barium titanate (d) Tungsten oxide.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

111. Which of the following are piezoelectric substances ?
1. Barium titanate. 2. Lead titanate.
3. Lead zirconate. 4. Cadmium sulphate.
(a) 1, 2 and 4. (b) 1, 3 and 4.
(c) 1, 2 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 1992]

112. Piezoelectric crystals produce an emf
(a) when external mechanical force is applied to it.
(b) when external magnetic field is applied.
(c) when radiant energy stimulates the crystal.
(d) when the junction of two such crystals is heated.
[A.M.I.E. Sec B. Summer 1994]

113. Piezoelectric materials owe their property to the
(a) presence of a centre of symmetry.
(b) lack of a centre of symmetry. (c) presence of axis of symmetry.
(d) lack of axis of symmetry. [U.P.S.C. I.E.S. E.E.-I, 2000]

114. Consider the following statements :
Piezoelectric materials are useful for converting
1. mechanical energy into electrical energy.
2. electrical energy into mechanical energy.
3. mechanical energy into chemical energy.
4. chemical energy into mechanical energy.
Of these statements
(a) 1 and 2 are correct. (b) 1, 2, 3 and 4 are correct.
(c) 1 alone is correct. (d) 2, 3 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1998]

115. Consider the following statements:
Piezoelectric materials serve as
1. A source of ultrasonic waves.
2. When electric field is applied, the mechanical dimensions of the substances are not at all altered.
3. Converts electrical energy to mechanical and vice versa.
4. Converts thermal energy to electrical energy.
Which of the above statements is/are correct?
(a) 1 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

116. Consider the following statements:
Piezoelectric materials
1. Crystal can be shown as electrical equivalent circuit similar to an inductor and a capacitor (Tank circuit).
2. Quartz, Rochelle salt, tourmaline.
3. Used in voltage stabilizers.
4. This exhibits the reverse effect of electrostriction.
Which of the above statements are correct?
(a) 1, 2 and 4 only. (b) 1 and 2 only.
(c) 2 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

117. The piezoelectric crystal voltage sensitivity is defined as
(a) Field developed per unit force.
(b) Field developed per unit stress.
(c) Voltage developed per unit stress.
(d) Voltage developed per unit force. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

118. Piezoelectric crystal is generally employed for the measurement of which one of the following ?
(a) Flow. (b) Velocity.
(c) Acceleration. (d) Temperature.
[U.P.S.C. I.E.S. E.E.-I, 2006]

119. Piezoelectric crystal can be used to measure
(a) static pressure only. (b) dynamic pressure only.
(c) both static and dynamic pressures.
(d) none of the above.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Summer 1997]

120. Piezoelectric crystals are used for the measurement of
(a) temperature. (b) velocity.
(c) sound. (d) none of the above.
[A.M.I.E. Summer 1994]

Answers: **102.** (a), **103.** (b), **104.** (d), **105.** (c), **106.** (a), **107.** (b), **108.** (a), **109.** (a), **110.** (d), **111.** (c), **112.** (a), **113.** (b), **114.** (a), **115.** (c), **116.** (d), **117.** (b), **118.** (c), **119.** (c), **120.** (a),

121. A 1 cm piezoelectric transducer having a g-coefficient of 58 V/kg/m^2 is subjected to a constant pressure of 10^{-3} kg/m^3 for about 15 minutes. The piezo voltage developed by the transducer will be
(a) 116 mV (b) 58 mV (c) 29 mV (d) 0 mV
[U.P.S.C. I.E.S. E.E.-I, 2002]

122. A piezoelectric transducer has the following parameter values :
Crystal capacitance = 10^{-9} F
Cable capacitance = 2×10^{-10} F
Charge sensitivity = 4×10^{-6} Coulomb/cm
If the oscilloscope used for readout has an input resistance of 1 MΩ in parallel with C = 4×10^{-10} F, then the voltage sensitivity constant will be
(a) 2,500 V/cm (b) 3,334 V/cm
(c) 4,000 V/cm (d) 4,500 V/cm
[U.P.S.C. I.E.S. E.E.-I, 1997]

123. A piezoelectric crystal has a thickness of 2.5 mm and a voltage sensitivity of 0.05 Vm/N. The piezoelectric crystal is subjected to an external pressure of 1.6×10^6 N/m^2, then the corresponding output voltage is
(a) 200 volts.
(b) 3.2×10^9 volts/m of thickness.
(c) 0.07×10^{-9} V/(m^3/New).
(d) 200 m volts. [U.P.S.C. I.E.S. E.E.-I, 2010]

124. A barium titanate crystal has a thickness of 2 mm. Its voltage sensitivity is 12×10^{-3} Vm/N. It is subjected to a pressure of 0.5 MN/m^2. What is the voltage generated?
(a) 3 V (b) 6 V (c) 5 V (d) 12 V
[U.P.S.C. I.E.S. E.E.-I, 2009]

125. Piezoelectric transducers have the following advantage(s).
(a) These are small in size, light in weight and very rugged in construction.
(b) wide operating temperature range.
(c) very good frequency response and quite large output.
(d) all of the above.

126. Hall effect transducers have the drawbacks of
(a) high sensitivity to temperature variations.
(b) variation of Hall coefficient from plate to plate.
(c) poor resolution. (d) both (a) and (b).

127. Hall effect transducers are used for measuring
(a) magnetic field. (b) current.
(c) electric field. (d) pressure.
[A.M.I.E. Sec B. Instrumentation & Control Winter 1995]

128. Hall effect device can be used to
(a) multiply two signals.
(b) divide one signal by another on an instantaneous basis.
(c) add two signals.
(d) subtract one signal from another. [U.P.S.C. I.E.S. E.E.-I, 1998]

129. The measurement of Hall coefficient of a semiconductor with one type of charge carrier gives the information about
(a) sign of charge carrier. (b) density of charge carrier.
(c) both sign and density of charge carrier.
(d) mass of the charge carrier. [U.P.S.C. I.E.S. E.E.-I, 2010]

130. Which one of the following transducers can be used for magnetic flux density measurement ?
(a) LVDT. (b) Synchro.
(c) Hall effect transducer. (d) Thermocouple.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2003]

131. Magnetoelastic transducers operate on the principle of
(a) change in permeability with change in stress.
(b) change in dimensions with change in applied stress.
(c) change in coercive force with change in stress.
(d) none of the above.

132. Photoelectric transducers are used for the measurement of any phenomenon associated with variation in
(a) light intensity. (b) magnetic flux.
(c) current. (d) voltage.

133. Which of the following does not require auxiliary circuitry if used as transducer ?
(a) Capacitance. (b) Photocell.
(c) Resistance. (d) Inductance.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1996]

134. A tachometer encoder has
(a) single output. (b) two outputs.
(c) three outputs. (d) four outputs.

135. A tachometer encoder can be used for measurement of
(a) displacement in one direction only.
(b) displacement in both directions.
(c) speed in situations where the rotation never reverse.
(d) both (a) and (c).

136. Incremental encoders use
(a) one channel only. (b) two channels.
(c) two channels and sometimes three.
(d) four channels.

137. The drawbacks of incremental encoders are that
(a) any false pulse resulting from electric noise will cause error, which will persist even on disappearance of noise.
(b) the failure of power supply causes total loss of position data which cannot be retrieved even after restoration of power supply.
(c) these encoders are usually limited to a measurement of single revolution.
(d) both (a) and (b).

138. Absolute encoders are employed for
(a) normally one revolution. (b) continuous speed.
(c) continuous speed in both directions.
(d) none of the above.

139. A bolometer is an element that
(a) senses thermal output.
(b) senses optical input and gives thermal output.
(c) senses optical input and gives electrical output.
(d) senses electrical input and gives optical output.

140. Bolometers are used for measuring
(a) electrical signals. (b) optical inputs.
(c) thermal radiations. (d) none of these.

141. Ring-balance meter cannot be used for measuring
(a) pressure. (b) differential pressure.
(c) mass flow rate. (d) total flow.

142. A force balance transducer
(a) amplifies the output from the sensing element.
(b) feeds back the output to an element which makes a force - summing member to return to its zero position.
(c) both (a) and (b). (d) neither (a) nor (b).

143. Which displacement transducer is used for accurate and linear measurement ?
(a) LVDT. (b) Strain gauge.
(c) Potentiometer.
(d) Capacitive displacement transducer. [U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **121.** (b), **122.** (a), **123.** (a), **124.** (d), **125.** (d), **126.** (d), **127.** (a), **128.** (a), **129.** (c), **130.** (c), **131.** (a), **132.** (a), **133.** (b), **134.** (a), **135.** (d), **136.** (c), **137.** (d), **138.** (a), **139.** (b), **140.** (c), **141.** (c), **142.** (c), **143.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

144. Which of the following primary detector type transducers are employed for displacement measurement ?
1. Thermistor. 2. Diaphragm.
3. Thermocouple. 4. Pivot Torque.
Select the correct answer using the code given below :
(a) 1 and 2 (b) 2 and 4 (c) 3 and 4 (d) 1 and 4
[U.P.S.C. I.E.S. E.E.-I, 2008]

145. The ballast circuit employs a capacitor to act as high pass filter for measurement of
(a) static strains. (b) dynamic strains.
(c) both static and dynamic strains.
(d) none of the above.

146. Why are dummy strain gauges employed ?
(a) For calibration of strain gauges.
(b) For increasing the sensitivity of the bridge.
(c) For compensation of temperature variations.
(d) For neutralizing the influence of bridge voltage supply variations. [U.P.S.C. I.E.S. E.E.-I, 2005]

147. Which one of the following is the main reason for insertion of two strain gauges in the adjacent arms of a bridge circuit ?
(a) Achievement of higher sensitivity.
(b) Elimination of radio-frequency interference.
(c) Elimination of effect of environmental temperature.
(d) To facilitate quick balancing of the bridge.
[U.P.S.C. I.E.S. E.E.-I, 1994]

148. A strain gauge bridge measures the strain in a cantilever where the gauge is fixed, with strain ε, the gauge resistance increases from 110 Ω to 110.52 Ω. If the gauge factor is 2.03, then the strain in the cantilever will be
(a) 2.33×10^{-3}. (b) 3.15×10^{-3}.
(b) 3.81×10^{-3}. (d) 4.33×10^{-3}.
[U.P.S.C. I.E.S. E.E.-I, 1997]

149. Why is strain gauge bridge sometimes excited with ac ?
(a) It has a stable performance with ac.
(b) Its sensitivity is more with ac.
(c) Power frequency pick-up can be avoided with ac.
(d) AC output can be easily amplified. [U.P.S.C. I.E.S. E.E.-I, 2007]

150. A load cell is an electromechanical device and is widely used for measurement of
(a) static forces. (b) dynamic forces.
(c) both static and dynamic forces. (d) temperature.

151. The factors to be considered in the selection of a load cell for a particular application are
(a) type of loading–tensile or compressive.
(b) required accuracy, loading conditions, environment, space available, scale capacity.
(c) desired output characteristics and number of cells required.
(d) all of the above.

152. Which of the following is not an element of electropneumatic pressure transmitter?
(a) LVDT. (b) Bellows.
(c) Flapper-nozzle mechanism. (d) Op-amp.

153. Which of the following transducers can be used for measurement of pressures as high as 100,000 atmosphere.
(a) Mcleod gauge. (b) Pirani gauge.
(c) Bridgman gauge. (d) Knudsen gauge.
[U.P.S.C. I.E.S. E.E.-I, 2001]

154. The operation of Pirani gauge depends upon the
(a) variation of the thermal conductivity of a gas with the change in pressure.
(b) variation of the electrical conductivity of a gas with the change in pressure.
(c) variation in humidity of the medium with the change in pressure.
(d) none of the above.

155. Thermal conductivity gauges have the following shortcomings
(a) these gauges need individual calibration and frequent checking.
(b) these gauges burn out when exposed to atmospheric pressure during operation.
(c) these gauges get easily damaged by organic vapours.
(d) all of the above.

156. The working principle of a pirani gauge pressure transducer is based on which one of the following ?
(a) Humidity of the medium.
(b) Thermal conductivity of the medium.
(c) Combustibility of the medium.
(d) Electrical resistivity of the medium. [U.P.S.C. I.E.S. E.T.E.-I, 2006]

157. The ionization vacuum gauge, in construction, is similar to a
(a) vacuum diode. (b) vacuum triode.
(c) thyratron. (d) none of these.

158. The advantages of ionization vacuum gauges are
(a) linearity. (b) interchangeability.
(c) that these can be used for measurement of vacuum pressure below 10^{-10} torr.
(d) both (a) and (b).

159. Pick the odd one out
(a) Pirani gauge. (b) Thermocouple gauge.
(c) Meleod gauge. (d) Resistance-wire strain gauge.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

160. Which one of the following statements is not correct ?
(a) Vacuum can act as a dielectric material.
(b) Piezoelectric materials can act as transducers.
(c) Quarz crystal is a ferroelectric material.
(d) The dielectric constant of dielectrics depends on the frequency of the applied field. [U.P.S.C. I.E.S. E.E.-I, 2004]

161. Which one of the following pressure transducers is suitable for measurement of high pressure ?
(a) Alphatron. (b) McLeod gauge.
(c) Pirani gauge. (d) Bourdon gauge.
[U.P.S.C. I.E.S. E.E.-I, 2007]

162. In strain gauge torque transducers, the strain gauges are mounted at which one of the following ?
(a) 0° to the shaft axis. (b) 45° to the shaft axis.
(c) 90° to the shaft axis. (d) at any angle with the shaft axis.
[U.P.S.C. I.E.S. E.E.-I, 2007]

163. Which of the following can be used/modified for measurement of angular speed ?
1. LVDT. 2. Magnetic pick-up.
3. Tachogenerator. 4. Strain gauge.
Select the correct answer using the code given below :
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 3. (d) Only 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2006]

164. The generated emf of a dc tachogenerator is
(a) directly proportional to angular speed.
(b) inversely proportional to angular speed.
(c) proportional to square root of angular speed.
(d) proportional to square of angular speed.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

165. AC tachometers are often built with thin metalic drag-cup rotor to
(a) reduce inertia. (b) obtain low Q.

Answers: **144.** (b), **145.** (b), **146.** (c), **147.** (a), **148.** (a), **149.** (c), **150.** (c), **151.** (d), **152.** (c), **153.** (a), **154.** (a), **155.** (d), **156.** (b), **157.** (b), **158.** (d), **159.** (d), **160.** (c), **161.** (b), **162.** (b), **163.** (b), **164.** (a), **165.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) make them suitable for high frequency (400 Hz) operation.
(d) eliminate direct coupling between two stator windings.
[U.P.S.C. I.E.S. E.E.-II, 2000]

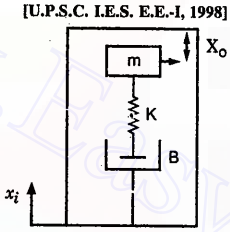
166. In a stroboscopic method of rotational speed measurement of a machine shaft,
N = the machine shaft speed of rotation in revolutions/minute.
n = Number of points on the circular pattern.
F = Number of flashes per minute.
The speed of rotation N will be
(a) $N = F + n$. (b) $N = F - n$.
(c) $N = F/n$. (d) $N = F.n$.
[U.P.S.C. I.E.S. E.E.-I, 2002]

167. Transducer for measurement of rotational displacement is
(a) shaft recorder. (b) differential capacitor.
(c) LVDT. (d) strain gauge.
[A.M.I.E. Sec B. Electronics and Elec. Measurements Winter 2002]

168. The speed of rotation of a shaft is measured by using a 120 teeth wheel and an inductive pick-up. The reading on a digital frequency meter is 3000 with a gating period of 10^6 μs. The shaft speed would be
(a) 750 rpm. (b) 1500 rpm.
(c) 300 rpm. (d) 3600 rpm.
[U.P.S.C. I.E.S. E.E.-I, 1999]

169. Doppler shift principle is used in the measurement of
(a) temperature. (b) frequency.
(c) speed. (d) pressure.
[U.P.S.C. I.E.S. E.E.-I, 1998]

170. A seismic transducer using a spring-mass-damper system as shown below will have an output displacement of zero when the input x_i is a



(a) Constant displacement.
(b) Constant velocity.
(c) Constant acceleration.
(d) Sinusoidal displacement.
[U.P.S.C. I.E.S. E.E.-I, 2003]

171. The accelerometer using LVDT has the advantage of
(a) high natural frequency. (b) being-contactless device.
(c) better resolution. (d) all of the above.

172. The accelerometer used for measurement of vibration of large structures is
(a) servo-accelerometer. (b) piezoelectric accelerometer.
(c) potentiometric accelerometer.
(d) strain gauge accelerometer.

173. The drawbacks of radiation pyrometers are that
(a) their initial as well as installation costs are high.
(b) they need maintenance.
(c) each pyrometer needs individual calibration.
(d) all of the above.

174. A temperature sensitive transducer is subjected to a sudden temperature change. It takes 10 seconds for the transducer to reach equilibrium condition (five time constants). The time taken by the transducer to read half of the temperature difference will be nearly
(a) 1.38 seconds. (b) 5 seconds.
(c) 8.62 seconds. (d) 10 seconds.
[U.P.S.C. I.E.S. E.E.-I, 1992]

175. The dead zone in a pyrometer is 0.125 per cent of span. The instrument is calibrated from 500°C to 2,000°C. What temperature change must occur before it can be detected in degree centigrade?
(a) 187.5 (b) 1.875 (c) 18.75 (d) 0.1875
[U.P.S.C. I.E.S. E.E.-I, 2009]

176. The commercial thermopiles are formed by
(a) Series of Si-Al thermocouples in an IC by doping Al layers on p-type Si on n-type Si epitaxial layers.
(b) Series of Cu-W thermocouple strips.
(c) Piezoelectric material strips piled together.
(d) Series of bismuth-telluride couples. [U.P.S.C. I.E.S. E.E.-I, 2011]

177. In optical pyrometers temperature is measured by
(a) thermocouple effect. (b) photocell principle.
(c) comparison of brightness of the source with that of a standard source.
(d) none of the above.

178. Which one of the following is the best method of measurement of temperature of hot bodies radiating energy in visible spectrum ?
(a) Thermocouple. (b) Thermopile.
(c) Optical pyrometer. (d) Bolometer.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

179. Which one of the following is used to measure temperature inside a boiler furnace ?
(a) Resistance thermometer. (b) Bimetallic thermometer.
(c) Optical pyrometer. (d) Thermistor.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

180. Which is the most suitable thermocouple transducer for the measurement of temperature in the range of 1,300°C to 1,500°C ?
(a) Chromel-alumel. (b) Platinum-rhodium.
(c) Iron-constantan. (d) Chromel-constantan.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

181. Hot-wire anemometers are used for measuring
(a) gas velocities. (b) pressure of fluids.
(c) liquid discharges. (d) very low pressures.

182. The device used for measuring flow of air around an aeroplane is
(a) rotameter. (b) venturi meter.
(c) anemometer. (d) none of these.

183. Consider the following statements:
1. Electromagnetic flowmeter is independent of liquid density.
2. Electromagnetic flowmeter cannot be employed for measuring flow of non-conducting fluids.
Which of the above statements is/are correct?
(a) 1 only. (b) Both 1 and 2.
(c) 2 only. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.E.-I, 2010]

184. Which one of the following transducers cannot measure flow in non-conducting medium ?
(a) Orifice meter. (b) Electromagnetic flow-meter.
(c) Turbine meter. (d) Rotameter.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

185. A flow-meter that is independent of liquid density is
(a) rotameter. (b) Electromagnetic flow-meter.
(c) venturimeter. (d) orifice meter.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1995]

186. Which of the following transducers is used for transmitting as well as receiving the acoustic energy in an ultrasonic flow-meter ?
(a) LVDT. (b) RTD.
(c) Piezoelectric crystals. (d) Strain gauge.
[A.M.I.E. Sec B. Instrumentation & Control Summer 1995]

187. Consider the following statements :
I. Ultrasonic technique cannot be used for measurement of flow of a liquid having air bubbles in it.
II. Attenuation of ultrasonic signal is less in air compared to that in a liquid.

Answers: **166.** (c), **167.** (a), **168.** (b), **169.** (c), **170.** (c), **171.** (d), **172.** (a), **173.** (d), **174.** (a), **175.** (b), **176.** (a), **177.** (c), **178.** (c), **179.** (b), **180.** (b), **181.** (a), **182.** (c), **183.** (b), **184.** (b), **185.** (b), **186.** (c), **187.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Of these statements
(a) II is false and I is true. (b) I and II are true.
(c) II is true and I is false. (d) I and II are false.
[U.P.S.C. I.E.S. E.E.-I, 1994]

188. The main drawbacks of ultrasonic flow-meter are
(a) low accuracy and slow response.
(b) complexity and relatively high cost.
(c) affected by pressure and temperature variations.
(d) none of the above.

189. In radioactive method, the receiver measures fluid level by recording the
(a) direction of the rays.
(b) number of radioactive particles received.
(c) time taken by the rays in reaching the receiver.
(d) none of the above.

190. The method, that can be employed for measuring only fluid level, is
(a) radioactive method. (b) bellows.
(c) strain gauge. (d) bourdon tube.
(e) bell type meter.

191. Hydrometer is employed for determination of
(a) relative humidity. (b) specific gravity of liquids.
(c) fluid level. (d) none of the above.

192. Inductive method can be used for measuring thickness of
(a) magnetic but non-conducting materials.
(b) conducting but non-magnetic materials.
(c) conducting and magnetic materials.
(d) non-conducting and non-magnetic materials.
(e) both magnetic and non-magnetic materials, as well as non-conducting and conducting materials.

193. The non-contact method of measuring thickness or density of cold or hot materials while in motion or when stationary is
(a) inductive. (b) capacitive.
(c) nuclear radiation. (d) ultrasonic.

194. The most suitable transducer for monitoring continuously variations in very fine thickness (say of paper in paper industry) is
(a) inductive. (b) capacitive.
(c) ultrasonic. (d) nuclear radiation.

195. In hygrometers the principle of measurement is
(a) change in resistance of salts with humidity.
(b) change in microwave power using klystron.
(c) change in thermal conductivity using thermistor.
(d) none of the above. [U.P.S.C. I.E.S. E.E.-I, 2000]

196. The electrical transducers used for continuous recording and control of humidity are
(a) resistive hygrometers. (b) electrolytic hygrometers.
(c) aluminium oxide hygrometers. (d) all of the above.

197. Measurements of flow, thermal conductivity and liquid level using thermistors make use of
(a) resistance decrease with temperature.
(b) resistance increase with temperature.
(c) self-heating phenomenon. (d) change of resistivity.
[U.P.S.C. I.E.S. E.E.-I, 2003]

198. The function of the reference electrode in a pH meter is to provide
(a) a constant current. (b) a constant voltage.
(c) temperature compensation. (d) both (b) and (c).

199. The disadvantage(s) of capacitor microphones is/are
(a) higher cost.
(b) high voltage supply requirement.
(c) limited frequency range. (d) both (a) and (b).

200. The devices extensively used in sound measurement systems are
(a) capacitor microphones. (b) carbon microphones.
(c) dynamic microphones. (d) vibration pickups.

201. Geiger counter has the advantages of
(a) being relatively inexpensive, reliable and rugged in construction.
(b) producing easily countable large pulses.
(c) having response independent of variations in humidity, temperature and atmospheric pressure.
(d) all of the above.

202. The activity of a radioactive sample goes down to 12.5 % in a time of x days. The half life of this sample is nearly
(a) $12x$ (b) $8x$ (c) $x/3$ (d) $3x$
[U.P.S.C. I.E.S. E.E.-I, 1992]

203. Scintillation counters have the advantage(s) of
(a) very fast counting rate.
(b) capability of detecting of radiations of lower levels.
(c) capability of detecting of x-rays.
(d) all of the above.

204. Environmental pollution is not caused by
(a) atmospheric air and water pollution.
(b) high humidity content in atmospheric air.
(c) noise pollution. (d) radioactive fallout.
[A.M.I.E. Sec B. Summer 1994]

205. Data acquisition systems are usually of
(a) analog type. (b) digital type.
(c) integrating type. (d) hybrid type.
[U.P.S.C. I.E.S. E.E.-I, 2006]

206. Which one of the following definitions correctly represents a data aquisition system (DAS) ?
(a) DAS is a group of electronic devices that are connected to perform the measurement and quantization of electrical signals for digital processing.
(b) DAS is a group of devices that are connected to store different signals.
(c) DAS is a system to control a process.
(d) DAS is a signal conditioner. [U.P.S.C. I.E.S. E.E.-I, 2004]

207. Consider the following statements
1. Low-pass filter. 2. Signal transmission medium.
3. Amplifier. 4. Digital-to-analog converter.
5. Analog-to-digital converter.
Which one of the following sequences is the correct sequence for effective signal reconstruction in a data acquisition and processing scheme ?
(a) 1–3–5–2–4. (b) 3–1–5–2–4.
(c) 1–5–3–2–4. (d) 3–5–1–4–2.
[U.P.S.C. I.E.S. E.E.-I, 2004]

208. Which of the following are data representation elements in a generalized measurement system ?
1. Analog indicator. 2. Amplifier.
3. A/D converter. 4. Digital display.
Select the correct answer using the codes given below:
(a) 1 and 2. (b) 1 and 4. (c) 2 and 4. (d) 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2003]

209. In an analog Data Acquisition System (DAS), what is the correct sequence of the blocks (therein) starting from the input ?

Answers: **188.** (b), **189.** (c), **190.** (a), **191.** (b), **192.** (e), **193.** (a), **194.** (d), **195.** (a), **196.** (d), **197.** (a), **198.** (b), **199.** (c), **200.** (d), **201.** (d), **202.** (c), **203.** (d), **204.** (b), **205.** (d), **206.** (a), **207.** (b), **208.** (b), **209.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Transducer - recorder - filter - signal conditioner.
(b) Transducer - signal conditioner - recorder.
(c) Signal conditioner - transducer - recorder.
(d) Signal conditioner - filter - transducer - recorder.

[U.P.S.C. I.E.S. E.E.-I, 2007]

210. Digital data acquisition systems are used
1. only when the output of the transducers is in digital form.
2. when physical process being monitored is slowly varying (narrow bandwidth).
3. when low accuracy can be tolerated.
4. when high accuracy and low per channel cost is required.

Which of these statements are correct ?
(a) 1, 2 and 3. (b) 1, 3 and 4.
(c) 1 and 3. (d) 2 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2001]

211. Consider the signal $V_m \sin 100t + 2V_m \sin 200t$ to be sampled and stored in a data acquisition system. The same is to be extracted off-line later on. In order to extract the signal effectively, the original sampling frequency has to be
(a) 100 rad/s (b) 200 rad/s
(c) 210 rad/s (d) $\sqrt{100^2 + 200^2}$ rad/s

[U.P.S.C. I.E.S. E.E.-I, 2005]

212. A sample-and-hold (S/H) circuit, having a holding capacitor of 0.1 nF, is used at the input of the ADC (analog-to-digital converter). The conversion time of the ADC is 1 μS, and during this time, the capacitor should not lose more than 0.5 % of the charge put across it during the sampling time. The maximum value of the input signal to the S/H circuit is 5 V. The leakage current of the S/H circuit should be less than
(a) 2.5 mA (b) 0.25 mA (c) 25.0 μA (d) 2.5 μA

[GATE E.E. 2001]

Answers: **210.** (d), **211.** (b), **212.** (d).

Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:
Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. (A): Magnetic tape is not used for digital data recording directly.
(R): Digital data require high speed recording.

[U.P.S.C. I.E.S. E.E.-I, 2003]

2. (A): Usualiy the magnetic recording head of a tape recorder is provided with ac bias for its operation.
(R): It is more convenient to provide ac bias to the magnetic recording head as compared to the dc bias.

[U.P.S.C. I.E.S. E.E.-I, 2007]

3. (A): In good quality magnetic cassette tape recorders, ac bias is provided to recording head for better recording and reproduction.
(R): The use of ac bias avoids the nonlinear characteristic of the B-H curve of the recording head. [U.P.S.C. I.E.S. E.E.-I, 2001]

4. (A): Flat diaphragms are most suited for static measurements.
(R): Flat diaphragms can be designed to have natural frequency.

5. (A): Bellows are quite suitable for dynamic pressure measurements.
(R): Bellows are rugged, simple and rugged in construction and are capable of providing large force and wide pressure range of measurements.

6. (A): Digital transducers are becoming more and more popular nowadays.
(R): The digital signals can be transmitted over a long distance without causing much distortion due to amplitude variation and phase shift.

7. (A): In resistance potentiometers used for measurement of displacement, sensitivity and linearity are conflicting requirements.
(R): The voltmeter used for measurement of output voltage of the potentiometer has a finite resistance which causes loading effects.

[U.P.S.C. I.E.S. E.E.-I, 2001]

8. (A): Platinum resistance thermometers are widely used in temperature measurement for industrial applications.
(R): Platinum resistance thermometers provide the highest temperature sensitivity of all known temperature transducers.

[U.P.S.C. I.E.S. E.E.-I, 1993]

9. (A): Capacitive transducers can be used for measurement of both static and dynamic phenomena.
(R): Capacitive transducers are extremely sensitive.

[U.P.S.C. I.E.S. E.E.-I, 2008]

10. (A): Capacitive transducers can be used for measuring humidity.
(R): Permittivity of gases varies with the variation in humidity.

11. (A): Piezoelectric transducers can be used for measurement of both static and dynamic phenomena.
(R): Piezoelectric transducers have very good high frequency response.

[U.P.S.C. I.E.S. E.E.-I, 2008; 2010]

12. (A): A piezoelectric transducer is not suitable for measurement of static pressure.
(R): Piezoelectric effect is reversible phenomenon.

[U.P.S.C. I.E.S. E.E.-I, 1999]

13. (A): Quartz crystals are piezoelectric.
(R): Fine watch circuits use quartz crystals.

[U.P.S.C. I.E.S. E.E.-I, 1992]

14. (A): Ceramic are none-ductile.
(R): They are sensitive to notches and flows during tensile loading.

[U.P.S.C. I.E.S. E.E.-I, 1992]

15. (A): On application of an electric field, a piezoelectric crystal exhibits a spontaneous mechanical strain.
(R): On application of an electric field, the ferroelectric domains tend to align themselves in the direction of the field.

[U.P.S.C. I.E.S. E.E.-I, 1996]

Answers: **1.** (b), **2.** (c), **3.** (a), **4.** (d), **5.** (d), **6.** (a), **7.** (a), **8.** (c), **9.** (b), **10.** (a), **11.** (d), **12.** (b), **13.** (b), **14.** (b), **15.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

16. (A): Piezoelectric accelerometers should not be used where the input frequency is lower than 10 Hz.
(R): Piezoelectric accelerometers have very poor response for low frequencies.

17. (A): Capacitor microphones are widely used as the standards for precise acoustical measurements.
(R): Capacitor microphones perform the most accurate conversion of sound vibrations in air to electrical signals.

18. (A): Carbon microphones are widely used in the field of sound measurements.
(R): Carbon microphones are cheaper, highly reliable and very rugged in construction.

19. (A): Data acquisition systems are used in a large and ever increasing number of applications in a variety of industrial and scientific areas.
(R): Transducer converts the analog signal to a form acceptable by the A/D convertor. [U.P.S.C. I.E.S. E.E.-I, 2004]

20. (A): Sampled data system requires hold circuit.
(R): Hold circuit converts the signal to analog form.
[U.P.S.C. I.E.S. E.E.-I, 2008]

Answers: **16.** (a), **17.** (a), **18.** (d), **19.** (a), **20.** (b).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Transducer)	List 2 (Input/Output Variable)
A. Electrodynamic generator.	1. Gas pressure to resistance change.
B. Venturimeter.	2. Force to displacement.
C. Pirani gauge.	3. Motion to voltage.
D. Spring balance.	4. Flow rate to pressure.

Codes :	A	B	C	D
(a)	2	1	4	3
(b)	2	4	1	3
(c)	3	4	1	2
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-I, 1998]

2.

List 1	List 2
A. Variable capacitance device.	1. Flow measurement.
B. Orifice meter.	2. Temperature measurement.
	3. Pressure transducer.
C. Thermistors.	4. Force and torque measurement.

Codes :	A	B	C
(a)	3	1	2
(b)	2	4	3
(c)	2	1	3
(d)	3	4	2

[U.P.S.C. I.E.S. E.E.-I, 2008]

3.

List 1 (Instrument)	List 2 (Measurand)
A. McLeod gage.	1. Temperature.
B. Turbine meter.	2. Pressure.
C. Pyrometer.	3. Flow.
D. Synchros.	4. Displacement.

Codes :	A	B	C	D
(a)	1	4	2	3
(b)	2	3	1	4
(c)	1	3	2	4
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-I, 2002]

4.

List 1 (Transducers)	List 2 (Characteristics)
A. Thermocouple.	1. Modulated output.
B. Thermistor.	2. Resistance changes with pressure.
C. Strain gauge.	3. Negative temperature coefficient.
D. LVDT.	4. Constant temperature at one end.

Codes :	A	B	C	D
(a)	3	2	4	1
(b)	4	3	2	1
(c)	2	1	4	3
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-II, 1994]

5.

List 1 (Quantity to be Measured)	List 2 (Type of Transducer)
A. Strain.	1. Magnetostrictive transducer.
B. Temperature.	2. Magnetoelectric transducer.
C. Angular velocity.	3. Encoder.
	4. Thermocouple.

Codes :	A	B	C
(a)	1	4	3
(b)	2	1	3
(c)	3	4	2
(d)	1	4	2

[U.P.S.C. I.E.S. E.E.-II, 1995]

6.

List 1 (Transducer)	List 2 (Parameter)
A. Piezoelectric crystal.	1. Static pressure measurement.
B. Manometer.	2. Dynamic force measurement.
C. Resistance bridge.	3. Study of vibration of a cantilever.
D. Resistance strain gauge.	4. Vibration in position of slider by an external force changes the resistance.

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	4	3	2	1

Answers: **1.** (c), **2.** (a), **3.** (b), **4.** (b), **5.** (d), **6.** (b),

(c)	2	1	4	3
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.E.-I, 2004]

7.

List 1 (Parameter)	List 2 (Transducer)
A. Pressure.	1. Thermistor.
B. Temperature.	2. Piezoelectric crystal.
C. Displacement.	3. Capacitance transducer.
D. Stress.	4. Ultrasonic waves.

Codes :	A	B	C	D
(a)	1	2	5	3
(b)	2	1	4	3
(c)	1	2	5	4
(d)	2	1	3	4

[U.P.S.C. I.E.S. E.E.-I, 2003]

8.

List 1 (Transducer)	List 2 (Range of Temperature)
A. Mercury in glass thermometer.	1. Can be used up to 300°C in normal conditions.
B. Platinum resistance thermometer.	2. Can be used up to 900°C with sufficient accuracy.
C. Thermocouple with lead compensation.	3. Can be used up to 1,400°C.
D. Optical radiation pyrometer.	4. Can be used for temperatures up to several thousand degrees.

Codes :	A	B	C	D
(a)	3	2	1	4
(b)	1	4	3	2
(c)	3	4	1	2
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-I, 2002]

9.

List 1 (Thermocouple)	List 2 (Temperature Range)
A. Copper-Constantan.	1. –200°C to + 850°C
B. (Platinum-Rhodium) - Platinum.	2. –200°C to + 350°C
C. (Rhodium-Indium) - Indium.	3. 0°C to + 1,000°C
D. Iron-Constantan.	4. 1,200°C to + 2,000°C

Codes :	A	B	C	D
(a)	1	4	3	2
(b)	2	3	4	1
(c)	1	3	4	2
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

10.

List 1 (Type of Solution)	List 2 (pH Value)
A. Pure water.	1. –1
B. Strong alkaline solution.	2. 7
C. Strong sulphuric acid.	3. 14

Codes :	A	B	C
(a)	1	2	3
(b)	1	3	2
(c)	2	3	1
(d)	2	1	3

11.

List 1 (Sound Measuring Device)	List 2 (Applications)
A. Capacitor.	1. Telephones microphones.
B. Carbon microphones.	2. Loudspeakers.
C. Dynamic microphones.	3. Extensive use in sound measurements.
D. Vibration pick-up.	4. As standard for precise acoustical measurements.

Codes :	A	B	C	D
(a)	4	1	2	3
(b)	1	2	3	4
(c)	2	3	4	1
(d)	3	4	1	2

12.

List 1 (Type of Hygrometer)	List 2 (Related Process / Material)
A. Resistive hygrometer.	1. Quartz crystal.
B. Capacitive hygrometer.	2. Lithium chloride crystal.
C. Microwave refractometer.	3. Change in dielectric constant.
D. Crystal hyrometer.	4. Change in frequency of oscillator.

Codes :	A	B	C	D
(a)	2	3	4	1
(b)	4	1	2	3
(c)	2	1	4	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

13.

List 1 (Instrument)	List 2 (Use)
A. Electroencephelograph.	1. Diagnostic tool for heart ailment.
B. Electrocardiograph.	2. Diagnostic tool for brain ailment.
C. Sphygmomanometer.	3. Instrument used for measuring BP.
D. Stethoscope.	4. Instrument used to hear pulse/heart beat.

Codes :	A	B	C	D
(a)	2	1	3	4
(b)	2	1	4	3
(c)	3	1	2	4
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-II, 1992]

14.

List 1	List 2
A. Bolometer.	1. Measurement of temperature of a furnace.
B. Hot-wire Anemometer.	2. Measurement of high pressure.
C. C-type Bourdon Tube.	3. Measurement of flow of air around an aeroplane.
D. Optical Pyrometer.	4. Measurement of power at 500 MHz.
	5. Measurement of angular position.

Codes :	A	B	C	D
(a)	2	3	5	1
(b)	4	1	2	3
(c)	2	1	5	3
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 2006]

15.

List 1	List 2
A. Hall effect.	1. Varistor.
B. Light energy.	2. Photodiodes.
C. Electric field.	3. Measuring low magnetic field.
D. Applied voltage.	4. Liquid crystal display.

Codes :	A	B	C	D
(a)	1	2	4	3
(b)	3	2	4	1
(c)	1	4	2	3
(d)	3	4	2	1

[U.P.S.C. I.E.S. E.E.-I, 2010]

Answers: **7.** (d), **8.** (d), **9.** (b), **10.** (c), **11.** (a), **12.** (a), **13.** (a), **14.** (d), **15.** (b).

True(T) / False(F) Type Questions

Note: - Identify whether the following statements are TRUE(T) or FALSE(F)

1. Analog recorders may broadly be classified in three categories viz graphic, oscillographic and magnetic tape recorders.
2. A servotype potentiometer recorder has a frequency response better than that of a galvanometer recorder. [A.M.I.E.Sec. B. Instrumentation & Control Winter 1994]
3. FM recording is usually used when more accurate and response to dc voltages are required.
4. Corrugated diaphragms are used for larger deflection requirements.
5. Bellows are well-suited for dynamic measurements.
6. Bourdon tubes have the advantages of high sensitivity and good repeatability.
7. The main advantages of the orifice plate are that it is quite cheap and easiest to instal and to replace.
8. Ring-balance meters can be used for measuring differential pressure.
9. The square root extractor is used in flow measuring systems so as to perform square root of the differential pressure.
10. Flow becomes completely turbulent for Reynold's number exceeding 2000.
11. If a large number of restrictions are installed along a pipe, the pressure at the pipe output will become less.
12. Helipots are multi-turn potentiometers.
13. Thermistors are essentially semiconductor devices, that behave as resistors having both negative and positive temperature coefficient of resistance.
14. Thermistors have a high negative temperature coefficient of resistance. [A.M.I.E. Summer 1993]
15. The sensing in thermocouple is based on the principle of variation of resistance of the couple with temperature. [A.M.I.E. Sec B. Winter 1994]
16. Primary and secondary windings of LVDT are wound on a tube of copper. [A.M.I.E. Summer 1993]
17. A piezoelectric pickup is an example for an active transducer. [GATE 1994]
18. A piezoelectric transducer cannot be used to measure static variables. [A.M.I.E.Sec. B. Instrumentation & Control Winter 1995]
19. A cadmium sulphide cell is a solar cell.
20. Piezoelectric transducers can be used for measurement of temperature.
21. A Wheatstone bridge circuit using strain gauges can be used for measuring both static and dynamic strains.
22. Dummy strain gauges are used for compensation of temperature variations.
23. The ballast circuit using a strain gauge cannot be employed for measuring dynamic strain.
24. Dynamic response of a resistance strain gauge type load cell is very good over a wide range of frequencies. [A.M.I.E. Sec B. Summer 1994]
25. Manometer is the simplest and well known gravitational type of mechanical device used for measurement of pressure.
26. Manometer is used to measure temperature. [A.M.I.E. Summer 1993]
27. Pirani gauge is used for measuring high pressures.
28. In an ionization vacuum gauge, the gas pressure is proportional to the ratio of plate current to grid current.
29. Pyrometer is used to measure low temperature.
30. Radiation pyrometers are used for measurement of temperature in the range of 1,200 – 3,500°C.
31. Piezoelectric transducers are widely used for shock and vibration measurements.
32. Ultrasonic measurement systems find extensive applications in the measurement of wall thickness and are useful in testing of most structural materials which transmit sound.
33. In a pH meter, the glass electrode is the reference electrode. [A.M.I.E. Sec B. Summer 1994]
34. Vibration pick-ups are mostly of the piezoelectric type.
35. Radiation emitted by radioactive substances is uniformly distributed in all directions in space.

Answers: **1.** (T), **2.** (T), **3.** (T), **4.** (T), **5.** (F), **6.** (T), **7.** (T), **8.** (F), **9.** (T), **10.** (F), **11.** (T), **12.** (T), **13.** (T), **14.** (T), **15.** (F), **16.** (F), **17.** (T), **18.** (T), **19.** (F), **20.** (T), **21.** (T), **22.** (T), **23.** (F), **24.** (T), **25.** (T), **26.** (F), **27.** (F), **28.** (T), **29.** (F), **30.** (T), **31.** (T), **32.** (T), **33.** (F), **34.** (T), **35.** (T).

Fill in the Blanks Type Questions

Note: - Fill in the blanks with appropriate word or words.

1. Galvanometers used in recorders are _____ damped.
2. CRO can be called a _____ plotter with a stylus as the electron beam. [A.M.I.E. Winter 1997]
3. X–Y recorder consists of a pair of _____ driving a recording pen in two axes through a proper sliding arrangement. [A.M.I.E. Sec B. Summer 1993]
4. The zero-suppression control is different from pen-position control in the sense that static component is removed _____ attenuation. (before/after)
5. The advantage of zero-suppression control over pen-position control is that full gain capability is available for _____ part of signal. (static/dynamic)
6. Selection of material for bourdon tube depends mainly on the fluid and the _____ for which these are designed.
7. The main advantages of Bourdon tube are _____ and good repeatability. [A.M.I.E. Summer 1993]
8. If the diameter of the torsion bar is reduced to half and torsion applied is made one-fourth, the angle of twist will become the _____ . (half/double/one-fourth/four times)

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

9. _____ is measured in N/m^2 or pascals.
10. When the average velocity of flowing fluid is slow, the flow is said to be _____.
11. For pipes, laminar flow occurs when Reynold's number is less than _____.
12. Reynold's number is given by the expression _____ .
13. A flow measuring system with a square root extractor has _____ scale.
14. In restriction flow-meters, the flow is proportional to _____ . $[(\Delta\rho)^{1/2}/\Delta\rho/(\Delta\rho)^2$
15. Stress is defined as _____ experienced per unit area. [A.M.I.E. Winter 1993]
16. Strain is defined as _____ per unit length. [A.M.I.E. Winter 1993]
17. The gauge factor of a strain gauge is always greater than _____ . [A.M.I.E. Summer 1994]
18. The gauge factor of a strain gauge is given by the expression _____ . [A.M.I.E. Winter 1994]
19. Semiconductor strain gauges employ the _____ property of doped silicon and germanium. [A.M.I.E. Summer 1993]
20. A _____ gauge may have gauge factor as high as 150. [A.M.I.E. Sec B. Instrumentation & Control Summer 1996]
21. Silicon and germanium are used to make _____ strain gauges [A.M.I.E. Sec B. Summer 1993]
22. Nitro-cellulose cement is used in strain gauges as _____ . (carrier/base/lead/adhesive)
23. Torque is measured by a foil strain gauge placed at an angle of _____ with the shaft axis. [A.M.I.E. Sec B. Instrumentation & Control Winter 1995]
24. A resistance thermometer is basically a / an _____ transducer. (active/passive/rosette/potentiometer)
25. The resistance of a thermistor increases with the _____ in temperature. [A.M.I.E. Summer 1994]
26. The sensitive range of thermistor is _____. [A.M.I.E. Winter 1994]
27. A commonly used temperature sensor with a negative temperature coefficient is called _____. [A.M.I.E. Sec B. Instrumentation & Control Winter 1996]
28. Thermistors are ideally suited to measure the temperature over _____ spans. [A.M.I.E. Sec B. Instrumentation & Control Winter 1996]
29. When two metals having different work functions are placed together, a voltage is generated at the junction proportional to temperature around it, and this arrangement is called a _____. [A.M.I.E. Sec B. Winter 1995]
30. Operation of the thermocouple is based on _____ effect. (Seebeck/Peltier/Thomson)
31. Thermocouples are _____ transducers. (active/passive/inverse)
32. A thermocouple is a junction of two _____ metals. (similar/dissimilar)
33. A current flows in a closed circuit made up of two dissimilar metals if the junction of the two metals are kept at different _____. [A.M.I.E. Summer 1993]
34. The size of air-cored transducers in comparison to iron-cored transducers is _____ . (same/smaller/larger)
35. LVDT is a variable _____ transducer. [A.M.I.E. Summer 1994]
36. LVDT can be used to measure _____. [A.M.I.E. Summer 1994]
37. LVDT windings are wound on _____ . (aluminium/copper/ferrite)
38. An LVDT has an output in the form of _____.
39. Fringing in a capacitive type transducer can be minimised by providing a _____. [GATE E.E. 1995]
40. The capacitive transducer has an excellent _____ response. [A.M.I.E. Winter 1995]
41. The phenomenon by which the quartz crystal is compressed to develop voltage across the ends is called _____. [A.M.I.E. Sec B. Instrumentation & Control Summer 1996]
42. Coulomb/Newton is a sensitivity for _____ sensor. [A.M.I.E. Sec B. Instrumentation & Control Winter 1996]
43. A quartz crystal exhibits _____ effect. [A.M.I.E. Summer 1995]
44. Certain types of materials generate an electrostatic charge or voltage when _____ is applied across them. [A.M.I.E. Summer 1993]
45. Temperature variables tend to affect strain measurement due to change in the gauge _____ as well as differential expansion of the gauge element w.r.t. the structural membrane. [A.M.I.E. Winter 1997]
46. Piezoelectric transducers are _____ transducers. (active/passive/both active and passive)
47. Piezoelectric transducers work when we apply to it _____ . (heat/mechanical force/illumination)
48. Displacement transducers using potentiometric variable resistance transduction elements are invariably _____ devices. [A.M.I.E. Winter 1997]
49. The load cell in _____ is employed to measure static and dynamic forces. [A.M.I.E. Winter 1993]
50. Piezometer is used for measuring _____ pressures.
51. Standard instrument used for calibration of temperature sensor is _____. [A.M.I.E. Winter 1994]
52. A non-contact type sensor for measuring temperature is commonly known as _____. [A.M.I.E. Sec B. Winter 1994]
53. Pirani gauges are used for measurement of pressure ranging from _____ torr to _____ torr.
54. Pirani gauge is used for _____ measurement. [A.M.I.E. Summer 1997]
55. Moving coil pick-up is used for measuring _____ . (linear velocity/displacement/pressure)
56. Electronic counters are used for measuring _____ . (linear velocity/acceration/pressure)
57. Rotameter is used for measuring _____ . (viscosity/flow/density)
58. The capacitive method is used for measuring thickness when the material under test is _____ .
59. A neutral solution has a pH of _____. [A.M.I.E. Sec. B Winter 1994]
60. When a p-H meter reads 7.0, the voltage developed by the electrode _____. [A.M.I.E. Sec B. Instrumentation & Control Summer 1996]
61. In an acidic solution $(OH)^-$ concentration is 10^{-9}. Its pH value is _____. [A.M.I.E. Sec B. Instrumentation & Control Winter 1996]
62. The standard reference value of pressure against which other pressures are compared is _____ μ bar or _____ N/m^2.
63. A pressure of _____dB or _____N/m^2 is normally the maximum sustained level that human beings can tolerate.
64. In nuclear instrumentation _____ particles are the heaviest and slow moving particles. [A.M.I.E. Sec B. Winter 1996]
65. Ionization chamber is mainly used to detect and measure _____ particles. [A.M.I.E. Sec B. Instrumentation & Control Summer 1996]
66. _____ is used to measure the electrical activity of the heart. [A.M.I.E. Sec B. Instrumentation & Control Summer 1993]

ANSWERS

1. elastically
2. X–Y
3. servomotors
4. before
5. dynamic
6. pressure
7. high sensitivity
8. double
9. Pressure
10. laminar
11. 2,000
12. $R_e = vD\rho/\eta$
13. linear
14. $(\Delta\rho)^{1/2}$
15. force
16. change in length
17. unity
18. $G = \frac{\Delta R/R}{\Delta l/l}$
19. piezoresistive
20. A semiconductor strain
21. semiconductor
22. adhesive
23. 45°
24. passive
25. decrease
26. – 100 to 300° C
27. thermistor
28. – 100 to 300 °C
29. thermocouple
30. Seeback
31. active
32. dissimilar
33. "temperatures"
34. larger
35. inductance
36. displacement
37. ferrite
38. linear displacement of core
39. guard ring
40. frequency
41. piezoelectric effect
42. piezoelectric
43. piezoelectric
44. force
45. resistance
46. both active and passive
47. mechanical force
48. resistive
49. electric transducer
50. very low
51. pyrometer
52. radiation pyrometer
53. 10^{-2}
54. vacuum
55. linear velocity
56. linear velocity
57. flow
58. an insulator
59. 7
60. as zero
61. 5
62. 0.0002, 2×10^{-3}
63. 90, 0.632
64. alpha
65. alpha
66. Electrocardiograph

20 CHAPTER

Control Systems

Short Answer Type Questions With Answers

Q. 1. What is control system ?

Ans. A control system is an arrangement of physical components connected or related in such a manner as to command, direct or regulate itself or another system.

Control systems can be of two types viz. open-loop control system and closed-loop control system.

Q. 2. What is feedback in control systems ? What are its characteristics ?

Ans. Feedback is that property of a closed loop control system which allows the output or some other controlled variable of the system, to be compared with the input to the system, so that the appropriate control action may be formed as some function of the output and input.

A feedback is said to exist in a system if the cause and effect between variables is interrelated.

The characteristics of feedback are : increased bandwidth, increased accuracy, reduced sensitivity to disturbances, reduced distortion and nonlinearties and tendency towards oscillations or instability.

Q. 3. What is system error ?

Ans. The system error is the ideal value of the controlled variable minus the value of the final controlled variable.

Q. 4. What are control system components ?

Ans. Various components employed in control systems are *servo-motors*, *amplidynes*, *synchros*, *stepper motors*, *tachometers*, *gyroscopes* etc.

Q. 5. Which types of servomotors generally lend themselves to small horse power requirements ? **[A.M.I.E. Sec B. Winter 1993]**

Ans. Two phase and the shaded pole type induction motors.

Q. 6. Give one advantage of the two phase servomotor over the shaded pole type. **[A.M.I.E. Sec B. Winter 1993]**

Ans. Better response to very small control signals.

Q. 7. Why are 'drag-cup-construction' used in rotors of certain fhp machines for control purposes ? **[A.M.I.E. Sec B. Winter 1993]**

Ans. In drag-cup-construction all heavy iron laminations remain stationary and only a light cup rotates, so the inertia is quite small.

Q. 8. Why is series compensating winding employed in the amplidyne ?

Ans. Compensating winding is connected in series with the power output brush terminals of the amplidyne to neutralize the armature reaction mmf set up by the load current and increase amplification factor.

Q. 9. Why are commutating poles required in amplidynes ?

Ans. Commutating poles are required in amplidynes to give satisfactory commutation.

Q. 10. Why are amplidynes not extremely over-compensated ?

Ans. In case of extreme over-compensation, undesirable self excitation of the amplidyne *i.e.* spontaneous rise in voltage and load current at constant control current (or with the control circuit open) can occur. Self excitation can cause considerable over-loading of the amplidyne and totally disrupt operation of the system containing the amplidyne.

Q. 11. Why amplidynes are provided with split-poles ?

Ans. Amplidynes are provided with split-poles to provide space for interpoles.

Q. 12. What is a stepper motor ?

Ans. A motor in which the rotor turns in discrete movements is called *a stepper motor.*

Q. 13. What are the two types of stepper motors ? **[M.S. Univ. April 1996; Bharathiyar Univ. April 1997]**

Ans. Permanent-magnet type and variable-reluctance type motors.

Q. 14. For the same number of poles which stepper motor produces (*i*) largest stepping angle, (*ii*) smallest stepping angle ?

Ans. (*i*) Permanent magnet type—largest stepping angle

(*ii*) Variable reluctance type—smallest stepping angle.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

Q. 15. Where is stepper motor used ? [Bharathidhasan Univ. Nov. 1996]

Ans. Stepper motors are used in industrial situations which call for precise positioning of an object or precise control of speed without having to resort to closed-loop feedback.

Q. 16. How an ac tachometer is superior to dc tachometer ?

Ans. AC tachometer does not cause any maintenance problem of commutator and brushes.

Q. 17. What is transfer function ?

Ans. It is the mathematical expression that relates the system output to the system input and so describes the behaviour of a system. It is expressed as the ratio of the Laplace transform of the output variable to the Laplace transform of the input variable with the assumption that all the initial conditions are zero.

Q. 18. What is linear system ?

Ans. A linear system is a system that follows the law of superposition and homogeneity.

Q. 19. What are analogous system ?

Ans. *Systems which are governed by the same types of equations are called analogous systems.* Analogous systems may have entirely different physical appearances. For example, a given electrical circuit consisting of resistances, inductances and capacitances may be analogous to a mechanical system consisting of a suitable combination of dashpots, weights and springs or it may be analogous to an acoustical device consisting of an appropriate arrangement of finemesh screens, tubes and cavities.

Q. 20. What is signal flow graph ?

Ans. A signal flow graph is pictorial representation of the simultaneous equations describing a system. It graphically displays the transmission of signals through the system, as does the block diagram.

Q. 21. What is meant by overshoot ?

Ans. Overshoot is the maximum difference between the transient and steady-state solutions for a unit step function input.

Q. 22. Enlist the applications of sampled data systems.

Ans. Sampled data system find applications in

(*i*) High speed tin plate rolling mills using quantized data for control.

(*ii*) Numerically controlled machine tool operations.

(*iii*) Pulse controlled or digital controlled electric drives.

(*iv*) Large complex systems using telemetry links based on pulse modulation (PM) translation of data.

Multiple Choice Type Questions

Note: Each of the following questions comprises multiple responses (two or more than two answers). Select the correct answers. In case you feel that there is more than one correct answers, select the answer which you consider the best. In any case, choose ONLY ONE answer or response for each question.

1. The most commonly used input signal(s) in control system is/are
(a) step function. (b) ramp or velocity function.
(c) accelerating function. (d) all of the above.
[A.M.I.E. Sec. B Circuit Theory and Control Summer 2007]

2. What is the characteristic of a good control system ?
(a) Sensitive to parameter variation.
(b) insensitive to input commands.
(c) Neither sensitive to parameter variation nor sensitive to input commands.
(d) Insensitive to parameter variation but sensitive to input commands. **[U.P.S.C. I.E.S. E.E.-II, 2009]**

3. The system described by the equation $y = a + bx$, $a > 0$, $b > 0$ is
(a) dynamic. (b) linear.
(c) nonlinear. (d) time-varying.
[A.M.I.E. Sec. B Control Systems Winter 2005; Summer 2007]

4. Consider the following statements regarding a linear system $y = f(x_2)$:
1. $f(x_1 + x_2) = f(x_1) + f(x_2)$ 2. $f[x(t + T)] = f[x(t)] + f[(x(T)]$
3. $f(Kx) = Kf(x)$
Of these statements
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 3 alone is correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-I, 1998]

5. Linear system obeys
(a) principle of maximum power transfer.
(b) reciprocity principle. (c) principle of superposition.
(d) all of these. **[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]**

6. A system can be completely described by a transfer function if it is
(a) nonlinear and continuous. (b) linear and time-varying.
(c) nonlinear and time-invariant.
(d) linear and time-invariant. **[U.P.S.C. I.E.S. E.T.E.-I, 2007]**

7. Compared to continuous time system, the discrete system is
(a) More accurate but less stable.
(b) Less accurate but more stable.
(c) More accurate and more stable.
(d) Less accurate and less stable. **[U.P.S.C. I.E.S. E.E.-I, 2007]**

8. If a linear time invariant system is excited by a true random signal like white noise, the output of the linear system will have which of the following properties ?
(a) Output will be a white noise.
(b) Output will be periodic. (c) Output will not be random.
(d) Output will be correlated or coloured noise.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

9. A function of one or more variables which conveys information on the nature of physical phenomenon is called
(a) noise. (b) interference.
(c) system. (d) signal.
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

10. If the initial conditions for a system are inherently zero, what does it physically mean ?
(a) The system is at rest but stores energy.
(b) The system is working but does not store energy.
(c) The system is at rest or no energy is stored in any of its parts.
(d) The system is working with zero reference input.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

11. In a control system, the use of negative feedback
(a) eliminates the chances of instability.
(b) increases the reliability.
(c) reduces the effects of disturbance and noise signals in the forward path.
(d) increases the influence of variations of component parameters on the system performance. **[U.P.S.C. I.E.S. E.E.-II, 1993]**

12. Which of the following are the characteristics of closed-loop systems ?
1. It does not compensate for disturbances.
2. It reduces the sensitivity of plant-parameter variations.
3. It does not involve output measurements.
4. It has the ability to control the system transient response.
Select the correct answer using the codes given below :
(a) 1 and 4. (b) 2 and 4. (c) 1 and 3. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2002]

13. Consider the following statements with respect to feedback control system :
1. Accuracy cannot be obtained by adjusting loop gain.
2. Feedback decreases overall gain.
3. Introduction of noise due to sensor reduces overall accuracy.
4. Introduction of feedback may lead to the possibility of instability of closed loop system.
Which of the statements given above are correct ?
(a) 1, 2, 3 and 4. (b) Only 1, 2 and 4.
(c) Only 1 and 3. (d) Only 2, 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

14. Which one of the following effects in the system is NOT caused by negative feedback ?
(a) Reduction in gain. (b) Increase in bandwidth.
(c) Increase in distortion.
(d) Reduction in output impedance. **[U.P.S.C. I.E.S. E.E.-I, 2003]**

15. A negative feedback closed-loop system is supplied to an input of 5 V. The system has a forward gain of 1 and a feedback gain of 1. What is the output voltage
(a) 1.0 V (b) 1.5 V (c) 2.0 V (d) 2.5 V
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

16. Feedback control systems are
(a) insensitive to both forward-and feedback-path parameter changes.
(b) less sensitive to feedback-path parameter changes than to forward-path parameter changes.
(c) less sensitive to forward-path parameter changes than to feedback-path parameter changes.
(d) equally sensitive to forward-and feedback path parameter changes. **[GATE E.E. 2000]**

Answers: **1.** (a), **2.** (d), **3.** (b), **4.** (d), **5.** (d), **6.** (d), **7.** (c), **8.** (c), **9.** (d), **10.** (d), **11.** (c), **12.** (b), **13.** (d), **14.** (c), **15.** (d), **16.** (c),

Downloaded From : www.EasyEngineering.net

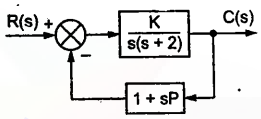
Downloaded From : www.EasyEngineering.net

17. In a speed control system, output rate feedback is used to
(a) Limit the speed of motor.
(b) Limit the acceleration of the motor.
(c) Reduce the damping of the system.
(d) Increase the gain margin. **[U.P.S.C. I.E.S. E.E.-I, 2005]**

18. Consider the following statements in connection with feedback in control system :
1. With an increase in forward gain, the output value approaches the input value in the case of negative feedback closed-loop system.
2. A negative feedback closed-loop system when subjected to an input of 5 V with forward gain of 1 and a feedback gain of 1 gives output 4.999 V.
3. The transfer function is dependent only upon its internal structure and components, and is independent of the input applied to the system.
4. The overall gain of the block diagram shown is 10.

Which of the statements given above are correct ?
(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 3 and 4. (d) Only 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

19. The block diagram of a closed control system is given by figure. The values of K and P such that the system has a damping ratio of 0.7 and an undamped natural frequency ω_n of 5 rad/sec, are respectively equal to

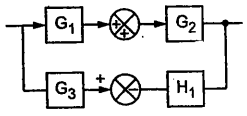


(a) 20 and 0.3. (b) 20 and 0.2.
(c) 25 and 0.3. (d) 25 and 0.2. **[GATE E.E. 2004]**

20. Consider the following block diagrams :

1. 
2. 
3. 
4. 
Which of these block diagrams can be reduced to transfer function $\frac{C(s)}{R(s)} = \frac{G_1}{1 - G_1G_2}$?
(a) 1 and 3. (b) 2 and 4. (c) 1 and 4. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2001]

21. What is the overall transfer functions of the block diagram shown in figure ?



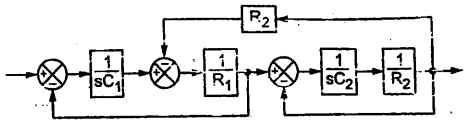
(a) $\frac{G_1G_2 + G_2G_3}{1 + G_2H_1}$

(b) $\frac{G_1G_3 + G_2G_3}{1 + G_3H_1}$

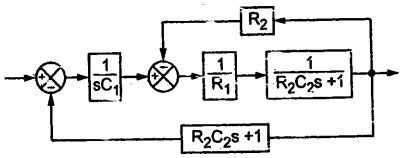
(c) $G_1G_2 + G_2G_3$ (d) $\frac{G_1G_3 + G_2G_3}{1 + G_2G_3H_1}$

[U.P.S.C. I.E.S. E.E.-I, 2005]

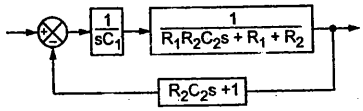
22. Consider the following three block diagrams A, B and C shown below :



Block diagram A



Block diagram B



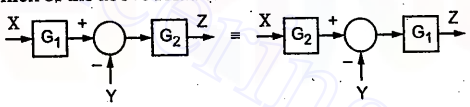
Block diagram C

Which one of the following statements is correct in respect of the above block diagrams ?
(a) Only A and B are equivalent. (b) Only A and C are equivalent.
(c) Only B and C are equivalent. (d) A, B and C are equivalent.
[U.P.S.C. I.E.S. E.E.-I, 2004]

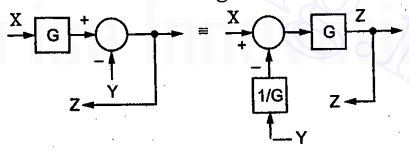
23. Which one of the following identity is correct one ?

(a) 
(b) 
(c) 
(d) 
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

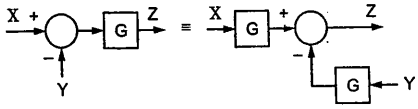
24. Consider the following three cases of block diagram A, B and C : Which of the above relations are correct ?



Block Diagram A



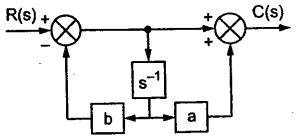
Block Diagram B



Block Diagram C

(a) A and B (b) B and C (c) A and C (d) A, B and C
[U.P.S.C. I.E.S. E.E.-I, 2004]

25. The block diagram for a particular control system is shown in the figure. What is the transfer function C(s)/R(s) for this system?



Answers: **17.** (c), **18.** (d), **19.** (d), **20.** (b), **21.** (a), **22.** (d), **23.** (b), **24.** (b), **25.** (b),

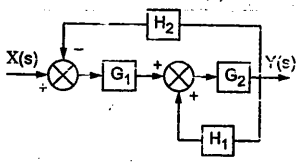
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) $\frac{s+a}{s-b}$ (b) $\frac{s+a}{s+b}$ (c) $\frac{s-b}{s+a}$ (d) $\frac{s+b}{s+a}$

[U.P.S.C. I.E.S. E.E.-I, 2007]

26. Which one of the following is the transfer function $\frac{Y(s)}{X(s)}$ for the block diagram given ?



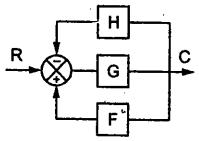
(a) $\frac{G_1G_2}{1+H_2G_1G_2-H_1G_2}$

(b) $\frac{G_1G_2}{1-H_2G_1G_2+H_1G_2}$

(c) $\frac{H_1G_1G_2}{1-H_2G_1G_2+H_1G_2}$ (d) $\frac{H_1G_1G_2}{1+H_2G_1G_2-H_1G_2}$

[U.P.S.C. I.E.S. E.E.-I, 2007]

27. For the feedback system shown in the figure, which one of the following expresses the input-output relation C/R of the overall system ?

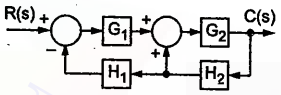


(a) $\frac{G}{1-FG+GH}$ (b) $\frac{G}{1+FG-GH}$

(c) $\frac{FG}{1+FGH}$ (d) $\frac{GH}{1-FGH}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

28. The overall gain $\frac{C(s)}{R(s)}$ of the block diagram shown is

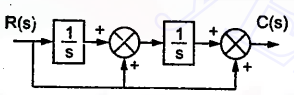


(a) $\frac{G_1G_2}{1-G_1G_2H_1H_2}$ (b) $\frac{G_1G_2}{1-G_2H_2-G_1G_2H_1}$

(c) $\frac{G_1G_2}{1-G_2H_2+G_1G_2H_1H_2}$ (d) $\frac{G_1G_2}{1-G_1G_2H_1-G_1G_2H_2}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

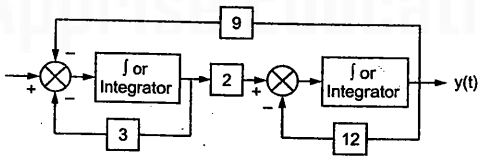
29. For the block diagram shown in figure, the transfer function $\frac{C(s)}{R(s)}$ is equal to



(a) $\frac{s^2+1}{s^2}$ (b) $\frac{s^2+s+1}{s^2}$

(c) $\frac{s^2+s+1}{s}$ (d) $\frac{1}{s^2+s+1}$ [GATE E.E. 2004]

30. The block diagram of a control system is shown in figure. The transfer function G(s) = Y(s)/U(s) of the system is

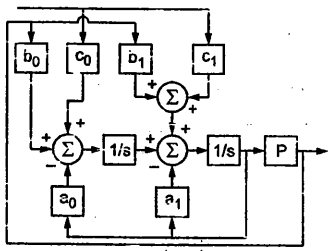


(a) $\frac{1}{18\left(1+\frac{s}{12}\right)\left(1+\frac{s}{3}\right)}$ (b) $\frac{1}{27\left(1+\frac{s}{6}\right)\left(1+\frac{s}{9}\right)}$

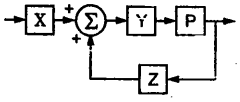
(c) $\frac{1}{27\left(1+\frac{s}{12}\right)\left(1+\frac{s}{9}\right)}$ (d) $\frac{1}{27\left(1+\frac{s}{9}\right)\left(1+\frac{s}{3}\right)}$

[GATE E.E. 2003]

31. The system shown in figure below



can be reduced to the form



with

(a) $X = c_0s + C_1$, $Y = 1/(s^2 + a_0s + a_1)$, $Z = b_0s + b_1$

(b) $X = 1$, $Y = (c_0s + c_1)/(S^2 + a_0s + a_1)$, $Z = b_0s + b_1$

(c) $X = C_1s + C_0$, $Y = (b_1s + b_0)/(s^2 + a_1s + a_0)$, $Z = 1$

(d) $X = c_1s + c_0$, $Y = 1/(s^2 + a_1s + a)$, $Z = b_1s + b_0$

[GATE E.E. 2007]

32. Mason's rule is applied to

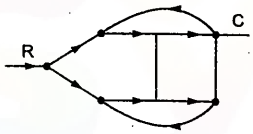
(a) signal flow graph.

(b) block diagram reduction technique.

(c) hydraulic system. (d) rotational system.

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

33. The signal flow graph shown in the given figure has



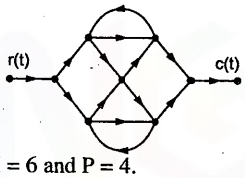
(a) three forward paths and two non-touching loops.

(b) three forward paths and three loops.

(c) two forward paths and two non-touching loops.

(d) two forward path and three loops. [U.P.S.C. I.E.S. E.E.-II, 1999]

34. A signal flow graph is shown in the given figure. The number of forward paths M and number of individual loops P for this signal flow graph would be

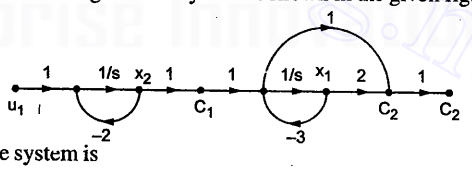


(a) M = 4 and P = 4. (b) M = 6 and P = 4.

(c) M = 4 and P = 6. (d) M = 6 and P = 6.

[U.P.S.C. I.E.S. E.E.-I, 2000]

35. The state diagram of a system is shown in the given figure :



The system is

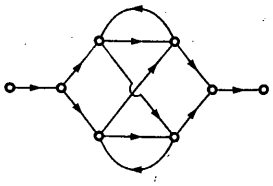
(a) controllable and observable.

(b) controllable but not observable.

(c) observable but not controllable.

(d) neither controllable nor observable. [U.P.S.C. I.E.S. E.E.-I, 2000]

36. The signal flow graph shown has M number of forward paths and P number of individual loops. What are their values ?



(a) M = 4 and P = 2.

(b) M = 6 and P = 3.

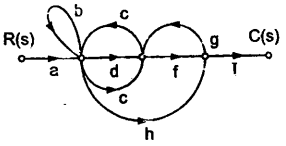
Answers: **26.** (a), **27.** (a), **28.** (c), **29.** (b), **30.** (b), **31.** (d), **32.** (a), **33.** (a), **34.** (b), **35.** (b), **36.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

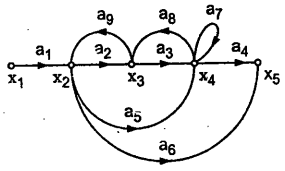
(c) M = 4 and P = 3. (d) M = 6 and P = 2.
[U.P.S.C. I.E.S. E.E.-i, 2006]

37. The number of forward paths and the number of non-touching loop pairs for the signal flow graph given in the figure are, respectively,



(a) 1, 3 (b) 3, 2 (c) 3, 1 (d) 2, 4
[U.P.S.C. I.E.S. E.E.-I, 2002]

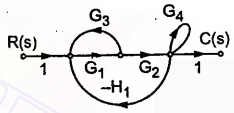
38. The signal flow graph for a certain feedback control system is shown.



Now consider the following set of equations for the nodes :
1. $x_2 = a_1x_1 + a_9x_3$
2. $x_3 = a_2x_2 + a_8x_4$
3. $x_4 = a_3x_3 + a_5x_2$
4. $x_5 = a_4x_4 + a_6x_2$

Which of the above equations are correct ?
(a) 1, 2 and 3. (b) 1, 3 and 4.
(c) 2, 3 and 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2004]

39. The gain $\frac{C(s)}{R(s)}$ of the signal flow graph shown is



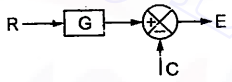
(a) $\frac{G_1G_2 + G_2G_3}{1 + G_1G_2H_1 + G_2G_3H_1 + G_4}$

(b) $\frac{G_1G_2 + G_2G_3}{1 + G_1G_2H_1 + G_2G_3H_1 - G_4}$

(c) $\frac{G_1G_3 + G_2G_3}{1 + G_1G_3H_1 + G_2G_3H_1 + G_4}$

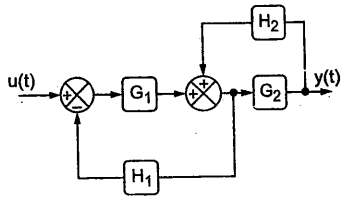
(d) $\frac{G_1G_3 + G_2G_3}{1 + G_1G_3H_1 + G_2G_3H_1 - G_4}$
[U.P.S.C. I.E.S. E.E.-I, 2003]

40. Which one of the following block diagrams is equivalent to the above diagram?



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2009]

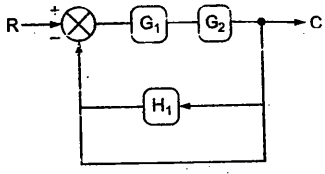
41. The system transfer function for the block diagram shown is



(a) $\frac{G_1G_2}{1 - G_2H_2 + G_1H_1}$ (b) $\frac{G_1G_2}{1 - H_1G_1 + G_2H_1}$

(c) $\frac{G_1G_2H_1}{1 + G_2H_1 + G_1H_1}$ (d) $\frac{G_1G_2H_1}{1 + G_2H_2 + G_1H_1}$
[U.P.S.C. I.E.S. E.E.-I, 2011]

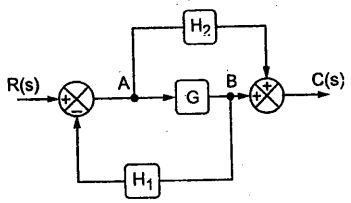
42. The resulting equivalent transfer function of the system shown below is



(a) $\frac{G_1G_2}{1 + G_1G_2 + G_1G_2H_1}$ (b) $\frac{G_1G_2}{1 + G_1G_2 + G_1H_1}$

(c) $\frac{G_1G_2}{1 + H_1G_1G_2}$ (d) $\frac{G_1G_2}{1 + G_1G_2 + H_1}$
[U.P.S.C. I.E.S. E.E.-I, 2011]

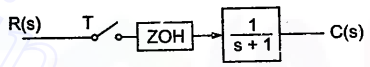
43. The transfer function $\frac{C(s)}{R(s)}$ for the system shown below is



(a) $\frac{G + H_1}{1 + GH_2}$ (b) $\frac{G + H_2}{1 + GH_1}$

(c) $\frac{H_2}{1 + GH_1}$ (d) $\frac{GH_2}{1 + GH_1}$
[U.P.S.C. I.E.S. E.E.-I, 2011]

44. What is the transfer function $\frac{C(Z)}{R(Z)}$ of sampled data system as shown below?



(a) $\frac{(1 - e^{-T})}{(Z - (e^{-T})}$ (b) $\frac{(Z - e^{-T})}{(1 - e^{-T})}$

(c) $\frac{(1 - 2e^{-T})}{(e^{-T} - Z)}$ (d) $\frac{(1 - 2Ze^{-T})}{(Z - 1)}$
[U.P.S.C. I.E.S. E.E.-I, 2009]

45. Consider the following sampled data systems :

1. 
2. 
3. 
Which of these systems are similar ?
(a) 1 and 2 (b) 1 and 3 (c) 2 and 3 (d) 1, 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 2000]

46. For the given sampled-data system

Answers: **37.** (c), **38.** (d), **39.** (b), **40.** (b), **41.** (a), **42.** (a), **43.** (b), **44.** (a), **45.** (d), **46.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

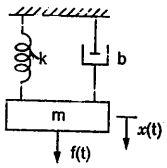
the z-transform is

(a) R(z) → $G_2G_1(z)$ → C(z) (b) R(z) → $G_2(s)G_1(s)$ → C(z)

(c) R(z) → $G_2(z)G_1(z)$ → C(z) (d) $RG_1(z)$ → $G_2(z)$ → C(z)

[U.P.S.C. I.E.S. E.E.-I, 2002]

47. Which one of the following represents the linear mathematical model of the physical system shown in the figure ?



(a) $m\frac{d^2x(t)}{dt^2}+b\frac{dx(t)}{dt}+kx(t)=f(t)$

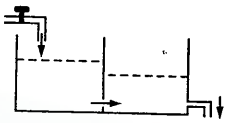
(b) $m\frac{d^2x(t)}{dt^2}+b\frac{dx(t)}{dt}+kx(t)=0$

(c) $m\frac{d^2x(t)}{dt^2}+b\frac{dx(t)}{dt}+kx(t)+f(t)=0$

(d) $m\frac{d^2x(t)}{dt^2}+b\frac{dx(t)}{dt}-kx(t)-f(t)=0$

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

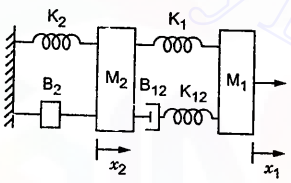
48. A two-tank system is shown in figure The electrical equivalent of this system is :



(a)

(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-II, 2000]

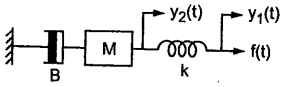
49. Consider the following mechanical system shown in the diagram:
Which one of the following circuits shows the correct force-current analogous electrical circuit for the mechanical diagram?



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2004]

50. The mechanical system is shown in the given figure.

The system is described as



(a) $M\frac{d^2y_1(t)}{dt^2}+B\frac{dy_1(t)}{dt}=k[y_2(t)-y_1(t)]$.

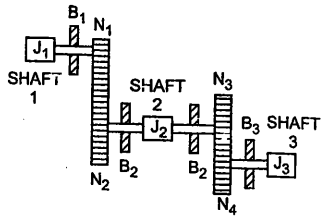
(b) $M\frac{d^2y_2(t)}{dt^2}+B\frac{dy_2(t)}{dt}=k[y_2(t)-y_1(t)]$.

(c) $M\frac{d^2y_1(t)}{dt^2}+B\frac{dy_1(t)}{dt}=k[y_1(t)-y_2(t)]$.

(d) $M\frac{d^2y_2(t)}{dt^2}+B\frac{dy_2(t)}{dt}=k[y_1(t)-y_2(t)]$.

[U.P.S.C. I.E.S. E.E.-I, 2001]

51. Consider the following diagram :
For the multiple gear system shown in figure, which one of the following gives the equivalent inertia referred to shaft 1 ?



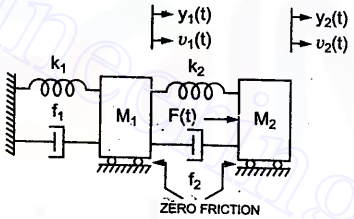
(a) $J_1+J_2\left(\frac{N_1}{N_2}\right)^2+J_3\left(\frac{N_1N_3}{N_2N_4}\right)^2$

(b) $J_1+J_2\left(\frac{N_2}{N_1}\right)^2+J_3\left(\frac{N_2N_4}{N_1N_3}\right)^2$

(c) $J_1+J_2\left(\frac{N_1}{N_2}\right)^2+J_3\left(\frac{N_1N_2}{N_3N_4}\right)^2$

(d) $J_1+J_2\left(\frac{N_2}{N_1}\right)^2+J_3\left(\frac{N_1N_2}{N_3N_4}\right)^2$ [U.P.S.C. I.E.S. E.E.-I, 2004]

52. $y_1(t)$ and $y_2(t)$ are displacements
$v_1(t)$ and $v_2(t)$ are velocities.



Which one of the following is the correct free body diagram for the physical system as shown in the figure above?

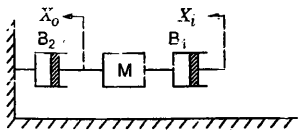
(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **47.** (a), **48.** (c), **49.** (c), **50.** (d), **51.** (a), **52.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

53. For the mechanical system with mass and viscous friction components, shown in figure, $\frac{X_o(s)}{X_i(s)}$ is

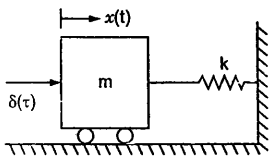


(a) $\frac{B_2}{Ms + B_1 + B_2}$ (b) $\frac{B_2}{Ms^2 + (B_1 + B_2)s}$

(c) $\frac{B_1}{Ms + B_1 + B_2}$ (d) $\frac{B_1}{Ms^2 + (B_1 + B_2)s}$

[U.P.S.C. I.E.S. E.E.-I, 2011]

54. A mechanical system is as shown in the figure. The system is set into by applying a unit impulse force. Assuming that the system is initially and ignoring friction, what is displacement $x(t)$ of mass?

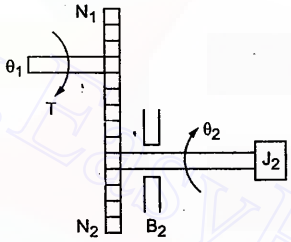


(a) $\frac{1}{\sqrt{k}} \exp(-m \cdot t)$ (b) $\frac{1}{\sqrt{mk}} \sin(t)$

(c) $\frac{1}{\sqrt{mk}} \sin\left(\sqrt{\frac{k}{m}} \cdot t\right)$ (d) $\frac{1}{\sqrt{mk}} \left(\sqrt{\frac{k}{m}} \cdot t\right)$

[U.P.S.C. I.E.S. E.E.-I, 2009]

55. Consider the following relations with regard to the adjoining shown gear trains:



1. $\frac{\theta_1}{\theta_2} = \frac{N_2}{N_1}$

2. $T_2 = J_2 \frac{d^2\theta_2}{dt^2} + B_2 \frac{d\theta_2}{dt}$

3. $T_1 = J_2 \left(\frac{N_1}{N_2}\right)^2 \frac{d^2\theta_1}{dt^2} + B_2 \left(\frac{N_1}{N_2}\right)^2 \frac{d\theta_1}{dt}$

Which of these relations are correct?

(a) 1, 2 and 3. (b) 1 and 2 only.

(c) 2 and 3 only. (d) 1 and 3 only.

[U.P.S.C. I.E.S. E.E.-I, 2011]

56. Indicate type one system out of the transfer functions given below

(a) $\frac{s(s+4)}{(s+1)(s+8)}$ (b) $\frac{(s+2)}{s(s+6)}$

(c) $\frac{(s+3)(s+5)}{s^2(s+4)(s+8)}$ (d) $\frac{s}{(s+4)(s+5)}$

[A.M.I.E. Sec B. Control Systems Winter 2005]

57. The type number of the control system with

$G(s)H(s) = \frac{K(s+2)}{s(s^2+2s+3)}$ is

(a) one. (b) two. (c) three. (d) four.

[U.P.S.C. I.E.S. E.E.-I, 2008]

58. A control system has a transfer function

$$\frac{K(1+0.5s)(1+2s+5s^2)}{s^2(1+s)(1+5s+10s^2)(1+100s+500s^2)}.$$

What is the type of the system ?

(a) 0 (b) I (c) II (d) III

[U.P.S.C. I.E.S. E.E.-I, 2008]

59. A system has the following transfer function $G(s) = \frac{100(s+5)(s+50)}{s^4(s+10)(s^2+3s+10)}$. The type and order of the system are respectively.

(a) 4 and 9 (b) 4 and 7 (c) 5 and 7 (d) 7 and 5

[U.P.S.C. I.E.S. E.E.-I, 1998]

60. What are the order and type of closed loop system for the plant transfer function $G(s) = \frac{k}{s^2(1+Ts)}$ and with unity feedback ?

(a) Two and two. (b) Three and two.

(c) Two and zero. (d) Three and zero.

[U.P.S.C. I.E.S. E.E.-I, 2005]

61. Which one of the following statements is INCORRECT with reference to pneumatic system ?

(a) Operating pressure is low compared to hydraulic system.

(b) Leaks can create problems as well as fire hazards.

(c) They are insensitive to temperature changes.

(d) High compressibility of air results in longer time delays.

[U.P.S.C. I.E.S. E.E.-I, 2002]

62. Consider the following statements for pneumatic and hydraulic control systems :

1. The normal operating pressure of pneumatic control is very much higher than that of hydraulic control.
2. In pneumatic control, external leakage is permissible to a certain extent, but there should be not leakage in a hydraulic control.

Which of the statements given above is/are correct ?

(a) 1 only. (b) 2 only.

(c) Both 1 and 2. (d) Neither 1 and 2.

[U.P.S.C. I.E.S. E.T.E.-II, 2008]

63. Which one of the following statements is NOT correct ?

(a) The action of bellows in pneumatic control system is similar to that of a spring.

(b) The flapper valve converts large changes in the position of the flapper into small changes in the back pressure.

(c) The common name of pneumatic amplifier is pneumatic relay.

(d) The transfer function of a pneumatic actuator is of the form: $\frac{A}{Ms^2 + fs + K}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

64. Which one of the following minimum information is necessary to formulate the problem of control systems optimization ?

(a) System state equation, output equation and the control vector only.

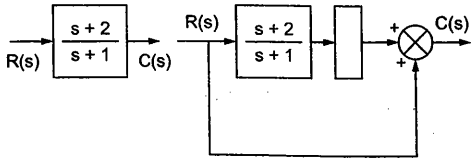
(b) System state equation, output equation, control vector and the performance index only.

(c) System state equation, output equation, control vector, constraints of the problem, the performance index and system parameters.

(d) System state equation, output equation, control vector and constraints of the problem only.

[A.M.I.E. Sec B. Control Systems Winter 2006]

65. For what value of K, are the two block diagrams as shown below equivalent?



(a) 1 (b) 2 (c) $(s+1)$ (d) $(s+2)$

[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **53.** (c), **54.** (c), **55.** (a), **56.** (b), **57.** (a), **58.** (c), **59.** (b), **60.** (b), **61.** (a), **62.** (c), **63.** (b), **64.** (d), **65.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

65. Consider the following statements in connection with the feedback of control systems:

1. Feedback can improve stability or be harmful to stability if it is not properly applied.
2. Feedback can always improve stability.
3. In many situations the feedback can reduce the effect of noise and disturbance on system performance.
4. In general the sensitivity of the system gain of a feedback system to a parameter variation depends on, where the parameter is located.

Which of the above statements are correct?
(a) 1, 2 and 3 only. (b) 1, 3 and 4 only.
(c) 1, 2 and 4 only. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2010]

67. Consider the following statements with reference to hydraulic systems:

1. A small size actuator can develop a very large force or torque.
2. A source with supply and return line is required.
3. It is insensitive to temperature changes.

Which of the above statements is/are correct?
(a) 1 only. (b) 2 only.
(c) 1 and 2. (d) 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2009]

68. In a fluid flow system two fluids are mixed in appropriate proportion. The concentration at the mixing point is $y(t)$ and it is reproduced without change, T_d seconds later at the monitoring point as $b(t)$. What is the transfer function between $b(t)$ and $y(t)$?

(where S is distance between monitoring point and mixing point)

(a) e^{-T_d} (b) $e^{+T_d S}$ (c) $e^{-T_d S}$ (d) e^{+T_d}
[U.P.S.C. I.E.S. E.E.-I, 2009]

69. The ratio of damped frequency to natural frequency of the given system having damping factor ξ is

(a) $1/\eta$ (b) ξ (c) ξ^2 (d) $\sqrt{1-\xi^2}$
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

70. The output of first order hold between two consecutive sampling instants is a
(a) constant. (b) quadratic function.
(c) ramp function. (d) exponential function.
[U.P.S.C. I.E.S. E.E.-I, 2002]

71. A second order system is said to be critically damped if the damping factor (ξ) is
(a) $\xi > 1$ (b) $\xi < 1$ (c) $\xi = 1$ (d) $\xi = 0.707$
[A.M.I.E. Sec B. Control Systems Winter 2005]

72. The transfer function of a system is given as

$$\frac{100}{s^2 + 20s + 100}$$

The system is
(a) an overdamped system. (b) an underdamped system.
(c) a critically damped system.
(d) an unstable system.
[GATE E.E. 2008]

73. The solution of the differential equation

$$\frac{d^2y}{dt^2} + 2\frac{dy}{dt} + 2y = 3 \text{ is}$$

(a) oscillatory. (b) overdamped.
(c) underdamped. (d) critically damped.
[A.M.I.E. Sec B. Control Systems Winter 2005]

74. Damping in a control system is a function of

(a) gain (b) $\sqrt{\text{gain}}$ (c) $\frac{1}{\sqrt{\text{gain}}}$ (d) $\frac{1}{\text{Gain}}$
[A.M.I.E Sec B. Circuit Theory and Control Winter 2006]

75. A second order system has a natural frequency of oscillations of 3 rad/sec and damping ratio of 0.5. What are the values of resonant frequency and resonant peak of the system?
(a) 1.5 rad/sec and 1.16 (b) 1.16 rad/sec and 1.5
(c) 1.16 rad/sec and 2.1 (d) 2.1 rad/sec and 1.16
[U.P.S.C. I.E.S. E.E.-I, 2009]

76. Consider the following:
1. Rise time 2. Settling time
3. Delay time 4. Peak time
What is the correct sequence of the time domain specifications of a second order system in the ascending order of the values?
(a) 2–4–1–3 (b) 3–4–1–2
(c) 2–1–4–3 (d) 3–1–4–2
[U.P.S.C. I.E.S. E.E.-I, 2009]

77. For the second order prototype system, when the undamped natural frequency increases, the maximum overshoot of the output
(a) stays the same. (b) increases.
(c) decreases. (d) just doubles.
[A.M.I.E. Sec B. Measurements and Control Winter 2006]

78. An underdamped second-order system initially at rest is subjected to a unit step input at $t = 0$. The first minimum value of the output response will occur when the time angle $\omega_d t$ is

(a) $\frac{\pi}{2}$ (b) $\frac{2\pi}{3}$ (c) $\frac{\pi}{3}$ (d) π
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

79. A second order control system has a transfer function $\frac{16}{s^2 + 4s + 16}$. What is the time for the first overshoot ?

(a) $\frac{2\pi}{\sqrt{3}}s$ (b) $\frac{\pi}{\sqrt{3}}s$ (c) $\frac{\pi}{2\sqrt{3}}s$ (d) $\frac{\pi}{4\sqrt{3}}s$
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

80. What is the value of k for a unity feedback system with $G(s) = \frac{k}{s(1+s)}$ to have a peak overshoot of 50% ?

(a) 0.53 (b) 5.3 (c) 0.6 (d) 0.047
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

81. In time domain, specification, the time delay is the time required for the response to reach
(a) 75% of the final value. (b) 50% of the final value.
(c) 25% of final value. (d) 100% of final value.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

82. In a second order linear control system, the output response for unity damping factor will be

(a) $1 + e^{\omega_n t} + \omega_n e^{-\omega_n t}$ (b) $1 - e^{-\omega_n t}(1 + \omega_n t)$
(c) $1 - e^{\omega_n t} + \omega_n t e^{-\omega_n t}$ (d) none of these.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

83. Given a unity feedback system with $G(s) = \frac{K}{s(s+4)}$, the value of K for damping ratio of 0.5 is

(a) 1 (b) 4 (c) 16 (d) 64
[U.P.S.C. I.E.S. E.E.-I, 2008]

84. For a second order system, if both the roots of the characteristic equation are real, then the value of damping ratio will be

Answers: **66.** (b), **67.** (d), **68.** (c), **69.** (d), **70.** (c), **71.** (c), **72.** (c), **73.** (d), **74.** (c), **75.** (d), **76.** (d), **77.** (c), **78.** (b), **79.** (c), **80.** (b), **81.** (b), **82.** (b), **83.** (c), **84.** (d),

(a) less than unity. (b) equal to unity.
(c) equal to zero. (d) greater than unity.
[U.P.S.C. I.E.S. E.E.-I, 2006]

85. For unity feedback control with $G(s) = \frac{16}{s(s+4)}$, the damping ratio is
(a) 2.0 (b) 1.0 (c) 0.707 (d) 0.5
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

86. The open loop transfer function of a unity feedback control system is given by $G(s) = \frac{k}{s(s+1)}$. If gain k is increased to infinity, then damping ratio will tend to become
(a) Zero. (b) 0.707. (c) Unity. (d) Infinite.
[U.P.S.C. I.E.S. E.E.-I, 2005]

87. For a unity feedback control system the damping ratio is 0.421. What is the resonance magnitude ?
(a) $M_r = 1$ (b) $M_r = 0.707$
(c) $M_r = 1.30$ (d) $M_r = 1.95$
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

88. For second-order system $2\frac{d^2y}{dt^2} + 4\frac{dy}{dt} + 8y = 8x$ what is the damping ratio ?
(a) 0.1 (b) 0.25 (c) 0.333 (d) 0.5
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

89. A second order control system is defined by the following differential equation :

$$4\frac{d^2c(t)}{dt^2} + 8\frac{dc(t)}{dt} + 16c(t) = 16u(t)$$

The damping ratio and natural frequency for this system are respectively
(a) 0.25 and 2 rad/s. (b) 0.50 and 2 rad/s.
(c) 0.25 and 4 rad/s. (d) 0.50 and 4 rad/s.
[U.P.S.C. I.E.S. E.E.-I, 2001]

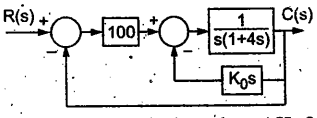
90. The impulse response of a second-order underdamped system starting from rest is given by

$$C(t) = 12.5e^{-6t} \sin 8t,\ t \geq 0.$$

The natural frequency and the damping factor of the system are respectively :
(a) 10 and 0.6. (b) 10 and 0.8.
(c) 8 and 0.6. (d) 8 and 0.8.
[U.P.S.C. I.E.S. E.E.-I, 2007, 2008; 2009]

91. The unit impulse response of a second order system is $\frac{1}{6}e^{-0.8t}\sin(0.6t)$. Then the natural frequency and damping ratio of the system are respectively ?
(a) 1 and 0.6. (b) 1 and 0.8. (c) 2 and 0.4. (d) 2 and 0.3.
[U.P.S.C. I.E.S. E.E.-I, 2003]

92. Output rate control is used to improve the damping of the system given in the figure. If the closed-loop system is required to have a damping factor of 0.5 what is the value of K_0 ?



(a) 4 (b) 19 (c) 1/4 (d) 6
[U.P.S.C. I.E.S. E.E.-I, 2007]

93. Which one of the following is the most likely reason for large overshoot in a control system ?
(a) High gain in a system.
(b) Presence of dead time delay in a system.
(c) High positive correcting torque.
(d) High retarding torque. [U.P.S.C. I.E.S. E.E.-I, 2008]

94. What is the value of the damping ratio of a second order system when the value of the resonant peak is unity ?
(a) $\sqrt{2}$ (b) Unity (c) $1/\sqrt{2}$ (d) zero
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

95. A unity feedback system has open-loop transfer function $G(s) = \{25/[s(s+6)]\}$. The peak overshoot in the step-input response of the system is approximately equal to
(a) 5% (b) 10% (c) 15% (d) 20%
[U.P.S.C. I.E.S. E.E.-I, 2006]

96. A second order control system has $M(j\omega) = \frac{100}{100 - \omega^2 + 10\sqrt{2}j\omega}$. Its M_P (peak magnitude) is
(a) 0.5 (b) 1 (c) $\sqrt{2}$ (d) 2
[U.P.S.C. I.E.S. E.E.-I, 2003]

97. What is the output as $t \to \infty$ for a system that has a transfer function $G(s) = \frac{2}{s^2 - s - 2}$; when subjected to a step input ?
(a) −1 (b) 1 (c) 2 (d) Unbounded
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

98. A control system whose step response is $-0.5(1 + e^{-2t})$ is cascaded to another control block whose impulse response is e^{-t}. What is the transfer function of the cascaded combination ?
(a) $\frac{1}{(s+1)(s+2)}$ (b) $\frac{1}{s(s+1)}$
(c) $\frac{1}{s(s+2)}$ (d) $\frac{0.5}{s(s+1)(s+2)}$
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

99. Consider the network function :

$$H(s) = \frac{2(s+3)}{(s+2)(s+4)}$$

What is the steady-state response due to a unity step input ?
(a) 4/3 (b) 1/2 (c) 3/4 (d) 1
[U.P.S.C. I.E.S. E.E.-I, 2006]

100. The unit step response of an underdamped second order system has steady state value of −2. Which one of the following transfer functions has these properties ?
(a) $\frac{-2.24}{s^2 + 2.59s + 1.12}$ (b) $\frac{-3.82}{s^2 + 1.91s + 1.91}$
(c) $\frac{-2.24}{s^2 + 2.59s + 1.12}$ (d) $\frac{-3.82}{s^2 - 1.91s + 1.91}$
[GATE E.C.E. 2009]

101. A linear second-order system with the transfer function $G(s) = \frac{49}{s^2 + 16s + 49}$ is initially at rest and is subject to a step input signal. The response of the system will exhibit a peak overshoot of
(a) 16% (b) 9% (c) 2% (d) zero
[U.P.S.C. I.E.S. E.E.-I, 1998; A.M.I.E Sec B. Control System Summer 2006]

102. The unit-step response of a system starting from rest is given by

$$c(t) = 1 - e^{-2t} \quad \text{for } t \geq 0$$

The transfer function of the system is
(a) $\frac{1}{1+2s}$ (b) $\frac{2}{2+s}$ (c) $\frac{1}{2+s}$ (d) $\frac{2s}{1+2s}$
[GATE E.C.E. 2006]

103. The frequency response of a linear, time-invariant system is given by $H(f) = \frac{5}{1 + j10\pi f}$. The step response of the system is
(a) $5(1 - e^{5t})u(t)$ (b) $5(1 - e^{t/5})u(t)$

Answers: **85.** (d), **86.** (a), **87.** (c), **88.** (d), **89.** (b), **90.** (a), **91.** (b), **92.** (b), **93.** (c), **94.** (d), **95.** (b), **96.** (b), **97.** (d), **98.** (a), **99.** (c), **100.** (b), **101.** (d), **102.** (b), **103.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) $1/5(1-e^{5t})u(t)$ (d) $\frac{1}{(s+5)(s+1)}$

[GATE E.C.E. 2007]

104. A circuit is modelled by the following differential equation :

$$\frac{d^2i(t)}{dt^2}+\frac{6di(t)}{dt}+9i(t)=0$$

The response $i(t)$ is of the form (with symbols having their standard meanings)

(a) $K_1e^{-t}+K_2e^{-9t}$ (b) $Ke^{-3t}\sin(t+\theta)$
(c) $(K_1+K_2t)e^{-3t}$ (d) $Ke^{-t}\sin(9t+\theta)$

[U.P.S.C. I.E.S. E.E.-I, 2003]

105. Let $s(t)$ be the step response of a linear system with zero initial conditions; then the response of this system to an input $u(t)$ is

(a) $\int_0^t s(t-\tau)u(\tau)d\tau$ (b) $\frac{d}{dt}\left[\int_0^t s(t-\tau)u(\tau)d\tau\right]$

(c) $\int_0^t s(t-\tau)\left[\int_0^t u(\tau_1)d\tau_1\right]d\tau$ (d) $\int_0^t s(t-\tau)^2u(\tau)d\tau$

[GATE E.E. 2002]

106. A function $y(t)$ satisfies the following differential equation :

$$\frac{dy(t)}{dt}+y(t)=\delta(t)$$

where $\delta(t)$ is the delta function. Assuming zero initial condition, and denoting the unit step function by $u(t)$, $y(t)$ can be of the form

(a) e^t (b) e^{-t} (c) $e^tu(t)$ (d) $e^{-t}u(t)$

[GATE E.E. 2008]

107. A system function

$$N(s)=\frac{V(s)}{I(s)}=\frac{s+3}{4s+5}.$$

The system is initially at rest. If the excitation $i(t)$ is a unit step, which of the following are the initial and steady-state values of $v(t)$?

	Initial value	Steady-state value
(a)	0	3/5
(b)	1/4	0
(c)	3/5	1/4
(d)	1/4	3/5

[U.P.S.C. I.E.S. E.E.-I, 2006]

108. The transfer function of ZOH (Zero Order Hold) is

(a) $1-e^{Ts}$ (b) $1-e^{-Ts}$ (c) $\frac{1-e^{Ts}}{s}$ (d) $\frac{1-e^{-Ts}}{s}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

109. The impulse response of an LTI system is given by $5u(t)$. If the input to the system is given by ε^{-t} then the output of the system is given by

(a) $5(1-\varepsilon^{-t})u(t)$ (b) $(1-5\varepsilon^{-t})u(t)$
(c) $5-\varepsilon^{-t}u(t)$ (d) $5u(t)-\varepsilon^{-t}$

[U.P.S.C. I.E.S. E.E.-I, 2002]

110. The output of a linear time invariant control system is $c(t)$ for a certain input $r(t)$. If $r(t)$ is modified by passing it through a block whose transfer function is e^{-s} and then applied to the system, the modified output of the system would be

(a) $\frac{c(t)}{1+e^t}$ (b) $\frac{c(t)}{1+e^{-t}}$
(c) $c(t-1)u(t-1)$ (d) $c(t)u(t-1)$ [GATE E.E. 1998]

111. A system with zero initial conditions has the closed loop transfer function.

$$T(s)=\frac{s^2+4}{(s+1)(s+4)}$$

The system output is zero at the frequency

(a) 0.5 rad/sec. (b) 1 rad/sec.
(c) 2 rad/sec. (d) 4 rad/sec. [GATE E.E. 2005]

112. The unit step response of a second order system is $1-e^{-5t}-5te^{-5t}$. Consider the following statements :

1. The undamped natural frequency is 5 rad/s
2. The damping ratio is 1.
3. The impulse response is $25\,te^{-5t}$

Which of the statements given above is/are correct ?

(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

113. The magnitude of frequency response of an underdamped second order system is 5 at 0 rad/sec and peaks to $10/\sqrt{3}$ at $5\sqrt{2}$ rad/sec. The transfer function of the system is

(a) $\frac{500}{s^2+10s+100}$ (b) $\frac{375}{s^2+5s+75}$
(c) $\frac{720}{s^2+12s+144}$ (d) $\frac{1125}{s^2+25s+225}$

[GATE E.C.E. 2008]

114. For a parallel resonant circuit, if the damped frequency is $\sqrt{8}$ rad/s and the bandwidth is 2 rad/s, the resonant frequency of the circuit is

(a) 10 rad/s (b) 7 rad/s (c) 3 rad/s (d) 2 rad/s

[U.P.S.C. I.E.S. E.E.-I, 2010]

115. The unit step response of a system is $[1-e^{-t}(1+t)]\,u(t)$. What is the nature of system in term of stability?

(a) Unstable. (b) Stable.
(c) Critically stable. (d) Oscillatory.

[U.P.S.C. I.E.S. E.E.-I, 2009]

116. The response of an initially relaxed, linear constant-parameter network to a unit impulse applied at $t=0$ is $4e^{-2t}u(t)$. What is the response of this network to unit step function?

(a) $2(1-e^{-2t})\,u(t)$ (b) $4(e^{-t}-e^{-2t})\,u(t)$
(c) $\sin 2t$ (d) $(1-4e^{-4t})\,u(t)$

[U.P.S.C. I.E.S. E.E.-I, 2009]

117. For the system $2/(s+1)$, the approximate time taken for a step response to reach 98% of its final value is

(a) 1 s (b) 2 s (c) 4 s (d) 8 s

[GATE E.E. 2010]

118. A cascade of 3 Linear Time Invariant systems is causal and unstable. From this, we conclude that

(a) each system in the cascade is individually causal and unstable.
(b) at least one system is unstable and at least one system is causal.
(c) at least one system is causal and all systems are unstable.
(d) the majority are unstable and the majority are causal.

[GATE E.E. 2009]

119. The system represented by the input-output relationship $y(t)=\int_{-\infty}^{5t}x(\tau)d\tau,\ t>0$ is

(a) linear and causal. (b) linear but not causal.
(c) causal but not linear. (d) neither linear nor causal.

[GATE E.E. 2010]

120. A system with input $x(t)$ and output $y(t)$ is defined by the input-output relation

$$y(t)=\int_{-\infty}^{-2t}x(\tau)d\tau$$

Answers: **104.** (c), **105.** (b), **106.** (d), **107.** (d), **108.** (d), **109.** (a), **110.** (d), **111.** (c), **112.** (d), **113.** (a), **114.** (c), **115.** (b), **116.** (a), **117.** (c), **118.** (b), **119.** (b), **120.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The system will be
(a) causal, time-invariant and unstable.
(b) causal, time-invariant and stable
(c) non-causal, time-invariant and unstable.
(d) non-causal, time-variant and unstable. [GATE E.E. 2008]

121. The response $h(t)$ of a linear time invariant system to an impulse $\delta(t)$, under initially relaxed condition is $h(t) = e^{-t} + e^{-2t}$. The response of this system for a unit step input $u(t)$ is
(a) $u(t) + e^{-t} + e^{-2t}$ (b) $(e^{-t} + e^{-2t})\,u(t)$
(c) $(1.5 - e^{-t} - 0.5e^{-2t})\,u(t)$ (d) $e^{-t}\delta(t) + e^{-2t}\,u(t)$
[GATE E.E. 2011]

122. A signal $e^{-\alpha t}\sin(\omega t)$ is the input to a Linear Time Invariant system. Given K and ϕ are constants, the output of the system will be of the form $Ke^{-\beta t}\sin(\nu t + \phi)$ where
(a) β need not be equal to α but ν equal to ω.
(b) ν need not be equal to ω but β equal to α.
(c) β equal to α and ν equal to ω.
(d) β need not be equal to α and ν need not be equal to ω.
[GATE E.E. 2008]

123. The transfer function of a linear time invariant system is given as

$$G(s) = \frac{1}{s^2 + 3s + 2}$$

The steady state value of the output of this system for a unit impulse input applied at time instant $t = 1$ will be
(a) 0 (b) 0.5 (c) 1 (d) 2
[GATE E.E. 2008]

124. $H(z)$ is a transfer function of a *real* system. When a signal $x[n] = (1+j)^n$ is the input to such a system, the output is zero. Further, the region of convergence (ROC) of $\left(1 - \frac{1}{2}z^{-1}\right) H(z)$ is the entire Z-plane (except $z = 0$). It can then be inferred that $H(z)$ can have a minimum of
(a) one pole and one zero. (b) one pole and two zeros.
(c) two poles and one zero. (d) two poles and two zeros.
[GATE E.E. 2008]

125. $X(z) = 1 - 3z^{-1}$, $Y(z) = 1 + 2z^{-2}$ are Z-transforms of two signals $x[n]$, $y[n]$ respectively. A linear time invariant system has the impulse response $h[n]$ defined by these two signals as

$$h[n] = x[n-1] * y[n]$$

where * denotes discrete time convolution. Then the output of the system for the input $\delta[n-1]$
(a) has Z-transform $z^{-1}\,X(z)\,Y(z)$
(b) equals $\delta[n-2] - 3\delta[n-3] + 2\delta[n-4] - 6\delta[n-5]$
(c) has Z-transform $1 - 3z^{-1} + 2z^{-2} - 6z^{-3}$
(d) does not satisfy any of the above three. [GATE E.E. 2007]

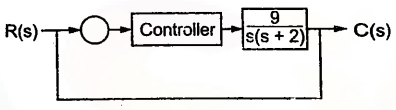
126. The Z-transform of a signal $x[n]$ is given by $4z^{-3} + 3z^{-1} + 2 - 6z^2 + 2z^3$. It is applied to a system, with a transfer function $H(z) = 3z^{-1} - 2$. Let the output be $y(n)$. When of the following is true?
(a) $y(n)$ is non causal with finite support.
(b) $y(n)$ is causal with infinite support.
(c) $y(n) = 0$; $|n| > 3$.
(d) $\mathrm{Re}[Y(z)]_{z=e^{j\theta}} = -\mathrm{Re}[Y(z)]_{z=e^{j\theta}}$; $\mathrm{Im}\,[Y(z)]_{z=e^{j\theta}}$
$= \mathrm{Im}\,[Y(z)]_{z=e^{j\theta}}$; $-\pi \le \theta < \pi$ [GATE E.E. 2009]

127. The impulse response of a causal linear time-invariant system is given as $h(t)$. Now consider the following two statements
Statement (I) Principle of superposition holds
Statement (II) $h(t) = 0$ for $t < 0$
Which one of the following statements is correct?
(a) Statement (I) is correct and Statement (II) is wrong.
(b) Statement (II) is correct and Statement (I) is wrong.
(c) Both Statement (I) and Statement (II) are wrong.
(d) Both Statement (I) and Statement (II) are correct.
[GATE E.E. 2008]

128. A Linear Time Invariant system with an impulse response $h(t)$ produces output $y(t)$ when input $x(t)$ is applied. When the input $x(t-\tau)$ is applied to a system with impulse response $h(t-\tau)$, the output will be
(a) $y(t)$ (b) $y(2(t-\tau))$
(c) $y(t-\tau)$ (d) $y(t-2\tau)$
[GATE E.E. 2009]

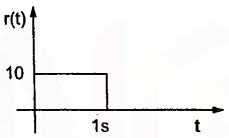
129. A signal $x(t) = \mathrm{sinc}\,(\alpha t)$ where α is a real constant $\left(\mathrm{sinc}\,(x) = \frac{\sin(\pi x)}{\pi x}\right)$ is the input to a Linear Time Invariant system whose impulse response $h(t) = \mathrm{sinc}\,(\beta t)$ where β is a real constant. If min (α, β) denotes the minimum of α and β, and similarly max (α, β) denotes the maximum of α and β, and K is a constant, which one of the following statements is true about the **output of the system?**
(a) It will be of the form K sin (γt) where γ = min (α, β).
(b) It will be of the form K sinc (γt) where γ = max (α, β).
(c) It will be of the form K sinc (αt).
(d) It cannot be a sinc type of signal.
[GATE E.E. 2008]

130. In the control system shown above the controller which can give zero steady-state error to a ramp input is of



(a) proportional type. (b) integral type.
(c) derivative type.
(d) proportional plus derivative type.
[U.P.S.C. I.E.S. E.E.-I, 2011]

131. The steady state error of a unity feedback linear system for a unit step input is 0.1. The steady state error of the same system, for a pulse input $r(t)$ having a magnitude of 10 and a duration of one second, as shown in the figure is



(a) 0 (b) 0.1 (c) 1 (d) 10
[GATE E.E. 2011]

132. A unity feedback system with open loop transfer function of $\frac{20}{s(s+5)}$ is excited by a unit step input. How much time will be required for the response to settle within 2% of final desired value?
(a) 0.25 sec (b) 1.60 sec (c) 2.40 sec (d) 4.00 sec
[U.P.S.C. I.E.S. E.E.-I, 2009]

133. The open loop transfer function of a unity negative feedback control system is given by

$$G(s) = \frac{k}{(s+2)(s+4)(s^2+6s+25)}$$

What is the value of k which causes sustained oscillations in the closed loop system ?
(a) 590 (b) 790 (c) 990 (d) 1190
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

134. Given the transfer function $G(s) = \frac{121}{s^2 + 13.2s + 121}$ of a system.
Which of the following characteristics does it have ?

Answers: **121.** (c), **122.** (a), **123.** (b), **124.** (b), **125.** (d), **126.** (a), **127.** (d), **128.** (d), **129.** (a), **130.** (b), **131.** (a), **132.** (b), **133.** (a), **134.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) Overdamped and settling time 1.1s.
(b) Underdamped and settling time 0.6s.
(c) Critically damped and settling time 0.8s.
(d) Underdamped and settling time 0.707s.

[U.P.S.C. I.E.S. E.E.-I, 2002]

135. A control system with certain excitation is governed by the following mathematical equation

$$\frac{d^2x}{dt^2}+\frac{1}{2}\frac{dx}{dt}+\frac{1}{18}x=10+5e^{-4t}+2e^{-5t}$$

The natural time constants of the response of the system are
(a) 2 s and 5 s. (b) 3 s and 6 s.
(c) 4 s and 5 s. (d) 1/3 s and 1/6 s. [GATE E.E. 2003]

136. When the input to a system was withdrawn at $t = 0$, its output was found to decrease exponentially from 1,000 units to 500 units in 1.386 seconds. The time constant of the system is
(a) 0.500 (b) 0.693 (c) 1.386 (d) 2.000

[U.P.S.C. I.E.S. E.E.-I, 1998]

137. For a second order system, natural frequency of oscillation is 10 rad/s and damping ratio is 0.1. What is the 2% settling time ?
(a) 40 s (b) 10 s (c) 0.4 s (d) 4 s

[U.P.S.C. I.E.S. E.E.-I, 2007]

138. The damping ratio and natural frequency of a second order system are 0.6 and 2 rad/s respectively. Which one of the following combinations gives the correct values of peak and settling time, respectively for the unit step response of the system ?
(a) 3.33 s and 1.95 s (b) 1.95 s and 3.33 s
(c) 1.95 s and 1.5 s (d) 1.5 s and 1.95 s

[U.P.S.C. I.E.S. E.E.-I, 2004]

139. The unit-step response of a unity feedback system with open loop transfer function G(s) = K/((s + 1)(s + 2)) is shown in the figure. The value of K is

(a) 0.5 (b) 2 (c) 4 (d) 6

[GATE E.E. 2009]

140. $[-a \pm jb]$ are the complex conjugate roots of the characteristic equation of a second order system. Its damping coefficient and natural frequency will be respectively

(a) $\frac{b}{\sqrt{a^2+b^2}}$ and $\sqrt{a^2+b^2}$ (b) $\frac{b}{\sqrt{a^2+b^2}}$ and a^2+b^2

(c) $\frac{a}{\sqrt{a^2+b^2}}$ and $\sqrt{a^2+b^2}$ (d) $\frac{a}{\sqrt{a^2+b^2}}$ and a^2+b^2

[U.P.S.C. I.E.S. E.E.-I, 2000]

141. If the closed-loop transfer function of a control system is given as $T(s)=\frac{s-5}{(s+2)(s+3)}$, then it is
(a) an unstable system. (b) an uncontrollable system.
(c) a minimum phase system.
(d) a non-minimum phase system. [GATE E.C.E. 2007]

142. Consider the following transfer functions :
1. $1/(S^2 + S + 1)$ 2. $4/(S^2 + 2S + 4)$
3. $2/(S^2 + 2S + 2)$ 4. $1/(S^2 + 2S + 1)$
5. $3/(S^2 + 6S + 3)$

Which of the above transfer functions represent underdamped second order systems ?
(a) 4 and 5. (b) 1, 4 and 5.
(c) 1, 2 and 3. (d) 1, 3 and 5.

[U.P.S.C. I.E.S. E.E.-I, 2004]

143. The transfer function of a linear time invariant system is given as

$$G(s)=\frac{1}{s^2+3s+2}$$

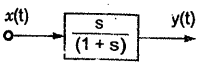
The steady-state value of the output of the system for a unit impulse input applied at time instant $t = 1$ will be
(a) 0 (b) 0.5 (c) 1 (d) 2

[GATE E.E. 2008]

144. The unit impulse response of a second order-underdamped system starting from rest is given by $c(t) = 12.5e^{-6t} \sin 8t$, $t \geq 0$. The steady-state value of the unit step response of the system is equal to
(a) 0 (b) 0.25 (c) 0.5 (d) 1.0

[GATE E.E. 2004]

145. Consider the following system shown in the diagram :
In the system shown in the diagram $x(t) = \sin t$. What will be the response $y(t)$ in the steady state ?



(a) $\sin(t - 45°)/\sqrt{2}$ (b) $\sin(t + 45°)/\sqrt{2}$
(c) $\sqrt{2}\, e^{-t} \sin t$ (d) $\sin t - \cos t$

[U.P.S.C. I.E.S. E.E.-I, 2004]

146. The characteristic equation for a third-order system is :
$q(s) = a_0s^3 + a_1s^2 + a_2s + a_3 = 0$.
For the third-order system to be stable, besides that all the coefficients have to be positive, which one of the following has to be satisfied as a necessary and sufficient condition ?
(a) $a_0a_i \geq a_2a_3$. (b) $a_1a_2 \geq a_0a_3$.
(c) $a_2a_3 \geq a_1a_0$. (d) $a_0a_3 \geq a_1a_2$.

[U.P.S.C. I.E.S. E.E.-I, 2004]

147. The loop transfer function of a system is given by

$$G(s)H(s)=\frac{K(s+10)^2(s+100)}{s(s+25)}$$

The number of loci terminating at infinity is
(a) 0 (b) 1 (c) 2 (d) 3

[U.P.S.C. I.E.S. E.E.-I, 2003]

148. The open loop transfer function of a unity feedback system is given by $\frac{K}{s(s+1)}$. If the value of gain K is such that the system is critically damped, the closed loop poles of the system will lie at
(a) –0.5 and –0.5. (b) $\pm j0.5$.
(c) 0 and –1. (d) $0.5 \pm j0.5$.

[U.P.S.C. I.E.S. E.E.-I, 2001]

149. For the function $X(s)=\frac{1}{s(s+1)^3(s+2)}$, the residues associated with the simple poles at $s = 0$ and $s = -2$ are respectively
(a) 1/2 and 1/2. (b) 1 and 1.
(c) –1 and –1. (d) --1/2 and 1/2.

[U.P.S.C. I.E.S. E.E.-I, 2000]

150. Given a unity feedback system with $G(s)=\frac{K}{s(s+4)}$, the value of K for damping ratio of 0.5 is
(a) 1 (b) 16 (c) 4 (d) 2

[U.P.S.C. I.E.S. E.E.-I, 2010]

151. Consider a unity feedback control system with open-loop transfer function

$$G(s)=\frac{K(s+1)}{s(s+2)(s+3)}$$

Answers: **135.** (b), **136.** (d), **137.** (d), **138.** (b), **139.** (d), **140.** (c), **141.** (d), **142.** (c), **143.** (a), **144.** (d), **145.** (b), **146.** (b), **147.** (a), **148.** (a), **149.** (a), **150.** (b), **151.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

The steady-state error of the system due to a unit step input is
(a) zero. (b) K/6 (c) 6/K (d) infinite.
[U.P.S.C. I.E.S. E.E.-I, 2010]

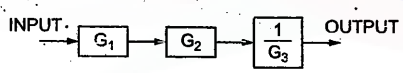
152. An open loop system represented by the transfer function $G(s) = \frac{(s-1)}{(s+2)(s+3)}$ is
(a) stable and of the minimum phase type.
(b) stable and of the non-minimum phase type.
(c) unstable and of the minimum phase type.
(d) unstable and of the non-minimum phase type.
[GATE E.E. 2011]

153. The open loop transfer function $G(s)$ of a unity feedback control system is given as,

$$G(s) = \frac{k\left(s+\frac{2}{3}\right)}{s^2(s+2)}$$

From the root locus, it can be inferred that when k tends to positive infinity,
(a) three roots with nearly equal real parts exist on the left half of the s-plane.
(b) one real root is found on the right half of the s-plane.
(c) the root loci cross the $j\omega$ axis for a finite value of k; $k \neq 0$.
(d) three real roots are found on the right half of the s-plane.
[GATE E.E. 2011]

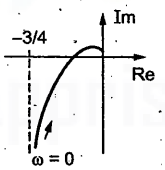
154. The measurement system shown in the figure uses three subsystems in cascade whose gains are specified as G_1, G_2 and $\frac{1}{G_3}$. The relative small errors associated with each respective subsystem G_1, G_2 and G_3 are ε_1, ε_2 and ε_3. The error associated with the output is



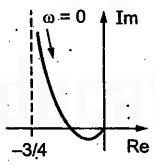
(a) $\varepsilon_1 + \varepsilon_2 + \frac{1}{\varepsilon_3}$ (b) $\frac{\varepsilon_1 \cdot \varepsilon_2}{\varepsilon_3}$
(c) $\varepsilon_1 + \varepsilon_2 - \varepsilon_3$ (d) $\varepsilon_1 + \varepsilon_2 + \varepsilon_3$ [GATE E.E. 2009]

155. The frequency response of $G(s) = 1/[s(s+1)(s+2)]$ plotted in the complex $G(j\omega)$ plane (for $0 < \omega < \infty$) is

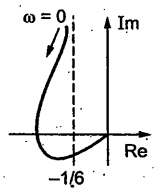
(a)



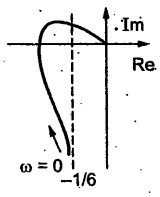
(b)



(c)



(d)



[GATE E.E. 2010]

156. A signal is processed by a causal filter with transfer function $G(s)$. For a distortion free output signal waveform, $G(s)$ must
(a) provide zero phase shift for all frequency.
(b) provide constant phase shift for all frequency.
(c) provide linear phase shift that is proportional to frequency.
(d) provide a phase shift that is inversely proportional to frequency.
[GATE E.E. 2007]

157. $G(z) = \alpha z^{-1} + \beta z^{-3}$ is a low-pass digital filter with a phase characteristics same as that of the above question if
(a) $\alpha = \beta$ (b) $\alpha = -\beta$
(c) $\alpha = \beta^{(1/3)}$ (d) $\alpha = \beta^{-(1/3)}$
[GATE E.E. 2007]

158. What is the initial slope of Bode magnitude plot of a type-2 system?
(a) – 20 db/decade. (b) + 20 db/decade.
(c) – 40 db/decade. (d) + 40 db/decade.
[U.P.S.C. I.E.S. E.E.-I, 2009]

159. What is the slope of the line due to $\frac{1}{j\omega}$ factor in magnitude part of Bode plot?
(a) – 20 db per octave. (b) – 10 db per octave.
(c) – 6 db per octave. (d) –2 db per octave.
[U.P.S.C. I.E.S. E.E.-I, 2009]

160. The transfer function of a linear control system is given by

$$G(s) = \frac{100(s+15)}{s(s+4)(s+10)}$$

In its Bode diagram, the value of gain for $\omega = 0.1$ rad/sec is
(a) 20 db (b) 40 db (c) 60 db (d) 80 db
[U.P.S.C. I.E.S. E.E.-I, 2011]

161. What will be the type of the system, if the steady state performance of control system yields a non-zero finite value of the velocity error constant?
(a) type-0 (b) type-1
(c) type-2 (d) type-3
[U.P.S.C. I.E.S. E.E.-I, 2009]

162. What is the error in magnitude at the corner frequency for an asymptotic Bode magnitude plot for the term $(1+s\tau)^{\pm n}$?
(a) $\pm 20n$ db. (b) $\pm 6n$ db.
(c) $\pm 3n$ db (d) $\pm 1n$ db.
[U.P.S.C. I.E.S. E.E.-I, 2009]

163. The frequency response of a linear system $G(j\omega)$ is provided in the tabular form below

$\lvert G(j\omega)\rvert$	1.3	1.2	1.0	0.8	0.5	0.3
$\angle G(j\omega)$	–130°	–140°	–150°	–160°	–180°	–200°

The *gain margin* and *phase margin* of the system are
(a) 6 dB and 30° (b) 6 dB and – 30°
(c) – 6 dB and 30° (d) – 6 dB and – 30°
[GATE E.E. 2011]

164. The Z-transform of X(K) is given by

$$X(Z) = \frac{(1-e^{-T})Z^{-1}}{(1-Z^{-1})(1-e^{-T}Z^{-1})}$$

The initial value $x(0)$ is
(a) zero (b) 1 (c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 2010]

165. Consider the following:
1. Phase margin 2. Gain margin
3. Maximum overshoot 4. Bandwidth
Which of the above are the frequency domain specifications required to design a control system?

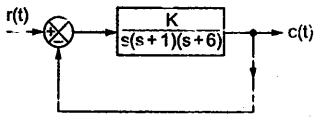
Answers: **152.** (b), **153.** (a), **154.** (d), **155.** (a), **156.** (c), **157.** (a), **158.** (c), **159.** (c), **160.** (c), **161.** (b), **162.** (c), **163.** (a), **164.** (a), **165.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 1 and 2 only. (b) 1 and 3 only.
(c) 1, 3 and 4. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2009]

166. The feedback system shown in figure is stable for all values of K given by



(a) $K > 0$
(b) $K < 0$
(c) $0 < K < 42$ (d) $0 < K < 60$
[U.P.S.C. I.E.S. E.E.-I, 2010]

167. Using Routh's criterion, the number of roots in the right half S-plane for the characteristic equation:

$$s^4 + 2s^3 + 2s^2 + 3s + 6 = 0 \text{ is}$$

(a) one. (b) two. (c) three. (d) four.
[U.P.S.C. I.E.S. E.E.-I, 2010]

168. Which one of the following describes correctly the effect of adding a zero to the system?
(a) System becomes oscillatory.
(b) Root locus shifts toward imaginary axis.
(c) Relative stability of the system increases.
(d) Operating range of K for stable operation decreases.
[U.P.S.C. I.E.S. E.E.-I, 2009]

169. A transfer function has a zero at $s = -1$ and poles at $s = -1 \pm j1$. The multiplier being unity, if the input is unit step function, the steady state response is given by

(a) $0.5 \angle 0°$ (b) $1.0 \angle 0°$ (c) $2.0 \angle 0°$ (d) $2.0 \angle 90°$
[U.P.S.C. I.E.S. E.E.-I, 2010]

170. Consider the following statements in connection with the closed-loop poles of feedback control system:
1. Poles on $j\omega$-axis will make the output amplitude neither decaying nor growing in time.
2. Dominant closed-loop poles occur in the form of a complex conjugate pair.
3. The gain of a higher order system is adjusted so that there will exist a pair of complex conjugate closed-loop poles on $j\omega$-axis.
4. The presence of complex conjugate closed-loop poles reduces the effects of such non-linearities as dead zones, backlash and coulomb friction.

Which of the above statements is/are correct?
(a) 2 only. (b) 2, 3 and 4 only.
(c) 1, 2 and 4 only. (d) 1, 2, 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

171. Root locus of $s(s + 2) + K(s + 4) = 0$ is a circle. What are the co-ordinates of the centre of this circle?
(a) $-2, 0$ (b) $-3, 0$ (c) $-4, 0$ (d) $-5, 0$
[U.P.S.C. I.E.S. E.E.-I, 2009]

172. The breakaway point in the root loci plot for the loop transfer function $G(s)H(s) = \dfrac{K}{s(s+3)^2}$ is
(a) -2.5 (b) -2.0 (c) -1.0 (d) -0.5
[U.P.S.C. I.E.S. E.E.-I, 2011]

173. The characteristic equation of a feedback control system is given by:

$$s^3 + 6s^2 + 9s + 4 = 0$$

What is the number of roots in the left-half of the s-plane?
(a) Three. (b) Two. (c) One. (d) Zero.
[U.P.S.C. I.E.S. E.E.-I, 2009]

174. The characteristic equation of a closed-loop system is $s(s + 1)(s + 3) + k(s + 2) = 0$, $k > 0$. Which of the following statements is true?
(a) Its roots are always real.
(b) It cannot have a breakaway point in the range $-1 < \text{Re}[s] < 0$.
(c) Two of its roots tend to infinity along the asymptotes $\text{Re}[s] = -1$.
(d) It may have complex roots in the right half plane.
[GATE E.E. 2010]

175. Consider the following statements:
1. A system is said to be stable if its output is bounded for any input.
2. A system is stable if all the roots of the characteristic equation lie in the left half of the s-plane.
3. A system is stable if all the roots of the characteristic equation have negative real parts.
4. A second order system is always stable for finite positive values of open loop gain.

Which of the above statements is/are correct?
(a) 2, 3 and 4. (b) 1 only.
(c) 2 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-I, 2009]

176. Consider the following statements in connection with pole location:
1. A distinct pole always lies on the real axis.
2. A dominant pole has a large time constant.

Which of the above statements is/are correct?
(a) Both 1 and 2. (b) Neither 1 nor 2.
(c) 1 only. (d) 2 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

177. Consider the following statements regarding root loci plot:
1. When gain K is zero, the roots coincide with the poles.
2. When K is increased, the roots move away from the poles.
3. A root locus diagram is always symmetric about the imaginary axis.
4. The number of branches terminates on infinity is open loop poles plus zeros.

Which of these statements are correct?
(a) 1 and 2. (b) 2 and 3.
(c) 3 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2011]

178. Which one of the following statements is correct for the open-loop transfer function?

$$G(s) = \frac{K(s+3)}{s(s-1)} \text{ for } K > 1$$

(a) Open-loop system is stable but the closed-loop system is unstable.
(b) Open-loop system is unstable but the closed-loop system is stable.
(c) Both open-loop and closed-loop systems are unstable.
(d) Both open-loop and closed-loop systems are stable.
[U.P.S.C. I.E.S. E.E.-I, 2009]

179. The feedback control system represented by the open loop transfer function

$$G(s)\,H(s) = \frac{10(s+2)}{[(s+1)(s+3)(s-5)]} \text{ is}$$

(a) unstable. (b) stable.
(c) marginally stable. (d) insufficient data.
[U.P.S.C. I.E.S. E.E.-I, 2010]

180. The open loop transfer function of a closed loop control system is given as:

Answers: **166.** (c), **167.** (b), **168.** (c), **169.** (a), **170.** (c), **171.** (c), **172.** (c), **173.** (a), **174.** (c), **175.** (c), **176.** (a), **177.** (a), **178.** (b), **179.** (a), **180.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

$$G(s)\,H(s) = \frac{K(s+2)}{s(s+1)(s+4)^2}$$

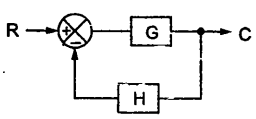
What are the number of asymptotes and the centroid of the asymptotes of the root-ioci of closed loop system?

(a) $-3; \left(\frac{7}{3}, 0\right)$ (b) $-2; (2, 0)$

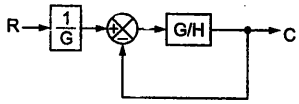
(c) $3; \left(\frac{-7}{3}, 0\right)$ (d) $2; (-2, 0)$

[U.P.S.C. I.E.S. E.E.-I, 2009]

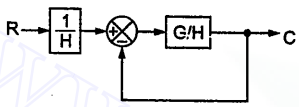
181. The adjoining feedback control system has to be reduced to equivalent unity feedback system. Which one of the following is equivalent?



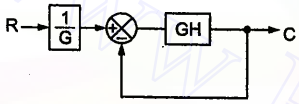
(a)



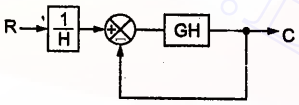
(b)



(c)

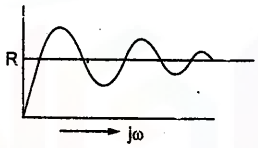


(d)

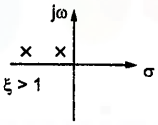


[U.P.S.C. I.E.S. E.E.-I, 2009]

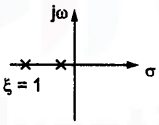
182. For the response shown below, the correct root locations in the s-plane is



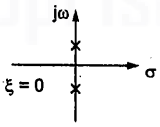
(a)



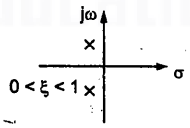
(b)



(a)



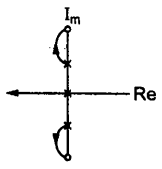
(b)



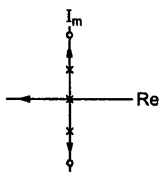
[U.P.S.C. I.E.S. E.E.-I, 2011]

183. Loop transfer function of unity feedback system is $G(s) = \frac{K(s^2+64)}{s(s^2+16)}$. The correct root locus diagram for the system is

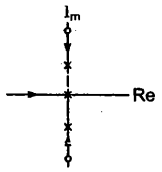
(a)



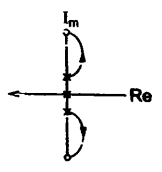
(b)



(c)



(d)



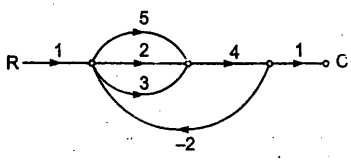
[U.P.S.C. I.E.S. E.E.-I, 2011]

184. The open-loop transfer function of a system has one pole in the right half of s-plane. If the system is to be closed loop stable, then $(-1 + j0)$ point should have how many encirclements in the GH-plane?

(a) -2 (b) -1 (c) $+1$ (d) $+2$

[U.P.S.C. I.E.S. E.E.-I, 2009]

185.



Consider the following statements with regards to signal flow graph:

1. The number of loops are 3.
2. The number of loops are 2.
3. The number of forward paths are 3.
4. $\frac{C}{R}$ ratio is $\frac{40}{81}$.
5. $\frac{C}{R}$ ratio is $\frac{28}{81}$.

Which of these statements are correct?

(a) 1, 3, 4 and 5 (b) 1, 3 and 4

(c) 2, 3 and 4 (d) 3, 4 and 5

[U.P.S.C. I.E.S. E.E.-I, 2011]

186. Consider the following statements:

1. Bandwidth is increased.
2. Peak overshoot in the step response is increased.

Which of these are the effects of using lead compensation in a feedback system?

(a) 1 only. (b) 2 only.

(c) Both 1 and 2. (d) Neither 1 nor 2.

[U.P.S.C. I.E.S. E.E.-I, 2009]

187. The transfer function of a phase-lead compensator is given by:

$$G(s) = \frac{1+3Ts}{1+Ts}$$

where $T > 0$.

What is the maximum shift provided by such a compensator?

(a) 90° (b) 60° (c) 45° (d) 30°

[U.P.S.C. I.E.S. E.E.-I, 2009, 2010]

188. Consider the following statements:

1. A phase lead network provides a positive phase angle over the frequency range of interest.
2. Armature controlled dc servomotor is inherently a closed-loop system.
3. Phase lag network provides significant amplification over the frequency range of interest.
4. Transfer functions with zeroes in the right half of s-plane is a non-minimum system.

Which of the above statements is/are correct?

(a) 3 only. (b) 1 and 2 only.

(c) 1, 2 and 4. (d) 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2009]

Answers: **181.** (d), **182.** (d), **183.** (d), **184.** (c), **185.** (b), **186.** (a), **187.** (d), **188.** (c),

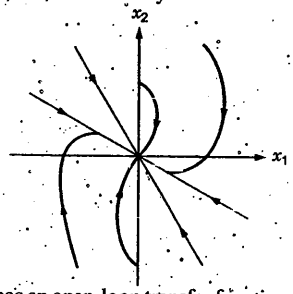
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

189. Consider the following statements with reference to the phase plane:
1. They are general and applicable to a system of any order.
2. Steady state accuracy and existence of limit cycle can be predicted.
3. Amplitude and frequency of limit cycle if exists can be evaluated.
4. Can be applied to discontinuous time system.

Which of the above statements are correct?
(a) 1, 2, 3 and 4. (b) 2 and 3 only.
(c) 3 and 4 only. (d) 2, 3 and 4 only.
[U.P.S.C. I.E.S. E.E.-I, 2010]

190. The figure shown is a phase-plane representation of trajectories. The singular point shown is a



(a) unstable node.
(b) saddle point.
(c) stable focus.
(d) stable node.
[U.P.S.C. I.E.S. E.E.-I, 2011]

191. A unity feedback control system has an open-loop transfer function $G(s) = \frac{K}{s(s^2+7s+12)}$. The gain K for which $s = -1 + j1$ will lie on the root locus of this system is
(a) 4 (b) 5.5 (c) 6.5 (d) 10
[GATE E.C.E. 2007]

192. The closed-loop transfer function of a system is ;
$$\frac{C(s)}{R(s)} = \frac{10(s+1)}{(s+2)(s+5)}$$
Which one of the following statements is *not* true ?
(a) the system is non-oscillatory.
(b) the unit step response exhibits overshoot due to the presence of a zero.
(c) the closed-loop frequency response of this system exhibits a resonant peak.
(d) the damping ratio of the closed-loop poles is less than unity.
[A.M.I.E. Sec B. Control Systems Winter 2006]

193. Consider the following statements :
For the first order transient systems, the time constant is
1. a specification of transient response.
2. reciprocal of real-axis pole location.
3. an indication of accuracy of response.
4. an indication of speed of the response.

Which of the statements given above is/are correct ?
(a) Only 1 and 2. (b) Only 1, 2 and 4.
(c) Only 3 and 4. (d) 1, 2, 3 and 4.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

194. In the time domain analysis of feedback control systems which one pair of the following is not correctly matched ?

(a)	Underdamped	: Minimizes the effect of nonlinearities
(b)	Dominant poles	: Transients die out more rapidly
(c)	Far away pole to the left half of s-plane	: Transients die out more rapidly
(d)	A pole near to the left of dominant complex poles and near a zero	: Magnitude of transient is small

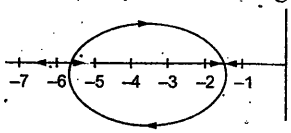
[U.P.S.C. I.E.S. E.E.-I, 2008]

195. The open loop transfer function of a feedback system has m poles and n zeros ($m > n$).
Consider the following statements
1. The number of separate root loci is m.
2. The number of separate root loci is n.
3. The number of root loci approaching infinity is $(m-n)$.
4. The number of root loci approaching infinity is $(m+n)$.

Which of the statements given above are correct ?
(a) 1 and 4 (b) 1 and 3 (c) 2 and 3 (d) 2 and 4
[U.P.S.C. I.E.S. E.E.-I, 2005]

196. The open-loop transfer function of a unity feedback control system is given by
$$G(s) = \frac{K(s+2)}{s(s^2+2s+2)}$$
The centroid and angles of root locus asymptotes are respectively
(a) zero and +90°, –90° (b) –2/3 and +60°, –60°
(c) zero and +120°, –120° (d) –2/3 and –90°, +90°
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

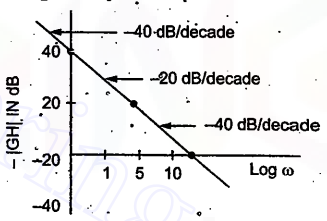
197. What is the open-loop transfer function for a unity feedback having root locus shown in the figure ?



(a) $\frac{k(s+5)}{(s+1)(s+2)}$
(b) $\frac{k(s+1)}{(s+5)(s+6)}$
(c) $\frac{k}{s(s+1)(s+5)}$
(d) $\frac{k(s+2)}{(s+1)(s+5)}$
[U.P.S.C. I.E.S. E.E.-I, 2006]

198. A unity feedback control system has a forward loop transfer function as $\frac{e^{-Ts}}{[s(s+1)]}$. Its phase value will be zero at frequency ω_1.
Which one of the following equations should be satisfied by ω_1 ?
(a) $\omega_1 = \cot(T\omega_1)$. (b) $\omega_1 = \tan(T\omega_1)$.
(c) $T\omega_1 = \cot(\omega_1)$. (d) $T\omega_1 = \tan(\omega_1)$.
[U.P.S.C. I.E.S. E.E.-I, 2004]

199. The log magnitude curve of a minimum phase system is shown in the figure. Its transfer function is given by



(a) $\frac{100(1+s)}{s^2(1+5s)}$
(b) $\frac{100(1+s)}{s^2(1+0.2s)}$
(c) $\frac{(1+s)}{s^2(1+5s)}$
(d) $\frac{(1+s)}{s^2(1+0.2s)}$
[A.M.I.E. Sec B. Control Systems Summer 2006]

200. Consider the following statements with reference to the root loci of the characteristic equation of unity feedback control system with an open loop transfer function of $G(s) = \frac{K(s+1)(s+3)(s+5)}{s(s+2)}$
1. Each locus starts at an open loop pole and ends either at an open loop zero or infinity.
2. Each locus starts at an open loop pole or infinity and ends at an open loop zero.
3. There are three separate root loci.
4. There are five separate root loci.

Which of these statements are correct ?
(a) 2 and 3 (b) 2 and 4 (c) 1 and 3 (d) 1 and 4
[U.P.S.C. I.E.S. E.E.-I, 2003]

Answers: **189.** (b), **190.** (d), **191.** (d), **192.** (d), **193.** (b), **194.** (b), **195.** (b), **196.** (a), **197.** (a), **198.** (a), **199.** (d), **200.** (c),

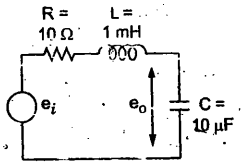
Data for Q. 201 and Q. 202 are given below. Solve the problems and choose the correct answers.

R-L-C circuit is shown in figure.



201. For a step-input e_i, the overshoot in the output e_0 will be
(a) 0, since the system is not underdamped
(b) 5% (c) 16% (d) 48% [GATE E.E. 2007]

202. If the above step response is to be observed on a non-storage CRO, then it would be best to have the e_i as a
(a) step function. (b) square wave of 50 Hz.
(c) square wave of 300 Hz. (d) square wave of 2.0 kHz.
[GATE E.E. 2007]

203. The transfer function of a linear-time invariant system is given as $\frac{1}{s+1}$. What is the steady-state value of the unit-impulse response?
(a) zero (b) 1 (c) 2 (d) infinite.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

204. How can the steady-state error in a system be reduced ?
(a) By decreasing the type of system.
(b) By increasing system gain.
(c) By decreasing the static error constant.
(d) By increasing the input. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

205. To reduce steady state error of the control system, increase its
(a) time constant. (b) gain constant.
(c) damping frequency. (d) All of the above.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

206. Which one of the following statements regarding steady state errors in control system is not correct ?
(a) Steady state error analysis relies on the use of initial value theorem.
(b) Steady state error is a measure of system accuracy when a specific type of input is applied to a control system.
(c) The error constants do not give information regarding steady state error when inputs are other than step, ramp and parabolic.
(d) Steady state error does not provide information on how the error varies with time. [U.P.S.C. I.E.S. E.E.-I, 2008]

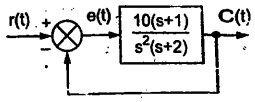
207. Which one of the following statements is NOT correct ?
(a) With the introduction of integral control, the steady state error increases.
(b) The generalized error coefficients provide a simple way of determining the nature of the response of a feedback control to any arbitrary input.
(c) The generalized error coefficients lead to calculation of complete steady state response without actually solving the system differential equation.
(d) For a type-1 system the steady state error for acceleration input is infinite. [U.P.S.C. I.E.S. E.E.-I, 2003]

208. For type 2 system, the steady-state error due to ramp input is equal to
(a) zero. (b) finite constant.
(c) infinite. (d) indeterminate.
[U.P.S.C. I.E.S. E.E.-I, 2008]

209. A unity feedback system has open-loop transfer function G(s). The steady-state error is zero for
(a) step input and type-1 G(s).
(b) ramp input and type-1 G(s).
(c) step input and type-0 G(s).
(d) ramp input and type-0 G(s). [GATE E.E. 2000]

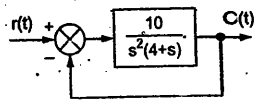
210. For the unity feedback system with $G(s) = \frac{10}{s^2(s+4)}$, what is the steady state error resulting form an input $10t$?
(a) 10 (b) 4 (c) zero (d) 1
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

211. In the system shown in the given figure, $r(t) = 1 + 2t$ $(t \geq 0)$. The steady-state value of the error $e(t)$ is equal to



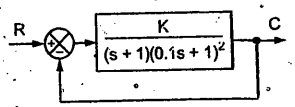
(a) zero (b) 2/10 (c) 10/2 (d) infinity
[U.P.S.C. I.E.S. E.E.-I, 2001]

212. The steady-state error resulting from input $r(t) = 2 + 3t + 4t^2$ for given system is



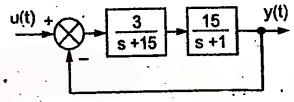
(a) 2.4 (b) 4.0
(c) zero (d) 3.2
[U.P.S.C. I.E.S. E.E.-I, 2002]

213. The system shown in figure has unit step input.
In order that the steady state error is 0.1, the value of K required should be



(a) 0.1 (b) 0.9 (c) 1.0 (d) 9.0
[A.M.I.E. Sec B. Control Systems Summer 2006]

214. The block diagram shown in figure gives a unity feedback closed loop control system. The steady state error in the response of the above system to unit step input is

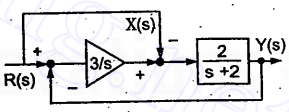


(a) 25% (b) 0.75% (c) 6% (d) 33%
[GATE E.E. 2003]

215. A unity feedback control system has a forward path transfer function $G(s) = \frac{10(1+4s)}{s^2(1+s)}$. If the system is subjected to an input $r(t) = 1 + t + t^2/2 (t \geq 0)$, the steady-state error of the system will be
(a) zero (b) 0.1 (c) 10 (d) infinity
[U.P.S.C. I.E.S. E.E.-I, 2000]

216. A particular control system yielded a steady-state error of 0.20 for unit step input. A unit integrator is cascaded to this system and unit ramp input is applied to the modified system. What is the value of steady-state error for this modified system ?
(a) 0.10 (b) 0.15 (c) 0.20 (d) 0.25
[U.P.S.C. I.E.S. E.E.-I, 2006]

217. When subjected to a unit step input, the closed loop control system shown in the figure will have a steady-state error of



(a) –1.0 (b) –0.5 (c) 0 (d) 0.5
[GATE E.E. 2005]

218. Which one of the following equations gives the steady-state error for a unity feedback system excited by $u_s(t) + tu_s(t) + [(t^2u_s(t)/2]$?

(a) $\frac{1}{(2+K_p)} + \frac{1}{K_V} + \frac{1}{K_a}$ (b) $\frac{1}{(1+K_p)} + \frac{1}{K_V} + \frac{2}{K_a}$

(c) $\frac{1}{K_p} + \frac{1}{K_V} + \frac{1}{K_a}$ (d) $\frac{1}{(1+K_p)} + \frac{1}{K_V} + \frac{1}{K_a}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

219. Consider the following statements regarding advantages of using the generalized error coefficients :

Answers: **201.** (c), **202.** (c), **203.** (a), **204.** (b), **205.** (d), **206.** (a), **207.** (a), **208.** (a), **209.** (a), **210.** (c), **211.** (a), **212.** (d), **213.** (a), **214.** (a), **215.** (d), **216.** (d), **217.** (c), **218.** (d), **219.** (b),

Downloaded From : www.EasyEngineering.net

1. The generalised error coefficients provide a simple way of determining the nature of the response of a feedback control system to almost any arbitrary input.
2. The generalised error coefficients lead to the calculation of the steady-state response without actually solving the system differential equation.
3. The generalised error coefficients establish relationships among the various types of inputs.

Which of the above statements are correct ?
(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2004]

220. The steady-state error coefficients for a system are $k_p = \infty$, $k_v = 0$ finite constant, $k_a = 0$. What is the type of system ?
(a) 0 (b) 1 (c) 2 (d) 8
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

221. For a unity feedback control system with forward path transfer function $G(s) = \frac{K}{s+5}$, what is error transfer function $w_e(s)$ used for determination of error coefficients ?
(a) $\frac{K}{s+5}$. (b) $\frac{K}{s+K+5}$.
(c) $\frac{s+5}{s+K+5}$. (d) $\frac{K(s+5)}{s+K+5}$.
[U.P.S.C. I.E.S. E.E.-I, 2007]

222. Which one of the following is the steady state error of a control system with step error, ramp error and parabolic error constants k_p, k_v and k_a, respectively for the input $(1 - t^2)\,3u(t)$?
(a) $\frac{3}{1+k_p} - \frac{3}{2k_a}$. (b) $\frac{3}{1+k_p} + \frac{6}{k_a}$.
(c) $\frac{3}{1+k_p} - \frac{3}{k_a}$. (d) $\frac{3}{1+k_p} - \frac{6}{k_a}$.
[U.P.S.C. I.E.S. E.E.-I, 2005]

223. The measurement system shown in the figure uses three subsystems in cascade whose gains are specified as G_1, G_2 and $1/G_3$. The relative small errors associated with each respective subsystem G_1, G_2 and G_3 are ε_1, ε_2 and ε_3. The error associated with the output is :

(a) $\varepsilon_1 + \varepsilon_2 + \frac{1}{\varepsilon_3}$. (b) $\frac{\varepsilon_1 \varepsilon_2}{\varepsilon_3}$.
(c) $\varepsilon_1 + \varepsilon_2 - \varepsilon_3$. (d) $\varepsilon_1 + \varepsilon_2 + \varepsilon_3$. [GATE E.E. 2009]

224. The open-loop transfer function for unity feedback system is given by $\frac{5(1+0.1s)}{s(1+5s)(1+20s)}$
Consider the following statements :
1. The steady-state error for a step input of magnitude 10 is equal to zero.
2. The steady-state error for a ramp input of magnitude 10 is 2.
3. The steady-state error for an acceleration input of magnitude 10 is infinite.

Which of the statements given above are correct ?
(a) Only 1 and 2. (b) Only 1 and 3.
(c) Only 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

225. To reduce the contribution of the large initial error to the value of the performance index (PI) of a feedback control system, as well as to place an emphasis on errors occurring later in the response, the following PI may be used

(a) $\int_0^T e^2(t)\,dt$ (b) $\int_0^T |e^2(t)|\,dt$
(c) $\int_0^T t\,|e(t)|\,dt$ (d) $\int_0^T t\,|e^2(t)|\,dt$

where $e(t)$ is the error signal and T is a finite time which makes the integral approach a steady-state value.
[A.M.I.E. Sec B. Control Systems Winter 2006]

226. For the equation, $s^3 - 4s^2 + s + 6 = 0$ the number of roots in the left half of s-plane will be
(a) zero. (b) one. (c) two. (d) three.
[GATE E.E. 2004]

227. What is the number of root-locus segments which do not terminate on zeros ?
(a) The number of poles.
(b) The number of zeros.
(c) The difference between the number of poles and the number of zeros.
(d) The sum of the number of poles and the number of zeros.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

228. How many roots with positive real parts do the equation $s^3 + s^2 - s + 1 = 0$ have ?
(a) zero (b) 1 (c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-II, 2009]

229. Consider the equation $s^2 + 2s + 2 + k(s + 2) = 0$. Where do the roots of this equation break on the root loci plot ?
(a) –3.414 (b) –2.414 (c) –1.414 (d) –0.414
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

230. For a given unity feedback system with $G(s) = \frac{k(s+3)}{s(s+1)(s+2)(s+5)}$, what is the real axis intercept for root locus asymptotes ?
(a) 2/3 (b) 1/4 (c) –5/3 (d) –3/2
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

231. Which one of the following open-loop transfer functions has root locus parallel to imaginary axis ?
(a) $K/(s + 1)$ (b) $K(s + 1)/(s + 2)^2$
(c) $K/(s + 2)^2$ (d) $K(s + 2)/(s + 1)^2$
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

232. The first two rows of Routh's tabulation of a third order equation are as follows.

s^3	2	2
S^2	4	4

This means there are
(a) two roots at $s = \pm j$ and one root in right half s-plane.
(b) two roots at $s = \pm j2$ and one root in left half s-plane.
(c) two roots at $s = \pm j2$ and one root in right half s-plane.
(d) two roots at $s = \pm j$ and one root in left half s-plane.
[GATE E.E. 2009]

233. For a second-order system, ξ is equal to zero in the transfer function given by $\frac{\omega_n^2}{s^2 + 2\xi\omega_n s + \omega_n^2}$ which one of the following is correct?
(a) Closed-loop poles are complex conjugate with negative real part.
(b) Closed-loop poles are purely imaginary.
(c) Closed-loop poles are real, equal and negative.
(d) Closed-loop poles are real, unequal and negative.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

Answers: **220.** (b), **221.** (c), **222.** (d), **223.** (c), **224.** (d), **225.** (d), **226.** (b), **227.** (c), **228.** (c), **229.** (a), **230.** (c), **231.** (c), **232.** (d), **233.** (b),

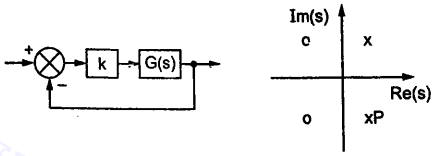
234. A control system is defined in S-domain. Following points regarding the poles of the transfer function obtained from the characteristic equation were noted :
1. Poles with positive real part denote stable system.
2. Complex poles always occur in pairs.
3. A pole $S = -\sigma(\sigma > 0)$ means that the transient response contains exponential decay.

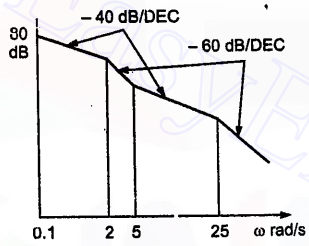
Which of the above are correct ?
(a) 1 and 2. (b) 1 and 3. (c) 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2004]

235. The feedback configuration and the pole-zero locations of $G(s) = \frac{s^2 - 2s + 2}{s^2 + 2s + 2}$ are shown below. The root locus for Negative values of k, i.e. for $-\infty < k < 0$, has breakaway/break-in points and angle of departure at pole P (with respect to the positive real axis) equal to



(a) $\pm\sqrt{2}$ and 0°. (b) $\pm\sqrt{2}$ and 45°.
(c) $\pm\sqrt{3}$ and 0°. (d) $\pm\sqrt{3}$ and 45°.
[GATE E.C.E. 2009]

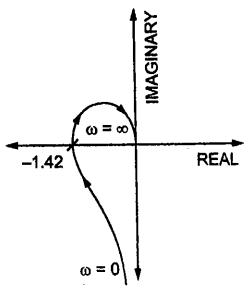
236. The asymptotic approximation of the log-magnitude vs frequency plot of a system containing only real poles and zeros is shown. Its transfer function is



(a) $\frac{10(s+5)}{s(s+2)(s+25)}$
(b) $\frac{1000(s+5)}{s^2(s+2)(s+25)}$
(c) $\frac{100(s+5)}{s(s+2)(s+25)}$
(d) $\frac{80(s+5)}{s^2(s+2)(s+25)}$
[GATE E.E. 2009]

237. For arbitrary pole placement, the following combination is necessary
(a) output feedback and controllability.
(b) state feedback and controllability.
(c) state feedback and stability
(d) output feedback and observability.
[A.M.I.E. Sec B. Control Systems Winter 2005]

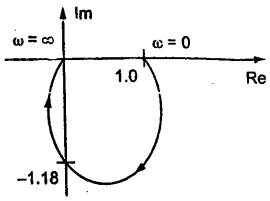
238. The polar plot of an open loop stable system is shown in figure. The closed loop system is
(a) always stable.
(b) marginally stable.
(c) unstable with one pole on the RH s-plane.
(d) unstable with two poles on the RH-s-plane. [GATE E.E. 2009]



239. Identify the correct root locus from the figures give below referring to poles and zeros at $\pm j8$ and $\pm j10$ respectively of $G(s)\,H(s)$ of a single-loop control system.

(a) (b) (c) (d)
[U.P.S.C. I.E.S. E.E.-I, 2002]

240. The polar plot of frequency response of a linear underdamped second order system is shown in the figure. What is the transfer function of this system ?



(a) $\frac{8}{s^2 + 10s + 1}$.
(b) $\frac{8}{s^2 + 8.48s + 10}$.
(c) $\frac{100}{s^2 + 8.48s + 100}$.
(d) $\frac{100}{s^2 + 10s + 8.48}$.
[U.P.S.C. I.E.S. E.E.-I, 2007]

241. The Bode diagram approach is the most commonly used method for the analysis and synthesis of
(a) nonlinear feedback control systems only.
(b) linear feedback control systems only.
(c) open loop system only.
(d) all of the above.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

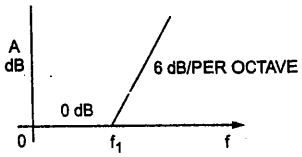
242. Consider the following statements :
1. For a linear discrete system to be stable, all the roots of the characteristic equation $1 + GH(z) = 0$ should be inside the unit circle.
2. The Bode diagram of sampled data system can be constructed using bilinear transformation.
3. The root locus technique can be used for sampled data system without requiring any modification.

Which of the statements given above is/are correct ?
(a) Only 1. (b) Only 2 and 3.
(c) Only 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

243. Consider the following statements with regard to the bandwidth of a closed-loop system.
1. In systems where the low frequency magnitude is 0 dB on the Bode diagram, the bandwidth is measured at the – 3 dB frequency.
2. The bandwidth of the closed loop control system is a measurement of the range of fidelity of response of the system.
3. The speed of response to a step input is proportional to the bandwidth.
4. The system with the larger bandwidth provides slower step response and lower fidelity ramp response.

Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) 1, 2 and 4.
(c) 1, 3 and 4. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2005]

244. The function corresponding to the Bode plot of figure is



(a) $A = jf/f_1$
(b) $A = 1/(1 - jf_1/f)$
(c) $A = 1/(1 + jf_1/f)$
(d) $A = 1 + jf/f_1$
[U.P.S.C. I.E.S. E.E.-I, 1999]

Answers: **234.** (c), **235.** (b), **236.** (b), **237.** (b), **238.** (d), **239.** (a), **240.** (c), **241.** (d), **242.** (c), **243.** (a), **244.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

245. The initial slope of Bode plot for a transfer function having no poles at the origin is
(a) –10 dB/decade. (b) +10 dB/decade.
(c) –20 dB/decade. (d) 0 dB/decade.
[A.M.I.E. Sec B. Control Systems Winter 2005]

246. A system has fourteen poles and two zeros. The slope of its highest frequency asymptote in its magnitude plot is
(a) –40dB/decade. (b) –240dB/decade.
(c) –280dB/decade. (d) –320dB/decade.
[U.P.S.C. I.E.S. E.E.-I, 2000]

247. Which one of the following statements is correct ?
Nichol's chart is useful for detailed study and analysis of
(a) closed loop frequency response.
(b) open loop frequency response.
(c) close loop and open loop frequency response.
(d) None of these.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

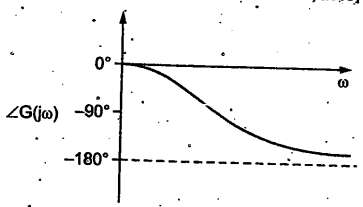
248. Consider the following statements :
The gain crossover point is the point where
1. the magnitude $|G(j\omega)| = 1$ in polar plot.
2. the magnitude curve of $G(j\omega)$ crosses zero dB line in Bode plot.
3. magnitude vs phase plot touches the zero dB loci in Nichol's chart.
Which of the statements given above are correct ?
(a) Only 1 and 2. (b) Only 1 and 3.
(c) Only 2 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

249. Consider the following statements regarding the asympotic Bode plots used for frequency response analysis :
1. The deviation of the actual magnitude response for a zero on real axis is 3 dB at the corner frequency.
2. The phase angle for a pair of complex conjugate poles at undamped frequency depends upon the value of damping ratio.
Which of the statements given above is/are correct
(a) Only 1. (b) Only 2.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

250. Nichol's chart is a plot of
(a) magnitude in decibels vs phase shift on rectangular coordinates.
(b) magnitude in decibels vs log ω.
(c) magnitude vs phase angle in the polar coordinates.
(d) none of the above.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

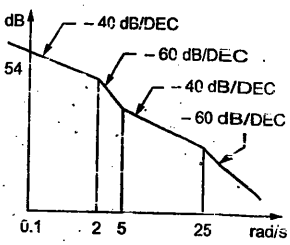
251. The low frequency and high frequency asymptotes of Bode magnitude plot are respectively –60 dB/decade and –40 dB/decade. What is the type of the system?
(a) Type 0 (b) Type I (c) Type II (d) Type III
[U.P.S.C. I.E.S. E.E.-I, 2008]

252. The Bode phase angle plot of a system is shown in the figure. The type of the system is
(a) 0 (b) 1
(c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 2003]



253. Which one of the following is correct ?
The slope of the asymptotic Bode magnitude plot is integer multiple of
(a) ±40dB/decade. (b) ±12dB/octave.
(c) ±6dB/octave. (d) ±3dB/octave.
[U.P.S.C. I.E.S. E.E.-I, 2008]

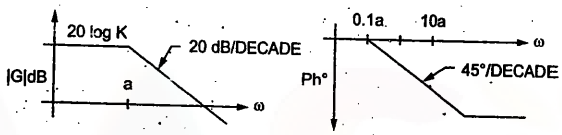
254. The asymptotic approximation of the log-magnitude versus frequency plot of a minimum phase system with real poles and one zero is shown in the figure. Its transfer function is



(a) $\frac{20(s+5)}{s(s+2)(s+25)}$
(b) $\frac{10(s+5)}{(s+2)^2(s+25)}$
(c) $\frac{20(s+5)}{s^2(s+2)(s+25)}$
(d) $\frac{50(s+5)}{s^2(s+2)(s+25)}$
[GATE E.E. 2001]

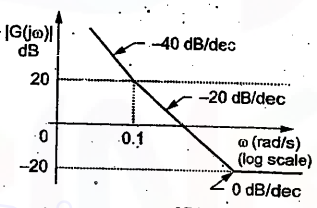
255. At which frequency does the Bode magnitude plot for the function K/s^2 have gain crossover frequency ?
(a) ω = 0 r/s. (b) $\omega = \sqrt{K}$ r/s.
(c) ω = K r/s. (d) $\omega = K^2$ r/s.
[U.P.S.C. I.E.S. E.E.-II, 2007]

256. The asymptotic Bode plot of the transfer function $K/[1 + (S/a)]$ is given in figure. The error in phase angle and dB gain at a frequency of $\omega = 0.5\,a$ are respectively



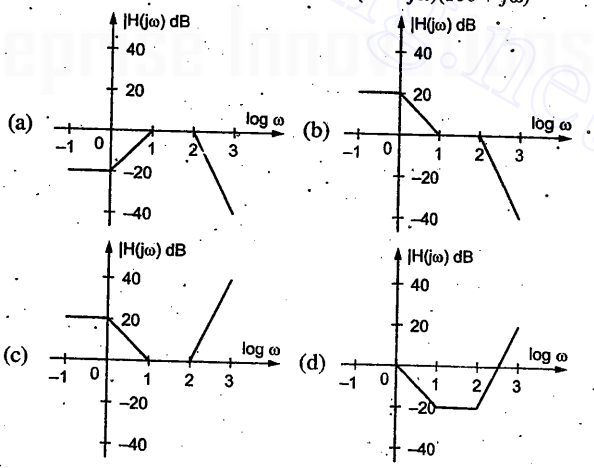
(a) 4.9°, 0.97 dB. (b) 5.7°, 3 dB.
(c) 4.9°, 3 dB. (d) 5.7°, 0.97 dB. [GATE E.E. 2003]

257. The asymptotic Bode magnitude plot of a minimum phase transfer function is shown in the figure :
This transfer function has
(a) three poles and one zero.
(b) two poles and one zero.
(c) two poles and two zeros.
(d) one pole and two zeros.



[GATE E.E. 2008]

258. The Bode magnitude plot of $H(j\omega) = \frac{10^4(1+j\omega)}{(10+j\omega)(100+j\omega)^2}$ is



[GATE E.E. 2006]

Answers: **245.** (d), **246.** (c), **247.** (a), **248.** (d), **249.** (a), **250.** (a), **251.** (d), **252.** (a), **253.** (c), **254.** (d), **255.** (b), **256.** (d), **257.** (c), **258.** (a),

259. Which one of the following is the correct statement ?
A non-minimum phase network is one whose transfer function has
(a) zeros in the left hand plane and poles in the right hand plane.
(b) zeros and poles in the left hand plane.
(c) zeros in the right hand plane and poles in the left hand plane.
(d) arbitrary distribution of zeros and poles in the s-plane.
[U.P.S.C. I.E.S. E.E.-I, 2007]

260. The transfer function $G(s) = \dfrac{10(s-10)}{s(s+2)(s+5)}$ is
(a) unstable. (b) minimum phase.
(c) non-minimum phase. (d) irrational.
[A.M.I.E. Sec B. Control Systems Summer 2007]

261. The transfer function of a system is $(1-s)/(1+s)$. The system is then which one of the following ?
(a) Non-minimum phase system.
(b) Minimum phase system.
(c) Low-pass system. (d) second-order system.
[U.P.S.C. I.E.S. E.E.-I, 2007]

262. The open-loop transfer function of a unity feedback control system is $\dfrac{10}{(s+5)^3}$. The gain margin of the system will be
(a) 20 dB (b) 40 dB (c) 60 dB (d) 80 dB
[U.P.S.C. I.E.S. E.E.-I, 1999]

263. What is the gain margin of a system when the magnitude of the polar plot at phase crossover is 'a' ?
(a) $1/a$ (b) $-a$ (c) zero. (d) a
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

264. The open loop transfer function of a unity feedback system is given by $G(s) = (e^{-0.1s})/s$. The gain margin of this system is
(a) 11.95 dB (b) 17.67 dB (c) 21.33 dB (d) 23.9 dB
[GATE E.E. 2009]

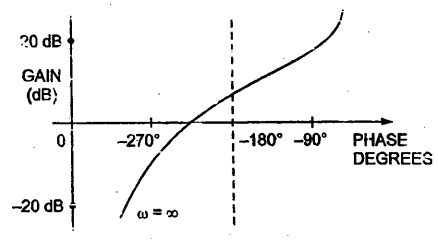
265. The gain margin of a control system having the loop transfer function $G(s)H(s) = \dfrac{\sqrt{2}}{s(s+1)}$ is, in dB
(a) 0 (b) 3 (c) 6 (d) ∞
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

266. The gain margin of a unity feedback control system with the open loop transfer function $G(s) = \dfrac{(s+1)}{s^2}$ is
(a) 0 (b) $\dfrac{1}{\sqrt{2}}$ (c) $\sqrt{2}$ (d) ∞
[GATE E.E. 2005]

267. A minimum phase unity feedback system has a Bode plot with a constant slope of –20 dB/decade for all frequencies. What is the value of the maximum phase margin for the system ?
(a) 0° (b) 90° (c) –90° (d) 180°
[U.P.S.C. I.E.S. E.E.-II, 2004]

268. Which one of the following statements is correct for gain margin and phase margin of two closed-loop systems having loop functions $G(s)H(s)$ and $\exp(-s)G(s)H(s)$?
(a) Both gain and phase margins of the two systems will be identical.
(b) Both gain and phase margins of $G(s)H(s)$ will be more.
(c) Gain margin of the two systems are the same but phase margin of $G(s)H(s)$ will be more.
(d) Phase margins of the two systems are the same but gain margin of $G(s)H(s)$ will be less. **[U.P.S.C. I.E.S. E.T.E.-II, 2007]**

269. The gain phase plot of a linear control system is shown in the figure. What are the gain-margin (GM) and the phase-margin (PM) of the system ?



(a) GM > 0 dB and PM > 0 degree.
(b) GM > 0 dB and PM < 0 degree.
(c) GM < 0 dB and PM > 0 degree.
(d) GM < 0 dB and PM < 0 degree. **[U.P.S.C. I.E.S. E.T.E.-II, 2008]**

270. For a control system having gain margin of –10 dB, the magnitude of $GH(s)$ for 180° phase shift is
(a) 10 dB (b) 1/10 (c) –1/10 dB (d) –10 dB
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

271. The open loop transfer function of a unity feedback control system is given as $G(s) = \dfrac{as+1}{s^2}$. The value of 'a' to give a phase margin of 45° is equal to
(a) 0.141 (b) 0.441 (c) 0.841 (d) 1.141
[GATE E.E. 2004]

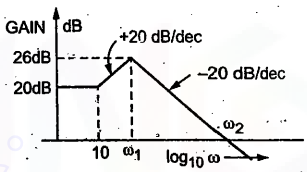
272. Gain crossover frequency is the frequency at which the gain of $L(j\omega)$ is
(a) 10 dB (b) 5 dB (c) 0 dB (d) 100 dB
[A.M.I.E. Sec B. Measurements and Control Winter 2006]

273. Consider two transfer functions

$$G_1(s) = \frac{1}{s^2+as+b} \text{ and } G_2(s) = \frac{s}{s^2+as+b}$$

The 3 dB bandwidths of their frequency responses are, respectively
(a) $\sqrt{a^2-4b}, \sqrt{a^2+4b}$ (b) $\sqrt{a^2+4b}, \sqrt{a^2-4b}$
(c) $\sqrt{a^2-4b}, \sqrt{a^2-4b}$ (d) $\sqrt{a^2+4b}, \sqrt{a^2+4b}$
[GATE E.C.E. 2006]

274. The magnitude-frequency response of a control system is shown in figure. The value of ω_1 and ω_2 are respectively



(a) 10 and 200.
(b) 20 and 200.
(c) 20 and 400.
(d) 100 and 400.
[U.P.S.C. I.E.S. E.E.-I, 1998]

275. The frequency spectrum of a signal lies within the band $f_0 \le f \le f_1$ Hz. To sample the signal properly, the sampling period should be
(a) $> \dfrac{1}{2f_0}$ (b) $< \dfrac{2}{f_0}$ (c) $< \dfrac{1}{2f_1}$ (d) $> \dfrac{2}{f_1}$
[U.P.S.C. I.E.S. E.E.-I, 2000]

276. $4\dfrac{d^2y}{dt^2} + 36y = 36x$

Consider the following statements in connection with the differential equation given above
1. The natural frequency of the response is 6 rad/s.
2. The response is always oscillatory.
3. The percentage overshoot is 10% and damping ratio of the system is 0.6.
4. Both system time constant and settling time are infinite.

Which of the statements given above are correct ?
(a) 1 and 3. (b) 2 and 4.
(c) 1, 2 and 3. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2005]

Answers: **259.** (c), **260.** (b), **261.** (a), **262.** (b), **263.** (a), **264.** (d), **265.** (d), **266.** (a), **267.** (b), **268.** (c), **269.** (d), **270.** (a), **271.** (c), **272.** (c), **273.** (c), **274.** (c), **275.** (c), **276.** (b),

277. If the loop gain K of a negative feedback system having a loop transfer function $K(s+3)/(s+8)^2$ is to be adjusted to induce a sustained oscillation then

(a) The frequency of this oscillation must be $4/\sqrt{3}$ rad/s.
(b) The frequency of this oscillation must be 4 rad/s.
(c) The frequency of this oscillation must be 4 or $4/\sqrt{3}$ rad/s.
(d) such a K does not exist. [GATE E.E. 2007]

278. Consider the following statements :
1. If the input is a sine wave of radian frequency ω, the output in general is non-sinusoidal containing frequencies which are multiple of ω.
2. The jump resonance may occur.
3. The system exhibits self-sustained oscillation of fixed frequency and amplitude.
4. The response to a particular test signal is a guide to the behaviour to other inputs.

Which of the above statements are correct and peculiar to nonlinear system ?
(a) 1, 3 and 4. (b) 2, 3 and 4.
(c) 1, 2 and 3. (d) 1, 2 and 4.
[U.P.S.C. I.E.S. E.E.-I, 2002]

279. Consider the following statements in connection with frequency domain specifications of a control system :
1. Resonant peak and peak overshoot are both functions of the damping ratio ξ only.
2. The resonant frequency $\omega_r = \omega_n$ for $\xi > 0.707$.
3. Higher the resonant peak, higher is the maximum overshoot of the step response.

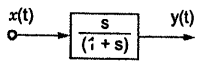
Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2007]

280. The information contained in a signal is preserved in the sampled version if
(a) $\omega_s = \omega_m$ (b) $\omega_s = 0.5\,\omega_m$
(c) $\omega_s = 0.1\,\omega_m$ (d) $\omega_s = 2\omega_m$
where ω_s is the sampling frequency, and ω_m is the maximum frequency contained in the signal. [U.P.S.C. I.E.S. E.E.-I, 2008]

281. In order to recover the original signal from the sampled one, what is the condition to be satisfied for sampling frequency ω_s and highest frequency component ω_m ?
(a) $\omega_m < \omega_s \le 2\,\omega_m$ (b) $\omega_s \ge 2\,\omega_m$
(c) $\omega_s < \omega_m$ (d) $\omega_s = \omega_m$
[U.P.S.C. I.E.S. E.E.-I, 2006]

282. Let a signal $a_1 \sin(\omega_1 t + \phi_1)$ be applied to a stable linear time invariant system. Let the corresponding steady state output be represented as $a_2 F(\omega_2 t + \phi_2)$. Then which of the following statements is true ?
(a) F is not necessarily a "sine", or "cosine" function but must be period with $\omega_1 = \omega_2$.
(b) F must be a "sine" or "cosine" function with $a_1 = a_2$.
(c) F must be a "sine" function with $\omega_1 = \omega_2$ and $\phi_1 = \phi_2$.
(d) F must be a "sine" or "cosine" function with $\omega_1 = \omega_2$.
[GATE E.E. 2007]

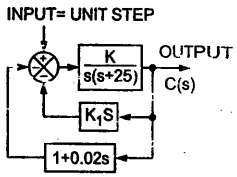
283. In the system shown in figure, the input $x(t) = \sin t$. In the steady-state, the response $y(t)$ will be



(a) $\frac{1}{\sqrt{2}}\sin(t-45°)$. (b) $\frac{1}{\sqrt{2}}\sin(t+45°)$.
(c) $\sin(t-45°)$. (d) $\sin(t+45°)$. [GATE E.E. 2004]

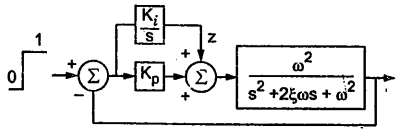
284. A system function has a pole at $s = 0$ and a zero at $s = -1$. The constant multiplier is unity. For an excitation $\sin t$, what is the steady-state response ?
(a) $\sqrt{2}\sin(t+45°)$. (b) $\sqrt{2}\sin(t-45°)$.
(c) $\sin(t-45°)$. (d) $\sin t$.
[U.P.S.C. I.E.S. E.E.-I, 2006]

285. For the system shown in the given figure, the steady-state value of the output $c(t)$ is



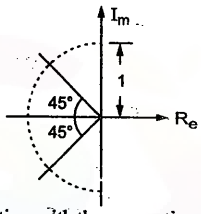
(a) 0 (b) 1
(c) ∞
(d) dependent of the values of K and K_t.
[U.P.S.C. I.E.S. E.E.-I, 1999]

286. Consider the feedback system shown below which is subjected to a unit step input. The system is stable and has following parameters $k_p = 4$, $k_i = 10$, $\omega = 500$ and $\xi = 0.7$. The steady state value of z is



(a) 1 (b) 0.25 (c) 0.1 (d) 0
[GATE E.E. 2007]

287. A diaphragm type pressure sensor has two poles as shown in the figure. The zeros are at infinity. What is its steady state deformation for a unit step input pressure?

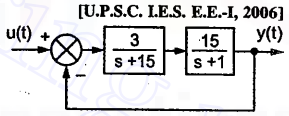


(a) 0.25 (b) 0.5
(c) 0.707 (d) 1
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

288. Consider the following statements in connection with the properties of R–C impedance functions :
1. All the poles and zeros are simple.
2. Poles and zeros interlace.
3. Poles and zeros are located on the negative real axis of the s-plane.

Which of the statements given above are correct ?
(a) 1, 2 and 3. (b) Only 1 and 2.
(c) Only 2 and 3. (d) Only 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

289. The roots of the closed loop characteristic equation of the system shown above in the figure



(a) –1 and –15. (b) 6 and 10.
(c) –4 and –15. (d) –6 and –10. [GATE E.E. 2003]

290. A discrete-time system is stable if all the poles of the Z-transfer function of the system lie
(a) outside the circle of unit radius on the Z-plane.
(b) within a circle of unit radius on the Z-plane.
(c) to the left of imaginary axis on the Z-plane.
(d) to the right of imaginary axis on the Z-plane.
[U.P.S.C. I.E.S. E.E.-I, 2008]

291. The characteristic polynomial of a discrete time system is given by $z^2 + z + a$. For what value of 'a' is the system stable ?
(a) 2 (b) 0.5 (c) 1.5 (d) –0.5
[U.P.S.C. I.E.S. E.E.-I, 2008]

292. The characteristic equation of second-order sampled data system is given by
$$F(z) = a_2 z^2 + a_1 z + a_0 = 0,\ a_2 > 0$$

Answers: **277.** (b), **278.** (c), **279.** (c), **280.** (d), **281.** (b), **282.** (d), **283.** (b), **284.** (a), **285.** (b), **286.** (a), **287.** (b), **288.** (a), **289.** (d), **290.** (b), **291.** (b), **292.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

What are the stability constraints for this system ?

1. $a_2 + a_1 + a_0 > 0$
2. $a_2 - a_1 + a_0 > 0$
3. $|a_0| < a_2$
4. $|a_0| > a_2$
5. $|a_1| < a_2$

Select the correct answer using the code given below :

Code :

(a) Only 1, 2 and 3. (b) Only 1, 2, and 4.
(c) Only 1, 3 and 5. (d) Only 2, 3 and 5.

[U.P.S.C. I.E.S. E.E.-I, 2006]

293. Consider the following statements :

1. A discrete-time system is said to be stable if and only if its response for unit impulse $\delta(t)$ decays with K.
2. Routh-Herwitz testing may be applied to determine the stability of discrete-data system using bilinear transformation $Z = \frac{1+\omega}{1-\omega}$.
3. A discrete data system is unstable if any of roots of the characteristic equation lies within the unit circle on the complex plane.

Which of these statements is/are correct ?

(a) 1 and 2 (b) 1 and 3 (c) 3 only (d) 2 and 3

[U.P.S.C. I.E.S. E.E.-I, 2003]

294. An impedance function has poles and zeros as follows : poles –1, –3; zeros –2, –4 and impedance has its value Z(0) = 8. Then which one of the following expresses Z(*s*) ?

(a) $\frac{(s^2+4s+3)}{(s^2+6s+8)}$. (b) $\frac{(3s^2+12s+9)}{(s^2+6s+8)}$.

(c) $\frac{(s^2+6s+8)}{(s^2+4s+3)}$. (d) $\frac{(3s^2+18s+24)}{(s^2+4s+3)}$.

[U.P.S.C. I.E.S. E.E.-I, 2007]

295. The constant M-circles corresponding to the magnitude (M) of the closed loop transfer function of a linear system for values of M greater than one lie in the G-plane and to the

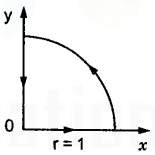
(a) Right of the M = 1 line (b) Left of the M = 1 line.
(c) Upper side of the M = +*j*1 line.
(d) Lower side of the M = –*j*1 line. [U.P.S.C. I.E.S. E.E.-I, 2005]

296. Encirclement of origin of 1 + G(*s*) plane corresponds to encirclement of a point in the –1 + G(*s*) plane, given by

(a) 1 + *j*0 (b) 0 + *j*0 (c) –2 + *j*0 (d) –1 + *j*0

[U.P.S.C. I.E.S. E.E.-I, 2005]

297. Given a vector field $\bar{A} = 2r\cos\phi\, I_r$ in cylindrical coordinates. For the contour as shown above, $\oint \bar{A}.d\bar{l}$ is

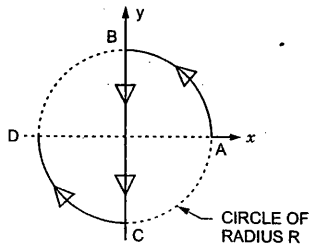


(a) 1 (b) $1-\frac{\pi}{2}$

(c) $1+\frac{\pi}{2}$ (d) –1

[U.P.S.C. I.E.S. E.E.-I, 2003]

298. What is the value of the integral $\int_c \bar{dl}$ along the curve *c*(*c* is the curve ABCD in the direction of the arrow) ?



(a) $2R(\hat{a}_x + \hat{a}_y)/\sqrt{2}$

(b) $-2R(\hat{a}_x + \hat{a}_y)/\sqrt{2}$

(c) $2R\,\hat{a}_x$ (d) $-2R\,\hat{a}_y$

[U.P.S.C. I.E.S. E.E.-I, 2005]

299. Which of the following may result in instability problem ?

(a) Large error. (b) High selectivity.
(c) High gain. (d) Noise.

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

300. Which one the following is the correct statement ?

For the minimum phase system to be stable,

(a) phase margin should be negative and gain margin positive.
(b) phase margin should be positive and gain margin negative.
(c) both gain margin and phase margin should be positive.
(d) both gain margin and phase margin should be negative.

[U.P.S.C. I.E.S. E.E.-I, 2007]

301. Consider the following statements with reference to relative stability of a system :

1. Phase margin is related to effective damping of the system.
2. Gain margin gives better estimate of damping ratio than phase margin.
3. When expressed in dB, gain margin is negative for a stable system.

Which of the statements given above are correct ?

(a) 1 and 2 only. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1, 2 and 3 only.

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

302. A system with gain margin close to unity or a phase margin close to zero is

(a) relatively stable. (b) oscillatory.
(c) stable. (d) highly stable.

[U.P.S.C. I.E.S. E.T.E.-II, 2008]

303. The characteristic equation of a system is given as $s^3 + 25s^2 + 10s + 50 = 0$. What is the number of roots in the right half *s*-plane and on the *j*ω axis, respectively ?

(a) 1, 1 (b) 0, 0 (c) 2, 1 (d) 1, 2

[U.P.S.C. I.E.S. E.E.-I, 2007]

304. A minimum phase transfer function has

(a) poles in the right half of *s*-plane.
(b) zeros in the right half of *s*-plane.
(c) poles in the left half of *s*-plane and zeros in the right half of *s*-plane.
(d) no poles or zeros in the right half of *s*-plane or on the *j*ω-axis excluding the origin. [U.P.S.C. I.E.S. E.E.-I, 2007]

305. Consider the following statements for minimum phase system :

1. All the poles of the transfer function should lie in the left of *s*-plane.
2. The zeros of the transfer function can lie anywhere in the *s*-plane.
3. Given the magnitude characteristic over the entire frequency range, the phase angle characteristic can be uniquely determined.

Which of the statements given above are correct

(a) 1, 2 and 3. (b) Only 1 and 2.
(c) Only 2 and 3. (d) Only 1 and 3.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

306. Consider the following equation $2s^4 + s^3 + + 3s^2 + 5s + 10 = 0$. How many roots does this equation have in the right half of *s*-plane ?

(a) One (b) Two (c) Three (d) Four

[U.P.S.C. I.E.S. E.E.-I, 2005]

307. Non-uniform phase transfer function is defined as the transfer function

(a) which has zeros in the right-half *s*-plane.
(b) which has zeros only in the left-half *s*-plane.
(c) which has poles in the right-half *s*-plane.
(d) which has poles in the left-half *s*-plane.

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

Answers: **293.** (a), **294.** (c), **295.** (a), **296.** (a), **297.** (a), **298.** (d), **299.** (c), **300.** (c), **301.** (a), **302.** (a), **303.** (b), **304.** (d), **305.** (d), **306.** (b), **307.** (b),

Downloaded From : www.EasyEngineering.net

308. If the poles of a system lie on the imaginary axis, the system will be
(a) stable. (b) conditionally stable.
(c) marginally stable. (d) unstable.
[U.P.S.C. I.E.S. E.E.-I, 2008]

309. The unit step response of a system is $1 - e^{-t}(1 + t)$. Which is this system ?
(a) Unstable. (b) Stable.
(c) Critically stable. (d) Oscillatory.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

310. The characteristic equation of a system is given by
$3s^4 + 10s^2 + 5s^2 + 2 = 0$. This system is
(a) stable. (b) marginally stable.
(c) unstable. (d) neither (a), (b) nor (c).
[U.P.S.C. I.E.S. E.E.-I, 2002]

311. The characteristic equation of a feedback control system is $s^3 + Ks^2 + 5s + 10 = 0$. For the system to be critically stable, the value of K should be
(a) 1 (b) 2 (c) 3 (d) 4
[U.P.S.C. I.E.S. E.E.-I, 1999]

312. The open-loop transfer function of a unity-feedback system is $G(s) = \frac{K(s+10)(s+20)}{s^2(s+2)}$. The closed-loop system will be stable if the value of K is
(a) 2 (b) 3 (c) 4 (d) 5
[U.P.S.C. I.E.S. E.E.-I, 1998]

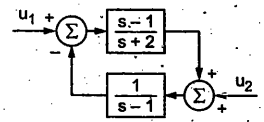
313. What is the range of K for which the open loop transfer function $G(s) = \frac{K}{s^2(s+a)}$ represents an unstable closed loop system ?
(a) $K > 0$. (b) $K = 0$.
(c) $K < 0$ only. (d) $-\infty < K < \infty$.
[U.P.S.C. I.E.S. E.E.-I, 2008]

314. A unity feedback system, having an open loop gain $G(s)H(s) = \frac{K(1-s)}{(1+s)}$, becomes stable when
(a) $|K| > 1$ (b) $K > 1$ (c) $|K| < 1$ (d) $K < -1$
[GATE E.E. 2005]

315. The loop gain GH of a closed loop system is given by the following equation $\frac{K}{s(s+2)(s+4)}$
The value of K for which the system just becomes unstable is
(a) $K = 6$ (b) $K = 8$ (c) $K = 48$ (d) $K = 96$
[GATE E.E. 2003]

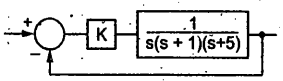
316. The dynamics of a motorcycle and an average rider is represented by the open-loop transfer function
$GH(s) = K/s(s + 20)(s^2 + 10s + 125)]$
The acceptable range of K for a stable system so that the vehicle can be easily controlled is
(a) $0 < K < 1.069$. (b) $0 < K < 10.69$.
(c) $0 < K < 106.9$. (d) $0 < K < 0.1069$.
[A.M.I.E Sec B. Control Systems Summer 2005]

317. The system shown in the figure is



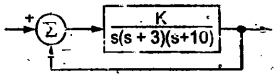
(a) Stable.
(b) Unstable.
(c) conditionally stable.
(d) stable for input u_1, but unstable for input u_2. [GATE E.E. 2007]

318. The closed loop system shown in the figure becomes marginally stable if the constant K is chosen to be



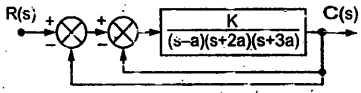
(a) 10 (b) 20 (c) 30 (d) 40
[U.P.S.C. I.E.S. E.E.-I, 2002]

319. Figure shows a feedback system where $K > 0$



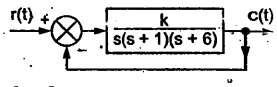
The range of K for which is stable will be given by
(a) $0 < K < 30$ (b) $0 < K < 39$
(c) $0 < K < 390$ (d) $K > 390$ [GATE E.E. 2008]

320. For the block diagram shown in the given figure, the limiting values of K for stability of inner loop is found to be $X < K < Y$. The overall system will be stable if and only if



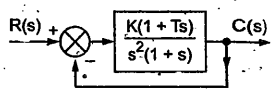
(a) $4X < K < 4Y$. (b) $2X < K < 2Y$.
(c) $X < K < Y$. (d) $\frac{X}{2} < K < \frac{Y}{2}$.
[U.P.S.C. I.E.S. E.E.-I, 2000]

321. For which of the following values of k, the feedback system shown in the figure is stable ?



(a) $k > 0$. (b) $k < 0$.
(c) $0 < k < 42$. (d) $0 < k < 60$.
[U.P.S.C. I.E.S. E.E.-I, 2005]

322. A feedback control system is shown in the given figure. The system is stable for all positive values of K, if

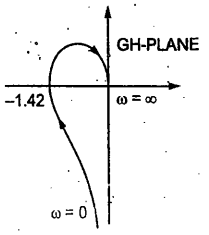


(a) $T = 0$ (b) $T < 0$ (c) $T > 1$ (d) $0 < T < 1$
[U.P.S.C. I.E.S. E.E.-II, 2000]

323. The open-loop transfer function of a unity feedback control system is given by
$$G(s) = Ke^{-Ts}$$
where K and T are variables and are greater than zero. The stability of the closed-loop system depends on
(a) K only. (b) Both K and T.
(c) T only. (d) Neither K nor T.
[U.P.S.C. I.E.S. E.E.-I, 2007; E.T.E.-II 2008]

324. Which one of the following is correct ?
A unity feedback system with forward path transfer function $G(s) = \frac{K}{s(1+sT_1)(1+sT_2)}$ is stable provided the value of K is given by
(a) $K < \frac{T_1 + T_2}{T_1 T_2}$. (b) $K < \frac{T_1 T_2}{T_1 + T_2}$.
(c) $K > \frac{T_1 + T_2}{T_1 T_2}$. (d) $K > \frac{T_1 T_2}{T_1 + T_2}$.
[U.P.S.C. I.E.S. E.E.-I, 2007]

325. The polar plot of a type-1, 3-pole, open-loop system is shown in figure. The closed-loop system is



(a) always stable.
(b) marginally stable.
(c) unstable with one pole on the right half s-plane.
(d) unstable with two poles on the right half s-plane. [GATE E.E. 2001]

Answers: **308.** (c), **309.** (b), **310.** (a), **311.** (b), **312.** (d), **313.** (a), **314.** (c), **315.** (c), **316.** (c), **317.** (d), **318.** (c), **319.** (c), **320.** (d), **321.** (c), **322.** (c), **323.** (c), **324.** (a), **325.** (d),

Downloaded From : www.EasyEngineering.net

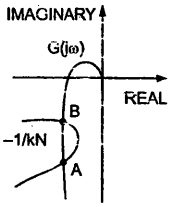
326. Which one of the following is correct in respect of the figure ?



(a) A and B are stable limit cycles.
(b) A is stable limit cycle but B is unstable.
(c) A is unstable limit cycle but B is stable.
(d) Both A and B are unstable.

[U.P.S.C. I.E.S. E.E.-I, 2005]

327. Consider the following statements with reference to a system with velocity error constant $K_v = 1000$
1. The system is stable. 2. The system is of type 1.
3. The test signal used is a step input.
Which of these statements are correct ?
(a) 1 and 2. (b) 1 and 3. (c) 2 and 3. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2003]

328. An electromechanical closed-loop control system has the transfer function $\frac{C(s)}{R(s)} = \frac{k}{s(s^2+s+1)(s+4)+k}$.
Which one of the following is correct ?
(a) The system is stable for all positive values of k.
(b) The system is unstable for all values of k.
(c) The system is stable for values of k between zero and 3.36.
(d) The system is stable for values of k between 1.6 and 2.45.

[U.P.S.C. I.E.S. E.E.-I, 2006]

329. Consider the following statements regarding Routh-Hurwitz criterion for stability :
1. Routh-Hurwitz criterion is a necessary and sufficient condition for stability.
2. The relative stability is dictated by the location of the roots of the characteristic equation.
3. A stable system is a dynamic system with a bounded response to a bounded input.
Which of the statements given above are correct ?
(a) 1 and 2 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 1, 2 and only.

[U.P.S.C. I.E.S. E.E.-I, 2007]

330. Consider the following statements :
When all the elements in one row of the Routh's tabulation are zero then this condition indicates
1. one pair of real roots with opposite signa in s-plane.
2. one pair of conjugate roots on the imaginary axis in s-plane.
3. conjugate roots forming a quadrate in s-plane.
Which of the statements given above is/are correct ?
(a) 1 only (b) 2 only (c) 3 only (d) 1, 2 and 3

[U.P.S.C. I.E.S. E.E.-I, 2008]

331. The number of sign changes in the Routh's array indicates the number of roots lying in the
(a) centre of the s-plane. (b) left half of s-plane
(c) right half of s-plane. (d) origin of s-plane.

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2007]

332. In order to use Routh Hurtwitz Criterion for determining the stability of sampled data system, the characteristic equation $1 + G(z)H(z) = 0$ should be modified by using bilinear transform of
(a) $z = r + 1$. (b) $z = r - 1$.
(c) $z = \frac{r-1}{r+1}$. (d) $z = \frac{r+1}{r-1}$.

[U.P.S.C. I.E.S. E.E.-I, 2001]

333. Number of intersect of the asymptotes of the complete root loci is
(a) unknown (b) two (c) three (d) one

[A.M.I.E. Sec B. Measurements and Control Winter 2006]

334. If the root locus branches crosses the imaginary axis the system becomes
(a) overdamped. (b) critically damped.
(c) stable. (d) unstable.

[A.M.I.E. Sec B. Measurements and Control Winter 2005]

335. Which one of the following statements is not correct ?
(a) Root loci can be used for anaiyzing stability and transient performance.
(b) Root loci provide insight into system stability and performance.
(c) Shape of root locus gives idea of type of controller needed to meet design specification.
(d) Root locus can be used to handle more than one variable at a time.

[U.P.S.C. I.E.S. E.E.-I, 2007]

336. Which one of the following is correct ?
The value of the system gain at any point on a root locus can be obtained as a
(a) product of lengths of vectors from the poles to that point.
(b) product of lengths of vectors from the zeros to that point.
(c) ratio of product of lengths of vectors from poles to that point to the product of length of vectors from zeros to that point.
(d) product of lengths of vectors from all poles to zeros.

[U.P.S.C. I.E.S. E.E.-I, 2008]

337. The characteristic equation of a feedback control system is given by $s^3 + 5s^2 + (K + 6)s + K = 0$. In the root loci diagram, the asymptotes of the root loci for large 'K' meet at a point in the s-plane whose coordinates are
(a) (2, 0) (b) (–1, 0) (c) (–2, 0) (d) (–3, 0)

[U.P.S.C. I.E.S. E.E.-I, 2001]

338. If the characteristic equation of a closed-loop system is $1 + \frac{K}{s(s+1)(s+2)} = 0$ the centroid of the asymptotes in root-locus will be
(a) zero (b) 2 (c) –i (d) –2

[U.P.S.C. I.E.S. E.E.-I, 1999]

339. The characteristic equation of a control system is given by $s(s + 4)(s^2 + 2s + 2) + k(s + 1) = 0$. What are the angles of the asymptotes for the root loci for $k \geq 0$?
(a) 60°, 180°, 300° (b) 0°, 180, 300°
(c) 120°, 180°, 240° (d) 0°, 120°, 240°

[U.P.S.C. I.E.S. E.E.-I, 2005]

340. Which one of the following is correct ?
The root locus is the path of the roots of the characteristic equation traced out in the s-plane
(a) as the input of the system is changed.
(b) as the output of the system is changed.
(c) as a system parameter is changed.
(d) as the sensitivity is changed.

341. Consider the following statements made on the basics of root locus analysis :
1. The intersection of asymptotes must always be on the real axis.
2. The asymptotes of root loci refer to the angles of root loci when gain K is zero.
Which of the statements given above is/are correct ?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.

[U.P.S.C. I.E.S. E.E.-I, 2007]

342. A control system has $G(s)H(s) = K/[s(s + 4)(s^2 + 4s + 20)](0 < K < \infty)$. What is the number of breakaway points in the root locus diagram ?
(a) One. (b) Two. (c) Three. (d) Zero.

[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **326.** (c), **327.** (a), **328.** (c), **329.** (b), **330.** (d), **331.** (c), **332.** (d), **333.** (d), **334.** (c), **335.** (d), **336.** (c), **337.** (c), **338.** (c), **339.** (a), **340.** (c), **341.** (d), **342.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

343. The open-loop transfer function of a feedback control system is $\frac{K}{s(s^2+3s+6)}$. The breakaway point(s) of its root-locus plot

(a) exist at $(-1 \pm j1)$. (b) exist at $\left(-\frac{3}{2} \pm \sqrt{\frac{15}{16}}\right)$.

(c) exists at origin. (d) do not exist.

[U.P.S.C. I.E.S. E.E.-I, 2000]

344. Which of the following are the characteristics of the root locus of

$$G(s)\,H(s) = \frac{K(s+5)}{(s+1)(s+3)}$$

1. It has one asymptote.
2. It has intersection with $j\omega$-axis.
3. It has two real axis intersections.
4. It has two zero at infinity.

Select the correct answer using the codes given below :

Codes :

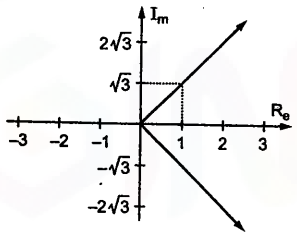
(a) 1 and 2. (b) 2 and 3. (c) 3 and 4. (d) 1 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2002]

345. A unity feedback system has an open loop transfer function, G(s) $= \frac{K}{s^2}$. The root locus plot is

(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2002]

346. Figure shows the root locus plot (location of poles not given) of a third order system whose open loop transfer function is



(a) $\frac{K}{s^3}$ (b) $\frac{K}{s^2(s+1)}$

(c) $\frac{K}{s(s^2+1)}$ (d) $\frac{K}{s(s^2-1)}$

[GATE E.E. 2005]

347. A closed-loop system has the characteristic function $(s^2 - 4)(s + 1) + K(s - 1) = 0$. Its root locus plot against K is

(a) 
(b) 
(c) 
(d) 
[GATE E.E. 2006]

348. Consider the following statements in connection with the addition of a pole to the forward path transfer function :

1. Closed-loop system becomes less stable.
2. Rise time of the system increases.
3. Bandwidth of the system increases.

Which of the statements given above are correct ?

(a) Only 1 and 2. (b) Only 2 and 3.

(c) Only 1 and 3. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2006]

349. Which one of the following rules determines the mapping of s-plane to z-plane ?

(a) Right half of the s-plane maps into outside of the unit circle in z-plane.

(b) Left half of s-plane maps into inside of the unit circle.

(c) Imaginary axis in s-plane maps into the circumference of the unit circle.

(d) All of the above. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

350. For a unity feedback system, the origin of the s-plane is mapped in the z-plane by transformation $z = e^{ST}$ to which one of the following?

(a) Origin (b) $1 + j0$ (c) $-1 + j0$ (d) $0 + j1$

[U.P.S.C. I.E.S. E.E.-I, 2004]

351. The right hand plane of s-plane, when mapped into z-plane, when the direction of contour is anticlockwise

(a) covers the entire portion of inside of the unit circle.

(b) covers the entire portion of outside of the unit circle.

(c) it falls on the unit-circle.

(d) it covers the entire portion except the unit circle.

[U.P.S.C. I.E.S. E.E.-I, 2007]

352. The Nyquist plot for the closed-loop control system with the loop transfer function $G(s)H(s) = \frac{100}{s(s+10)}$ is plotted. Then, the critical point $(-1, j0)$ is

(a) never enclosed.

(b) enclosed under certain conditions.

(c) just touched. (d) enclosed.

[U.P.S.C. I.E.S. E.E.-I, 2004]

353. If the Nyquist plot cuts the negative real axis at a distance of 0.4, then the gain margin of the system is

(a) 0.4 (b) –0.4 (c) 4% (d) 2.5

[U.P.S.C. I.E.S. E.E.-I, 2001]

354. The Nyquist plot of a system passes through $(-1, j0)$ point in the $G(j\omega)\,H(j\omega)$ plane, the phase-margin of the system is

(a) infinite. (b) greater than zero but not infinite.

(c) zero. (d) less than zero.

[U.P.S.C. I.E.S. E.E.-I, 2008]

355. The Nyquist plot of loop transfer function $G(s)H(s)$ of a closed loop control system passes through the point $(-1, j0)$ in the $G(s)\,H(s)$ plane. The phase margin of the system is

(a) 0° (b) 45° (c) 90° (d) 180°

[GATE E.E. 2004]

356. If $x = \text{Re}\,G(j\omega)$, and $y = \text{Im}\,G(j\omega)$ then for $\omega \to 0^+$, the Nyquist plot for $G(s) = 1/s(s + 1)(s + 2)$

(a) $x = 0$ (b) $x = -3/4$

(c) $x = y - 1/6$ (d) $x = y/\sqrt{3}$ [GATE E.E. 2007]

357. In the $GH(s)$ plane, the Nyquist plot of the loop transfer function $G(s)H(s) = \frac{\pi e^{-0.25s}}{s}$ passes through the negative real axis at the point

(a) $(-0.25, j0)$. (b) $(-0.5, j0)$.

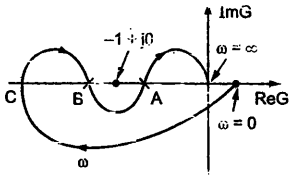
(c) $(-1, j0)$. (d) $(-2, j0)$. [GATE E.E. 2005]

Answers: **343.** (a), **344.** (a), **345.** (b), **346.** (a), **347.** (b), **348.** (d), **349.** (d), **350.** (b), **351.** (b), **352.** (a), **353.** (d), **354.** (c), **355.** (a), **356.** (b), **357.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

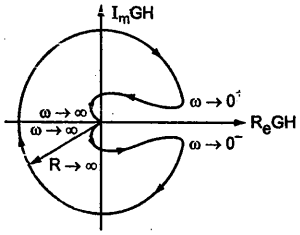
358. Nyquist plot of a system is shown in the figure. This system is which one of the following ?



(a) Marginally stable.
(b) Conditionally stable.
(c) Stable. (d) Unstable.

[U.P.S.C. I.E.S. E.E.-I, 2007]

359. Consider the following Nyquist plot of a feedback system having open loop transfer function $GH(s) = (s+1)/[s^2(s-2)]$ as shown in the diagram :



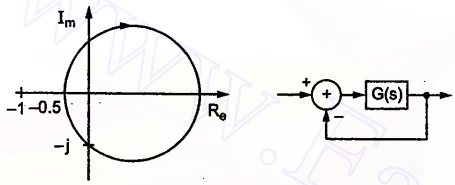
What is the number of closed loop poles in the right half of the s-plane ?

(a) 0 (b) 1 (c) 2 (d) 3

[U.P.S.C. I.E.S. E.E.-I, 2004]

Common Data for Questions 360 and 361:

The Nyquist plot of a stable transfer function $G(s)$ is shown in the figure. We are interested in the stability of the closed loop system in the feedback configuration shown.



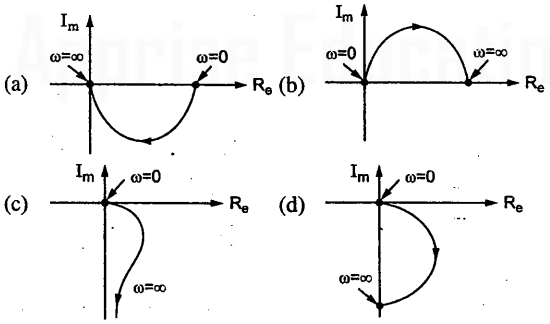
360. Which of the following statement is true ?
(a) $G(s)$ is an all-pass filter.
(b) $G(s)$ has a zero in the right-half plane.
(c) $G(s)$ is the impedance of a passive network.
(d) $G(s)$ is marginally stable. [GATE E.C.E. 2009]

361. The gain and phase margins of $G(s)$ for closed loop stability are
(a) 6 dB and 180°. (b) 3 dB and 180°.
(c) 6 dB and 90°. (d) 3 dB and 90°. [GATE E.C.E. 2009]

362. The transfer function of a certain system is given by

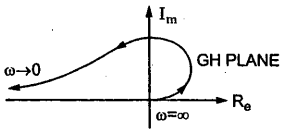
$$G(s) = \frac{s}{(1+s)}$$

The Nyquist plot of the system is



[U.P.S.C. I.E.S. E.E.-I, 2001]

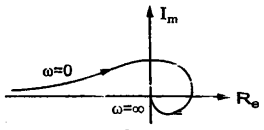
363. The Nyquist plot of a control system is shown in figure. For this system, $G(s)H(s)$ is equal to



(a) $\frac{K}{s(1+sT_1)}$ (b) $\frac{K}{s^2(1+sT_1)}$

(c) $\frac{K}{s^3(1+sT_1)}$ (d) $\frac{K}{s^2(1+sT_1)(1+sT_2)}$ [U.P.S.C. I.E.S. E.E.-I, 2003]

364. The Nyquist plot of a system is sketched below :



Corresponding to this plot, what is the open-loop transfer function?

(a) $\frac{k}{(1+sT_1)(1+sT_2)(1+sT_3)}$ (b) $\frac{k}{s(1+sT_1)(1+sT_2)(1+sT_3)}$

(c) $\frac{k}{s^2(1+sT_1)(1+sT_2)}$ (d) $\frac{k}{s^2(1+sT_1)(1+sT_2)(1+sT_3)}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

365. Which one of the following is correct ?
If the open-loop transfer function has one pole in the right half of s-plane, the closed loop system will be stable if the Nyquist plot of GH
(a) does not encircle the $(-1 + j0)$ point.
(b) encircles the $(-1 + j0)$ point once in the counterclockwise direction.
(c) encircles the $(-1 + j0)$ point once in the clockwise direction.
(d) encircles the origin one in the counterclockwise direction.

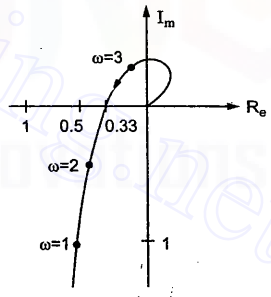
[U.P.S.C. I.E.S. E.E.-I, 2008]

366. Consider the following statements for a counterclockwise Nyquist path :
1. For a stable closed loop system, the Nyquist plot of $G(s)H(s)$ should encircle $(-1, j0)$ point as many times as there are poles of $G(s)H(s)$ in the right half of the s-plane, the encirclements, if there are any must be made in the counterclockwise direction.
2. If the loop gain function $G(s)H(s)$ is a stable function, the closed loop system is always stable.
3. If the loop gain function $G(s)H(s)$ is a stable function, for a stable closed-loop system, the Nyquist plot of $G(s)H(s)$ must not enclose the critical point $(-1, j0)$.

Which of the statements given above is/are correct ?
(a) Only 1. (b) 1 and 2. (c) 1 and 3. (d) Only 3.

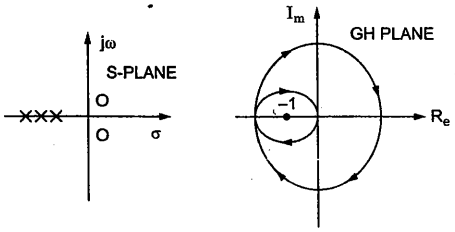
[U.P.S.C. I.E.S. E.E.-I, 2004]

367. What is the appropriate value of the gain margin in the Nyquist diagram given in the figure ?



(a) 0.67.
(b) 3.0.
(c) 1.0.
(d) 1/2. [U.P.S.C. I.E.S. E.E.-I, 2006]

368. The pole-zero map and the Nyquist plot of the loop transfer function $GH(s)$ of a feedback system are shown. For this



(a) Both open loop and closed loop systems are stable.
(b) Open loop system is stable but closed loop system in unstable.

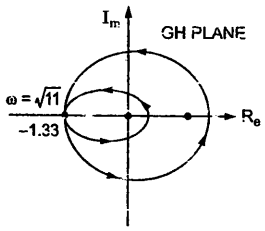
Answers: **358.** (b), **359.** (c), **360.** (b), **361.** (c), **362.** (b), **363.** (d), **364.** (d), **365.** (b), **366.** (c), **367.** (b), **368.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

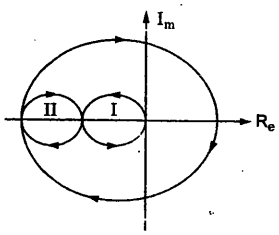
(c) Open loop system is unstable but closed loop system is stable.
(d) Both open loop and closed loop system are unstable.
[U.P.S.C. I.E.S. E.E.-I, 2003]

369. The Nyquist plot of a unity feedback system having open loop transfer function $G(s)=\frac{K(s+3)(s+5)}{(s-2)(s-4)}$ for K = 1 is as shown in the figure. For the system to be stable, the range of values of K is



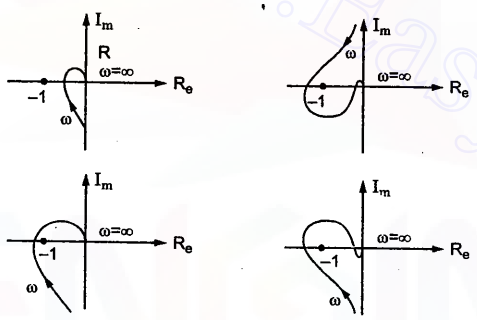
(a) $0 < K < 1.33$.
(b) $0 < K < 1/1.33$.
(c) $K > 1.33$.
(d) $K > 1/1.33$.
[U.P.S.C. I.E.S. E.E.-I, 2003]

370. Consider the Nyquist diagram for given $KG(s)H(s)$. The transfer function $KG(s)H(s)$ has no poles and zeros in the right half of s-plane. If the $(-1, j0)$ point is located first in region I and then in region II, the change in stability of the system will be from



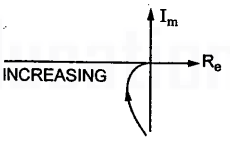
(a) unstable to stable.
(b) stable to stable.
(c) unstable to unstable.
(d) stable to unstable.
[U.P.S.C. I.E.S. E.E.-I, 2003]

371. Consider the following Nyquist plots of loop transfer functions over $\omega = 0$ to $\omega = \infty$. Which of these plots represents a stable closed loop system ?



(a) (1) only.
(b) all, except (I).
(c) all, except (3).
(d) (1) and (2) only.
[GATE E.E. 2006]

372. The Nyquist plot of a servosystem is shown in the figure. The root loci for the system would be



(a) 
(b) 
(c) 
(d) None of the drawn plot of (a), (b), (c) of the question.
[U.P.S.C. I.E.S. E.E.-I, 2001]

373. Which one of the following is *not* a property of the Liapunov function ?
(a) it is a scalar function.
(b) it is positive definite, at least in the neighbourhood of the origin.
(c) its time derivative is non-positive.
(d) it is a unique function for a given system.
[A.M.I.E. Sec B. Control Systems Winter 2006]

374. Which of the following conditions is not true for study of global asymptotic stability using Liapunov's method ?
(a) $V(0) = 0$.
(b) $V(x) > 0$ for $x \neq 0$.
(c) $V(x) \to \infty$ as $\|x\| \to \infty$.
(d) $V(x) > 0$
[A.M.I.E. Sec B. Control Systems Summer 2007]

375. A phase lead compensation network
(a) decreases the system bandwidth.
(b) speeds up the dynamic response.
(c) is applied when error constants are specified.
(d) reduces the steady-state error.
[A.M.I.E. Sec B. Control System Winter 2006]

376. Addition of zeros in a transfer function causes
(a) lead compensation.
(b) lag compensation.
(c) lead-lag compensation.
(d) none of these.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

377. What is the effect of phase lead compensator on gain crossover frequency (ω_{cg}) and on the bandwidth (w_b)
(a) Both are increased.
(b) ω_{cg} is increased but w_b is decreased.
(c) ω_{cg} is decreased but w_b is increased.
(d) Both are decreased.
[U.P.S.C. I.E.S. E.E.-I, 2006]

378. A property of phase-lead compensation is that the
(a) overshoot is increased.
(b) bandwidth of closed loop system is reduced.
(c) rise time of closed loop system is reduced.
(d) gain margin is reduced.
[U.P.S.C. I.E.S. E.E.-I, 2003]

379. The phase lead compensation is used for which one of the following?
(a) To increase rise time and decrease overshoot.
(b) To decrease both rise time and overshoot.
(c) To increase both rise time and overshoot.
(d) To decrease rise time and increase overshoot.
[U.P.S.C. I.E.S. E.E.-I, 2007]

380. Backlash in a stable control system may cause
(a) underdamping.
(b) overdamping.
(c) high level oscillations.
(d) low level oscillations.
[U.P.S.C. I.E.S. E.E.-I, 2002]

381. Which one of the following statements is NOT correct ?
(a) The transfer function of a lag-lead compensation network is $\frac{(1+sT_1a)(1+sT_2b)}{(1+sT_1)(1+sT_2)}\ (a>1, b<1)$
(b) Bridged T-network is used for cancellation compensation.
(c) Phase-lag compensation improves steady state response and often results in reduced rise time.
(d) Compensation network can be introduced in the feedback path of a control system.
[U.P.S.C. I.E.S. E.E.-I, 2003]

382. Indicate which one of the following transfer functions represents phase lead compensator ?
(a) $\frac{s+1}{s+2}$ (b) $\frac{6s+3}{6s+2}$ (c) $\frac{s+5}{3s+2}$ (d) $\frac{s+8}{s^2+5s+6}$
[U.P.S.C. I.E.S. E.E.-I, 2002]

383. How can be the bandwidth of a control system be increased ?
(a) By the use of phase lead network.
(b) By the use of phase lag network.

Answers: **369.** (c), **370.** (d), **371.** (d), **372.** (b), **373.** (d), **374.** (a), **375.** (c), **376.** (a), **377.** (a), **378.** (c), **379.** (b), **380.** (d), **381.** (c), **382.** (a), **383.** (a),

Downloaded From : www.EasyEngineering.net

(c) By the use of both phase-lag and phase-lead network.
(d) By the use of cascaded amplifiers in the system.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

384. The transfer function of a phase-lead compensator is given by

$$G_e(s) = \frac{1+3Ts}{1+Ts} \text{ where } T > 0$$

The maximum phase-shift provided by such a compensator is
(a) $\pi/2$ (b) $\pi/3$ (c) $\pi/4$ (d) $\pi/6$
[GATE E.C.E. 2006]

385. The transfer function of a lead compensator is

$$G_C(s) = \frac{1+0.12s}{1+0.04s}.$$

The maximum phase shift that can be obtained from this compensator is
(a) 60° (b) 45° (c) 30° (d) 15°
[U.P.S.C. I.E.S. E.E.-I, 1999]

386. The transfer function of a phase lag compensator is given by $\frac{1+Ts}{1+aTs}$ where $a>1$ and $T>0$. The maximum phase shift provided by such a compensator is

(a) $\tan^{-1}\left(\frac{a+1}{a-1}\right)$. (b) $\tan^{-1}\left(\frac{a-1}{a+1}\right)$.
(c) $\sin^{-1}\left(\frac{a+1}{a-1}\right)$. (d) $\sin^{-1}\left(\frac{a-1}{a+1}\right)$.
[U.P.S.C. I.E.S. E.E.-I, 2001]

387. A phase lead compensating network consists of only capacitors and resistors. The locations of its pole and zero in s-plane are at P_C and Z_C respectively. Which of the following conditions must be satisfied ?
(a) Both P_C and Z_C in LHS and $P_C < Z_C$.
(b) Both P_C and Z_C in LHS and $P_C > Z_C$.
(c) P_C is in LSH and Z_C can be in RHS.
(d) Z_C is in LHS and P_C can be in RHS. [U.P.S.C. I.E.S. E.E.-I, 2006]

388. An effect of phase-lag compensation on servosystem performance is that
(a) for a given relative stability, the velocity constant is increased.
(b) for a given relative stability the velocity constant is decreased.
(c) the bandwidth of the system is increased.
(d) the time response is made faster. [U.P.S.C. I.E.S. F.E.-II, 1995]

389. A phase-lag compensation will
(a) improve relative stability.
(b) increase the speed of response.
(c) increase bandwidth.
(d) increase overshoot. [U.P.S.C. I.E.S. E.E.-II, 1994]

390. The transfer function of a phase lead compensator is found to be of the form $\frac{s+z_1}{s+p_1}$ and that of a lag compensator to be of the form $\frac{s+z_2}{s+p_2}$.
Then which of the following conditions must be satisfied?
(a) $z_1 > p_1$ and $z_2 > p_2$. (b) $z_1 > p_1$ and $z_2 < p_2$.
(c) $z_1 < p_1$ and $z_2 < p_2$. (d) $z_1 < p_1$ and $z_2 > p_2$.
[U.P.S.C. I.E.S. E.E.-I, 2006]

391. Which one of the following is the correct expression for the transfer function of an electrical RC phase-lag compensating network ?

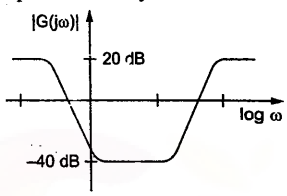
(a) $\frac{RCS}{(1+RCS)}$ (b) $\frac{RC}{(1+RCS)}$
(c) $\frac{1}{(1+RCS)}$ (d) $\frac{1}{(1+RCS)}$
[U.P.S.C. I.E.S. E.E.-I, 2004]

392. Which one of the following is not a correct reason to select feedback compensation over cascaded one ?
(a) No amplification is required as the energy transfer is from higher to lower level.
(b) Suitable devices are not available for compensation (serics).
(c) It is economical.
(d) Provides greater stiffness against load disturbances.
[U.P.S.C. I.E.S. E.E.-i, 2004]

393. What is the effect of lag compensator on the system bandwidth (BW) and the signal to noise ratio (SNR) ?
(a) BW is reduced and SNR is improved.
(b) BW is reduced and SNR is deteriorated.
(c) BW is increased and SRN is improved.
(d) BW is increased and SNR is deteriorated.
[U.P.S.C. I.E.S. E.E.-I, 2007]

394. What is the effect of providing distance velocity lag/transportation lag ?
(a) To increase the phase margin.
(b) To reduce the phase margin.
(c) To alter the gain at a given ω.
(d) To improve the transient response of the system.
[U.P.S.C. I.E.S. E.E.-I, 2007]

395. The magnitude plot of a rational transfer function $G(s)$ with real coefficients is shown in figure. Which of the following compensators has such a magnitude plot ?



(a) Lead compensator. (b) Lag compensator.
(c) PID compensator. (d) Lead-lag compensator.
[GATE E.C.E. 2009]

396. The open-loop transfer function of a plant is given as $G(s) = \frac{1}{s^2+s+1}$. If the plant is operated in a unity feedback configuration, then the lead compensator that can stabilize this control system is

(a) $\frac{10(s-1)}{s+2}$. (b) $\frac{10(s+4)}{s+2}$.
(c) $\frac{10(s+2)}{s+10}$. (d) $\frac{10(s+2)}{s+10}$. [GATE E.C.E. 2007]

397. The transfer functions of two compensators are given below :

$$C_1 = \frac{10(s+1)}{(s+10)}, \qquad C_2 = \frac{s+10}{10(s+1)}$$

Which one of the following statements is correct ?
(a) C_1 is lead compensator and C_2 is a lag compensator.
(b) C_1 is a lag compensator and C_2 is lead compensator.
(c) Both C_1 and C_2 are lead compensators.
(d) Both C_1 and C_2 are lag compensators. [GATE E.E. 2008]

398. A lead compensator used for a closed loop controller has the following transfer function

$$\frac{K\left(1+\frac{s}{a}\right)}{\left(1+\frac{s}{b}\right)}$$

For such a lead compensator
(a) $a < b$ (b) $b < a$ (c) $a > Kb$ (d) $a < Kb$
[GATE E.E. 2003]

399. If the compensated system shown in the figure has a phase margin of 60° at the crossover frequency of 1 rad/sec, then value of the gain K is

Answers: **384.** (d), **385.** (c), **386.** (d), **387.** (b), **388.** (a), **389.** (a), **390.** (d), **391.** (c), **392.** (c), **393.** (a), **394.** (b), **395.** (d), **396.** (a), **397.** (a), **398.** (a), **399.** (c),

Downloaded From : www.EasyEngineering.net

(a) 0.366 (b) 0.732 (c) 1.366 (d) 2.738

[GATE E.E. 2005]

400. Consider the following statements regarding compensators used in control systems

1. For type-2 or higher systems, lag compensator is universally used to overcome the undesirable oscillatory transient response.
2. In case of lag-lead compensator, a lag and a lead compensator are basically connected in parallel.
3. The s-plane representation of the lead compensator has a zero closer to the origin than the pole.
4. A lag compensator improves the steady state behaviour of a system while nearly maintaining its transient response.

Which of the statements given above are correct ?

(a) 1 and 4. (b) 1 and 3. (c) 2 and 3. (d) 2 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2005]

401. The system $900/s(s+1)(s+9)$ is to be such that its gain-crossover frequency becomes same as its uncompensated phase crossover frequency and provides a 45° phase margin. To achieve this, one may use

(a) a lag compensator that provides an attenuation of 20 dB and a phase lag of 45° at the frequency of $3\sqrt{3}$ rad/s.

(b) a lead compensator that provides an amplification of 20 dB and a phase lead of 45° at the frequency of 3 rad/s.

(c) a lag-lead compensator that provides an amplification of 20 dB and a phase lag of 45° at the frequency of $\sqrt{3}$ rad/s.

(d) a lag-lead compensator that provides an attenuation of 20 dB and phase lead of 45° at the frequency of 3 rad/s.

[GATE E.E. 2007]

402. A nonlinear control system is described by the equation $\ddot{\theta} + k \sin\theta = 0$. The types of singular points A = (0, 0) and B = (π, 0) will be respectively

(a) centre and saddle. (b) centre and focus.
(c) focus and saddle. (d) saddle and centre.

[U.P.S.C. I.E.S. E.E.-I, 1999]

403. Which one of the following systems described by the following input-output relations is nonlinear ?

(a) $y(n) = nx(2n)$. (b) $y(n) = x(n^2)$.
(c) $y(n) = n^2x(n)$. (d) $y(n) = x^2(n)$.

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

404. Presence of nonlinearities in a control system tends to introduce

(a) transient error. (b) instability.
(c) steady state error. (d) all of these.

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

405. Which one of the following methods is NOT used for the analysis of nonlinear control systems ?

(a) Phase plane method. (b) Describing function method.
(c) Liapunov's method. (d) Piecewise linear method.

[U.P.S.C. I.E.S. E.E.-I, 2003]

406. The phenomena of 'limit cycles' and 'jump resonance' are observed in

(a) discrete time systems. (b) linear systems.
(c) non-linear systems. (d) distributed systems.

[A.M.I.E. Sec B. Control Systems Summer 2007]

407. Isocline method is used for which one of the following ?

(a) Design of nonlinear system.
(b) Construction of root loci of nonlinear system.
(c) Construction of phase trajectories of nonlinear systems.
(d) Stability analysis of nonlinear system.

[U.P.S.C. I.E.S. E.E.-I, 2008]

408. Which one of the following statements relating to phase plane techniques is not correct ?

(a) They are general and applicable to system of any order.
(b) Steady-state accuracy and existence of limit cycle can be predicted.
(c) Amplitude and frequency of limit cycle, if exists, can be predicted.
(d) It is applicable even to discontinuous time systems.

[U.P.S.C. I.E.S. E.E.-I, 2007]

409. Which one of the following statements is not related to limit cycles (phenomena) found in nonlinear systems ?

(a) They are oscillations of fixed amplitude and period.
(b) They are undesirable. However, they can be tolerated if magnitude is within desirable limit.
(c) They are independent of initial conditions.
(d) Slight change in parameter, destroys the oscillation.

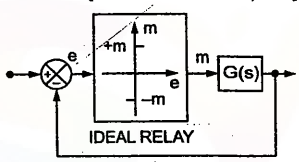
[U.P.S.C. I.E.S. E.E.-I, 2006]

410. About which one of the following is the phase-plane portrait for the nonlinear system given by $\ddot{X} + f(X, \dot{X})$ and satisfying $f(-X, \dot{X}) = f(X, \dot{X})$, symmetrical ?

(a) X–axis (b) $\dot{X}$-axis
(c) Both the X and $\dot{X}$ axes (d) Neither X nor $\dot{X}$ axes

[U.P.S.C. I.E.S. E.E.-I, 2004]

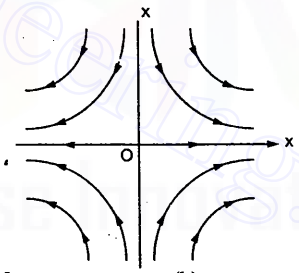
411. A nonlinear control system is shown in the figure. If the intercept of $G(j\omega)$ on the negative real axis of G-plane is $\left(-\frac{\pi}{2}, +j0\right)$ then the amplitude of the limit cycle is



(a) m (b) $2m$ (c) $3m$ (d) $4m$

[U.P.S.C. I.E.S. E.E.-I, 1999]

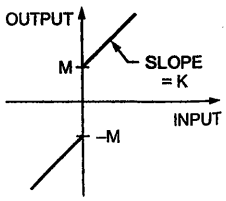
412. The phase portrait of nonlinear system is shown in the figure. Here the origin is a



(a) stable focus. (b) vortex.
(c) stable node. (d) saddle point.

[U.P.S.C. I.E.S. E.E.-I, 1998]

413. The describing function of relay nonlinearity is $\frac{4M}{X}$; M = Magnitude of relay, X = Magnitude of input. The describing function of given nonlinearity will be



(a) $\frac{4MK}{\pi x}$ (b) $K + \frac{4M}{\pi x}$

(c) $\frac{4M\sqrt{1-K^2}}{\pi x}$ (d) $\frac{4M}{\pi K x}$

[U.P.S.C. I.E.S. E.E.-I, 2002]

Answers: **400.** (d), **401.** (d), **402.** (b), **403.** (d), **404.** (d), **405.** (c), **406.** (c), **407.** (c), **408.** (a), **409.** (c), **410.** (b), **411.** (b), **412.** (d), **413.** (b),

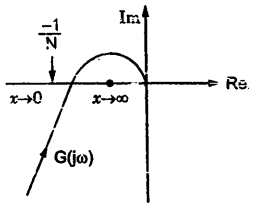
414. A unity feedback nonlinear control system's plot for $-1/N$ and $G(j\omega)$ is shown in the diagram : N is the describing function of the nonlinear device and $G(s)$ is the transfer function of the linear plant. Which one of the following statements is correct ?



The limit cycle is
(a) stable. (b) unstable.
(c) critically stable. (d) none of these.
[U.P.S.C. I.E.S. E.E.-I, 2004]

415. A set of linear equations is represented by the matrix equation $Ax = b$. The necessary condition for the existence of a solution for this system is
(a) A must be invertible.
(b) b must be linearly depended on the columns of A.
(c) b must be linearly independent of the columns of A.
(d) none of the above. **[U.P.S.C. I.E.S. E.E.-I, 1998]**

416. For the system $\dot{X} = \begin{bmatrix} 2 & 3 \\ 0 & 5 \end{bmatrix} X + \begin{bmatrix} 1 \\ 0 \end{bmatrix} u$, which of the following statements is true ?
(a) The system is controllable but unstable.
(b) The system is uncontrollable and unstable.
(c) The system is controllable and stable.
(d) The system is uncontrollable and stable. **[GATE E.E. 2002]**

417. Consider the single input, single output system with its state variable representation :

$$\dot{X} = \begin{bmatrix} -1 & 0 & 0 \\ 0 & -2 & 0 \\ 0 & 0 & -3 \end{bmatrix} X + \begin{bmatrix} 1 \\ 1 \\ 0 \end{bmatrix} U$$

$$Y = [1 \quad 0 \quad 2]X$$

The system is
(a) neither controllable nor observable.
(b) controllable but not observable.
(c) uncontrollable but observable.
(d) both controllable and observable. **[U.P.S.C. I.E.S. E.E.-I, 2001]**

418. Let $\dot{x} = \begin{bmatrix} 1 & 2 \\ 0 & b \end{bmatrix} x + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u$

where b is an unknown constant. This system is
(a) uncontrollable for $b = 1$.
(b) uncontrollable for $b = 0$.
(c) uncontrollable for all values of b.
(d) controllable for all values of b. **[U.P.S.C. I.E.S. E.E.-I, 2011]**

419. The system $\dot{x} = Ax + Bu$ with $A = \begin{bmatrix} -1 & 2 \\ 0 & 2 \end{bmatrix}$, $B = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$ is
(a) stable and controllable. (b) stable but uncontrollable.
(c) unstable but controllable. (d) unstable and uncontrollable.
[GATE E.E. 2010]

420. The system matrix of a linear time invariant continuous time system is given by $A = \begin{bmatrix} 0 & 1 \\ -3 & -5 \end{bmatrix}$.

What is the characteristic equation?
(a) $s^2 + 5s + 3 = 0$ (b) $s^2 - 3s - 5 = 0$
(c) $s^2 + 3s + 5 = 0$ (d) $s^2 + s + 2 = 0$
[U.P.S.C. I.E.S. E.E.-I, 2009]

421. The state variable description of a linear autonomous system is $\dot{X} = AX$, where X is a two-dimensional vector and A is a matrix given by $A = \begin{bmatrix} 0 & -2 \\ 2 & 0 \end{bmatrix}$. The poles of the system are located at
(a) -2 and $+2$ (b) $-j2$ and $+j2$
(c) -2 and -2 (d) $+2$ and $+2$
[U.P.S.C. I.E.S. E.E.-I, 2010]

422. The state variable description of a linear autonomous system is $\dot{x} = Ax$, where x is the two-dimensional state vector and A is given by

$$A = \begin{bmatrix} 0 & -2 \\ -2 & 0 \end{bmatrix}$$

The poles of the system are located at
(a) -2 and $+2$ (b) $-2j$ and $+2j$
(c) -2 and -2 (d) $+2$ and $+2$
[U.P.S.C. I.E.S. E.E.-I, 2011]

423. A linear time-invariant system is described by the following dynamic equation :

$$\frac{dx(t)}{dt} = Ax(t) + Bu(t) \qquad y(t) = Cx(t)$$

where $A = \begin{bmatrix} 0 & 1 \\ -2 & -3 \end{bmatrix}$, $B = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$, $C = [1 \ 1]$

The system is
(a) both controllable and observable.
(b) controllable but unobservable.
(c) observable but uncontrollable.
(d) both uncontrollable and unobservable.
[U.P.S.C. I.E.S. E.E.-I, 2002]

424. Consider the system $\frac{dx}{dt} = Ax + Bu$ with $A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$ and $B = \begin{bmatrix} p \\ q \end{bmatrix}$ where p and q are arbitrary real numbers. Which of the following statements about the controllability of the system is true ?
(a) The system is completely state controllable for any nonzero values of p and q.
(b) Only $p = 0$ and $q = 0$ result in controllability.
(c) The system is uncontrollable for all values of p and q.
(d) We cannot conclude about controllability from the given data.
[GATE E.C.E. 2009]

425. Let $\dot{X} = \begin{bmatrix} 1 & 2 \\ 0 & 1 \end{bmatrix} X + \begin{bmatrix} 0 \\ 1 \end{bmatrix} U \quad Y = [b \quad 0]X$

where b is an unknown constant. This system is
(a) observable for all values of b.
(b) unobservable for all values of b.
(c) observable for all nonzero values of b.
(d) unobservable for all nonzero values of b.
[U.P.S.C. I.E.S. E.E.-I, 2002]

426. The state equations of a system are given by

$$\dot{x} = \begin{bmatrix} -3 & 1 & 0 \\ 0 & -3 & 0 \\ 0 & 0 & 1 \end{bmatrix} x + \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix} u, \quad y = (1 \quad 0 \quad 1\}x$$

The system is
(a) Controllable and observable.
(b) Controllable but not completely observable.

Answers: **414.** (b), **415.** (b), **416.** (b), **417.** (a), **418.** (d), **419.** (c), **420.** (a), **421.** (b), **422.** (a), **423.** (b), **424.** (c), **425.** (c), **426.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) Neither controllable nor completely observable.
(d) Not completely controllable but observable.
[U.P.S.C. I.E.S. E.E.-I, 2005]

427. The state and output equations of a system are as under :

State equation : $\begin{bmatrix} \dot{x}_1 & (t) \\ \dot{x}_2 & (t) \end{bmatrix} = \begin{bmatrix} 0 & 1 \\ -1 & -2 \end{bmatrix} + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u(t)$

Output equation : $C(t) = [1 \quad 1] \begin{bmatrix} x_1 & (t) \\ x_2 & (t) \end{bmatrix}$

The system is
(a) neither state controllable not output controllable.
(b) state controllable but not output controllable.
(c) output controllable but not state controllable.
(d) both state controllable and output controllable.
[U.P.S.C. I.E.S. E.E.-I, 1998]

428. Consider a system $\frac{dx(t)}{dt} = Ax(t) + Bu(t); y = Cx(t)$

where $A = \begin{bmatrix} -2 & 0 \\ 0 & -1 \end{bmatrix}; B = \begin{bmatrix} 3 \\ 1 \end{bmatrix}; C = [1 \ 0]$

Which of the statements given below in respect of above system is correct ?
(a) System is controllable and observable.
(b) System is controllable but not observable.
(c) System is not controllable but observable.
(d) System is not controllable and not observable.
[U.P.S.C. I.E.S. E.E.-I, 2007]

429. The eigen values of linear system are the location of
(a) poles of the system. (b) zero of the system.
(c) both (a) and (b). (d) finite poles and zeros.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

430. The eigen values of the system represented by $\dot{X} = \begin{bmatrix} 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \\ 0 & 0 & 0 & 1 \end{bmatrix} X$ are

(a) 0, 0, 0, 0 (b) 1, 1, 1, 1
(c) 0, 0, 0, –1 (d) 1, 0, 0, 0 [GATE E.E. 2002]

431. Given the matrix $A = \begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -11 & -6 \end{bmatrix}$ the eigen values of A are

(a) –1, –2, –3. (b) –1, 2, –3.
(c) 0, 0, –6. (d) –6, –11, –6.
[U.P.S.C. I.E.S. E.E.-I, 2008]

432. The vector $\begin{bmatrix} 1 \\ 2 \\ -1 \end{bmatrix}$ is an eigen vector of $A = \begin{bmatrix} -2 & 2 & -3 \\ 2 & 1 & -6 \\ -1 & -2 & 0 \end{bmatrix}$.

One of the eigen values of A is
(a) 1 (b) 2 (c) 5 (d) –1
[GATE E.E. 1998]

433. $A = \begin{bmatrix} 2 & 0 & 0 & -1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 3 & 0 \\ -1 & 0 & 0 & 4 \end{bmatrix}$. The sum of the eigen values of the matrix A is
(a) 10 (b) –10 (c) 24 (d) 22
[GATE E.E. 1998]

434. Consider the state transition matrix :

$$\phi(s) = \begin{bmatrix} \frac{s+6}{s^2+6s+5} & \frac{1}{s^2+6s+5} \\ \frac{-5}{s^2+6s+5} & \frac{s}{s^2+6s+5} \end{bmatrix}.$$

The eigen values of the system are
(a) 0 and –6 (b) 0 and +6
(c) 1 and –5 (d) –1 and –5
[U.P.S.C. I.E.S. E.E.-I, 2000]

435. Consider the following statements with respect to a system represented by its state-space model

$$\dot{X} = AX + BU \text{ and } Y = CX$$

1. The static vector X of the system is unique.
2. The Eigen values of A are the poles of the system transfer function.
3. The minimum number of state variables required is equal to the number of independent energy storage elements in the system.

Which of these statements are correct ?
(a) 1 and 2. (b) 2 and 3. (c) 1 and 3. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2003]

436. The system matrix of a discrete system is given by

$$A = \begin{bmatrix} 0 & 1 \\ -3 & -5 \end{bmatrix}$$

The characteristic equation is given by
(a) $z^2 + 5z + 3 = 0$ (b) $z^2 - 3z - 5 = 0$
(c) $z^2 + 3z + 5 = 0$ (d) $z^2 + z + 2 = 0$
[U.P.S.C. I.E.S. E.E.-I, 2001]

437. The state variable description of a linear autonomous system is, $\dot{X} = AX$, where X is the two dimensional state vector and A is the system matrix given by $A = \begin{bmatrix} 0 & 2 \\ 2 & 0 \end{bmatrix}$. The roots of the characteristic equation are
(a) –2 and +2. (b) $-j2$ and $+j2$.
(c) –2 and –2. (d) +2 and +2.
[GATE E.E. 2004; U.P.S.C. I.E.S. E.E.-I, 2000; 2008]

438. The state transition matrix for the system $\dot{X} = AX$ with initial state X(0) is
(a) $(sI - A)^{-1}$ (b) $e^{At}X(0)$
(c) Laplace inverse of $[(sI - A)^{-1}]$
(d) Laplace inverse of $[(sI - A)^{-1}X(0)]$ [GATE E.E. 2002]

439. For the system $\dot{X} = \begin{bmatrix} 2 & 0 \\ 0 & 4 \end{bmatrix} X + \begin{bmatrix} 1 \\ 1 \end{bmatrix} u; y = [4 \ 0]X$, with u as unit impulse and with zero initial state, the output y, becomes
(a) $2e^{2t}$ (b) $4e^{2t}$ (c) $2e^{4t}$ (d) $4e^{4t}$
[GATE E.E. 2002]

440. Given the homogeneous state-space equation $\dot{x} = \begin{bmatrix} -3 & 1 \\ 0 & -2 \end{bmatrix} x$ the steady state value of $x_{ss} = \lim_{t \to \infty} x(t)$, given the initial state value of $x(0) = [10 - 10]^T$, is

(a) $x_{ss} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$ (b) $x_{ss} = \begin{bmatrix} -3 \\ -2 \end{bmatrix}$
(c) $x_{ss} = \begin{bmatrix} -10 \\ 10 \end{bmatrix}$ (d) $x_{ss} = \begin{bmatrix} \infty \\ \infty \end{bmatrix}$ [GATE E.E. 2001]

Answers: **427.** (b), **428.** (b), **429.** (a), **430.** (d), **431.** (a), **432.** (c), **433.** (a), **434.** (d), **435.** (b), **436.** (a), **437.** (a), **438.** (c), **439.** (b), **440.** (a),

441. The value of A matrix in $\dot{X} = AX$ for the system described by the differential equation $\ddot{y} + 2\dot{y} + 3y = 0$ is

(a) $\begin{bmatrix} 1 & 0 \\ -2 & -1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 0 \\ -1 & -2 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 1 \\ -2 & -1 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 1 \\ -3 & -2 \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 1998]

442. A second order system starts with an initial condition of $\begin{bmatrix} 2 \\ 3 \end{bmatrix}$ without any external input. The state transition matrix for the system is given by $\begin{bmatrix} e^{-2t} & 0 \\ 0 & e^{-t} \end{bmatrix}$. The state of the system at the end of 1 second is given by

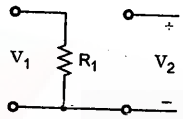
(a) $\begin{bmatrix} 0.271 \\ 1.100 \end{bmatrix}$ (b) $\begin{bmatrix} 0.135 \\ 0.368 \end{bmatrix}$

(c) $\begin{bmatrix} 0.271 \\ 0.736 \end{bmatrix}$ (d) $\begin{bmatrix} 0.135 \\ 1.100 \end{bmatrix}$ [GATE E.E. 2003]

443. The [y] parameters of the network given in figure are given by

(a) $\begin{bmatrix} R_1^{-1} & R_1^{-1} \\ R_1^{-1} & R_1^{-1} \end{bmatrix}$ (b) $\begin{bmatrix} 0 & R_1^{-1} \\ R_1^{-1} & R_1^{-1} \end{bmatrix}$

(c) $\begin{bmatrix} R_1^{-1} & 0 \\ 0 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} R_1^{-1} & 0 \\ R_1^{-1} & 0 \end{bmatrix}$



[U.P.S.C. I.E.S. E.E.-I, 2002]

444. If $\alpha = e^{j\frac{2\pi}{3}}$, and $I = AI_S$ where I is equal to phase current vector, and I_S is equal to symmetrical current vector, then which one of the following matrices is the symmetrical components transformation matrix A ?

(a) $\begin{bmatrix} 1 & 1 & 1 \\ 1 & \alpha & \alpha^2 \\ 1 & \alpha^2 & \alpha \end{bmatrix}$ (b) $\begin{bmatrix} 1 & \alpha & \alpha^2 \\ 1 & 1 & 1 \\ 1 & \alpha^2 & \alpha \end{bmatrix}$

(c) $\begin{bmatrix} 1 & 1 & 1 \\ 1 & \alpha^2 & \alpha \\ 1 & \alpha & \alpha^2 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & \alpha^2 & \alpha \\ 1 & \alpha & \alpha^2 \\ 1 & 1 & \alpha \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 2004]

445. The state-space representation of a system is given by

$$\dot{X} = \begin{bmatrix} -1 & 0 \\ 0 & -2 \end{bmatrix} X + \begin{bmatrix} 1 \\ 0 \end{bmatrix} U \text{ and } Y = \begin{bmatrix} 1 \\ 1 \end{bmatrix} X$$

Then the transfer function of the system is

(a) $\frac{1}{s^2+3s+2}$ (b) $\frac{1}{s+2}$

(c) $\frac{s}{s^2+3s+2}$ (d) $\frac{1}{s+1}$

[U.P.S.C. I.E.S. E.E.-I, 2003]

446. A particular control system is described by the following state equations :

$$\dot{X} = \begin{bmatrix} 0 & 1 \\ -2 & -3 \end{bmatrix} X + \begin{bmatrix} 0 \\ 1 \end{bmatrix} U \text{ and } Y = [2\ 0] X$$

The transfer function of this system is :

(a) $\frac{Y(s)}{U(s)} = \frac{1}{2s^2+3s+1}$ (b) $\frac{Y(s)}{U(s)} = \frac{2}{2s^2+3s+1}$

(c) $\frac{Y(s)}{U(s)} = \frac{1}{s^2+3s+2}$ (d) $\frac{Y(s)}{U(s)} = \frac{2}{s^2+3s+2}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

447. Given

$$[\dot{X}] = \begin{bmatrix} 0 & 1 \\ -1 & -1 \end{bmatrix} [x] + \begin{bmatrix} 0 \\ k \end{bmatrix} u \quad y = x_1 + x_2 \quad [x] = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix}$$

What is the transfer function y/x ?

(a) $\frac{k(s+2)}{s^3+2s^2+s+1}$ (b) $\frac{k(s+1)}{s^2+s+1}$

(c) $\frac{ks}{s^2+2s+1}$ (d) $\frac{k}{s^2+s+1}$

[U.P.S.C. I.E.S. E.E.-I, 2006]

448. The state-space representation in phase-variable form for the transfer function $G(s) = \frac{2s+1}{s^2+7s+9}$ is

(a) $\dot{x} = \begin{bmatrix} 0 & 1 \\ -9 & -7 \end{bmatrix} x + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u;\ y = [1\ 2] x$

(b) $\dot{x} = \begin{bmatrix} 1 & 0 \\ -9 & -7 \end{bmatrix} x + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u;\ y = [0\ 1] x$

(c) $\dot{x} = \begin{bmatrix} -9 & 0 \\ 0 & -7 \end{bmatrix} x + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u;\ y = [2\ 0] x$

(d) $\dot{x} = \begin{bmatrix} 9 & -7 \\ 1 & 0 \end{bmatrix} x + \begin{bmatrix} 0 \\ 1 \end{bmatrix} u;\ y = [1\ 2] x$ [U.P.S.C. I.E.S. E.E.-I, 2002]

449. For a system with the transfer function $H(s) = \frac{3(s-2)}{s^3+4s^2-2s+1}$, the matrix A in the state space form $\dot{x} = Ax + Bu$ is equal to

(a) $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ -1 & 2 & -4 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -1 & 2 & -4 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 1 & 0 \\ 3 & -2 & 1 \\ 1 & -2 & 4 \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 0 & 1 \\ -1 & 2 & -4 \end{bmatrix}$

[GATE E.E. 2006]

450. The following equation defines a separately excited dc motor in the form of a differential equation

$$\frac{d^2\omega}{dt^2} + \frac{B}{J}\frac{d\omega}{dt} + \frac{K^2}{LJ}\omega = \frac{K}{LJ} V_a$$

The above equation may be organized in the state-space form as follows

$$\begin{bmatrix} \frac{d^2\omega}{dt^2} \\ \frac{d\omega}{dt} \end{bmatrix} = P \begin{bmatrix} \frac{d\omega}{dt} \\ \omega \end{bmatrix} + QV_a$$

where the P matrix is given by

(a) $\begin{bmatrix} -\frac{B}{J} & -\frac{K^2}{LJ} \\ 1 & 0 \end{bmatrix}$ (b) $\begin{bmatrix} -\frac{K^2}{LJ} & -\frac{B}{J} \\ 0 & 1 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 1 \\ -\frac{K^2}{LJ} & -\frac{B}{J} \end{bmatrix}$ (d) $\begin{bmatrix} 1 & 0 \\ -\frac{B}{J} & -\frac{K^2}{LJ} \end{bmatrix}$

[GATE E.E. 2003]

Data for Questions 451 and 452 are given below. Solve the problems and choose the correct answers.

A state variable system $\dot{X}(t) = \begin{bmatrix} 0 & 1 \\ 0 & -3 \end{bmatrix} X(t) + \begin{bmatrix} 1 \\ 0 \end{bmatrix} u(t)$, with the initial condition $X(0)$ $[-1 \quad 3]^T$ and the unit step input $u(t)$ has

451. The state transition matrix

(a) $\begin{bmatrix} 1 & \frac{1}{3}(1-e^{-3t}) \\ 0 & e^{-3t} \end{bmatrix}$ (b) $\begin{bmatrix} 1 & \frac{1}{3}(e^{-t}-e^{-3t}) \\ 0 & e^{-t} \end{bmatrix}$

(c) $\begin{bmatrix} 1 & \frac{1}{3}(e^{-t}-e^{-3t}) \\ 0 & e^{-3t} \end{bmatrix}$ (d) $\begin{bmatrix} 1 & (1-e^{-t}) \\ 0 & e^{-t} \end{bmatrix}$

[GATE E.E. 2005]

452. The state transition equation

(a) $X(t) = \begin{bmatrix} 1-e^{-t} \\ e^{-t} \end{bmatrix}$ (b) $X(t) = \begin{bmatrix} t-e^{-t} \\ 3e^{-3t} \end{bmatrix}$

(c) $X(t) = \begin{bmatrix} t-e^{-3t} \\ 3e^{-3t} \end{bmatrix}$ (d) $X(t) = \begin{bmatrix} t-e^{-3t} \\ e^{-t} \end{bmatrix}$

[GATE E.E. 2005]

Statement for Linked Answer Questions 453 and 454 :

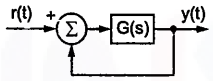
The state space equation of a system is described by $\dot{x} = Ax + Bu, y = Cx$ where x is state vector, u is input, y is output and $A = \begin{bmatrix} 0 & 1 \\ 0 & -2 \end{bmatrix}$, $B = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$, $C = [1 \quad 0]$

453. The transfer function G(s) of this system will be

(a) $\frac{s}{(s+2)}$ (b) $\frac{s+1}{s(s-2)}$

(c) $\frac{s}{(s-2)}$ (d) $\frac{1}{s(s+2)}$ [GATE E.E. 2008]

454. A unity feedback is provided to the above system G(s) to make it a closed loop system as shown in figure.



For a unit step input $r(t)$, the steady state error in the input will be

(a) 0 (b) 1 (c) 2 (d) ∞

[GATE E.E. 2008]

Common Data for Questions 455 and 456 :

A system is described by the following state and output equations

$$\frac{dx_1(t)}{dt} = -3x_1(t) + x_2(t) + 2u(t)$$

$$\frac{dx_2(t)}{dt} = -2x_2(t) + u(t)$$

$$y(t) = x_1(t)$$

when $u(t)$ is the input and $y(t)$ is the output.

455. The system transfer function is

(a) $\frac{s+2}{s^2+5s-6}$ (b) $\frac{s+3}{s^2+5s-6}$

(c) $\frac{2s+5}{s^2+5s+6}$ (d) $\frac{2s-5}{s^2+5s-6}$ [GATE E.E. 2009]

456. The state-transition matrix of the above system is

(a) $\begin{bmatrix} e^{-3t} & 0 \\ e^{-2t}+e^{-3t} & e^{-2t} \end{bmatrix}$ (b) $\begin{bmatrix} e^{-3t} & e^{-2t}-e^{-3t} \\ 0 & e^{-2t} \end{bmatrix}$

(c) $\begin{bmatrix} e^{-3t} & e^{-2t}+e^{-3t} \\ 0 & e^{-2t} \end{bmatrix}$ (d) $\begin{bmatrix} e^{3t} & e^{-2t}-e^{-3t} \\ 0 & e^{-2t} \end{bmatrix}$

[GATE E.E. 2009]

457. When a transfer function model is converted into state space model, the order of the system may be reduced during which one of the following conditions?

(a) Some of the variables are not considered.
(b) Some of the variables are hidden.
(c) Pole, zero cancellation takes place.
(d) The order of the system will never be changed.

[U.P.S.C. I.E.S. E.E.-I, 2009]

458. A linear system is described by the following state equations:

$$\dot{X}(t) = \begin{bmatrix} 0 & -2 \\ 1 & -3 \end{bmatrix} X + \begin{bmatrix} 2 \\ 0 \end{bmatrix} Y$$

$$Y(t) = [0 \quad 3]X$$

What is the transfer function of the system?

(a) $\frac{1}{s^2+2s+3}$ (b) $\frac{6}{s^2+3s+2}$

(c) $\frac{6}{s^2+2s+3}$ (d) $\frac{1}{s^2+3s+2}$

[U.P.S.C. I.E.S. E.E.-I, 2009]

459. What is represented by state transition matrix of a system?

(a) Free response. (b) Impulse response.
(c) Step response. (d) Forced response.

[U.P.S.C. I.E.S. E.E.-I, 2009]

460. Consider the following statements in connection with two-position controller:

1. If the controller has a 4% neutral zone, its positive error band will be 2% and negative error band will be 8%.
2. The neutral zone is also known as dead band.
3. The controller action of a two-position controller is very similar to that of a pure on-off controller.
4. Air-conditioning system works essentially on a two-position control basis.

Which of the above statements are correct?

(a) 1, 2 and 3 only. (b) 2, 3 and 4 only.
(c) 2 and 4 only. (d) 1, 2, 3 and 4.

[U.P.S.C. I.E.S. E.E.-I, 2010]

461. Given a sequence $x[n]$, to generate the sequence $y[n] = x[3-4n]$, which one of the following procedures would be correct?

(a) First *delay* $x[n]$ by 3 sample to generate $z_1[n]$, then pick every 4th sample of $z_1[n]$ to generate $z_2[n]$, and then finally time reverse $z_2[n]$ to obtain $y[n]$.
(b) First *advance* $x[n]$ by 3 samples to generate $z_1[n]$, then pick every 4th sample of $z_1[n]$ to generate $z_2[n]$, and then finally time reverse $z_2[n]$ to obtain $y[n]$.
(c) First pick every fourth sample of $x[n]$ to generate $v_1[n]$, time-reverse $v_1[n]$ to obtain $v_2[n]$, and finally *advance* $v_2[n]$ by 3 sample to obtain $y[n]$.
(d) First pick every fourth sample of $x[n]$ to generate $v_1[n]$, time-reverse $v_1[n]$ to obtain $v_2[n]$, and finally *delay* $v_2[n]$ by 3 samples to obtain $y[n]$. [GATE E.E. 2008]

462. Given $X(z) = \frac{z}{(z-a)^2}$ with $|z| > a$, the residue of $X(z)z^{n-1}$ at $z = a$ for $n \geq 0$ will be

(a) a^{n-1} (b) a^n (c) na^n (d) na^{n-1}

[GATE E.E. 2008]

Answers: **451.** (a), **452.** (c), **453.** (d), **454.** (a), **455.** (c), **456.** (b), **457.** (c), **458.** (b), **459.** (a), **460.** (b), **461.** (d), **462.** (d),

463. For the network function.

$$T(s) = \frac{s}{s^2 + 2s + 100},$$

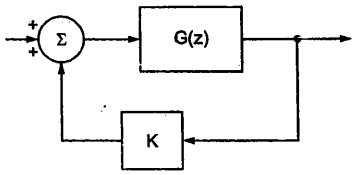
the resonant frequency and bandwidth are respectively

(a) 10, 1 (b) 10, 2 (c) 100, 1 (d) 100, 2

[U.P.S.C. I.E.S. E.E.-I, 2010]

464. Consider the discrete-time system shown in the figure where the impulse response of G(z) is

$g(0) = 0, g(1) = g(2) = 1, g(3) = g(4) = ... = 0.$

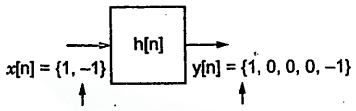


This system is stable for range of values of K

(a) [–1, 1/2] (b) [–1, 1] (c) [–1/2, 1] (d) [–1/2, 2]

[GATE E.E. 2007]

465. Given the finite length input $x[n]$ and the corresponding finite length output $y[n]$ of an LTI system as shown below, the impulse response $h[n]$ of the system is

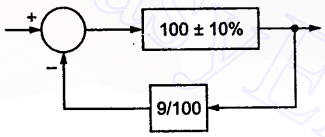


(a) $h[n] = \{\underset{\uparrow}{1}, 0, 0, 1\}$ (b) $h[n] = \{\underset{\uparrow}{1}, 0, 1\}$

(c) $h[n] = \{\underset{\uparrow}{1}, 1, 1, 1\}$ (d) $h[n] = \{\underset{\uparrow}{1}, 1, 1\}$

[GATE E.E. 2010]

466. As shown in the figure, a negative feedback system has an amplifier of gain 100 with ± 10% tolerance in the forward path, and an attenuator of value $\frac{9}{100}$ in the feedback path. The overall system gain is approximately:



(a) 10 ± 1% (b) 10 ± 2% (c) 10 ± 5% (d) 10 ± 10%

[GATE E.E. 2010]

467. For a tachometer, if $\theta(t)$ is the rotor displacement, $e(t)$ is the output voltage and K is the tachometer constant, then the transfer function is defined as

(a) Ks^2 (b) $\frac{K}{s}$ (c) Ks (d) K

[U.P.S.C. I.E.S. E.E.-I, 2011]

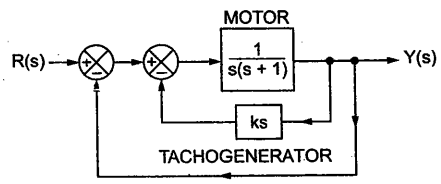
468. If D is the rotor diameter and L, the axial length, then a high performance ac servomotor is characterized by which one of the following?

(a) Large D and Large L. (b) Large D and Small L.

(c) Small D and Small L. (d) Small D and Large L.

[U.P.S.C. I.E.S. E.E.-I, 2009]

469. A two-loop position control system is shown below.



The gain k of the tachogenerator influences mainly the

(a) peak overshoot.

(b) natural frequency of oscillation.

(c) phase shift of the closed loop transfer function at very low frequencies ($\omega \to 0$).

(d) phase shift of the closed loop transfer function at very high frequencies ($\omega \to \infty$). [GATE E.E. 2011]

470. In case of an armature controlled separately excited dc motor drive with closed-loop speed control, an inner current loop is useful because it

(a) limits the speed of the motor to a safe value.

(b) helps in improving the drive energy efficiency.

(c) limits the peak current of the motor to the permissible value.

(d) reduces the steady state speed error. [GATE E.E. 2001]

471. Single step response of a typical stepper motor is quite oscillatory. Brakes are used to reduce or eliminate oscillations. Which one of the following statements is not correct regrading use of brakes?

(a) It provides memory or position information when motor is switched off.

(b) It reduces deceleration time.

(c) It reduces length of motor load.

(d) It reduces pullout torque. [U.P.S.C. I.E.S. E.E.-I, 2008]

472. For a stepper motor, what is the correct relationship between the maximum slew rate (MSR) and the load ?

(a) MSR decreases as load is reduced.

(b) MSR increases considerably as load is increased.

(c) MSR increases as load is reduced.

(d) MSR remains the same even if the load is changed.

[U.P.S.C. I.E.S. E.E.-I, 2007]

473. Consider the following statements :

1. Servomotors have lighter rotor as compared to ordinary motors and hence lower inertia.
2. Back emf in field controlled dc motors acts as minor loop feedback and results in increased damping and improved transient response.
3. Permanent magnetic dc servomotors can be used in either armature controlled or field-controlled modes.

Which of the above statements are not correct ?

(a) 1 and 2. (b) 2 and 3.

(c) 1 and 3. (d) 1, 2 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2004]

474. Which of the following motors would be suitable for use as servomotors ?

1. Two-phase induction motor.
2. DC separately excited motor.
3. Single-phase capacitance start induction motor.
4. Universal motor.
5. Single-phase synchronous motors.

Select the correct answer using the codes given below :

Codes :

(a) 1, 2, 3, 4 and 5. (b) 2, 3, and 4.

(c) 1, 2 and 5. (d) 1 and 5.

[U.P.S.C. I.E.S. E.E.-I, 1998]

475. In case of dc servomotor the back emf is equivalent to an "electric friction" which tends to

(a) improve stability of the motor.

(b) slowly decrease stability of the motor.

(c) very rapidly decrease stability of the motor.

(d) have no effect on stability. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

476. Which one of the following is required for stability of an ac servomotor ?

Answers: **463.** (b), **464.** (b), **465.** (c), **466.** (a), **467.** (c), **468.** (d), **469.** (a), **470.** (c), **471.** (a), **472.** (c), **473.** (c), **474.** (c), **475.** (a), **476.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) A negative slope on the torque-speed curve.
(b) A linearized torque-speed curve.
(c) The ratio of the rotor reactance to rotor resistance should be high.
(d) The rotor diameter should be less and axial length large.
[U.P.S.C. I.E.S. E.E.-I, 2007]

477. Which one of the following is the correct statement ? The rotor resistance to reactance ratio and the moment of inertia of an ac servomotor in comparison to an ordinary 2-ϕ induction motor of similar rating are, respectively,
(a) lower and lower. (b) lower and higher.
(c) higher and higher. (d) higher and lower.
[U.P.S.C. I.E.S. E.E.-I, 2007]

478. A tachometer is added to a servomechanism because
(a) it is easily adjusted. (b) it can adjust damping.
(c) it converts velocity of the shaft to a proportional dc voltage.
(d) it reduces steady-state error. [U.P.S.C. I.E.S. E.E.-I, 2008]

479. The effect of tachometer feedback in a control system is to reduce
(a) only time constant. (b) only gain.
(c) damping. (d) both gain and time constant.
[U.P.S.C. I.E.S. F.E.-I, 2006]

480. For a tachometer if $\theta(t)$ is the rotor displacement, $e(t)$ is the output voltage and K_t is the tachometer constant, then the transfer function is defined as
(a) $K_t \cdot s^2$ (b) $K_t \cdot s$ (c) K_t/s (d) K_t
[GATE E.E. 2004; U.P.S.C. I.E.S. E.E.-I, 2008]

481. Which one of the following can be used as a tachogenerator in control system ?
(a) Microsyn. (b) DC servomotor.
(c) AC servomotor. (d) Magnetic amplifier.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

482. If the rotor axis of a synchro transmitter is along the axis of S_2 stator winding, when will be the electrical zeroing ?
(a) Vs_1s_2 is maximum. (b) Vs_2s_3 is maximum.
(c) Vs_2s_3 is minimum. (d) Vs_3s_1 is minimum.
[U.P.S.C. I.E.S. E.E.-I, 2005]

483. Microsyn is based on the principle of
(a) DC motor. (b) Resolver.
(c) Saturable reactor.
(d) Rotating differential transformer. [U.P.S.C. I.E.S. E.E.-I, 2007]

484. Synchro machines are used for which one of the following ?
(a) Converting 1-phase supply to 3-phase supply.
(b) Stepping up low frequency signal to high frequency.
(c) Detection of positional error in ac servosystem.
(d) Detection of positional error in dc servosystem.
[U.P.S.C. I.E.S. E.E.-I, 2008]

485. To detect the position error in a position control system, which of the following may be used ?
1. Potentiometers 2. Synchros 3. LVDT
Select the correct answer using the code given below :
(a) 1 and 2 only. (b) 1 and 3 only.
(c) 2 and 3 only. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2008]

486. A control system is defined by the following mathematical relationship

$$\frac{d^2x}{dt^2} + 6\frac{dx}{dt} + 5x = 12(1 - e^{-2t})$$

The response of the system as $t \to \infty$ is
(a) $x = 6$ (b) $x = 2$ (c) $x = 2.4$ (d) $x = -2$
[GATE E.E. 2003]

487. The running integrator, given by $y(t) = \int_0^{\pi} \pi R^2$
(a) has no finite singularities in its double side Laplace Transform $Y(s)$.
(b) produces a bonded output for every casual bounded input.
(c) produces a bonded output for every anticausal bounded input.
(d) has no finite zeroes in its double side Laplace Transform $Y(s)$.
[GATE E.E. 2005]

488. A continuous-time system is described by $y(t) = e^{-|x(t)|}$, where $y(t)$ is the output and $x(t)$ is the input. $y(t)$ is bounded
(a) only when $x(t)$ is bounded.
(b) only when $x(t)$ is non-negative.
(c) only for $t \le 0$ if $x(t)$ is bounded for $t \ge 0$.
(d) even when $x(t)$ is not bounded. [GATE E.E. 2005]

489. The input-output relationship of a linear time invariant continuous time system is given by $r(t) = \frac{d^2c(t)}{dt^2} + 3\frac{dc(t)}{dt} + 2c(t)$, where $r(t)$ and $c(t)$ are input and output respectively. What is the transfer function of the system equal to ?
(a) $\frac{1}{(s^2+s+2)}$. (b) $\frac{1}{(s^2+3s+2)}$.
(c) $\frac{2}{(s^2+3s+2)}$. (d) $\frac{2}{(s^2+s+2)}$.
[U.P.S.C. I.E.S. E.E.-I, 2007]

490. Given the relationship between the input $u(t)$ and the output $y(t)$ to be

$$y(t) = \int_0^t (2 + t - \tau)e^{-3(t-\tau)}u(\tau)d\tau,$$

the transfer function $Y(s)/U(s)$ is
(a) $\frac{2e^{-2s}}{s+3}$. (b) $\frac{s+2}{(s+3)^2}$.
(c) $\frac{2s+5}{s+3}$. (d) $\frac{2s+7}{(s+3)^2}$. [GATE E.E. 2001]

491. The response i of a network is expressed by the differential equation $\frac{d^2i}{dt^2} + i = v$. If $v = Ae^{2t}$, the dominant solution of i for $t > 0$ is of the nature
(a) $K_1 e^t$ (b) $K_1 e^{-t}$ (c) $K_1 e^{2t}$
(d) $K_2 \cos t + K_3 \sin t$ [U.P.S.C. I.E.S. E.E.-I, 2001]

492. For a driving point impedance function, $Z(s) = \frac{s+\alpha}{s+\beta}$; the voltage will lead the current for sinusoidal input, if
(a) α and β are real positive and $\alpha > \beta$.
(b) α is real positive and β is real negative and $\alpha > \beta$.
(c) α and β are real positive and $\beta > \alpha$.
(d) α and β are real negative and $\beta > \alpha$. [U.P.S.C. I.E.S. E.E.-I, 2003]

493. Impedance $Z(s) = [(s+3)(s+5)]/[(s+4)(s+6)]$ is realized in the Foster's second form. What will be the values, respectively of R and L in one of the series R – L branches ?
(a) $2\ \Omega, \frac{1}{3}$H. (b) $2\ \Omega, \frac{4}{3}$H.
(c) $2\ \Omega, \frac{5}{3}$H. (d) $2\ \Omega, \frac{2}{3}$H.
[U.P.S.C. I.E.S. E.E.-I, 2004]

Answers: **477.** (d), **478.** (c), **479.** (c), **480.** (b), **481.** (c), **482.** (d), **483.** (d), **484.** (c), **485.** (d), **486.** (c), **487.** (c), **488.** (d), **489.** (b), **490.** (d), **491.** (c), **492.** (c), **493.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

494. Which one of the following is correct ? The impedance function

$$z(s) = \frac{(s^2+1)(s^2+3)}{s(s^2+2)}$$ is an

(a) LC driving point function.
(b) RL driving point function.
(c) RC driving point function.
(d) RLC driving point function. [U.P.S.C. I.E.S. E.E.-I, 2008]

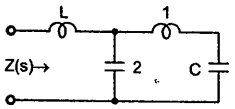
495. Consider the following network functions :

1. $\frac{(s^2+1)(s^2+4)}{(s^2+3)(s^2+9)}$
2. $\frac{(s^2+1)(s^2+9)}{s(s^2+4)}$
3. $\frac{s(s^2+9)}{(s^2+1)(s^2+4)}$
4. $\frac{s(s^2+4)}{(s^2+1)}$

Which of the above functions can represent L-C driving-point admittances ?

(a) Only 1 and 2. (b) Only 2 and 3.
(c) Only 2 and 4. (d) Only 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2006]

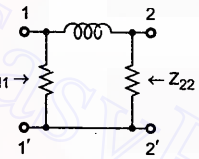
496. For the given driving point impedance function $Z(s) = \frac{4s^4+7s^2+1}{s(2s^2+3)}$, the



circuit realization is shown in the given figure. Then the values of L and C are, respectively,

(a) 0.5 and 3. (b) 2 and 1.
(c) 4 and 1. (d) 4 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2001]

497. If the driving-point impedance Z_{11} of the network shown in the figure is given by



$$Z_{11} = k_1\left(\frac{s+3}{s+8}\right)$$

then what is the driving-point impedance Z_{22} ?

(a) $k_2\left(\frac{s+5}{s+3}\right)$. (b) $k_2\left(\frac{s+5}{s+8}\right)$.
(c) $k_2\left(\frac{s+3}{s+5}\right)$. (d) $k_2\left(\frac{s+8}{s+5}\right)$.

where k_1 and k_2 are scale factors. [U.P.S.C. I.E.S. E.E.-I, 2006]

498. The driving point impedance, $Z(s)$ of an RC network is given by

$$Z(s) = \frac{s^2+4s+3}{s(s+2)}$$

If it is realized in the first foster form, then what shall be the first and the last elements ?

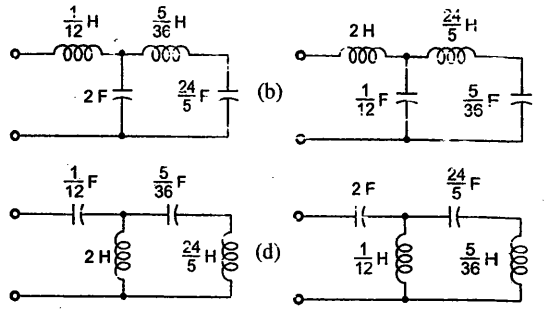
	First element	Last element
(a)	Resistance.	Capacitance.
(b)	Capacitance.	Resistance.
(c)	Resistance.	Resistance.
(d)	Capacitance.	Capacitance.

[U.P.S.C. I.E.S. E.E.-I, 2007]

499. Cauer and Foster forms of realizations are used only for

(a) driving point reactance functions.
(b) transfer reactance functions.
(c) driving point impedance functions.
(d) transfer impedance functions. [U.P.S.C. I.E.S. E.E.-I, 2001]

500. $Z(s) = \frac{2(s^2+1)(s^2+9)}{s(s^2+4)}$ may be synthesized into Cauer first form as



[U.P.S.C. I.E.S. E.E.-I, 2006]

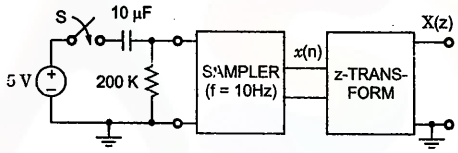
501. Which one of the following is correct ?
Final value theorem is not applicable for the system when the input is :

(a) step. (b) ramp.
(c) parabolic. (d) exponential.
[U.P.S.C. I.E.S. E.E.-I, 2008]

502. If $u(t)$ is the unit step and $\delta(t)$ is the unit impulse function, the inverse z-transform of $F(z) = \frac{1}{z+1}$ for $k > 0$ is

(a) $(-1)^k\delta(k)$. (b) $\delta(k) - (-1)^k$.
(c) $(-1)^k u(k)$. (d) $u(k) - (-1)k$. [GATE E.E. 2005]

Statement for linked Answer Questions 503 and 504 :
In the following network, the switch is closed at $t = 0^-$ and the sampling starts from $t = 0$. The sampling frequency is 10 Hz.



503. The sample $x(n)$ $(n = 0, 1, 2, ...)$ are given by

(a) $5(1 - e^{-0.05n})$. (b) $5e^{-0.05n}$.
(c) $5(1 - e^{-5n})$. (d) $5e^{-5n}$. [GATE E.C.E. 2008]

504. The expression and the region of convergence of the z-transform of the sampled signal are

(a) $\frac{5z}{z-e^5}, |z| < e^{-5}$ (b) $\frac{5z}{z-e^{-0.05}}, |z| < e^{-0.05}$
(c) $\frac{5z}{z-e^{-0.05}}, |z| > e^{-0.05}$ (d) $\frac{5z}{z-e^{-5}}, |z| > e^{-5}$

[GATE E.C.E. 2008]

505. The input to a controller is

(a) sensed signal. (b) error signal.
(c) desired variable value.
(d) signal of fixed amplitude not dependent on desired variable value. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

506. A process is controlled by a PID controlled. The sensor has high measurement noise. How can this effect be reduced ?

(a) By use of a bandwidth limited derivative term.
(b) By use of proportional and derivative terms in the forward path.
(c) By use of high proportional band.
(d) By use of low integral gain. [U.P.S.C. I.E.S. E.T.E.-II, 2007]

507. Consider the following statements :
A first order system with a proportional controller exhibits an offset to a step input. In order to reduce the offset, it is necessary to

Answers: **494.** (a), **495.** (c), **496.** (b), **497.** (b), **498.** (a), **499.** (c), **500.** (b), **501.** (d), **502.** (b), **503.** (b), **504.** (c), **505.** (b), **506.** (b), **507.** (d),

1. increase the gain of proportional controller.
2. add a derivative mode. 3. add an integral mode.

Select the correct answer using the code given below

Codes :

(a) 1, 2 and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.

[U.P.S.C. I.E.S. E.E.-I, 2005]

508. The transfer function of a P-I controller is

(a) $K_p + K_i/s$ (b) $K_p + (K_i/s)$
(c) $(K_p/s) + K_i \cdot s$ (d) $K_p \cdot s + (K_i/s)$

[U.P.S.C. I.E.S. E.E.-I, 2008]

509. A first order dynamic linear system with a proportional controller exhibits an offset to a unit step input. The offset can be reduced by

(a) decreasing the proportional gain.
(b) adding derivative mode.
(c) adding integral mode.
(d) increasing the proportional gain.

[A.M.I.E. Sec B. Control Systems Summer 2007]

510. Which one of the following is a disadvantage of proportional controller ?

(a) It destabilises the system. (b) It produces offset.
(c) It makes response faster.
(d) It has very simple implementation. [U.P.S.C. I.E.S. E.T.E.-II, 2006]

511. Consider the following statements for a PI compensator for a control system :

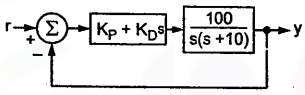
1. It is equivalent to adding a zero at origin.
2. It reduces overshoot.
3. It improves order of the system by 1.
4. It improves steady-state error of the system.

Which of the statements given above are correct ?

(a) 1, 2, 3 and 4. (b) 1, 2, and 3 only.
(c) 2, 3 and 4 only. (d) 1 and 4 only.

[U.P.S.C. I.E.S. E.E.-II, 2007]

512. A control system with a PD controller is shown in the figure. If the velocity error constant $K_V = 1{,}000$ and the damping ratio $\zeta = 0.5$, then the values of K_P and K_D are



(a) $K_P = 100$, $K_D = 0.09$. (b) $K_P = 100$, $K_D = 0.9$.
(c) $K_P = 10$, $K_D = 0.09$. (d) $K_P = 10$, $K_D = 0.9$.

[GATE E.C.E. 2007]

513. A transfer function of a control system does not have pole-zero cancellation. Which one of the following statements is true ?

(a) System is neither controllable nor observable.
(b) System is completely controllable and observable.
(c) System is observable but uncontrollable.
(d) System is controllable but unobservable.

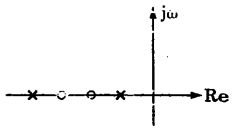
[U.P.S.C. I.E.S. E.E.-I, 2002]

514. For a linear time invariant system, an optimal controller can be designed if

(a) the system is controllable and observable.
(b) the system is uncontrollable but stable.
(c) the system is unstable but observable.
(d) the system is stable and unobservable.

[A.M.I.E. Sec B. Control Systems Winter 2005]

515. The pole-zero plot shown in the figure is that of which one of the following ?



(a) Integrator.
(b) PD controller.
(c) PID controller.
(d) Lag-lead compensator. [U.P.S.C. I.E.S. E.E.-I, 2007]

516. Which of the following are the characteristics of a phase-lead controller ?

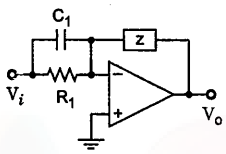
1. When used properly it can increase the damping of the system.
2. It improves rise time. 3. It improves settling time.
4. It affects the steady state error.

Select the correct answer using the code given below :

(a) 1, 2 and 4 (b) 1, 3 and 4
(c) 2, 3 and 4 (d) 1, 2 and 3

[U.P.S.C. I.E.S. E.E.-I, 2007]

517. Group I gives two possible choices for the impedance Z in the diagram. The circuit elements in Z satisfy the condition $R_2C_2 > R_1C_1$. The transfer function V_0/V_i represents a kind of controller. Match the impedances in Group I with the types of controllers in Group II.



Group-I	Group-II
Q. 	1. PID controller
R. 	2. Lead compensator
	3. Lag compensator

(a) Q–1, R-2. (b) Q–1, R–3.
(c) Q–2, R–3. (d) Q–3, R–2. [GATE E.C.E. 2008]

518. A controller transfer function is given by $C(s) = (2s + 1)/(0.2s + 1)$. What is its nature and parameter ?

(a) Lag controller, $\alpha = 10$ (b) Lag controller, $\alpha = 2$
(c) Lead controller, $\beta = 0.1$ (d) Lead controller, $\beta = 0.2$

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

519. The transfer function of a controller is given as $k_p + k_d s$ where k_p and k_d are constants. What type of controller is this ?

(a) Proportional. (b) Proportional plus integral.
(c) Proportional plus derivative.
(d) Integral plus derivative. [U.P.S.C. I.E.S. E.T.E.-II, 2009]

520. The transfer function of a controller is given as $k_p + k_d s + k_i/s$ where k_p, k_d and k_i are constants. What type of controller is this

(a) Proportional. (b) Proportional plus derivative.
(c) Proportional plus integral.
(d) Proportional plus integral plus derivative.

[U.P.S.C. I.E.S. E.T.E.-II, 2009]

Answers: **508.** (b), **509.** (c), **510.** (a), **511.** (c), **512.** (b), **513.** (b), **514.** (a), **515.** (d), **516.** (d), **517.** (b), **518.** (c), **519.** (c), **520.** (d).

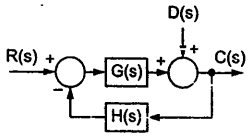
Assertion(A) / Reason (R) Type Questions

Note : Each of the following questions consists of two statements, one labelled 'Assertion (A)' and the other labelled the 'Reason (R)'. Examine the two statements carefully and decide if the Assertion (A) and Reason (R) are individually true and if so whether the Reason (R) is correct explanation of the Assertion (A). Select your answers to these questions using the codes given below:

Codes : (a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

1. In the feedback system C(s), R(s) and D(s) are the system output, input and disturbance, respectively.



(A): For the system $\frac{C(s)[R(s)+D(s)]}{R(s)D(s)} = \frac{1+G(s)}{1+G(s)H(s)}$

(R): Transfer function of a system is defined as the ratio of output Laplace transform and input Laplace transform setting other inputs and the initial conditions to zero.

[U.P.S.C. I.E.S. E.E.-I, 2001]

2. (A): Signal flow graphs can be used for block diagram reduction of linear control system.

(R): Signal flow graph is a graphical representation for the variables representing the outputs of the various blocks of the control system. [U.P.S.C. I.E.S. E.E.-I, 2005]

3. (A): All the systems which exhibit overshoot in transient response will also exhibit resonance peak in frequency response.

(R): Large resonance peak in frequency response corresponds to a large overshoot transient response.

[U.P.S.C. I.E.S. E.E.-I, 2006]

4. (A): All the coefficients of the characteristic equation should be positive and no term should be missing in the characteristic equation for a system to be stable.

(R): If some of the coefficients are zero or negative then the system is not stable. [U.P.S.C. I.E.S. E.E.-I, 2010]

5. (A): The system having characteristic equation $4s^2 + 6s + 1 = 0$ gives rise to underdamped oscillations for a step input.

(R): The undamped natural frequency of oscillation of the system is $\omega_n = 0.5$ rad/s. [U.P.S.C. I.E.S. E.T.E.-II, 2008]

6. (A): The state steady response of a linear network is termed 'forced response'.

(R): The forcing function does not have any effect on the transient response of a linear system. [U.P.S.C. I.E.S. E.E.-I, 1998]

7. (A): For a prototype second order system, the larger the bandwidth, the faster the system will respond.

(R): Bandwidth and rise time are inversely proportional.

[U.P.S.C. I.E.S. E.E.-I, 2007]

8. (A): The impulse response is only a function of the terms in natural response.

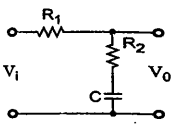
(R): The differentiation and differencing operations eliminate the constant terms associated with the particular solution in the step response and change only the constants associated with exponential terms in the natural response.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

9. (A): The closed-loop system $\frac{C(s)}{R(s)} = \frac{5}{(s+1)(s+5)}$ for a step input can be approximated by system $\frac{C_1(s)}{R(s)} = \frac{1}{s+1}$ for $R(s) = \frac{1}{s}$.

(R): Both $\frac{C(s)}{R(s)}$ and $\frac{C_1(s)}{R(s)}$ have approximately the same transient response. [U.P.S.C. I.E.S. E.E.-I, 2000]

10. (A): The compensating network shown in the given figure is used for reduction of steady-state error in the system response.



(R): A lead compensating network reduces system steady-state error.

[U.P.S.C. I.E.S. E.E.-I, 1998]

11. (A): A system may have no steady state error to a step input, but the same system may exhibit nonzero steady state error to ramp input.

(R): The steady state error of a system depends on the 'type' of the open loop transfer function. [U.P.S.C. I.E.S. E.E.-I, 2002]

12. (A): The stability of a closed-loop system can be obtained from the open-loop transfer function G($j\omega$)H($j\omega$) plot with respect to the critical point (–1, j0) in G($j\omega$) H($j\omega$) plane.

(R): The origin of 1 + G($j\omega$) + H($j\omega$) corresponds to (–1, j0) point in G($j\omega$) H($j\omega$) plane. [U.P.S.C. I.E.S. E.E.-I, 2000]

13. (A): Relative stability of a system reduces due to the presence of transportation lag.

(R): Transportation lag can be conveniently handled by Bode plot.

[U.P.S.C. I.E.S. E.E.-I, 2002]

14. (A): The closed loop stability can be determined from the poles of an open loop system and the polar plot of frequency response.

(R): Unstable system has right half-poles.

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

15. (A): The variation in gain of the system does not alter the phase angle plot in the Bode diagram.

(R): The phase margin of the system is not affected by the variation in gain of the system. [U.P.S.C. I.E.S. E.E.-I, 2005]

16. (A): An unstable control system possesses at least a pair of complex conjugate roots in its s-plane.

(R): Complex conjugate roots always give rise to oscillating responses. [U.P.S.C. I.E.S. E.E.-I, 1999]

17. (A): For a system to be stable, all coefficients of the characteristic polynomial must be positive.

(R): All positive coefficients of the characteristic polynomial of a system is a sufficient condition for stability.

[U.P.S.C. I.E.S. E.E.-I, 2001]

18. (A): The number of separate loci of the closed loop system corresponding to $G(s)\,H(s) = \frac{K(s+4)}{s(s+1)(s+3)}$ is three.

(R): Number of separate loci is equal to number of finite poles of $G(s)\,H(s)$ if the latter is more than the number of finite zeros of $G(s)\,H(s)$. [U.P.S.C. I.E.S. E.E.-I, 2001]

19. (A): Adding a pole to the open-loop transfer function $G(s)\,H(s)$ has the effect of pushing the root loci towards the R.H. s-plane.

Answers: **1.** (a), **2.** (a), **3.** (a), **4.** (a), **5.** (d), **6.** (c), **7.** (a), **8.** (a), **9.** (c), **10.** (c), **11.** (a), **12.** (a), **13.** (b), **14.** (b), **15.** (c), **16.** (d), **17.** (c), **18.** (a), **19.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(R): If the number of poles increases the angle of asymptotes for the complex roots is reduced. [U.P.S.C. I.E.S. E.E.-I, 2007]

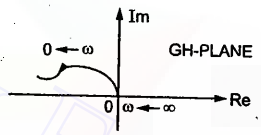
20. (A): Addition of a pole to the forward path transfer function of unity feedback system increases the rise time of step response.
(R): The additional pole has the effect of increasing the bandwidth of the system. [U.P.S.C. I.E.S. E.E.-I, 2009]

21. (A): An addition of real zero at $s = -z_0$ in the transfer function $G(s)\,H(s)$ of a control system results in the increase of stability margin.
(R): An addition of real zero at $s = -z_0$ in the transfer function $G(s)\,H(s)$ will make the resultant root loci bend towards the left. [U.P.S.C. I.E.S. E.E.-I, 2004]

22. (A): If any one of the state variable is independent of the control $u(t)$, the process is said to be completely uncontrollable.
(R): There is no way of driving this particular state variable to a desired state in finite time by means of a control effort. [U.P.S.C. I.E.S. E.E.-I, 2002]

23. (A): For a stable feedback control system, the zeros of the characteristic equation must all be located in the left-half of the s-plane.
(R): The poles of the closed-loop transfer function are the zeros of the characteristic equation. [U.P.S.C. I.E.S. E.E.-I, 2006]

24. The Nyquist plot of a system with the loop transfer function $G(s)\,H(s)$ is shown in the given figure.



(A): The system is unstable.
(R): The Nyquist plot does not encircle the critical point $(1, j0)$. [U.P.S.C. I.E.S. E.E.-I, 1998]

25. (A): Use of lead compensation results in increased system bandwidth.
(R): The angular contribution of the compensator pole is more than that of the compensator zero. [U.P.S.C. I.E.S. E.E.-I, 2003]

26. (A): With lag-lead compensation, the bandwidth of the system is not affected much.
(R): The effect of lag and lead compensations at high frequencies cancel one another. [U.P.S.C. I.E.S. E.E.-I, 2006]

27. (A): The state transition matrix represents the free response of the system.
(R): The state transition matrix satisfies the homogeneous state equation. [U.P.S.C. I.E.S. E.E.-I, 2007]

28. (A): Tachogenerator feedback is used as minor loop feedback in position control systems to improve stability.
(R): Tachogenerator provides velocity feedback which decreases the damping in the system. [U.P.S.C. I.E.S. E.E.-I, 2003]

29. (A): DC servomotors are more commonly used in armature controlled mode instead of in field controlled mode.
(R): Armature controlled dc motors have higher starting torque than field controlled motors. [U.P.S.C. I.E.S. E.E.-I, 2006]

30. (A): The stator windings of a control transformer has higher impedance per phase.
(R): The rotor of a control transformer is cylindrical in shape. [U.P.S.C. I.E.S. E.E.-I, 2009]

31. (A): Servomotors normally have heavier rotors and lower R/X ratio as compared to ordinary motors of similarly ratings.
(R): Servomotors should have smaller electrical and mechanical time constants for faster response. [U.P.S.C. I.E.S. E.E.-I, 2003]

32. (A): For a control system having synchro pair as error detector and dc amplifier as control amplifier, a phase sensitive detector is required to demodulate in place of ordinary diode detector.
(R): Synchro output is a suppressed carrier amplitude modulated signal which cannot be demodulated by ordinary diode detector. [U.P.S.C. I.E.S. E.E.-I, 2005]

33. (A): Stability of a system deteriorates when integral control is incorporated in it.
(R): With integral control order of the system increases, and higher the order of the system more the system tends to become unstable. [U.P.S.C. I.E.S. E.E.-I, 2003]

34. (A): When plant parameter uncertainties are present, the open-loop structure is potentially superior to the close-loop structure.
(R): When feedback is employed, there is a possibility of additional noise or uncertainty in the measurement of the plant signals. [U.P.S.C. I.E.S. E.E.-I, 1998]

35. (A): The effects of noise disturbance and parameter variations are relatively easy to visualize and access through frequency response.
(R): Frequency response test is suitable for systems with very large time constants. [U.P.S.C. I.E.S. E.E.-I, 2010]

36. (A): Process industry applications should ideally be tuned for critical damping.
(R): Critically damped response has no oscillations in the output. [U.P.S.C. I.E.S. E.E.-I, 2010]

37. (A): If the impulse response of a network is available, the response to any arbitrary input can be derived.
(R): The Laplace transform of unit impulse is unity. [U.P.S.C. I.E.S. E.E.-I, 2001]

Answers: **20.** (c), **21.** (a), **22.** (b), **23.** (a), **24.** (c), **25.** (c), **26.** (d), **27.** (c), **28.** (d), **29.** (a), **30.** (d), **31.** (d), **32.** (a), **33.** (a), **34.** (c), **35.** (c), **36.** (a), **37.** (a).

Matching Type Questions

Note: Each of the following questions consists of two lists. Match the items given in list 1 and those in list 2. Select your answers to these questions using the codes given in each of the questions.

1.

List 1 (Physical Action or Activity)	List 2 (Category of System)
A. Human respiration system.	1. Man-made control system.
B. Pointing of an object with a finger.	2. Natural including biological control system.
C. A man driving a car.	3. Control system whose components are both man-made and natural.
D. A thermostatically controlled room heater.	

Answers: **1.** (a),

[U.P.S.C. I.E.S. E.E.-I, 2005]

5.

List 1 (Response)	List 2 (Parameter)
A. Swiftness of transient response.	1. Feedback control.
B. Closeness of the response to the desired response.	2. Type number.
C. Reduction of steady state error.	3. Rise time and peak time.
D. Number of integrators in loop transfer function.	4. Overshoot and settling time.

Codes :	A	B	C	D
(a)	3	4	1	2
(b)	2	1	4	3
(c)	3	1	4	2
(d)	2	4	1	3

[U.P.S.C. I.E.S. E.E.-I, 2005]

6. A second-order control system has a transfer function

$$\frac{C(s)}{R(s)} = \frac{\omega_n^2}{s^2 + 2\delta\omega_n s + \omega_n^2}$$

For unit step input, match List-I with List-II and select the correct answer using the code given below the lists :

List 1 (Time Domain Specification)	List 2 (Expression)
A. Rise time	1. $\dfrac{\pi - \tan^{-1}\left(\dfrac{\sqrt{1-\delta^2}}{\delta}\right)}{\omega_n\sqrt{1-\delta^2}}$
B. Peak time	2. $\dfrac{\pi}{\omega_n\sqrt{1-\delta^2}}$
C. Peak overshoot	3. $e^{(-\pi\delta/\sqrt{1-\delta^2})}$
D. Settling time	4. $\dfrac{4}{\delta\omega_n}$

Codes :	A	B	C	D

B. Sampler	2. Computer
C. Hold	3. D/A converter

Codes :	A	B	C
(a)	3	1	2
(b)	2	3	1
(c)	3	2	1
(d)	2	1	3

[U.P.S.C. I.E.S. E.E.-I, 2002]

38.

List 1 (Type of Controller)	List 2 (Operation)
A. Pneumatic controller.	1. Flexible operation.
B. Hydraulic controller.	2. High torque, high speed operation.
C. Electronic controller.	3. Fire and explosion of proof operation.

Codes :	A	B	C
(a)	1	3	2
(b)	1	2	3
(c)	3	1	2
(d)	3	2	1

[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

39.

List 1 (System)	List 2 (Transfer Function)
A. Lag network	1. $K\left(\frac{1+aTs}{1+Ts}\right)$
B. AC servomotor	2. $K_1 s$
C. Field controlled dc servomotor	3. $\frac{K}{s(1+s\tau_m)(1+s\tau_f)}$
D. Tachogenerator	4. $\frac{K_m}{s(1+s\tau_m)}$

Codes :	A	B	C	D
(a)	3	2	1	4
(b)	1	4	3	2
(c)	3	4	1	2
(d)	1	2	3	4

[U.P.S.C. I.E.S. E.E.-I, 2005]

Answers: **34.** (c), **35.** (a), **36.** (c), **37.** (d), **38.** (d), **39.** (b).

True(T) / False(F) Type Questions

Note: Identify whether the following statements are TRUE (T) or FALSE (F)

1. Each system may have a large number of subsystems.
2. Universe is a large system having infinite small systems.
3. In open loop control system, the control action depends upon the desired output.
4. An open loop control system is one in which the control action is not independent of the output.
5. All control systems operated by present timing mechanism are open loop.
6. In open-loop control system stability cannot be ensured.
7. Closed-loop control systems are generally troubled with problems of instability.
8. In a closed loop control system feedback signal is usually negative.
9. A positive feedback signal improves the performance of an automatic control system.
10. In the presence of nonlinearities the closed-loop control system operates better in comparison to an open loop control system.

Answers: **1.** (T), **2.** (T), **3.** (F), **4.** (F), **5.** (T), **6.** (F), **7.** (F), **8.** (T), **9.** (F), **10.** (T),

11. A linear system obeys superposition theorem.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]
12. The transfer function equation determines the system dynamics.
13. A temperature control system is process control system.
14. Negative feedback reduces the gain of the system.
15. Simultaneous equations can be solved by using signal flow graph technique.
16. Mason's gain formula is used to determine the overall gain of the system.
17. For a system having damping factor zero, the magnitude of the output will be infinite.
18. A high damping ratio will give a high overshoot.
19. Two systems having same damping ratio but different ω_n will have same overshoot.
20. Type of the system and order of the system are one and the same thing.
21. The resonance peak of the system will occur when the system gain is at the critical damping.
22. Velocity feedback increases the damping ratio without affecting undamped natural frequency of the system.
23. For a second order system there is a correlation between frequency and transient response.
24. From the state variable representation of plant, transfer function cannot be determined.
25. Damping due to back emf is observed in armature controlled dc motor.
26. Transfer function of a control system depends on initial conditions of input and output.
27. Transfer function of control system depends on the system parameters alone.
28. The capacitance is not used to fabricate a lag network.
29. The range of frequencies $\omega_2 = 10\omega_1$ is called the decade.
30. The range of frequencies $\omega_2 = 2\omega_1$ is called the octave.
31. Bode plot and Nyquist plot have some relation.
32. From Bode plot static error coefficient cannot be determined.
33. The Bode plot of gain constant is a straight line parallel to the frequency axis with phase angle 0° for positive value and 180° for negative value of gain constant.
34. The polar plot and Nicholas plot can be had from Bode plot and vice versa.
35. The Bode plot is a plot relating log w with magnitude in decibel and phase angle.
36. The closed loop frequency response can be had from open loop frequency plot.
37. The bandwidth of a system is the range of frequencies (of the output) over which the system will respond satisfactorily.
38. Roots of the closed loop control system can be had from Bode plot.
39. The root locus originates at the zeros of the characteristic equation.
40. The polar plot relates the magnitude in decibel with phase angle.
41. According to the Shanon's sampling theorem, the lowest sampling frequency is double the bandwidth.
42. A system is stable if its closed-loop poles are on the RHS of the s-plane. [A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]
43. For a system it is possible that open loop to be unstable but closed loop stable.
44. Active devices cannot be employed for stabilization.
45. A system is absolutely stable if its oscillations are not strong enough to change the parameters of the system.
46. Routh-Hartwiz criterion suggests the way to improve the system stability.
47. Nyquist criteria gives direct value of corner frequency.
48. The root locus terminates at the poles of the characteristic equation.
49. In an unstable system, it is possible to achieve initial equilibrium state.
50. When transient response is satisfactory and steady state characteristics are not satisfactory, normally lag compensation is employed.
51. Phase lag network is employed for increasing system stability as well as bandwidth.
52. Phase lag network is used to increase system stability and maintain velocity gain constant.
53. The friction coefficient in a system is a kept low to increase velocity lag error.
54. A servo with better frequency response need not be stable.
55. Some servos do not need to be stable, since they are intended for use with steady signals.
56. A tachogenerator is a speed sensor.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]
57. The function $F(s) = \dfrac{s+3}{s^2+3s+5}$ is positive real.
58. The final value $y(t)$ of the step response of a single pole (at $s \to a$) system is $y(t) \to a$.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]
59. Integral control action reduces steady state error.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2005]
60. A phase lead controller affects the steady-state error.

Answers: **11.** (T), **12.** (T), **13.** (T), **14.** (T), **15.** (T), **16.** (T), **17.** (T), **18.** (F), **19.** (T), **20.** (F), **21.** (F), **22.** (T), **23.** (T), **24.** (F), **25.** (T), **26.** (F), **27.** (T), **28.** (F), **29.** (T), **30.** (T), **31.** (T), **32.** (F), **33.** (T), **34.** (T), **35.** (T), **36.** (T), **37.** (T), **38.** (F), **39.** (F), **40.** (F), **41.** (T), **42.** (F), **43.** (T), **44.** (F), **45.** (F), **46.** (F), **47.** (F), **48.** (F), **49.** (F), **50.** (T), **51.** (F), **52.** (T), **53.** (F), **54.** (T), **55.** (F), **56.** (T), **57.** (T), **58.** (F), **59.** (T), **60.** (F).

Fill in the Blanks Type Questions

Note: Fill in the blanks with appropriate word or words.

1. Closed loop system is _____ accurate than open-loop system.
2. In a closed loop control system feedback _____ distortion.
3. In a closed loop control system feedback _____ tendency towards oscillations or instability.

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

4. With the feedback system, the transient response _____ rapidly. (decays/rises)
5. A closed loop control system is one in which control action is some how dependent upon the _____.
6. The input which can be independently varied is known as _____.
7. A standard signal used for comparison in a closed-loop control system is called the _____ input.
8. The difference between the output response and the reference signal is known as the _____ signal.
9. Usually actuating signal is at _____ power level.
10. A signal other than the reference which affects the performance of the system is called the _____.
11. The difference between the actual value and ideal value is known as the system _____.
12. The z-transform of $F(s) = 1/s$ is _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
13. A nonlinear system does not obey _____ theorem.
[A.M.I.E. Sec B. Control Systems Summer 2007]
14. For a sampling period T, the sampling frequency ω_s _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
15. For a sampling period T, the relationship between z and s transform variable is $z =$ _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
16. The transfer function of a linear time invariant system $\dot{X} = Ax + Bu$, $Y = Cx + Du$ is given by $G(s) =$ _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
17. A large time constant corresponds to a _____ system.
18. A _____ time constant corresponds to a fast response.
19. For an _____ system, damping factor is less than unity.
20. For an overdamped system, damping factor is _____.
21. The factor $1/j\omega$ has a phase angle of _____.
22. The factor $1/(j\omega)^3$ has a phase angle of _____.
23. The settling time of second order system according to 5% criterion is _____ T.
24. In Bode plots real part is measured by a basic unit known as _____.
25. According to Shanon's sampling theorem, the information contained in a signal is fully preserved in the sampled version so long as the sampling frequency is at least _____ the _____ frequency contained in the signal.
[A.M.I.E. Sec B Control Theory Summer 1994]
26. In a sampled control system if the bandwidth is 2 Hz then the lowest sampling frequency is _____ Hz.
27. The _____ theorem states that every square matrix, A satisfies its own characteristic equation.
[A.M.I.E. Sec B. Control Systems Summer 2007]
28. An n-dimensional linear time invariant system $\dot{\underline{X}} = A\underline{x} + B\underline{u}$ is completely state controllable, if the controllability matrix w is of rank n. The matrix ω is given by _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
29. A position control system is a _____.
30. Steady state accuracy of a servo is _____ than that of a regulator.
31. A _____ amplifier is the amplifier employed for amplification of the small output of the error detector to directly operate the actuator.
32. Steady state time response expression is obtained by the use of a final value _____.
33. The Laplace transform of $f(t) = e^{-at} \sin \omega t$ is $F(s) =$ _____ .
[A.M.I.E. Sec B. Control Systems Summer 2007]
34. $z = (1 + \omega)/(1 - \omega)$ is called _____ transformation.
[A.M.I.E. Sec B. Control Systems Summer 2007]
35. The input to a controller is _____ signal. (error/sensed)

ANSWERS

1. more
2. reduces
3. increases
4. decays
5. output
6. command
7. reference
8. actuating
9. low
10. disturbance
11. error
12. $\frac{z}{z-1}$
13. superposition
14. $2f_s = T/2$
15. e^{sT}
16. $C(sI - A)^{-1} B + D$
17. sluggish
18. small
19. underdamped
20. more than unity
21. $-90°$
22. $-270°$
23. 4
24. neper
25. twice, maximum
26. 4
27. Caley Hamilton
28. $S = [B \; AB \; A^2B \; \ldots \; A^{n-1}B]$
29. servomechanism
30. better
31. servo
32. theorem
33. $\frac{\omega}{(s+a)^2 + \omega^2}$
34. Bilinear
35. error

Model Test Papers

TEST PAPER-I

Time Allowed : 2 Hours *Maximum Marks : 200*

Note: The following 100 items are multiple choice type. Each item comprises four or more responses (answers). Select the response which you feel most appropriate.

1. What is the internal resistance of an ideal current source
(a) 0 (b) 100 (c) 1 (d) Infinity.
[R.G.T.U. Basic Electrical Engineering June 2008]

2. If a network has all linear elements except for a few nonlinear ones, then superposition theorem
(a) cannot hold at all. (b) always holds.
(c) may hold on careful selection of elements values, source waveform and response.
(d) holds in case of direct current excitations.
[U.P.S.C. I.E.S. E.E.-I, 1999]

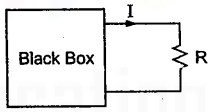
3. Two materials having temperature coefficient of 0.004 and 0.0004 respectively are joined in series. The overall temperature coefficients is approximately
(a) 0.08 (b) 0.04 (c) 0.001 (d) 0.0001
[U.P.S.C. I.E.S. E.E.-I, 2008]

4. The relationship between charge distribution and the electric field is obtained by integrating
(a) Laplace equation. (b) Lorentz gauge equation.
(c) Poisson equation. (d) RWH equation.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

5. A two port network is reciprocal if and only if
(a) $Z_{11} = Z_{22}$ (b) BC – AD = –1
(c) $Y_{12} = Y_{21}$ (d) $H_{12} = H_{21}$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

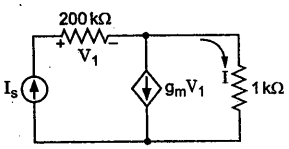
6. The number of branches in a network is b, the number of nodes is n and the number of dependent loop is 1. Then the number of independent current laws will be
(a) $n+l-1$ (b) $b-l$ (c) $b-n$ (d) $n-1$
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

7. The black box as shown in the circuit above contains resistors and independent sources. For R = 0 and 2; the value of current I is 3 and 1.5, respectively. The value of I for R = 1 will be



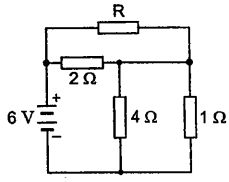
(a) 0.5 (b) 1.5 (c) 2.0 (d) 3.0
[U.P.S.C. I.E.S. E.E.-I, 2003]

8. In the circuit shown in the given figure, if g_m is 0.5 × 10, then the current I will be



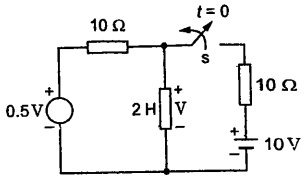
(a) I_s (b) 100 I_s
(c) 101 I_s (d) 200 I_s

9. In the circuit shown above, when is the power absorbed by the 4 Ω resistor maximum?



(a) R = 0 (b) R = 2 Ω
(c) R = 4 Ω (d) R = ∞
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

10. The circuit shown above is under steady-state condition with the switch closed. The switch is opened at $t = 0$. What is the time constant of the circuit ?



(a) 0.1 s (b) 0.2 s
(c) 5 s (d) 10 s
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

11. What does the function $f(x - v_0 t)$ represent?
(a) A stationary wave.
(b) A wave motion in a reverse direction.
(c) A wave motion in a forward direction.
(d) Not a travelling wave.
[U.P.S.C. I.E.S. E.E.-I, 2006]

12. A lossless transmission line of characteristic impedance Z_0 and length $l < \lambda/4$ is terminated at the load end by an open circuit. What is its input impedance Z_S?
(a) $Z_S = jZ_0 \tan \beta l$ (b) $Z_S = jZ_0 \cot \beta l$
(c) $Z_S = -jZ_0 \tan \beta l$ (d) $Z_S = -jZ_0 \cot \beta l$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

13. What is the electric flux density (in $\mu C/m^2$) at a point (6, 4, – 5) caused by a uniform surface charge density of 60 $\mu C/m^2$ at a plane $x = 8$?
(a) $-30\,\bar{a}_x$ (b) $-60\,\bar{a}_x$ (c) $30\,\bar{a}_x$ (d) $60\,\bar{a}_x$
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

14. In the relation $S = \dfrac{1+|\Gamma|}{1-|\Gamma|}$; the value of S and Γ (where S stands for wave ratio and Γ is reflection coefficient), respectively, vary as
(a) 0 to 1 and –1 to 0 (b) 1 to ∞ and –1 to +1
(c) –1 to +1 and 1 to ∞ (d) –1 to 0 and 0 to 1
[U.P.S.C. I.E.S. E.E.-I, 2001]

15. In a dielectric medium of relative permittivity 4, the electric field intensity is 20 sin $(10^8 t - \beta z)\ \bar{a}_y$ V/m and z being in m. The phase shift constant β is
(a) $\frac{1}{3}$ rad /m (b) $\frac{2}{3}$ rad /m (c) $\frac{2\pi}{3}$ rad /m (d) $\frac{1}{6\pi}$ rad /m

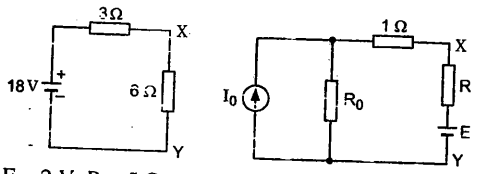
16. Application of the method of images to a boundary value problem in electrostatics involves which one of the following?
(a) Introduction of an additional distribution of charges and removal of a set of conducting surfaces.
(b) Introduction of an additional distribution of charges and an additional set of conducting surfaces.
(c) Removal of a charge distribution and introduction of an additional set of conducting surfaces.
(d) Removal of a charge distribution as well as a set of conducting surfaces will as a set of conducting surfaces.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

Answers: **1.** (d), **2.** (a), **3.** (c), **4.** (c), **5.** (b), **6.** (c), **7.** (c), **8.** (c), **9.** (a), **10.** (b), **11.** (b), **12.** (d), **13.** (a), **14.** (b), **15.** (b), **16.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

17. If the two circuits shown below are equivalent, then which of the following is/are correct?

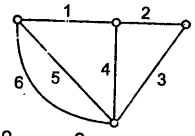


1. E = 2 V, R = 5 Ω
2. E = 4 V, R = 4 Ω
3. E = 6 V, R = 3 Ω
4. E = 10 V, R = 1 Ω

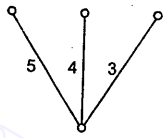
Select the correct answer using the code given below:
(a) Only 1 and 2. (b) Only 3.
(c) 1, 2, 3 and 4. (d) None of these.

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

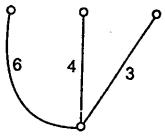
18. The graph of a network is shown in figure above. Which one of the figures shown below is not a tree of the graph?



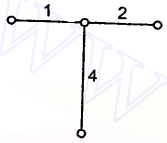
(a)



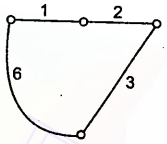
(b)



(c)



(d)



[U.P.S.C. I.E.S. E.E.-I, 2007]

19. In the source free wave equation

$$\nabla^2 \bar{E} - \mu_0 \in_0 \mu \in \frac{\partial^2 \bar{E}}{\partial t^2} - \mu_0 \mu \sigma \frac{\partial \bar{E}}{\partial t} = 0.$$

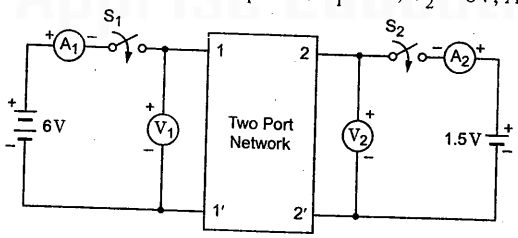
The term responsible for the attenuation of the wave is

(a) $\mu_0 \mu \sigma \frac{\partial \bar{E}}{\partial t}$ (b) $\mu_0 \in_0 \mu \in \frac{\partial^2 \bar{E}}{\partial t^2}$

(c) $\nabla^2 \bar{E}$ (d) $\mu_0 \mu \sigma \frac{\partial \bar{E}}{\partial t}$ and $\mu_0 \in_0 \mu \in \frac{\partial^2 \bar{E}}{\partial t^2}$

[U.P.S.C. I.E.S. E.E.-I, 2001]

Statement for linked Answer Questions 20 and 21:
A two-port network shown below is excited by external dc sources. The voltages and currents are measured with voltmeters V_1, V_2 and ammeters A_1, A_2 (all assumed to be ideal) as indicated. Under following switch conditions, the readings obtained are:
(i) S_1 – Open, S_2 – closed $A_1 = 0A$, $V_1 = 4.5V$, $V_2 = 1.5V$, $A_2 = 1A$
(ii) S_1 – Closed, S_2 – Open $A_1 = 4A$, $V_1 = 6V$, $V_2 = 6V$, $A_2 = 0A$



20. The *z*-parameter matrix for this network is

(a) $\begin{bmatrix} 1.5 & 1.5 \\ 4.5 & 1.5 \end{bmatrix}$ (b) $\begin{bmatrix} 1.5 & 4.5 \\ 1.5 & 4.5 \end{bmatrix}$

(c) $\begin{bmatrix} 1.5 & 4.5 \\ 1.5 & 1.5 \end{bmatrix}$ (d) $\begin{bmatrix} 4.5 & 1.5 \\ 1.5 & 4.5 \end{bmatrix}$

21. The *h* - parameter matrix for this network is

(a) $\begin{bmatrix} -3 & 3 \\ -1 & 0.67 \end{bmatrix}$ (b) $\begin{bmatrix} -3 & -1 \\ 3 & 0.67 \end{bmatrix}$

(c) $\begin{bmatrix} 3 & 3 \\ 1 & 0.67 \end{bmatrix}$ (d) $\begin{bmatrix} 3 & 1 \\ -3 & -0.67 \end{bmatrix}$

[GATE E.C.E. 2008]

22. Number of fundamental cut-sets of any graph will be
(a) same as the number of twigs.
(b) same as the number of tree branches.
(c) same as the number of nodes.
(d) equal to 1.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

23. What is the attenuation constant α for distortionless transmission line?

(a) $\alpha = 0$ (b) $\alpha = R\sqrt{\frac{C}{L}}$ (c) $\alpha = R\sqrt{\frac{L}{C}}$ (d) $\alpha = \sqrt{\frac{RL}{C}}$

[U.P.S.C. I.E.S. E.E.-I, 2005]

24. Who developed the concept of time varying electric field producing a magnetic field?
(a) Gauss (b) Faraday (c) Hertz (d) Maxwell.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

25. What will be the equipotential surfaces by a pair of equal and opposite line charges?
(a Spheres. (b) Concentric cylinders.
(c) Non-concentric cylinders.
(d) None of the above.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

26. A series R-C circuit with R = 3 Ω and X_C = 4 Ω at 50 Hz is supplied with a voltage $V = 50 + 141.4 \sin 314t$. What is the rms value of the current flowing through the circuit?
(a) 5 A (b) 10 A (c) 20 A (d) 22.36 A

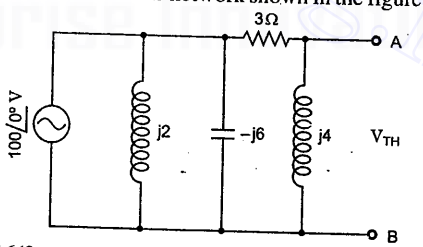
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

27. Consider the following statements regarding the properties of an R-L-C series circuit under resonance:
1. Current in the circuit is in phase with applied voltage.
2. Voltage drop across capacitor C and inductance L are equal in magnitude.
3. Voltage across the capacitor is equal in magnitude to the applied voltage.
4. Current in the circuit is maximum.

Which of the above statements is/are correct?
(a) 1 Only. (b) 1, 2 and 4. (c) 2 and 4. (d) 1, 3 and 4.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

28. The Thevenin equivalent voltage V_{TH} appearing between the terminals A and B of the network shown in the figure is given by



(a) $j16(3 - j4)$ (b) $j16(3 + j4)$
(c) $16(3 + j4)$ (d) $16(3 - j4)$ [GATE E.C.E. 1999]

29. While applying reciprocity theorem
(a) initial conditions are taken into consideration.
(b) impedances are real quantities.
(c) admittances are real quantities.
(d) none of the above.

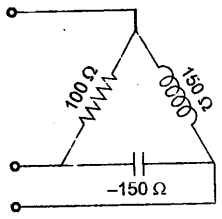
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]

Answers: **17.** (c), **18.** (d), **19.** (a), **20.** (c), **21.** (a), **22.** (a), **23.** (b), **24.** (b), **25.** (c), **26.** (d), **27.** (b), **28.** (a), **29.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

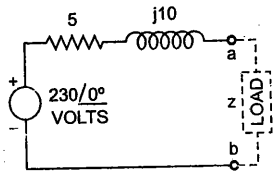
30. A set of 3 equal resistors, each of value R_X connected in star across R_{YB} in place of load as shown in the given figure consumes the same power as the unbalanced delta connected load. The value of R_X is



(a) 33.33 Ω (b) 100 Ω
(c) 173.2 Ω (d) 300 Ω

[U.P.S.C. I.E.S. E.E.-II, 1995]

31. The generator with internal impedance of $5 + j10$ has a voltage $230\angle 0°$ across its terminals a b as shown in the figure given below. A load is connected across terminals a b. For maximum power to be transmitted by the generator to the load, the impedance of the load to be connected across a b should be



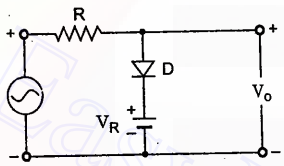
(a) $+j10$ (b) $5 - j10$ (c) $-5 - j10$ (d) 15

[U.P.S.C. I.E.S. E.E.-I, 1993]

32. Any waveform can be expressed in Fourier series if

(a) sampling conditions are satisfied.
(b) Dirchiet conditions are satisfied.
(c) Maxwell's conditions are satisfied.
(d) none of the above conditions is required to be satisfied.

33. If a sinusoidal input is applied to the circuit shown in the given figure, the output waveform of V_o will be



(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.T.E.-I, 2000]

34. The impedance functions of passive elements are given below:

(A) $\dfrac{s(s+4)}{(s+2)(s+6)}$ (B) $\dfrac{s(s^2+4)}{(s^2+1)(s^2+9)}$

(C) $\dfrac{s(s+4)(s+20)}{(s+16)}$

(a) (A), (B), (C) are R-C, L-C and R-L networks.
(b) (A), (B), (C) are L-C, R-L and R-C networks.
(c) (A), (B), (C) are L-C, R-C and R-L networks.
(d) (A), (B), (C) are R-L, L-C and R-C networks.

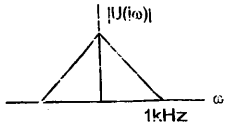
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

35. The convolution of $f(t)$ with itself is given to be $\int_0^t F(\tau)\, d\tau$. Then what is $f(t)$?

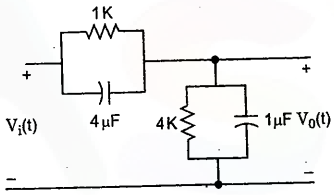
(a) The unit ramp function. (b) Equal to 1.
(c) The unit step function. (d) The unit impulse function.

[U.P.S.C. I.E.S. E.T.E.-I, 2008]

36. The frequency spectrum of a signal is shown in the figure. If this is ideally sampled at intervals of 1 ms, then the frequency spectrum of the sampled signal will be



(a) 
(b) 
(c) 
(d) 
37. In the figure shown below, assume that all the capacitors are initially uncharged. If $v_i(t) = 10u(t)$ volts, $v_o(t)$ is given by



(a) $8e^{-t/0.004}$ Volts. (b) $8\,(1 - e^{-t/0.004})$ Volts.
(c) $8u(t)$ Volts. (d) 8 Volts. [GATE E.C.E. 2006]

38. The Laplace transform of $e^{-at} \sin \omega t$ is

(a) $\dfrac{s}{(s+a)^2+\omega^2}$ (b) $\dfrac{\omega}{(s+a)^2+\omega^2}$

(c) $\dfrac{as}{(s^2+\omega^2)}$ (d) $\dfrac{a\omega}{(s^2+\omega^2)}$

[A.M.I.E. Sec B. Control Systems Winter 2005]

39. The response $c(t)$ of a system to a input $r(t)$ is given by the following differential equation

$$\frac{d^2c(t)}{dt^2} + \frac{3\,dc(t)}{dt} + 5c(t) = 5r(t)$$

The transfer function of the system is given by

(a) $G(s) = \dfrac{1}{s^2+3s+5}$ (b) $G(s) = \dfrac{5}{s^2+3s+5}$

(c) $G(s) = \dfrac{3s}{s^2+5s+3}$ (d) $G(s) = \dfrac{3s}{s^2+3s+3}$

[A.M.I.E. Sec B. Control Systems Summer 2006]

40. In a series RLC circuit containing a voltage source $v(t)$, choose the current i and the voltage v_c across the capacitor as the state variables x_1 and x_2 respectively. Show that the state equation is

(a) $\begin{pmatrix} \frac{dx_1}{dt} \\ \frac{dx_2}{dt} \end{pmatrix} = \begin{pmatrix} \frac{R}{L} & \frac{1}{L} \\ \frac{1}{C} & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} + \begin{pmatrix} \frac{1}{L} \\ 0 \end{pmatrix} v(t)$

Answers: **30.** (b), **31.** (b), **32.** (b), **33.** (d), **34.** (d), **35.** (c), **36.** (b), **37.** (b), **38.** (b), **39.** (b), **40.** (b),

(b) $\begin{pmatrix} \frac{dx_1}{dt} \\ \frac{dx_2}{dt} \end{pmatrix} = \begin{pmatrix} \frac{-R}{L} & \frac{-1}{C} \\ \frac{1}{C} & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} + \begin{pmatrix} \frac{1}{L} \\ 0 \end{pmatrix} v(t)$

(c) $\begin{pmatrix} \frac{dx_1}{dt} \\ \frac{dx_2}{dt} \end{pmatrix} = \begin{pmatrix} \frac{-R}{L} & \frac{-1}{L} \\ \frac{1}{L} & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} + \begin{pmatrix} \frac{1}{C} \\ 0 \end{pmatrix} v(t)$

(d) $\begin{pmatrix} \frac{dx_1}{dt} \\ \frac{dx_2}{dt} \end{pmatrix} = \begin{pmatrix} \frac{-R}{L} & \frac{-1}{L} \\ \frac{-1}{C} & 0 \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} + \begin{pmatrix} \frac{-1}{C} \\ 0 \end{pmatrix} v(t)$

[A.M.I.E. Sec B. Control System Summer 2005]

41. Which of the following statements is/are true for the diamond structure?
1. Coordination number is four.
2. Packing fraction is 0.34.
3. Copper crystallizes into diamond structure.
4. Lattic is FCC.

(a) 1 only. (b) 1, 2 and 4.
(b) 2 and 3 only. (d) 2, 3, and 4.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

42. Which of the following materials is not an insulator?
(a) Diamond. (b) Graphite.
(c) Bakelite. (d) Lucite.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

43. Which of the following is not a conducting material?
(a) Copper. (b) Tungsten.
(c) Germanium. (d) Platinum.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

44. The fuse material used in electrical lines must have which one of the following properties?
(a) High resistivity. (b) Low conductivity.
(c) High melting point. (d) Low melting point.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

45. Manganin an alloy of copper and manganese is used in
(a) soldering material. (b) heating elements.
(c) ballast resistors. (d) standard resistances.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

46. Which one of the following pairs is not correctly matched?
(a) NaCl Diamagnetic
(b) Gd Paramagnetic
(c) Ferrite Ferrimagnetic
(d) Cr_2O_3 Ferromagnetic

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

47. Which one of the following materials is used for making permanent magnets?
(a) Steel. (b) Carbon. (c) Carbon steel. (d) Graphite.

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

48. Effective Q of the equivalent electrical circuit of quartz crystal is of the order of
(a) 200 (b) 2,000 (c) 20,000 (d) 2,00,000

[U.P.S.C. I.E.S. E.T.E.-I, 2009]

49. Consider the following statements: Superconductivity in a material can be destroyed by
1. increasing the temperature above a certain limit.
2. applying a magnetic field above a certain limit.
3. passing a current, above a certain limit, through the material.
4. decreasing the temperature to a point below the critical temperature.

Of these statements
(a) 2, 3 and 4 are correct. (b) 1, 3 and 4 are correct.
(c) 1, 2 and 3 are correct. (d) 1, 2 and 4 are correct.

[U.P.S.C. I.E.S. E.E.-I, 1993]

50. What type of magnetic behavior is observed in a type I superconductor ?
(a) Perfect diamagnetism. (b) Perfect paramagnetism.
(c) Perfect ferromagnetism. (d) Perfect ferrimagnetism.

[U.P.S.C. I.E.S. E.E.-I, 1995]

51. Purely mechanical instruments cannot be used for dynamic measurements because they have
(a) high inertia. (b) large time constant.
(c) high response time. (d) all of the above.

[A.M.I.E. Winter 1998]

52. A 0-250 V voltmeter has a guaranteed accuracy of 1% full-scale reading (deflection). The voltage measured by this instrument is 100 V. The limiting error is given by
(a) 1.25% (b) 25% (c) 0.25% (d) 2.5%

[U.P.S.C. I.E.S. E.T.E.-2008]

53. The absolute measurement of resistance involves the measurement of
(a) length and time. (b) length and mass.
(c) velocity. (d) acceleration.
(e) either (a) or (c).

54. The 'voltage stability with time' of reference diodes incorporating Zener diodes is comparable to that of which of the following?
(a) Dry cells. (b) Nickel-cadmium cells.
(c) Lead-acid accumulator batteries.
(d) Conventional standards cells. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

55. To increase voltage measurement range of a voltmeter, it is
(a) shunted by a high resistance.
(b) put in series with a high resistance.
(c) put in series with a low resistance.
(d) shunted by a low resistance.

[A.M.I.E. Sec B. Circuit Theory and Control Winter 2007]

56. Consider the following statements in respect of two types of a dynamometer wattmeter connection as shown above in figure (a) and figure (b)?

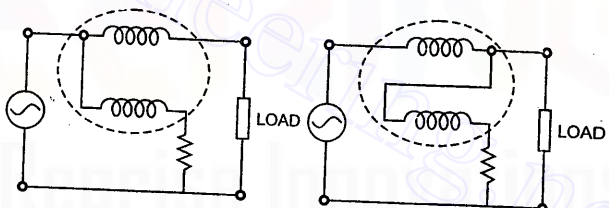

Fig. (a) Fig. (b)

1. Figure (*a*) is used when applied voltage is high and load current flowing is low.
2. Figure (*b*) is used when applied voltage is low and load current flowing is high.
3. If the order of connections in Statements 1 and 2 are in opposite order, gross error will be increased.
4. If the order of connections in Statements 1 and 2 are in opposite order, gross error will be reduced.

Which of the following statements given above are correct?
(a) Only 1 and 2. (b) Only 1 and 3.
(c) 1, 2, and 3. (d) 1, 2, and 4.

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

57. What is the major cause of creeping in an energy meter?
(a) Over compensation for friction.
(b) Mechanical vibrations.

Answers: **41.** (b), **42.** (b), **43.** (c), **44.** (d), **45.** (d), **46.** (b), **47.** (c), **48.** (c), **49.** (c), **50.** (a), **51.** (a), **52.** (d), **53.** (e), **54.** (b), **55.** (b), **56.** (c), **57.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

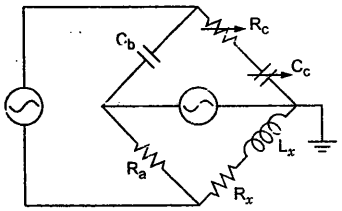
(c) Excessive voltage across the potential coil.
(d) Stray magnetic fields. [U.P.S.C. I.E.S. E.T.E.-I, 2009]

58. Which of the following meter cannot measure ac quantities?
(a) Thermocouple. (b) Hot wire.
(c) PMMC. (d) Electrodynamometer.
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

59. Kelvin double bridge is used for measuring
(a) high resistance. (b) low inductance.
(c) low resistance. (d) high resistance.
[A.M.I.E. Sec B. Measurements and Control Winter 2006]

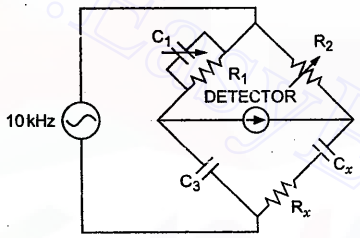
60. Hay's bridge is used to measure inductance of a coil of Q value
(a) less than 10. (b) more than 10.
(c) more than 100. (d) none of these.
[A.M.I.E. Sec B. Measurements and Control Summer 2006]

61. The figure shows 'Owen bridge' arranged to measure incremental inductance of the unknown inductance L_x, R_x, At balance, what are the value of L_x and R_x?



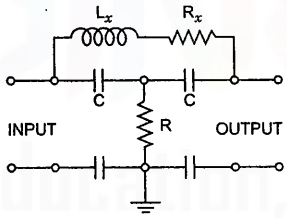
(a) $L_x = \frac{R_a R_c}{C_b}, R_x = \frac{R_a C_b}{C_c}$ (b) $L_x = R_a R_c C_b, R_x = R_a C_b C_c$
(c) $L_x = \frac{R_a R_c}{C_b}, R_x = \frac{R_a C_c}{C_b}$ (d) $L_x = R_a R_c C_b, R_x = \frac{R_a C_b}{C_c}$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

62. The AC bridge is supplied with a source of 10 kHz as shown in the figure. What is the value of C_x?



(a) $C_3 \frac{R_1}{R_2}$
(b) $C_3 \frac{R_2}{R_1}$
(c) $C_3 \frac{R_x}{R_1}$
(d) $C_3 \frac{R_2}{R_x}$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

63. The bridged-T network circuit shown in the figure can be used for determination of inductance and Q of RF coil. L_X and R_X are unknown parameters of the coil. Using equations for balance, what are the values of L_X and R_X?



(a) $L_X = \frac{2}{\omega^2 C}, R_X = \frac{1}{R(\omega C)^2}$ (b) $L_X = \frac{1}{\omega^2 C}, R_X = \frac{1}{R(\omega C)^2}$
(c) $L_X = \frac{1}{\omega^2 C}, R_X = \frac{1}{\omega^2 CR}$ (d) $L_X = \frac{2}{\omega^2 C}, R_X = \frac{1}{R(\omega C)^2}$
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

64. Which of the following devices are used at the first stage of an electronic voltmeter?
(a) BJT (b) SCR (c) MOSFET (d) UJT
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

65. What is the advantage of an electronic voltmeter over a non-electronic voltmeter?
(a) Low power consumption.
(b) Low input impedance.
(c) The ability to measure wide ranges of voltages and resistances.
(d) Low portability. [U.P.S.C. I.E.S. E.T.E.-I, 2009]

66. An average response rectifier electronic voltmeter has a dc voltage of 10 V applied to it. What is the meter reading?
(a) 7.1 V (b) 10 V (c) 11.1 V (d) 22.2 V
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

67. A certain oscilloscope with 4 cm × 4 cm screen has its own sweep output fed to its input. If the X and Y sensitivities are same, what will the oscilloscope display?
(a) Triangular wave. (b Straight line.
(c) Since wave. (d) Circle.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

68. Which one of the following is not true of digital instruments?
(a) Loading of the circuit under measurement is less.
(b) Accuracy is better.
(c) Free from observational errors.
(d) Can present the reading in overall context of range.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

69. The best use of a resistance thermometer is in which range?
(a) Between 600° C to about 1100° C.
(b) Between 1100° C to 1400° C.
(c) Between 1400° C to 1800° C.
(d) Above 1800° C. [U.P.S.C. I.E.S. E.T.E.-I, 2007]

70. Which one of the following is the correct statement?
Thermistor
(a) is non-metallic resistor.
(b) has positive temperature coefficient.
(c) is chemically unstable.
(d) requires cold junction compensation.
[U.P.S.C. I.E.S. E.T.E.-I, 2006]

71. In an analog data acquisition unit, what is correct sequence of the blocks starting from the input?
(a) Transducer-Recorder-Signal conditioner
(b) Transducer-Signal conditioner-Recorder
(c) Signal conditioner-Transducer-Recorder
(d) Signal conditioner-Recorder-Transducer
[U.P.S.C. I.E.S. E.E.-I, 2005]

72. Which one of the following statements is not correct?
(a) Data loggers are usually of digital types.
(b) A digital voltmeter is essentially an A-D converter.
(c) A servo-type potentiometric recorder has a frequency response better than that of a galvanometric recorder.
(d) In digital transducers, there are ergonomic advantages in presenting digital data. [U.P.S.C. I.E.S. E.T.E.-I, 2008]

73. The advantages of *x-y* recorders are that
(a) they are economical to operate.
(b) they are easy and convenient to use.
(c) they are cheaper than strip-chart recorders.
(d) they can be conveniently used for continuous recording.
(e) both (a) and (b).

74. The main short-comings of diaphragms are that
(a) they are difficult to repair.
(b) they are prone to shock vibrations.
(c) poor stability and reliability.
(d) high hysteresis and creep.
(e) both (a) and (b).

75. Strain gauge, LVDT and thermocouple may be classified as
(a) active transducers. (b) analog transducers.
(c) primary transducers. (d) none of the above.
[U.P.S.C. I.E.S. E.E.-I, 1992]

Answers: **58.** (c), **59.** (c), **60.** (b), **61.** (d), **62.** (a), **63.** (b), **64.** (c), **65.** (a), **66.** (c), **67.** (b), **68.** (d), **69.** (a), **70.** (a), **71.** (b), **72.** (c), **73.** (e), **74.** (e), **75.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

76. Bonded strain gauges are
(a) exclusively used for construction of transducers.
(b) exclusively used for stress analysis.
(c) used for both stress analysis and for construction of transducers.
(d) none of the above.

77. LVDT has following advantage(s)
(a) infinite resolution, high sensitivity and very high output.
(b) low hysteresis, good repeatability and capability of tolerating shock and vibrations.
(c) good dynamic response. (d) both (a) and (b).

78. Thermal conductivity gauges have the following shortcomings
(a) these gauges need individual calibration and frequent checking.
(b) these gauges burn out when exposed to atmospheric pressure during operation.
(c) these gauges get easily damaged by organic vapours.
(d) all of the above.

79. In comparison to PPM, which of the following statements is/are true for PDM ?
(a) The pulse amplitude in PDM remains constant.
(b) The PDM transmitter should be able to handle maximum width pulse.
(c) PDM will still work if synchronisation between transmitter and receiver fails.
(d) all of the above.

80. The steady state error due to a ramp input for a type two system is equal to
(a) zero. (b) Infinite.
(c) non-zero number. (d) constant.
[U.P.S.C. I.E.S. E.E.-I, 2001]

81. For a stable feedback system, the phase margin
(a) is always positive.
(b) is always negative.
(c) may be positive or negative.
(d) none of these.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

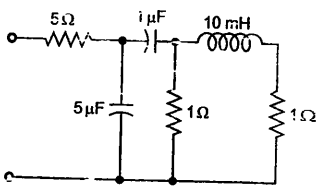
82. A system function has a single zero and single pole. The constant multiplier 'K' is 1. For the given excitation sin t, the response is $\sqrt{2}$ with 45° lagging. The system has a pole and zero respectively at
(a) zero and 1. (b) infinity and – 1.
(c) – 1 and zero. (d) zero and – 1.
[U.P.S.C. I.E.S. E.E.-I, 1999]

83. None of the poles of a linear control system lie in the right half of s-plane. For bounded input, the output of this system
(a) is always bounded. (b) could be unbounded.
(c) always tends to zero. (d) none of the above.
[GATE E.E. 1998]

84. The number of roots on the equation
$2S^4 + S^3 + 3S^2 + 5S + 7 = 0$ that lie in the right half of s plane is
(a) Zero (b) One (c) Two (d) Three
[GATE E.E. 1998]

85. The auxiliary polynomial for a system with characteristic equation
$f(s) = s^6 + s^5 + 3s^4 + 2s^3 + 11s^2 + 9s + 9$ is
(a) $4s^3 + 4s$ (b) $12s^2 + 4$
(c) $s^4 + 2s^2 + 9$ (d) $s^5 + s^3 + 9s$
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]

86. The minimum number of states necessary to describe the network shown in the figure in a state variable form is
(a) 2 (b) 3
(c) 4 (d) 6



[U.P.S.C. I.E.S. E.E.-I, 1998]

87. The block diagrams in figure-I and figure-II are equivalent if 'X' (in figure-II) is equal to

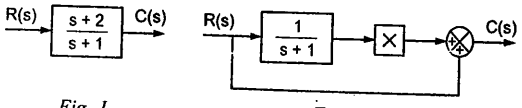


Fig. I *Fig. II*

(a) 1 (b) 2 (c) $s + 1$ (d) $s + 2$
[U.P.S.C. I.E.S. E.E.-I, 1999]

88. A driving-point impedance function is given by

$$F = \frac{(s+k_1)(s+k_2)(s+k_3)}{(s+1)(s+2)(s+3)(s+4)}.$$

The product k_1, k_2, k_3 cannot be more than
(a) 48 (b) 24 (c) 10 (d) 4
[U.P.S.C. I.E.S. E.E.-I, 2000]

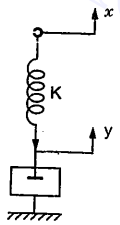
89. The acceleration error constant of a stable canonical feedback system is given by
(a) $\lim_{s\to 0} s.G(s)$ (b) $\lim_{s\to 0} G(s)$
(c) $\lim_{s\to 0} s^2 G(s)$ (d) $\lim_{s\to \infty} G(s)$
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

90. The Nyquist plot of $G(j\omega)H(j\omega)$ for a closed loop control system, passed through $(-1, j0)$ point in the GH plane. The gain margin of the system in dB is equal to
(a) infinite. (b) greater than zero.
(c) less than zero. (d) zero. [GATE E.C.E. 2006]

91. The response of a control system having damping factor unity will be
(a) oscillatory. (b) underdamped.
(c) critically damped. (d) none.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

92. If a uniform plane wave propagating in the direction $(4\hat{a}_x - 2\hat{a}_y + \hat{a}_z)$ has its E field in the direction $(4\hat{a}_x - 2K\hat{a}_y + 4K\hat{a}_z)$, the value of K must be
(a) 2 (b) – 2 (c) 1 (d) zero
[U.P.S.C. I.E.S. E.E.-I, 2000]

93. The mechanical system shown below has its pole(s) at



(a) $\frac{-K}{D}$ (b) $\frac{-D}{K}$ (c) $-DK$
(d) $-0, -\frac{K}{D}$
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2005]

94. The phase lead compensation is used to
(a) increase rise time and decrease overshoot.
(b) decrease both rise time and overshoot.
(c) increase both rise time and overshoot.
(d) decrease rise time and increase overshoot. [GATE E.E. 1998]

Answers: **76.** (c), **77.** (d), **78.** (d), **79.** (d), **80.** (a), **81.** (a), **82.** (d), **83.** (b), **84.** (c), **85.** (c), **86.** (b), **87.** (a), **88.** (b), **89.** (c), **90.** (d), **91.** (c), **92.** (b), **93.** (d), **94.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

95. Maximum phase-lead of the compensator $D(s) = \frac{(0.5s+1)}{(0.05s+1)}$, is

(a) 52 deg at 4 rad/sec. (b) 52 deg at 10 rad/sec.
(c) 55 deg at 12 rad/sec.
(d) None of the answers is correct. [GATE E.E. 2000]

96. The matrix $P = \begin{bmatrix} 1 & 1 \\ 1 & 2 \end{bmatrix}$ is

(a) positive definite. (b) negative definite.
(c) positive semi-definite. (d) negative semi-definite.
[A.M.I.E. Sec B. Control Systems Winter 2005]

97. The state equation of a linear system is given by $\dot{X} = AX + BU$, where

$$A = \begin{bmatrix} 0 & 2 \\ -2 & 0 \end{bmatrix} \text{ and } B = \begin{bmatrix} 0 \\ 1 \end{bmatrix}$$

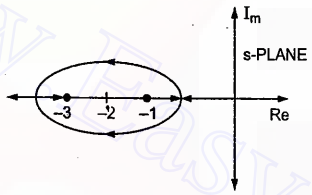
The state transition matrix of the system is

(a) $\begin{bmatrix} e^{2t} & 0 \\ 0 & e^{2t} \end{bmatrix}$ (b) $\begin{bmatrix} e^{-2t} & 0 \\ 0 & e^{2t} \end{bmatrix}$

(c) $\begin{bmatrix} \sin 2t & \cos 2t \\ -\cos 2t & \sin 2t \end{bmatrix}$ (d) $\begin{bmatrix} \cos 2t & \sin 2t \\ -\sin 2t & \cos 2t \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 1999]

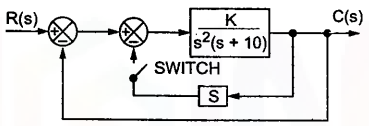
98. The root-locus of a unity feedback system is shown in the given figure. The open-loop transfer function of the system is



(a) $\frac{K}{s(s+1)(s+3)}$
(b) $\frac{K(s+1)}{s(s+3)}$
(c) $\frac{K(s+3)}{s(s+1)}$
(d) $\frac{Ks}{(s+1)(s+3)}$

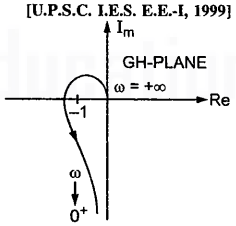
[U.P.S.C. I.E.S. E.E.-I, 1999]

99. The control system shown in the given figure has an internal feedback loop. The closed-loop system for open and close conditions of switch will be respectively



(a) unstable and stable. (b) unstable and unstable.
(c) stable and unstable. (d) stable and stable.
[U.P.S.C. I.E.S. E.E.-I, 1999]

100. The Nyquist plot of the open-loop transfer function of a feedback control system is shown in the given figure. If the open-loop poles and zeros are all located in the left half of the s-plane, then the number of closed-loop poles in the right half of the s-plane will be



(a) zero (b) 1 (c) 2 (d) 3
[U.P.S.C. I.E.S. E.E.-I, 1999]

Use following codes for questions from 101 to 110.

(a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

101. (A): In a linear network, the superposition theorem can be used to calculate power dissipation in a resistive branch of the network.
(R): Superposition theorem is valid for currents and voltages, and therefore is valid also for power dissipation.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

102. (A): Ideal current sources and ideal voltage sources do not exist is reality.
(R): All sources have finite internal impedances.
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

103. (A): Capacitance of a solid conducting spherical body of radius 'a' is given by $4\pi\varepsilon_0 a$ in free space.
(R): $\nabla \times H = j\omega \varepsilon E + J$ [U.P.S.C. I.E.S. E.T.E.-I, 2009]

104. (A): The Ohm's law does not hold good in ac circuits.
(R): Variations in current and applied voltage set up magnetic and electrostatic effects respectively and these effects are to be taken into account with the circuit resistance while determining relation between V and I.

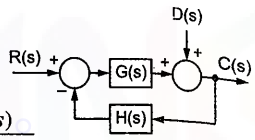
105. (A): Hard magnetic materials are used for making cores of electrical machines.
(R): Hard magnetic materials after magnetization store a considerable amount of magnetic energy, and retain it for a long time.

106. (A): The quality of measurement is indicated preferably in terms of relative error.
(R): The absolute error of measurement does not indicate precisely the accuracy of measurements.

107. (A): The Q-meter measures the Q-factor of a coil when the circuit is in resonance.
(R): The Q-factor of a coil depends only on its inductance and not on its resistance. [U.P.S.C. I.E.S. E.E.-I, 1993]

108. (A): In a good quality cassette audio tape recorder, ac bias is provided for recording purposes to improve the quality.
(R): The ac bias provided for recording in an audio tape recorder takes care of the non-linearity of the head.
[U.P.S.C. I.E.S. E.E.-I, 2000]

109. In the feedback system $C(s)$, $R(s)$ and $D(s)$ are the system output, input and disturbance, respectively.



(A): For system

$$\frac{C(s)[R(s)+D(s)]}{R(s)D(s)} = \frac{1+G(s)}{1+G(s)H(s)}$$

(R): Transfer function of a system is defined as the ratio of output Laplace transform and input Laplace transform setting other inputs and the initial conditions to zero.
[U.P.S.C. I.E.S. E.E.-I, 2001]

110. (A): Laplace transform of

$$e^{-at}\sin\omega t = \frac{\omega}{(s+a)^2+\omega^2}$$

(R): If Laplace transform of $f(t) = F(s)$, Laplace transform of $e^{-at}f(t) = F(s+a)$ [U.P.S.C. I.E.S. E.E.-II, 1993]

111. Match List-1 with List-2 and select the correct answer using the code given below the lists:

	List 1 (Term)	List 2 (Concept)
A.	Norton equivalent of one port.	1. Network where loop and node equations have a symmetric coefficients matrix.
B.	Open-circuit output admittance.	2. Hybrid parameter h_{22}.

Answers: **95.** (d), **96.** (a), **97.** (d), **98.** (c), **99.** (a), **100.** (b), **101.** (a), **102.** (a), **103.** (b), **104.** (a), **105.** (d), **106.** (a), **107.** (c), **108.** (a), **109.** (a), **110.** (a), **111.** (b),

TEST PAPER-II

Time Allowed : 2 Hours *Maximum Marks : 200*

Note: The following 100 items are multiple choice type. Each item comprises four or more responses (answers). Select the response which you feel most appropriate.

1. If a current carrying coil is placed in a uniform magnetic field with its plane perpendicular to the direction of magnetic induction, then
(a) the net force and torque on the coil are both zero.
(b) the net force is zero but torque is finite.
(c) the net force is finite but torque is zero.
(d) the net force and torque are both finite.
[A.M.I.E. Sec B. Elec. Machines Summer 1997]

2. For a P-pole machine, the relation between electrical and mechanical degrees is given by
(a) $\theta_{elec} = \frac{2}{P}\theta_{mech}$. (b) $\theta_{elec} = \frac{4}{P}\theta_{mech}$.
(c) $\theta_{elec} = P\theta_{mech}$. (d) $\theta_{elec} = \frac{P}{2}\theta_{mech}$.

3. In a dc motor the windage loss is proportional to
(a) supply voltage. (b) square of the supply voltage.
(c) square of the flux density.
(d) square of the armature speed.
[A.M.I.E. Elec. Science Summer 1995]

4. Poles of dc machine are often laminated to
(a) reduce pulsation loss. (b) reduce armature reaction.
(c) reduce iron weight. (d) dissipate more heat.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

5. In dc machines, the air gap flux distribution in space at no load is
(a) sinusoidal. (b) triangular.
(c) flat topped. (d) pulsating.

6. To have sparkless commutation in dc generator, the brushes are rocked ahead so as to be
(a) just ahead of magnetic neutral axis.
(b) in magnetic neutral axis.
(c) just behind the magnetic neutral axis.
(d) in geometrical neutral axis.

7. Consider the following statements
1. In a dc series generator, full load voltage is more than the no load voltage.
2. In a separately excited dc generator full load voltage is more than the no load voltage.
3. In a dc shunt generator, full load voltage is less than the no load voltage.

Of these statements.
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 3 are correct. (d) 1 and 3 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1994]

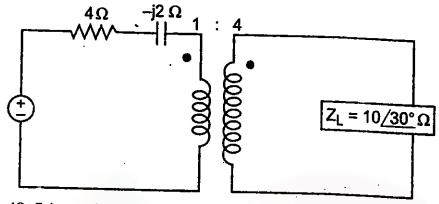
8. If the load current and flux of a dc motor are held constant and voltage applied across its armature is increased by 5%, the speed of the motor will
(a) increase by 5%. (b) reduce by 5%.
(c) remain unalternated. (d) depends on other factors.

9. For non-reversing dc drives it is preferable to use
(a) plugging. (b) regenerative braking.
(c) dynamic braking with separate excitation.
(d) dynamic braking with self excitation.
[A.M.I.E. Sec B. Summer 1994]

10. For an ideal transformer the windings should have
(a) maximum resistance on primary side and least resistance on secondary side.
(b) least resistance on primary side and maximum resistance on secondary side.
(c) equal resistance on primary and secondary sides.
(d) no ohmic resistance on either side. [U.P.S.C. I.E.S. E.E.-II, 1992]

11. The differential transformer is
(a) electrical transformer. (b) mechanical transformer.
(c) non-linear transformer. (d) none of the above.
[A.M.I.E. Sec B. Circuit Theory and Control Summer 2006]

12. The impedance seen by the source in the circuit in figure below is given by



(a) $(0.54 + j\,0.313)\ \Omega$ (b) $(4 - j\,2)\ \Omega$
(c) $(4.54 - j\,1.69)\ \Omega$ (d) $(4 + j\,2)\ \Omega$ [GATE E.E. 2000]

13. While performing the open-circuit and short-circuit tests on a transformer to determine parameters the status of the low voltage (LV) and high voltage (HV) windings will be such that
(a) in OC, LV is open and in SC HV is shorted.
(b) in OC, HV is open and in SC LV is shorted.
(c) in OC, LV is open and in SC LV is shorted.
(d) in OC, HV is open and in SC HV is shorted.
[U.P.S.C. I.E.S. E.E.-II, 1996]

14. Under short circuit condition, the windings of a transformer having 5% impedance will experience a radial force
(a) 5 times of full load value.
(b) 20 times of full load value.
(c) 25 times of full load value.
(d) 400 times of full load value. [A.M.I.E. Sec B. Summer 1993]

15. For system voltages exceeding 66 kV, condenser bushings are preferred over non-condenser bushings because
(a) the axial stresses can be eliminated.
(b) the radial stresses can be made independent of the radial thickness of the dielectric.
(c) optimum utilization of dielectric because of uniform potential distribution results in reduction of radial and axial dimensions of the bushings.
(d) none of the above.

16. Scott-connections are used for
(a) single-phase to three-phase transformation.
(b) three-phase to single-phase transformation.
(c) three-phase to two-phase transformation.
(d) any of the above. [U.P.S.C. I.E.S. E.E.-II, 1992]

17. Keeping in view the requirement of parallel operation, which of the 3-phase connections given below are possible:
(a) Delta-delta to delta-star. (b) Delta-delta to star-delta.
(c) Star-star to delta-delta. (d) Delta-star to star-delta.
[GATE E.E. 1996]

Answers: **1.** (a), **2.** (d), **3.** (d), **4.** (a), **5.** (c), **6.** (a), **7.** (d), **8.** (a), **9.** (c), **10.** (d), **11.** (a), **12.** (c), **13.** (b), **14.** (d), **15.** (c), **16.** (c), **16.** (c), **17.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

18. An auto-transformer is preferred over an ordinary two winding transformer due to
(a) safety in operation.
(b) availability of taps on the secondary.
(c) considerable saving in copper when transformation ratio is near unity.
(d) none of the above.

19. In operating a 400 Hz transformer at 50 Hz
(a) only voltage is reduced in the same proportion as the frequency.
(b) only KVA rating is reduced in the same proportion as the frequency.
(c) both voltage and KVA rating are reduced in the same proportions as the frequency.
(d) none of the above. [A.M.I.E. Sec B. Elec. Machines Winter 1993]

20. Practically all large generators are made with revolving field as
(a) it is easier to insulate stationary armature winding for high ac voltage (as high as 33,000 V).
(b) rotating field is comparatively light and can run with high speed.
(c) the load circuit can be connected directly with the fixed terminals of the stator without passing through slip-rings and brushes.
(d) the excitation current (dc) can be supplied to the rotor at low voltage of 125 or 250 V through two slip-rings without any difficulty.
(e) this arrangement provides more efficient cooling.
(f) all of the above.

21. The most appropriate operating speeds in rpm of generators used in Thermal, Nuclear and Hydro-power plants would respectively be
(a) 3000, 300 and 1500. (b) 3000, 3000 and 300.
(c) 1500, 1500 and 3000. (d) 1000, 900 and 750.
[U.P.S.C. I.E.S. Elec. Engg. II, 1994]

22. To eliminate rth harmonic from the induced emf in a phase of a synchronous machine pitch of the coil must be
(a) $\frac{r-1}{r}$ th fraction of full pitch.
(b) $\frac{2r-1}{r}$ th fraction of full pitch.
(c) $\frac{r}{r+1}$ th fraction of full pitch
(d) $\frac{2r}{r+1}$ th fraction of full pitch. [A.M.I.E. Sec B. Winter 1996]

23. The regulation obtained by synchronous impedance method is always higher than actual value because
(a) synchronous reactance is assumed variable while it is not.
(b) effective armature resistance is assumed constant.
(c) synchronous reactance is assumed constant while it is not.
(d) field current is increased to give short-circuit current about twice of full-load current.

24. A synchronous motor operates at 0.8 pf lagging. If the field current of the motor is continuously increased
(a) the power factor decreases up to a certain value of the field current and there-after it increases.
(b) the armature current increases up to a certain value of the field current and thereafter it decreases.
(c) the power factor increases up to a certain value of field current and thereafter it decreases.
(d) the armature current decreases up to a certain value of field current and there after it increases.
(e) both (c) and (d). [GATE E.E. 1993]

25. A cylindrical rotor synchronous motor is switched on to the dc supply with its field windings shorted on themselves. It will
(a) not start.
(b) start but not run at synchronous speed.
(c) start as an induction motor and then run as a synchronous motor.
(d) start and run as a synchronous motor. [GATE E.E. 1996]

26. A 3-phase synchronous generator with constant power input is supplying electrical power to an infinite bus at a lagging power factor. If its excitation is reduced
(a) both power factor and power angle will increase.
(b) both power factor and power angle will decrease.
(c) power factor will improve but power angle will decrease.
(d) power angle will increase but power factor will decrease.

27. In an induction motor the slip will be negative when
(a) stator magnetic field and rotor rotate in opposite directions.
(b) rotor rotates at a speed less than synchronous speed and in the direction of rotation of stator field.
(c) rotor rotates at a speed more than synchronous speed and in the direction of rotation of stator field.
(d) none of the above.

28. An increase in rotor circuit reactance of a 3-phase induction motor will
(a) reduce starting torque as well as maximum torque.
(b) increase starting torque as well as maximum torque.
(c) increase starting torque and reduce maximum torque.
(d) increase maximum torque and reduce starting torque.

29. Cogging and crawling are phenomenon associated with
(a) cage induction machines and they are essentially the same.
(b) squirrel cage induction machines, the former during starting and the latter at a fraction of its rated speed.
(c) squirrel cage induction machines, the former at a fraction of its rated speed and the latter during starting.
(d) wound rotor induction machines and they are reduced by skewing, chording and distribution of windings.
[U.P.S.C. I.E.S. E.E.-II, 1995]

30. In a repulsion motor by shifting the brush position
(a) speed and direction of rotation can be controlled.
(b) only speed can be controlled.
(c) speed, torque and direction of rotation can be controlled.
(d) only torque can be controlled by varying the speed at constant output power. [A.M.I.E. Sec B. Elec. Machines Winter 1996]

31. A hydel power plant of run-off-river type should be provided with pondage so that
(a) firm capacity of the plant is increased.
(b) operating head is controlled.
(c) pressure inside the turbine casing remains constant.
(d) kinetic energy of the running water is fully utilized.
[U.P.S.C. I.E.S. E.E.-II, 1998]

32. A power station has a maximum demand of 15000 kW. The annual load factor is 50% and plant capacity factor is 40%. What is the reserve capacity of the plant?
(a) 1875 kW (b) 3750 kW
(c) 6000 kW (d) 7500 kW
[U.P.S.C. I.E.S. E.E.-II, 2006]

33. A 90 MAV, 11 kV water wheel generator has an inertia constant H = 3. The stored energy in the rotor at synchronous speed is
(a) 40 kJ (b) 270 kJ
(c) 270 MJ (d) 40 MJ [U.P.S.C. I.E.S. E.E.-II, 2005]

Answers: **18.** (c), **19.** (c), **20.** (f), **21.** (b), **22.** (a), **23.** (c), **24.** (e), **25.** (b), **26.** (a), **27.** (c), **28.** (a), **29.** (b), **30.** (c), **31.** (a), **32.** (b), **33.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

34. For the same conductor length, same amount of power, same losses and same maximum voltage to earth, which system requires minimum conductor area?
(a) single-phase ac. (b) 3-phase ac.
(c) 2-wire ac. (d) 3-wire dc.
[A.M.I.E Sec B. Design of Electrical Systems Winter 2006]

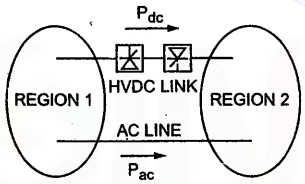
35. The good effect of corona on overhead lines is to
(a) increase the line carrying capacity due to conducting ionised air envelope around the conductor.
(b) increase the power factor due to corona loss.
(c) reduce the ratio interference from the conductor.
(d) reduce the steepness of surge fronts.
[U.P.S.C. I.E.S. E.E.-II, 2001]

36. If within an untransposed 3-phase circuit of a transmission line, the series impedance of each of the conductors is considered, it is found to contain resistive terms of the form $K \log_e \left(\frac{d_{12}}{d_{13}}\right)$, K being a constant and d_{12} and d_{13} etc. being spacings between the conductors. These terms represent power transfer from one phase to another. The sum of these terms over three phase is
(a) three times the average. (b) $\sqrt{3}$ times the average.
(c) one-third of the average. (d) zero.
[U.P.S.C. I.E.S. E.E.-II, 1998]

37. An 11 kV short transmission line has a total resistance of 2 Ω, reactance of 3Ω, current of 125 A and pf of 0.8. Regulation in percentage is equal to
(a) 1.9 (b) 0.38 (c) 3.8 (d) 0.19
[U.P.S.C. I.E.S. E.E.-II, 1999]

38. What is the approximate value of the surge impedance loading of a 400 kV, 3-phase 50 Hz overhead single circuit transmission line?
(a) 230 MW (b) 400 MW (c) 1000 MW (d) 1600 MW
[U.P.S.C. I.E.S. E.E.-II, 2006]

39. Two regional systems, each having several synchronous generators and loads are interconnected by an ac line and a HVDC link as shown in the figure. Which of the following statements is true in the steady state:



(a) Both regions need not have the same frequency.
(b) The total power flow between the regions ($P_{ac} + P_{dc}$) can be changed by controlling the HDVC converters alone.
(c) The power sharing between the ac line and the HDVC link can be changed by controlling the HDVC converters alone.
(d) The directions of power flow in the HVDC link (P_{dc}) cannot be reversed. [GATE E.E. 2007]

40. An approximate formula for loss factor in a distribution system is
(a) loss factor = 0.3 × load factor + 0.7 (load factor)^2.
(b) loss factor = 0.5 (load factor).
(c) loss factor = load factor.
(d) loss factor = 0.7 × load factor + 0.3 (load factor)^2.
[A.M.I.E Sec B. Design of Electrical System Summer 2005]

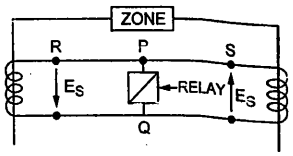
41. The per-unit impedance of a circuit element is 0.15. If the base kV and base MVA are halved then the new value of the per-unit impedance of the circuit element will be
(a) 0.075 (b) 0.15 (c) 0.30 (d) 0.60
[U.P.S.C. I.E.S. E.E.-II, 2002]

42. If the fault current is 2 kA, the relay setting is 50% and the CT ratio is 400/5, then plug setting is
(a) 25 (b) 15 (c) 50 (d) 12.5
[U.P.S.C. I.E.S. E.E.-II, 1999]

43. A travelling wave 400/1/50 means crest value of
(a) 400 V with rise time of 1/50 s.
(b) 400 kV with rise time 1 s and fall time 50 s.
(c) 400 kV with rise time 1μs and fall time 50 μs.
(d) 400 MV with rise time 1μs and fall time 50 μs.
[U.P.S.C. I.E.S. E.E.-II, 2001]

44. Which type of connection is employed for current transformers for the protection of star-delta connected 3-phase transformer?
(a) Delta-delta. (b) Star-star.
(c) Star-delta. (d) Delta-star.
[U.P.S.C. I.E.S. E.E.-II, 2005]

45. The basic circuit of a circulating current system of protection is shown in the figure. To improve the through-fault stability, a stabilizing resistor is connected between the points



(a) R and P in series. (b) P and S in series.
(c) P and T in series. (d) P and Q in parallel.
[U.P.S.C. I.E.S. E.E.-II, 1998]

46. Normally Z_{BUS} matrix is a
(a) Null matrix. (b) Sparse matrix.
(c) Full matrix. (d) Unity matrix.
[U.P.S.C. I.E.S. E.E.-II, 2004]

47. Which one of the following relays has the capability of anticipating the possible major fault in a transformer ?
(a) Overcurrent relay. (b) Differential relay.
(c) Buchholz relay. (d) Overfluxing relay.
[U.P.S.C. I.E.S. E.E.-II, 2001]

48. An overhead line having a surge impedance of 400 Ω is connected in series with an underground cable having a surge impedance of 100 Ω. If a surge of 50 kV travels from the line end towards the line-cable junction, the value of the transmitted voltage wave at the junction is
(a) 30 kV. (b) 20 kV. (c) 80 kV. (d) −30 kV.
[GATE E.E. 1999]

49. A shunt reactor of 100 MVAr is operated at 98% of its rated voltage and at 96% of its rated frequency. The reactive power absorbed by the reactor is;
(a) 98 MVAr. (b) 10.402 MVAr.
(c) 96.04 MVAr. (d) 100.04 MVAr. [GATE E.E. 1998]

50. Compared to Gauss-Seidel method, Newton-Raphson method takes
(a) less number of iterations and more time per iteration.
(b) less number of iterations and less time per iteration.
(c) more number of iterations and more time per iteration.
(d) more number of iterations and less time per iteration.
[U.P.S.C. I.E.S. E.E.-II, 1999]

51. For a semiconductor, which one the following statements is NOT correct?
(a) When an electron and a hole recombine, energy must be liberated.
(b) Electrons in the conduction band can acquire a net acceleration from a field because there are empty energy levels available.
(c) An electron in the valence band cannot be accelerated by the field unless there are empty energy levels available.
(d) Holes cannot be accelerated by the field unless there are empty energy levels available. [U.P.S.C. I.E.S. E.E.-I, 2001]

Answers: **34.** (d), **35.** (d), **36.** (a), **37.** (c), **38.** (b), **39.** (c), **40.** (a), **41.** (c), **42.** (d), **43.** (c), **44.** (d), **45.** (c), **46.** (c), **47.** (c), **48.** (b), **49.** (d), **50.** (a), **51.** (d),

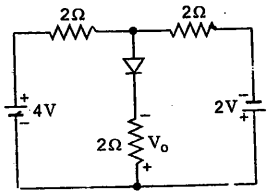
52. The mobility of an electron in a conductor is expressed in terms of
(a) $cm^2/V\text{-}s$. (b) $cm/V\text{-}s$.
(c) cm^2/V. (d) cm^2/s. [GATE E.E. 1999]

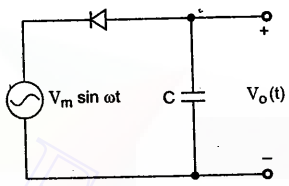
53. When a junction diode is used as a half-wave rectifier with purely resistive load and sinusoidal input voltage, what is the value of diode conduction angle (where ϕ_i is the ignition angle corresponding to the cut-in voltage)?
(a) π (b) $\pi - \phi_i$
(c) $\pi - 2\phi_i$ (d) Slightly greater then π
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

54. Tunnel diode is commonly used as which one of the following ?
(a) Logic memory storage device.
(b) FM modulator. (c) Voltage regulator.
(d) AM modulator. [U.P.S.C. I.E.S. E.E.-I, 2007]

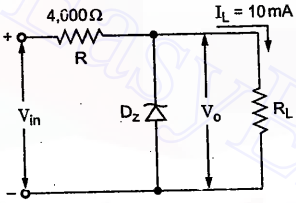
55. For the circuit shown in the figure, the voltage v_o is
(a) 2 V
(b) 1 V
(c) – 1 V
(d) None of the above.
[GATE E.C.E. 2000]



56. In the circuit shown below, the average value of $v_o(t)$ will be
(a) 0
(b) $-V_m/\pi$
(c) $-V_m/\sqrt{2}$
(d) $-V_m$
[U.P.S.C. I.E.S. E.E.-II, 2002]



57. A Zener diode regulator shown in the figure is to be designed to meet the following specifications: I_L = 10 mA, V_o = 10 V, V_{in} varies from 30 V to 50 V. The Zener diode has V_z = 10 V and I_{zk} (knee current) = 1 mA. For satisfactory operation, which one of the following is correct?

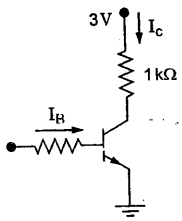


(a) R ≤ 1,800 Ω. (b) 2,000 Ω ≤ R ≤ 2,200 Ω.
(c) 3,700 Ω ≤ R ≤ 4,000 Ω. (d) R > 4,000 Ω.
[U.P.S.C. I.E.S. E.E.-II, 2007]

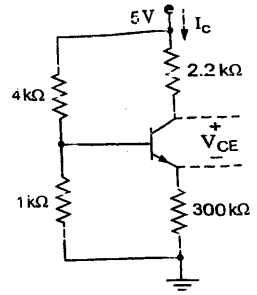
58. A fixed resistor of suitable value is usually connected across a thermistor to
(a) decrease its resistance. (b) increase its sensitivity.
(c) compensate its self-heating effect.
(d) improve linearity. [U.P.S.C. I.E.S. E.E.-I, 1999]

59. The current gain of a bipolar transistor drops at high frequencies because of
(a) transistor capacitances.
(b) high current effects in the base.
(c) parasitic inductive elements.
(d) the Early effect. [GATE E.C.E. 1999]

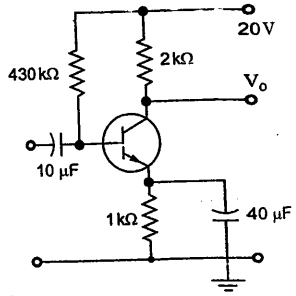
60. Assuming V_{CEsat} = 0.2 V and β = 50, the minimum base current (I_B) required the drive the transistor in the figure to saturation is
(a) 56 μA (b) 140 mA
(c) 60 mA (d) 3 mA. [GATE. E.C.E. 2004]



51. Assuming that the β of the transistor is extremely large and V_{BE} = 0.7 V, I_C and V_{CE} in the circuit shown in the figure are
(a) I_C = 1 mA, V_{CE} = 4.7V.
(b) I_C = 0.5mA, V_{CE} = 3.75V.
(c) I_C = 1 mA, V_{CE} = 2.5V.
(d) I_C = 0.5mA, V_{CE} = 3.9V.
[GATE E.C.E. 2004]



62. The circuit using a BJT with β = 50 and V_{BE} = 0.7V is shown in the figure. The base current I_B and collector voltage V_C are respectively
(a) 43 μA and 11.4 Volts.
(b) 40 μA and 16 Volts.
(c) 45 μA and 11 Volts.
(d) 50 μA and 10 Volts.
[GATE E.C.E. 2005]



63. Structure of an N-channel JFET comprises of
(a) Two back to back P-N junctions.
(b) Two back to back P^+/N junctions.
(c) Two back to back P/N^+ junctions.
(d) none of these.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Winter 2005]

64. If P is Passivation, Q is *n*-well implant, R is metallization and S is source/drain diffusion, then the order in which they are carried out in a standard *n*-well CMOS fabrication process, is
(a) P-Q-R-S (b) Q-S-R-P
(c) R-P-S-Q (d) S-R-Q-P [GATE E.C.E. 2003]

65. An FET source follower circuit has g_m of 2mmho and r_d of 50 kΩ. If the source resistance R_s is 1 kΩ, the output resistance of the amplifier will be
(a) 330 Ω (b) 450 Ω (c) 500 Ω (d) 1 kΩ
[U.P.S.C. I.E.S. E.E.-II, 1999]

66. When the gate-to-source voltage (V_{GS}) of a MOSFET with threshold voltage of 400 mV, working in saturation is 900 mV, the drain current is observed to be 1 mA. Neglecting the channel width modulation effect and assuming that the MOSFET is operating at saturation, the drain current for an applied V_{GS} of 1,400 mV is
(a) 0.5 mA (b) 2.0 mA (c) 3.5 mA (d) 4.0 mA
[GATE E.C.E. 2003]

67. The third capacitor is to be used in a Clapp oscillator to give frequency of oscillation of 100 kHz with an inductance of 250 m H is
(a) 1 nF (b) 1 μF
(c) 10 mF (d) none of the above.
[A.M.I.E. Sec B. Design of Electronic Devices and Circuits Winter 2005]

68. In a magnetron oscillator, the improvement of stability and efficiency is achieved by which technique?
(a) Strapping. (b) Cross coupling.
(c Bunching. (d) Bouncing.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

69. In a practical oscillator circuit, which one of the following limits the amplitude of the oscillations?
(a) Onset of non-linearity. (b) Power supply voltage.
(c) Oscillation frequencies.
(d) Temperature of the active device.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: **52.** (a), **53.** (c), **54.** (b), **55.** (d), **56.** (d), **57.** (a), **58.** (d), **59.** (a), **60.** (a), **61.** (c), **62.** (b), **63.** (d), **64.** (b), **65.** (b), **66.** (d), **67.** (d), **68.** (a), **69.** (a),

70. The dynamic transfer characteristics of a transistor is represented by $i_c = A_1 i_b + A_2 i_b^2$ where A_1 and A_2 are constants. If input signal $i_b = I_1 \cos \omega_1 t + I_2 \cos \omega_2 t$ the output will contain
(a) $\omega_1, \omega_2, 2\omega_1, 2\omega_2$
(b) dc term $\omega_1, \omega_2, \omega_1 + \omega_2, \omega_1 - \omega_2$
(c) dc term $\omega_1, \omega_2, 2\omega_1, 2\omega_2, 2\omega_1 + 2\omega_2, 2\omega_1 - 2\omega_2$
(d) dc term $\omega_1, \omega_2, 2\omega_1 + 2\omega_2, \omega_1 + \omega_2, \omega_1 - \omega_2$
[U.P.S.C. I.E.S. E.T.E.-II, 2005]

71. Negative feedback in an amplifier
(a) reduces gain.
(b) increases frequency and phase distortions.
(c) reduces bandwidth. (d) increases noise.
[GATE E.C.E. 1999]

72. In an amplifier, the power output is 2 W at 5 kHz, and 0.5 W at 50 Hz. If the input power is constant at 10 m W, what is the variation (approximate) of power gain in dB at two frequencies? ($\log_{10}^2 \approx 0.30$)
(a) 6 dB (b) 8 dB (b) 3 dB (d) 16 dB
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

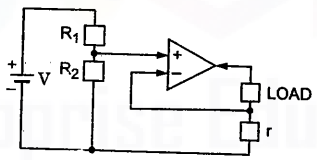
73. Crossover distortion behaviour is characteristic of
(a) Class A output stage. (b Class B output stage.
(c) Class AB output stage. (d) Common-base output stage.
[GATE E.C.E. 1999]

74. The upper cut-off frequencies f_{21} and f_{22} of the two stages of a cascaded amplifier are respectively 5 MHz and 3.3 MHz. The equivalent upper cut-off frequency of the cascaded amplifier would be
(a) 4.16 MHz. (b) 3.33 MHz.
(c) 2 MHz. (d) 5 MHz.
[U.P.S.C. I.E.S. E.E.-II, 2000]

75. An alternate to high-temperature diffusion for introducing dopants into a semiconductor is
(a) etching. (b) ion implantation.
(c) photolithography. (d) masking.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

76. An amplifier using an opamp with a slew-rate SR = 1 V/μsec has a gain of 40dB. If this amplifier has to faithfully amplify sinusoidal signals from dc to 20 kHz without introducing any slew-rate induced distortion, then the input signal level must not exceed.
(a) 795 mV (b) 395 mV (c) 79.5 mV (d) 39.5 mV
[GATE E.C.E. 2002]

77. The circuit shown in the figure is



(a) a voltage source with voltage $\frac{rV}{R_1 \| R_2}$

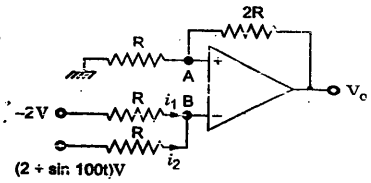
(b) a voltage source with voltage $\frac{r \| R_2}{R_1} V$

(c) a current source with current $\frac{r \| R_2}{R_1 + R_2} \cdot \frac{V}{r}$

(d) a current source with current $\frac{R_2}{R_1 + R_2} \cdot \frac{V}{r}$

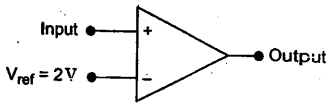
[GATE E.E. 2007]

78. A noninverting operational amplifier summer is shown in the figure. The output voltage V_o is



(a) $\frac{3}{2} \sin 100\,t$.
(b) $3 \sin 100\,t$.
(c) $\sin 100\,t$. (d) $2 \sin 100\,t$.
[U.P.S.C. I.E.S. E.E.-II, 2005]

79. If the input to the ideal comparator shown in the figure is a sinusoidal signal of 8V (peak to peak) without any dc component, then the output of the comparator has a duty cycle of



(a) 1/2. (b) 1/3.
(c) 1/6. (d) 1/12.
[GATE E.C.E. 2003]

80. The maximum number of quantized amplitude levels, that a 3-digit ternary PCM system can be used to represent is
(a) 8 (b) 9 (c) 27 (d) 81
[U.P.S.C. I.E.S. E.E.-II, 2002]

81. Consider a binary Hamming code of block length 31 and rate equal to (26/31). Its minimum distance is
(a) 3 (b) 5 (c) 26 (d) 31
[U.P.S.C. I.E.S. E.E.-II, 2002]

82. For an AM signal, the bandwidth is 10 kHz and the highest frequency component present is 705 kHz. The carrier frequency used for this AM signal is
(a) 695 kHz. (b) 700 kHz.
(c) 705 kHz. (d) 710 kHz.
[U.P.S.C. I.E.S. E.E.-II, 2003]

83. For a binary symmetric channel, which one of the following is the correct expression for entropy? (p = conditional probability of error)
(a) $p \log_2 (1/p) + (1-p) \log_2 \{(1/(1-p)\}$.
(b) $p \log_2 \{1/(1-p)\} + (1-p) \log_2 (1/p)\}$.
(c) $2 \log_2 (1/p) + 2 \log_2 \{1/(1-p)\}$.
(d) $(1-p) \{\log_2 (1/p)\} + \log_2 \{1/(1-p)\}$.
[U.P.S.C. I.E.S. E.E.-II, 2004]

84. When zero mean Gaussian noise of variance N is applied to an ideal half-wave rectifier, what is the mean square value of the rectified noise?
(a) $\frac{N}{4}$ (b) $\frac{N}{2}$ (c) N (d) 2N
[U.P.S.C. I.E.S. E.E.-II, 2008]

85. An ideal sawtooth voltage waveform of frequency 500 Hz and amplitude 3 V is generated by charging a capacitor of 2μF in every cycle. The charging requires
(a) constant voltage source of 3 V for 1 ms.
(b constant voltage source of 3 V for 2 ms.
(c) constant current source of 3 mA for 1 ms.
(d) constant current source of 3 mA for 2 ms. [GATE E.C.E. 2003]

86. A step down chopper operates from a dc voltage source V_s, and feeds a dc motor armature with a back emf E_b. From oscilloscope traces, it is found that the current increases for time t_r, falls to zero over time t_1, and remains zero for time t_0, in every chopping cycle. Then the average dc voltage across the freewheeling diode is
(a) $\frac{V_s t_r}{(t_r + t_f + t_0)}$. (b) $\frac{(V_s t_r + E_b t_f)}{(t_r + t_f + t_0)}$.
(c) $\frac{(V_s t_r + E_b t_0)}{(t_r + t_f + t_0)}$. (d) $\frac{V_s t_r + E_b [t_f + t_0]}{(t_r + t_f + t_0)}$.
[GATE E.E. 2000]

Answers: **70.** (c), **71.** (a), **72.** (a), **73.** (b), **74.** (c), **75.** (b), **76.** (c), **77.** (d), **78.** (a), **79.** (b), **80.** (a), **81.** (c), **82.** (b), **83.** (a), **84.** (a), **85.** (d), **86.** (c),

Downloaded From : www.EasyEngineering.net

87. A dc motor armature, supplied through phase controlled thyristors, receives a smoother voltage shape at
(a) higher motor speeds. (b) low motor speeds.
(c) rated motor speeds. (d) None of the above.
[A.M.I.E. Sec B. Power Electronics Winter 2007]

88. AC-to-dc circulating current dual converters are operated with following relationship between their triggering angles (α_1 and α_2)
(a) $\alpha_1 + \alpha_2 = 180°$. (b) $\alpha_1 + \alpha_2 = 360°$.
(c) $\alpha_1 - \alpha_2 = 180°$. (d) $\alpha_1 + \alpha_2 = 90°$. [GATE E.E. 2001]

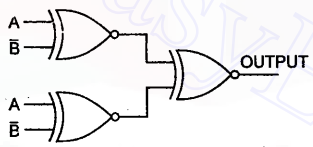
89. LEDs fabricated from GaAs emit radiation in the
(a) UV region. (b) visible region.
(c) IR region. (d) mm wave region.
[A.M.I.E. Sec. B. Solid State Physics and Semiconductor Devices Winter 2005]

90. The main switching element of a SMPS in the operating range of 20 kHz to 100 kHz is
(a) SCR (b) UJT (c) GTO (d) MOSFET
[A.M.I.E. Sec. B. Power Electronics Summer 2008]

91. Which of the following Boolean algebra rules is correct?
(a) $A.\overline{A} = 1$ (b) $A + AB = A + B$
(c) $A + \overline{A}B = A + B$ (d) $A(A + B) = B$
[U.P.S.C. I.E.S. E.T.E.-I, 2009]

92. A logic circuit will have 1 output only when $X = 0, Y = 0, Z = 1$ and $X_1 = Y_1 = 1, Z = 0$
The Boolean expression in SOP form is
(a) $\overline{X}\,\overline{Y}\,Z + X\,Y\,\overline{Z}$ (b) $X\,Y\,Z + X\,Y\,\overline{Z}$
(c) $(X + Y + Z)(X + Y + \overline{Z})$
(d) $(\overline{X} + \overline{Y} + Z) + (X + Y + \overline{Z})$
[A.M.I.E. Sec. B. Pulse and Digital Circuit Summer 2005]

93. The output of the circuit shown in the figure is equal to
(a) 0
(b) 1
(c) $\overline{A}B + A\overline{B}$
(d) $(\overline{A*B}) * (\overline{A*B})$

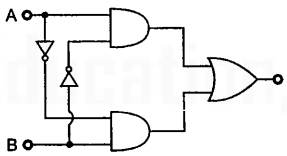


[U.P.S.C. I.E.S. E.T.E.-II, 2008]

94. The minimal product-of-sums function described by the K-map given in figure
(a) $\overline{A}\overline{C}$ (b) $\overline{A} + \overline{C}$
(c) $A + C$ (d) AC [GATE E.E. 2000]

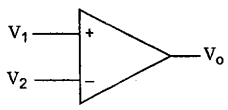
C \ AB	00	01	11	10
0	1	1	ϕ	0
1	0	0	ϕ	0

95. Which one of the following logic operations is performed by the digital circuit shown above?
(a) NOR (b) NAND
(c) EX-OR (d) OR
[U.P.S.C. I.E.S. E.T.E.-II, 2006]



96. The figure of merit of a logic family is given by
(a) gain bandwidth product.
(b) (propagation delay time) × (power dissipation).
(c) (fan-out) × (propagation delay time).
(d) (noise margin) × (power dissipation).
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

97. How can the voltage comparator shown in the circuit given be used in the analog-to-digital conversion?
(a) As a 1-bit quantizer.
(b) As a 2-bit quantizer.
(c) As a 4-bit quantizer.
(d) As a 8-bit quantizer. [U.P.S.C. I.E.S. E.T.E.-II, 2006]



98. The length of a bus cycle in 8086/8088 is four clock cycles, T_1, T_2, T_3, T_4 and an indeterminate number 0 wait state clock cycles denoted by T_w. The wait states are always inserted between
(a) T_1 and T_2 (b) T_2 and T_3
(c) T_3 and T_4 (d) T_4 and T_1
[U.P.S.C. I.E.S. E.E.-II, 2001]

99. In a 8085 microprocessor, the following sequence of instructions is executed:
STC
CMC
MOVE A, B
REAL
MOVE B, A
After the last instruction, the output will
(a) rotate the contents of the accumulator and store it in B.
(b) get the contents of B register into accumulator and rotate it to left by one bit.
(c) double contents of B register.
(d) manipulate carry in A and B. [U.P.S.C. I.E.S. E.E.-II, 1998]

100. If the clock has a frequency of 5 MHz, then the execution time for ADD memory to register instruction using based indexed relative addressing (result put in register) required is
(a) 4.8 μs (b) 4.9 μs (c) 5 μs (d) 5.1 μs
[U.P.S.C. I.E.S. E.E.-II, 1999]

Use following codes for Questions from 101 to 110.
(a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

101. (A) : In an electromagnetic energy conversion device forces are setup due to flux in the system which tends to decrease the reluctance and move mechanical parts towards the configuration of minimum reluctance.
(R) : The change in field energy of the system with motion under constant magnetic flux conditions is a measure of the force developed. [U.P.S.C. I.E.S. E.E.-II, 1996]

102. (A) : Speed control of induction motors is commonly affected by variation of supply voltage.
(R) : Line voltage control is simpler and has low initial as well as maintenance cost.

103. (A) : In a single-phase induction motor, while the motor is connected to single-phase ac supply and is rotating, the two fields (stator and rotor field) combine to form a resultant rotating field revolving at a synchronous speed.
(R) : The rotor field created by rotor currents acts at right angle to the stator field and also lags the stator field by 90° electrical degrees in time phase.

104. (A) : In a high or medium head hydroelectric power station having a long penstock, a surge tank is provided near the turbine.
(R) : A surge tank stores additional water to be released during the peak load period. [U.P.S.C. I.E.S. E.E. 2000]

105. (A) : The string efficiency can be improved by using long X-arms.
(R) : Use of long X-arms reduces the ratio of capacity to earth to capacity per insulator thereby increasing the string efficiency.

106. (A) : Voltage magnitudes are different at different points in the system.
(R) : Voltage is controlled by governors. [U.P.S.C. I.E.S. E.E.-II, 2007]

Answers: **87.** (a), **88.** (a), **89.** (c), **90.** (d), **91.** (c), **92.** (a), **93.** (b), **94.** (a), **95.** (c), **96.** (b), **97.** (a), **98.** (b), **99.** (a), **100.** (a), **101.** (a), **102.** (d), **103.** (a), **104.** (d), **105.** (a), **106.** (c),

107. (A): The mobility of the conduction electrons is greater than that of holes.
(R): Recombination of electrons is greater than that of holes.
[U.P.S.C. I.E.S. E.E.-I, 1995]

108. (A): The noise level in FETs is very small.
(R): FET is a voltage driven unipolar device.

109. (A): UJT can be used as an oscillator.
(R): UJT is operated with emitter junction forward-biased.

110. (A): Processor-level design is very much a heuristic process.
(R): At this level of abstraction, components are very complex.
[U.P.S.C. I.E.S. E.T.E.-II, 2006]

Match List 1 with List 2 and select the correct answer using the codes given below the list.

111.

List 1 (D C Motors)	List 2 (Characteristics)
A. Cumulatively compounded motor.	1. Fairly constant speed irrespective of the load.
B. Differentially compounded motor.	2. It may start in reverse direction.
C. Series motor.	3. Definite no-load speed.
D. Shunt motor.	4. Never started without load.

Codes:	A	B	C	D
(a)	2	3	1	4

TEST PAPER-III

Time Allowed : $1\frac{1}{2}$ Hours

Maximum Marks : 150

Note: The following 78 items are multiple choice type. Each item comprises four or more responses (answers). Select the response which you feel most appropriate.

1. An electrical network with 8 independent nodes will have
(a) 8 nodal equations. (b) 7 nodal equations.
(c) 9 nodal equations. (d) 4 nodal equations.
[A.M.I.E. Sec B. Circuit Theory and Control Winter 2006]

2. The complex dielectric constant of a material is given by the expression

$$\varepsilon = \varepsilon' - \varepsilon''$$

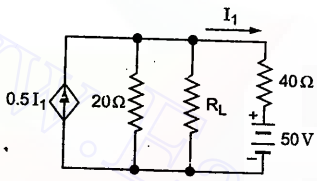
If a parallel plate capacitor with area 'A' and separation 'd' is formed with this material as a dielectric, the loss factor will be

(a) $\frac{(A\varepsilon')}{d\varepsilon''}$ (b) $\frac{\varepsilon''}{\varepsilon'}$

(c) $\tan^{-1}\left\{\frac{(A\varepsilon')}{(d\varepsilon'')}\right\}$ (d) $\tan^{-1}\left\{\frac{(d\varepsilon'')}{(A\varepsilon')}\right\}$

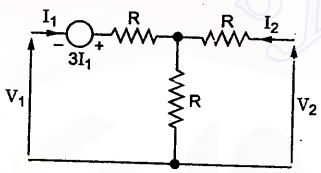
[U.P.S.C. I.E.S. E.E.-I, 2002]

3. In the network of the figure, the maximum power is delivered to R_L if its value is



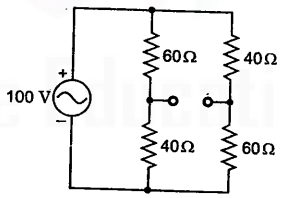
(a) 16 Ω (b) $\frac{40}{3}\Omega$
(c) 60 Ω (d) 20 Ω
[GATE E.C.E. 2002]

4. The circuit shown in the figure



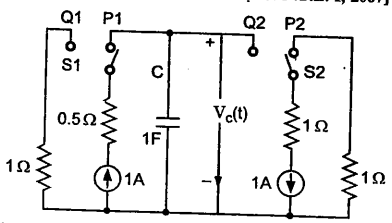
(a) is reciprocal but not symmetrical.
(b) is not reciprocal but symmetrical.
(c) is not reciprocal and symmetrical.
(d) is neither reciprocal nor symmetrical.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

5. What are the source voltage and source resistance, respectively for the Thevenin's equivalent circuit as seen from the terminals indicated in the circuit given here?



(a) 2.0 V, 24 Ω.
(b) 20 V, 48 Ω.
(c) 20 V, 4.8 Ω.
(d) 20 V, 12 Ω.
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

6. The circuit shown in the figure is used to charge the capacitor C alternately from two current sources as indicated. The switches S_1 and S_2 are mechanically coupled and connected as follows:



For $2n\,T \le t < (2n+1)\,T$, $(n = 0, 1, 2, ...)$ S_1 to P_1 and S_2 to P_2.
For $(2n+1)\,T \le t < (2n+2)\,T$, $(n = 0, 1, 2, ...)$ S_1 to Q_1 and S_2 to Q_2

Assume that the capacitor has zero initial charge. Given that $u(t)$ is a unit step function, the voltage $V_c(t)$ across the capacitor is given by

(a) $\sum_{n=1}^{\infty}(-1)^n\, tu(t-nT)$ (b) $u(t)+2\sum_{n=i}^{\infty}(-1)^n\, u(t-nT)$

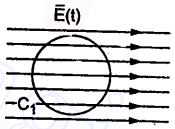
(c) $tu(t)+2\sum_{n=1}^{\infty}(-1)^n\,(t-nT)\,u(t-nT)$

(d) $\sum_{n=0}^{\infty}\left[0.5-e^{-(t-2nT)}+0.5\,e^{-(t-2nT-T)}\right]$ [GATE E.C.E. 2008]

7. For a transmission line load matching over a range of frequencies, it is best to use a
(a) balun transformer.
(b) single stub of adjustable position.
(c) double stub.
(d) broad band directional coupler. [U.P.S.C. I.E.S. E.E.-I, 2008]

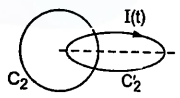
8. Consider coils C_1, C_2, C_3 and C_4 (shown in the following figures) which are placed in the time-varying electric field $\bar{E}(t)$ and electric field produced by the coils C_2', C_3', and C_4', carrying time varying current $I(t)$ respectively:

1.



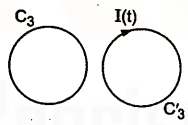
Time varying electric field $\bar{E}(t)$ parallel to the plane of the coil C_1

2.



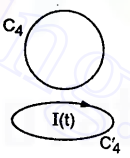
Coil planes are orthogonal

3.



Co-planer coils

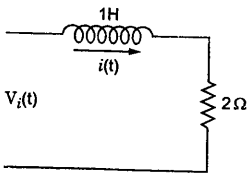
4.



Coil planes are orthogonal

The electric field will induce an emf in the coils
(a) C_1 and C_2 (b) C_2 and C_3
(c) C_1 and C_3 (d) C_2 and C_4
[U.P.S.C. I.E.S. E.E.-I, 2001]

9. For the R-L circuit shown in the figure, the input voltage $v_i(t) = u(t)$. The current $i(t)$ is



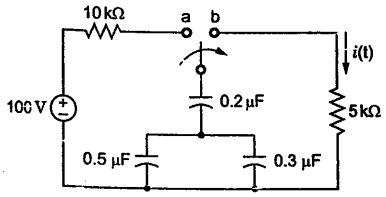
Answers: **1.** (b), **2.** (b), **3.** (a), **4.** (a), **5.** (b), **6.** (c), **7.** (c), **8.** (a), **9.** (c),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(a) 
(b) 
(c) 
(d) 
[GATE E.C.E. 2004]

10. The switch in the circuit shown was on position *a* for a long time, and is moved to position *b* at time $t = 0$. The current $i(t)$ for $t > 0$ is given by



(a) $0.2e^{-125t}u(t)$ mA
(b) $20e^{-1250t}u(t)$ mA
(c) $0.2e^{-1250t}u(t)$ mA
(d) $20e^{-1000t}u(t)$ mA

[GATE E.C.E. 2009]

11. A series circuit containing passive elements has the following current and applied voltage v = 200 sin (2,000*t* + 50°), $i = 4\cos(2{,}000t + 13.2°)$
The circuit elements
(a) must be resistance and capacitance.
(b) must be resistance and inductance.
(c) must be inductance, capacitance and resistance.
(d) could be either resistance and capacitance or resistance, inductance and capacitance. [U.P.S.C. I.E.S. E.E.-I, 1996]

12. Three equal impedances are first connected in delta across a 3–ϕ balanced supply. If the same impedances are connected in star across the same supply
(a) phase currents will be one-third.
(b) line currents will be three times.
(c) power consumed will be one-third.
(d) none of the above.

13. The transfer function of a system is the Laplace transform of its
(a) step response. (b) square wave response.
(c) impulse response. (d) ramp response.
[A.M.I.E. Sec B. Measurements and Control Winter 2005]

14. If *a* is the width of the rectangular wave guide and λ is the wavelength, then which one of the following is correct?
(a) $a > \lambda/4$ but $< \lambda/2$. (b) $a > \lambda/2$ but $< 3\lambda/2$.
(c) $a > 3\lambda/2$. (d) $a > \lambda/4$.
[U.P.S.C. I.E.S. E.E.-I, 2007]

15. Impedance inversion may be obtained with
(a) a short-circuited stub. (b) an open-circuited stub.
(c) a quarter-wave line. (d) a half-wave line.
[U.P.S.C. I.E.S. E.E.-I, 2006]

16. Consider the following statements:
Characteristic impedance of a transmission line is given by
1. $\sqrt{\dfrac{R + j\omega L}{G + j\omega C}}$, (R, L, G and C are line constants).
2. $\sqrt{Z_{oc}\, Z_{sc}}$, (Z_{oc} and Z_{sc} are the open and short circuit impedances of the line).
3. $\dfrac{V'}{I'}$, (V′ and I′ are the voltage and current of the wave travelling in the positive $\hat{y}$ direction).
Which of these are correct ?
(a) 1, 2, and 3. (b) 1 and 2.
(c) 2 and 3. (d) 1 and 3.
[U.P.S.C. I.E.S. E.E.-I, 2003]

17. A loss-less transmission line of characteristic impedance Z_0 and $l < \dfrac{\lambda}{4}$ is terminated at the load end by a short circuit. Its input impedance Z is
(a) $Z_s = -jZ_0 \tan \beta l$. (b) $Z_s = jZ_0 \cot \beta l$.
(c) $Z_s = jZ_0 \tan \beta l$. (d) $Z_0 = -jZ_0 \cot \beta l$.
[U.P.S.C. I.E.S. E.E.-I, 2003]

18. A dc shunt motor has external resistances of R_a and R_f in the armature and field circuits respectively. Armature current at starting can be reduced by keeping
(a) R_f maximum and R_a minimum.
(b) R_a maximum and R_f maximum.
(c) R_a minimum and R_f maximum.
(d) R_a maximum and R_f minimum. [U.P.S.C. I.E.S. E.E.-II, 1996]

19. In regenerative braking, the motor energy is
(a) dissipated in armature heating.
(b) dissipated in windage losses.
(c) returned to the supply mains.
(d) none of the above.

20. If P_i be the iron loss and P_c be the copper loss on full load, then which of the following conditions had to be satisfied to obtain maximum efficiency at 3/4 full load ?
(a) $P_c = \dfrac{3P_i}{4}$ (b) $P_c = \dfrac{4P_i}{3}$
(c) $P_c = \dfrac{16P_i}{9}$ (d) $P_c = \dfrac{9P_i}{16}$ [U.P.S.C. I.E.S. E.E.-II, 1993]

21. The low-voltage winding of a core type transformer is subdivided into two equal halves, each of half the original width of the single winding with the high-voltage winding in between (instead of having the usual construction of low voltage winding adjacent to the core and surrounded by the high-voltage winding). Such an interlacing of coils would make the combined primary and secondary leakage reactance (in terms of the primary) nearly
(a) twice. (b) equal. (c) half. (d) one-fourth.
[U.P.S.C. I.E.S. E.E.-II 1997]

22. If the transformers operated in parallel are not connected with regard to polarity
(a) the transformers will not share the load in proportion to their kVA ratings.
(b) dead short-circuit will take place.
(c) the transformer of lower rating will be out of operation.
(d) none of the above.

23. A 3-ϕ alternator has negligible stator resistance. A short-circuit test is conducted on this alternator. At a particular speed a field current of I_{f1} is required to drive the rated armature current. If the speed of the alternator is reduced to half, the field current required to maintain rated armature current
(a) would be equal to I_{f1}
(b) would be equal to $2\, I_{f1}$
(c) would be equal to $\dfrac{I_{f1}}{2}$
(d) cannot be predicted due to insufficient data. [GATE E.E. 1993]

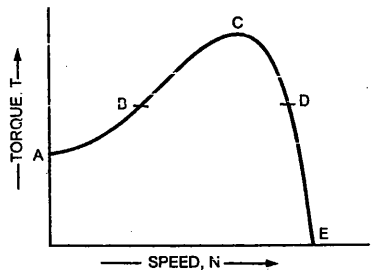
Answers: **10.** (c), **11.** (d), **12.** (c), **13.** (a), **14.** (a), **15.** (c), **16.** (a), **17.** (c), **18.** (d), **19.** (c), **20.** (c), **21.** (c), **22.** (b), **23.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

24. In a 3-phase synchronous motor the magnitude of field flux
(a) remains constant at all loads.
(b) varies with load. (c) varies with speed .
(d) varies with power factor.

25. In the torque-speed characteristic of an induction motor shown in the figure given below, stable region is



(a) AB
(b) BC
(c) CD
(d) DE

26. "Cogging" in induction motor occurs when
(a) number of stator teeth – number of rotor teeth = odd number.
(b) number of stator teeth – number of rotor teeth = even number.
(c) number of stator teeth – number of rotor teeth = 0.
(d) number of stator teeth – number of rotor teeth = negative number. [U.P.S.C. I.E.S. E.E.-II, 1992]

27. Which material is used for making permanent magnet?
(a) Carbon steel. (b) Germanium.
(c) Silicon. (d) None of the above.
[U.P.S.C. I.E.S. E.E.-I, 2007]

28. Which of the following is not an electromagnetic device?
(a) Hall transducer. (b) Transformer.
(c) Speedometer.
(d) Eddy current damping device. [U.P.S.C. I.E.S. E.T.E.-I, 2009]

29. The maximum head of a Kaplan turbine is limited to
(a) 25 m. (b) 70 m. (c) 125 m.
[A.M.I.E. Sec B. Power Plant Engineering, Winter 1996]

30. Which of the following equipment is installed in steam power plants to reduce air pollution ?
(a) Desuper heater. (b) Air filter.
(c) Air electrostatic precipitator.
(d) Stock. (e) None of them.
[A.M.I.E. Sec B. Winter 1993]

31. Diversity factor is the ratio of
(a) sum of maximum demands of consumers/system maximum demand.
(b) maximum demand of consumers/average demand.
(c) demand of all consumers/average demand.
(d) none of the above. [A.M.I.E. Sec B. Power Systems, Winter 1998]

32. The open-circuit impedance of a certain length of a loss-less line is 100 Ω. The short-circuit impedance of the same line is also 100 Ω. The characteristic impedance of the line is
(a) $100\sqrt{2}\ \Omega$. (b) 50 Ω.
(c) $\frac{100}{\sqrt{2}}\ \Omega$. (d) 100 Ω. [U.P.S.C. I.E.S. E.E.-I, 2001]

33. Effect of temperature rise in overhead lines is to
(a) increase the sag and decrease the tension.
(b) decrease the sag and increase the tension.
(c) increase both. (d) decrease both.
[A.M.I.E. Sec B. Power Systems Winter 1996]

34. In a cable the sheath radius is R and conductor radius is *r*. As *r* changes from 0.5 R to 0.25 R the maximum voltage gradient in the dielectric
(a) decreases by about 6%. (b) increases by about 6%.
(c) increases by about 15%. (d) decreases by about 15%
[A.M.I.E. Sec B. Power Systems Summer 2000]

35. Bundled conductors in EHV transmission system provide
(a) reduced capacitance. (b) increased capacitance.
(c) increased inductance. (d) increased voltage gradient.
[U.P.S.C. I.E.S. E.E.-II, 1996]

36. Shunt compensation in an EHV line is used to
(a) improve stability. (b) reduce fault level.
(c) improve the voltage profile.
(d) substitute for synchronous phase modifier.
[U.P.S.C. I.E.S. E.E.-II, 1994]

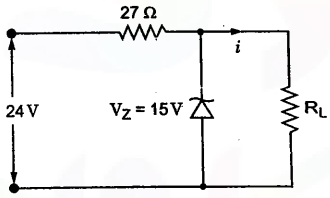
37. Zero-sequence currents can flow from a line to transformer bank if the windings are in
(a) grounded star/delta. (b) delta/star.
(c) star/grounded star. (d) delta/delta.
[U.P.S.C. I.E.S. E.E.-II, 1997]

38. The air-blast circuit breakers for 400 kV system are designed to operate in
(a) 0.1 s. (b) 0.5 s. (c) 50 ms. (d) 100 μs.
[A.M.I.E. Sec B. Summer 1999]

39. IDMT relays are used to protect the power transformers against
(a) external short-circuits. (b) overloads.
(c) internal short-circuits. (d) both (a) and (b).

40. For the protection of a large squirrel cage induction motor against single phasing normally
(a) an overcurrent relay is used.
(b) a differential relay is used.
(c) a directional relay is used.
(d) negative-sequence current sensitive relay is used.
[A.M.I.E. Sec B. Summer 1993]

41. In the circuit shown in the figure, the zener diode is ideal. The minimum value of R_L up to which the output voltage remains constant is

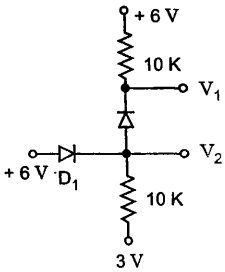


(a) 27 ohms.
(b) 45 ohms.
(c) 15 ohms.
(d) 24 ohms. [U.P.S.C. I.E.S. E.E.-II, 2005]

42. The nature of crystal binding in germanium is
(a) ionic. (b) metallic.
(c) covalent. (d) Van der Waal type.
[U.P.S.C. I.E.S. E.E.-I, 1992]

43. When a reverse bias is applied to a germanium P-N junction diode, the reverse saturation current at room temperature is 0.3 μA. The current flowing in the diode when 0.15 V forward bias is applied at room temperature is
(a) 120.73 mA. (b) 120.73 nA.
(c) 120.73 A. (d) 120.73 μA.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer, 2006]

44. The voltage at V_1 and V_2 of the arrangement shown in the figure will be respectively
(a) 6 V and 5.4 V.
(b) 5.4 V and 6 V.
(c) 3 V and 5.4 V.
(d) 6 V and 3 V.
[U.P.S.C. I.E.S. E.E.-II, 1998]



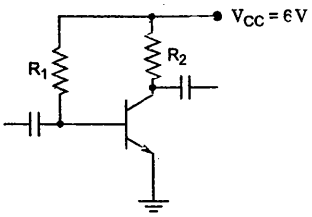
Answers: **24.** (a), **25.** (d), **26.** (c), **27.** (a), **28.** (a), **29.** (a), **30.** (c), **31.** (a), **32.** (d), **33.** (a), **34.** (b), **35.** (b), **36.** (c), **37.** (a), **38.** (c), **39.** (d), **40.** (d), **41.** (b), **42.** (c), **43.** (d), **44.** (a),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

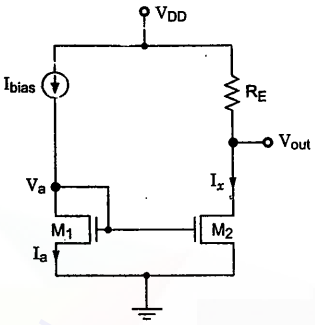
45. The Early effect in a bipolar junction transistor is caused by
(a) fast turn-on. (b) fast turn-off.
(c) large collector-base reverse bias.
(d) large emitter-base forward bias. **[GATE E.C.E. 1999]**

46. In the amplifier circuit shown in the figure, the values of R_1 and R_2 are such that the transistor is operating at V_{CE} = 3V and I_C = 1.5 mA when its β is 150. For a transistor with β of 200, the operating point (V_{CE}, I_C) is



(a) (2V, 2mA). (b) (3V, 2mA).
(c) (4V, 2mA). (d) (4V, 1mA). **[GATE E.C.E 2003]**

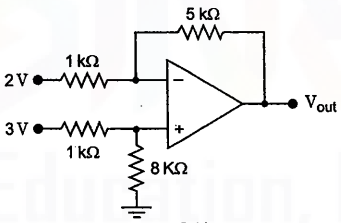
47. For the circuit shown in the figure, transistors M_1 and M_2 are identical NMOS transistors. Assume that M_2 is in saturation and the output is unloaded



The circuit I_x is related to I_{bias} as
(a) $I_x = I_{bias} + I_s$
(b) $I_x = I_{bias}$
(c) $I_x = I_{bias} - I_s$
(d) $I_x = I_{bias} - \left(V_{DD} - \frac{V_{out}}{R_E}\right)$ **[GATE E.C.E. 2008]**

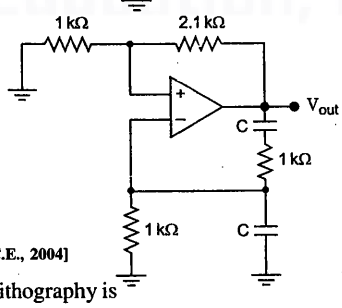
48. What is the collector circuit efficiency of a class A push-pull amplifier if
V_m = peak load voltage, and V_{cc} = collector supply voltage?
(a) $\eta = \frac{\pi}{4}\frac{V_m}{V_{cc}} \times 100\%$ (b) $\eta = \frac{\pi}{2}\frac{V_m}{V_{cc}} \times 100\%$
(c) $\eta = \frac{\pi}{2}\frac{V_{cc}}{V_m} \times 100\%$ (d) $\eta = \frac{\pi}{4}\frac{V_{cc} - V_m}{V_m} \times 100\%$
[U.P.S.C. E.T.E.-II, 2008]

49. If the op-amp in the figure is ideal, the output voltage V_{out} will be equal to



(a) 1 V (b) 6 V
(c) 14 V (d) 17 V **[GATE. E.C.E. 2003]**

50. The value of C required for sinusoidal oscillations of frequency 1 kHz in the circuit of the figure is



(a) $\frac{1}{2\pi}$ μF.
(b) 2π μF.
(c) $\frac{1}{2\pi\sqrt{6}}$ μF.
(d) $2\pi\sqrt{6}$ μF. **[GATE E.C.E., 2004]**

51. The first step in the photolithography is
(a) The application of the photoresist.
(b) aligning of the photomask over the silicon wafer.
(c) to expose the setup to ultraviolet radiation.
(d) to heat the setup in the oven at 150 °C for about 20 minutes.
[A.M.I.E. Sec.B. Solid State Physics and Semiconductor Devise Summer 2005]

52. The directive gain of an antenna is 30 dB. If the antenna radiates 7.5 kW, the power density at a distance of 40 km will be
(a) $\frac{7.5\times10^3}{40\times10^3} \times 30\ W/m^2$ (b) $\frac{7.5\times10^3}{4\pi(40\times10^3)^2}\ W/m^2$
(c) $\frac{7.5\times10^3\times1000}{4\pi(40\times10^3)^2}\ W/m^2$ (d) $\frac{7.5\times10^3}{(40\times10^3)^2} \times 30\ W/m^2$
[U.P.S.C. I.E.S. E.E.-I, 2000]

53. X-band frequencies are in which one of the following ranges?
(a) 3.5 to 5.5 GHz. (b) 5.5 to 8.0 GHz.
(c) 8.0 to 12.0 GHz. (d) 12.4 to 16.4 GHz.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

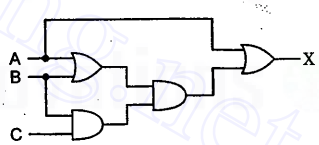
54. In coding theory, if
$\bar{L}$ = average word length of the code word
$\bar{L}_{min}$ = minimum average word length of the code word
then what is the efficiency of source-code(η)?
(a) $\sqrt{\frac{\bar{L}_{min}}{\bar{L}}}$ (b) $\sqrt{\frac{\bar{L}}{\bar{L}_{min}}}$ (c) $\frac{\bar{L}_{min}}{\bar{L}}$ (d) $\frac{\bar{L}}{\bar{L}_{min}}$
[U.P.S.C. I.E.S. E.E.-II, 2003]

55. The triac is equivalent to
(a) two SCRs connected in parallel.
(b) two SCRs connected in antiparallel.
(c) one SCR, one diode connected in parallel.
(d) one diode, one SCR connected in antiparallel.
[A.M.I.E. Sec B. Power Electronics Summer, 1995]

56. How many switches are used to construct a three-phase to three-phase cycloconverter ?
(a) 3. (b) 6. (c) 12. (d) 18.
[U.P.S.C. I.E.S. E.E.-II, 2002]

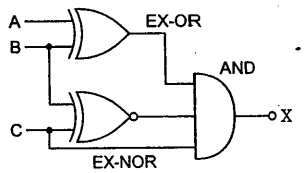
57. Consider the following statements:
For 3 input variables *a*, *b*, *c*; a Boolean function $y = ab + bc + ca$ represents
1. a 3-input majority gate.
2. a 3-input minority gate.
3. carry output of a full adder.
4. product circuit for *a*, *b*, and *c*.
Which of the above statements are correct?
(a) 1 and 4 only. (b) 2 and 3 only.
(c) 1 and 3 only. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

58. For the given logic circuit what is the simplified Boolean function?



(a) X = AB + C.
(b) X = BC + A.
(c) X = AB + A.
(d) X = AC + B. **[U.P.S.C. I.E.S. E.T.E.-II, 2007]**

59. For the logic circuit shown in the figure, what is the required input condition (A, B, C) to make output X = 1?



(a) 1, 0, 1 (b) 0, 0, 1
(c) 1, 1, 1 (d) 0, 1, 1
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

60. Quantization process used in analog to digital conversion process is a
(a) One-to-many mapping which causes loss of information.
(b) Many-to-one mapping. It causes a loss of information at the transmitter which can be recovered at the receiver.

Answers: **45.** (c), **46.** (a), **47.** (b), **48.** (a), **49.** (b), **50.** (a), **51.** (a), **52.** (b), **53.** (c), **54.** (c), **55.** (b), **56.** (d), **57.** (c), **58.** (b), **59.** (d), **60.** (d),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) One-to-one mapping.
(d) Many-to-one mapping. The loss of information at the transmitter cannot be recovered at the receiver.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

61. In 8085 microprocessor system, the direct addressing instruction is
(a) MOV A, B (b) MOV B, OAH
(c) MOV, C, M (d) STA addr
[U.P.S.C. I.E.S. E.T.E.-II, 1998]

62. The fetch and execute instructions are repeatedly executed by the microprocessor until the power is switched OFF. The microprocessor enters into a loop described by
while power is ON do
being
fetch the next instruction
execute this instruction
end
These two tasks are sequential. Which one of the following microprocessors does not follow this sequence?
(a) 8085 (b) Z 80 (c) 8086 (d) 68000
[U.P.S.C. I.E.S. E.E.-II, 1999]

63. A fragment of assembly code is given below for 8085:
EL
MVI 09
SIM
This sequence of instruction
(a) Enables RST 7.5, RST 6.5 and RST 5.5.
(b) Enables RST 7.5 and RST 6.5 and disables RST 5.5.
(c) Enables RST 7.5 and disables RST 6.5 and RST 5.5.
(d) Disables RST 7.5, RST 6.5 and RST 6.5.
[U.P.S.C. I.E.S. E.E.-II, 1998]

64. The Wheatstone bridge method of measuring resistance is ideally suited for the measurement of resistance values in the range of
(a) 0.001 to 1 Ω. (b) 0.1 to 100 Ω.
(b) 100 Ω to 10 kΩ. (d) 100 kΩ to 10 MΩ.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

65. A compensated wattmeter has its reading corrected for error due to which one of the following parameters?
(a) Frequency. (b) Friction.
(c) Power consumed in current coil.
(d) Power consumed in pressure coil.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

66. Which of the following cannot provide as much time interval accuracy as the oscilloscope but can capture and display eight or more signals simultaneously, something that scopes cannot do
(a) Logic analyzer. (b) Digital oscilloscope.
(c) Frequency analyzer. (d) Wave analyzer.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

67. An 8-bit ADC has a maximum output voltage of 2 V. If $V_{in} = 1.5$ V, the digital output at the end of the conversion will be
(a) 0.001 1100. (b) 0010 0011.
(c) 0110 0000. (d) 1100 0000.
[A.M.I.E. Sec B. Electronics & Elec. Measurements Summer 2003]

68. Which of the following transducers is most suitable for monitoring continuous variation in very fine thickness of a material?
(a) Diaphragm. (b) Capacitor.
(c) LVDT. (d) Piezoelectric crystal.
[U.P.S.C. I.E.S. E.E.-II, 2009]

69. The main functions of the presentation layer of the OSI model include
(a) encryption and authentification.
(b) authentification and compression.
(c) compression and coding.
(d) encryption and compression.
[U.P.S.C. I.E.S. E.E.-II, 2000]

70. Consider the following functions:

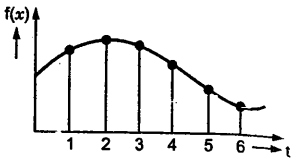
1. $\frac{s^3+3s}{2(s^2+1)}$ 2. $\frac{s^2+3s+1}{5(s^2+1)}$

3. $\frac{s^2+1}{3s}$ 4. $\frac{3\left(s^3+\frac{7s}{2}\right)}{s^4+14s^2+30}$

Which of these are valid driving-point impedance functions?
(a) 1, 2 and 3. (b) 1, 3 and 4.
(c) 1, 2 and 4. (d) 2, 3 and 4.
[U.P.S.C. I.E.S. E.E.-II 2000]

71. The characteristic equation of a feedback control system is
$$2s^4 + s^3 + 3s^2 + 5s + 10 = 0$$
The number of roots in the right half of s-plane are
(a) zero (b) 1 (c) 2 (d) 3
[GATE E.E. 2000]

72. Consider a signal $f(x)$ sampled at $t = 0, 1, 2, 3, \ldots$ as shown in the figure. The expression for the sampled signal is
(a) $\{f(x).\ n\}$ where n = number of samples
(b) $\{f(x)\,\delta(t, n)\}$ where $\delta(t, n)$ kronek or delta $n = 0, 1, 2 \ldots$
(c) $\{f(x).\ \Delta n\}$ where Δ = constant equal to sample duration
(d) not possible to write.



[U.P.S.C. I.E.S. E.E.-II, 1999]

73. Consider the following driving-point functions:

$$F_1 = \frac{(s^2+1)(s^2+3)}{s(s^2+4)}. \qquad F_2 = \frac{(s^2+1)(s^2+3)}{(s^2+2)(s^2+4)}.$$

$$F_3 = \frac{s(s^2+3)}{(s^2+2)(s^2+4)}. \quad \text{and} \quad F_4 = \frac{(s^2+2)(s^2+5)}{s(s^2+4)}.$$

Among these, the LC function would include
(a) F_1 and F_2. (b) F_2 and F_3.
(c) F_3 and F_4. (d) F_1 and F_4.
[U.P.S.C. I.E.S. E.E.-I, 2000]

74. For a tachometer, if $\theta(t)$ is the rotor displacement in radians, $e(t)$ is the output voltage and K_t is the tachometer constant in V/rad/sec, then the transfer function, $\frac{E(s)}{Q(s)}$ will be
(a) $K_t s^2$ (b) $\frac{K_t}{s}$ (c) $K_t s$ (d) K_t
[GATE E.E. 2004]

75. The loop transfer function GH of a control system is given by $GH = \frac{K}{s(s+1)(s+2)(s+3)}$. Which of the following statements regarding the conditions of the system root loci diagram is/are correct.
1. There will be four asymptotes.
2. There will be three separate root loci.
3. Asymptotes will intersect at real axis at $\sigma_A = -2/3$
Select the correct answer using the codes given below:
Codes:
(a) 1 alone. (b) 2 lone. (c) 3 alone. (d) 1, 2 and 3.
[U.P.S.C. I.E.S. E.E.-I, 1998]

76. The impulse response of linear time invariant system is given as
$$g(t) = e^{-t},\ t > 0$$
The transfer function of the system is equal to:
(a) $1/s$ (b) $1/[s(s+1)]$
(c) $1/(s+1)$ (d) $s/(s+1)$
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

Answers: **61.** (d), **62.** (d), **63.** (a), **64.** (b), **65.** (d), **66.** (a), **67.** (d), **68.** (b), **69.** (d), **70.** (b), **71.** (c), **72.** (b), **73.** (c), **74.** (c), **75.** (a), **76.** (c),

77. Consider the following Nyquist plots of different control systems:

1. 
2. 
3. 
4. 
Which of these plot(s) represent(s) a stable system?

(a) 1 alone. (b) 2, 3 and 4.
(c) 1, 3 and 4. (d) 1, 2, and 4.

[U.P.S.C. I.E.S. E.E.-I, 2000]

78. The characteristic equation of a linear control system is

$$s^2 + 5Ks + 10 = 0$$

The root-loci of the system for $0 < K < \infty$ is

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 2000]

Use following codes for Questions from 79 to 82.

(a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false. (d) A is false but R is true.

79. (A) : There are no convergence issues with the discrete-time Fourier series in general.
(R) : A discrete time signal is always obtained by sampling a continuous signal. [U.P.S.C. I.E.S. E.T.E.-I, 2009]

80. (A) : Lepidolite type mica is unsuitable for electric insulation.
(R) : Lepidolite is hard and brittle. [U.P.S.C. I.E.S. E.E.-I, 2003]

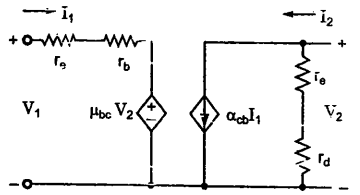
81. (A) : Potier method of determination of voltage regulation of an alternator gives accurate results.
(R) : Potier method is based on the separation of armature leakage reactance and armature reaction mmf.

82. (A) : The z-transform of the output of an ideal sampler is given by

$$Z[f(t)] = K_0 + \frac{K_1}{z} + \frac{K_2}{z^2} + \ldots + \frac{K_n}{z^n}$$

(R) : The relationship is the result of application of $z = e^{-sT}$, where T stands for the time gap between the samples.
[U.P.S.C. I.E.S. E.T.E.-I, 2008]

83. Consider the two port transistor circuit as given below:



Match List 1 (Hybrid Parameter) with List 2 (Circuit Element) and select the correct answer using the codes given below the lists:

List 1	List 2
A. h_{11}	1. $\frac{1}{r_e + r_d}$
B. h_{12}	2. $r_b + r_e$
C. h_{21}	3. μbc
D. h_{22}	4. α_{cb}

Codes:	A	B	C	D
(a)	2	1	4	3
(b)	4	3	2	1
(c)	2	3	4	1
(d)	4	1	2	3

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

84. Match List 1 (Mathematical expression) with List 2 (Nomenclature) and select the correct answer using the codes given below the lists:

List 1	List 2
A. $\int_0^\infty h(t-\tau) \times (\tau)\, d\tau$	1. Step function
B. $\int_0^\infty \times (t)\, e^{-st}\, dt$	2. Convolution integral
C. $\int_0^\infty \times (t)\, e^{-j\omega t}\, dt$	3. Fourier transform
D. $\int_0^\infty \delta(t)\, dt$	4. Laplace transform

Codes:	A	B	C	D
(a)	1	3	4	2
(b)	3	4	1	2
(c)	4	3	2	1
(d)	2	4	3	1

[U.P.S.C. I.E.S. E.E.-I, 1998]

85. Match List 1 with List 2 and select the correct answer using the code given under the lists:

List 1 (Modulation)	List 2 (Power Input to Antenna in Watts)
A. 100 % AM	1. 1.5
B. 50 % AM	2. 1.125
C. 10 % AM	3. 1.005
D. FM	4. 1.00

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	3	4	1	2
(c)	1	4	3	2
(d)	3	2	1	4

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

Answers: **77.** (a), **78.** (a), **79.** (d), **80.** (a), **81.** (a), **82.** (c), **83.** (c), **84.** (d), **85.** (a),

Downloaded From : www.EasyEngineering.net

86. Match the List 1 (Device) with List 2 (Associated Term) and select the correct answer using the code given below the lists:

List 1 (Device)	List 2 (Associated Term)
A. Diode	1. Pinch off voltage
B. SCR	2. Holding current
C. BJT	3. Forward resistance
D. FET	4. Active region

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	1	2	4	3
(c)	3	2	4	1
(d)	1	4	2	3

[U.P.S.C. I.E.S. E.T.E.-I, 2006]

87. Match items in Group 1 with items in Group 2, most suitably.

Group 1	Group 2
P. LED	1. Heavy doping
Q. Avalanche Photodiode	2. Coherent radiation
R. Tunnel diode	3. Spontaneous emission
S. LASER	4. Current gain

(a) P – 1; Q – 2; R – 4; S – 3
(b) P – 2; Q – 3; R – 1; S – 4
(c) P – 3; Q – 4; R – 1; S – 2
(d) P – 2; Q – 1; R – 4; S – 3 **[GATE E.C.E. 2003]**

88. Match List I with List II and select the correct answer using the code given below the lists:

List I	List II
A. 8255A	1. Programmable Peripheral Interface.
B. 8279	2. Programmable Interval Timer.
C. 8254/8253	3. DMA Controller.
D. 8237/8257	4. Programmable Keyboard/Display Interface.

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	1	3	2	4
(c)	2	3	1	4
(d)	1	4	2	3

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

89. Match List 1 (Terms) with List 2 (Definitions) and select the correct answer using the codes given below the lists:

List 1	List 2
A. Resolution	1. Closeness with which the instrument reading approaches the true value.
B. Sensitivity	2. Reproducibility of measurements.
C. Accuracy	3. Smallest change in measured value to which the instrument can respond.
D. Precision	4. Ratio of response of the instrument to the input variable.

Codes:	A	B	C	D
(a)	4	3	1	2
(b)	3	4	2	1
(c)	3	4	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 2000]

90. Math List 1 with List 2 in respect of the open-loop transfer function $G(s)\,H(s) = \dfrac{K(s+10)(s^2+20s+500)}{s(s+20)(s+50)(s^2+4s+5)}$ and select the correct answer using the codes given below the lists:

List 1 (Types of Loci)	List 2 (Numbers)
A. Separate loci	1. One
B. Loci on the real axis	2. Two
C. Asymptotes	3. Three
D. Breakaway points	4. Five

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	3	4	1	2
(c)	4	3	1	2
(d)	4	3	2	1

[U.P.S.C. I.E.S. E.E.-I, 1999]

Answers: **86.** (c), **87.** (c), **88.** (d), **89.** (c), **90.** (d).

TEST PAPER-IV

Time Allowed : 2 Hours *Maximum Marks : 200*

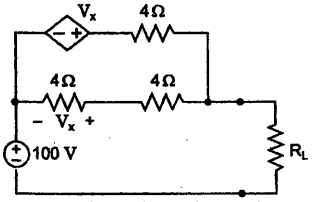
Note : The following 88 items are multiple choice type. Each item comprises four or more responses (answers). Select the response which you feel is most appropriate.

1. Three resistance each of R ohms are connected to form a triangle. The resistance between only two terminals will be

(a) R Ω (b) $\frac{3}{2}\Omega$ (c) 3 R Ω (d) $\frac{2}{3}$R Ω

[R.G.P.V. Basic Electrical Engineering June/July 2006]

2. In the circuit shown, what value of R_L maximizes the power delivered to R_L?



(a) 2.4 Ω (b) $\frac{8}{3}\Omega$

(c) 4 Ω (d) 6 Ω

[GATE E.C.E. 2009]

3. Which one of the following statements for a short-circuited loss-free line is not correct?

(a) The line appears as a pure reactance when viewed from the sending end.

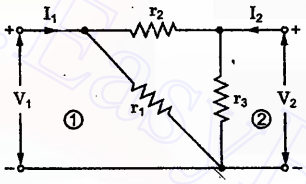
(b) It can be either inductive or capacitive.

(c) There are no reflections in the line.

(d) Standing waves of voltage and current are set up along length of the lines.

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

4. For the network shown in the given figure, the hybrid parameter h_{21} is



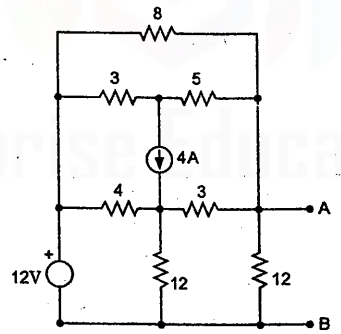
(a) $\frac{r_2}{r_1+r_2}$

(b) $\frac{r_1+r_2}{r_1+r_2+r_3}$

(c) $-\frac{r_2}{r_1+r_2}$ (d) $-\frac{r_1}{r_1+r_2}$

[U.P.S.C. I.E.S. E.E.-I, 2000]

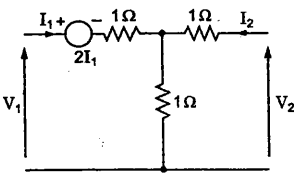
5. What is the Thevenin resistance seen from the terminals AB of the circuit shown below in the figure?



(a) 2 Ω (b) 4 Ω (c) 8 Ω (d) 12 Ω

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

6. The circuit shown in the figure



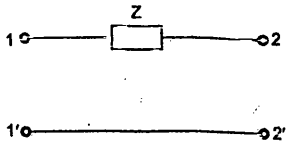
1. is reciprocal
2. has $Z_{11} = 2, Z_{22} = 2$
3. has $Z_{11} = 4, Z_{22} = 2$
3. has $Z_{11} = 0, Z_{22} = 2$

Select the correct answer using the code given below:

(a) 1 and 3. (b) 1 and 2. (c) 1 and 4. (d) 3 only.

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

7. What are the ABCD parameters of the single element circuit given above?



(a) $\begin{bmatrix} 1 & Z \\ 0 & 1 \end{bmatrix}$ (b) $\begin{bmatrix} 1 & 1 \\ Z & 0 \end{bmatrix}$

(c) $\begin{bmatrix} 1 & Z \\ 1 & 0 \end{bmatrix}$ (d) $\begin{bmatrix} Z & 1 \\ 1 & 1 \end{bmatrix}$

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

8. A transmission line has R, L, G and C distributed parameters per unit length of the line. γ is the propagation constant of the lines. Which expression gives the characteristic impedance of the line?

(a) $\frac{\gamma}{R + j\omega l}$ (b) $\frac{R + j\omega l}{\gamma}$

(c) $\frac{G + j\omega C}{\gamma}$ (d) $\sqrt{\frac{G + j\omega C}{R + j\omega L}}$

[U.P.S.C. I.E.S. E.E.-I, 2002]

9. When a lossless transmission line is terminated by a resistance equal to surge impedance, then what is value of the reflection coefficient?

(a) 1 (b) − 1 (c) 0 (d) 0.5

[U.P.S.C. I.E.S. E.E.-I, 2005]

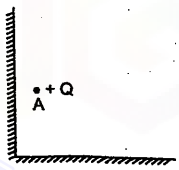
10. For an air dielectric transmission line, it is found that as the frequency is varied from 50 MHz upward, the current reaches a minimum at 50.01 MHz and then a maximum at 50.04 MHz. The distance of the location of the short-circuit from the generator will then be

(a) 10 km (b) 2.5 km (c) 1 km

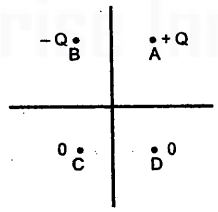
(d) not determinable from the given data

[U.P.S.C. I.E.S. E.E.-I, 1998]

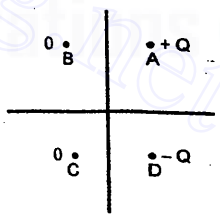
11. A point charge +Q is brought near a corner of two right angle conducting planes which are at zero potential as shown in the given Figure-I. Which one of the following configurations describes the total effect of the charges for calculating the actual field in the first quadrant?



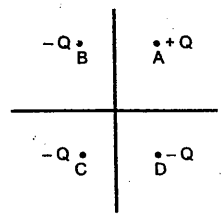
(a)



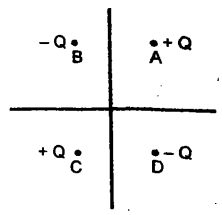
(b)



(c)



(d)



[U.P.S.C. I.E.S. E.E.-I, 2001]

Answers: **1.** (d), **2.** (c), **3.** (c), **4.** (d), **5.** (a), **6.** (a), **7.** (a), **8.** (b), **9.** (c), **10.** (d), **11.** (d),

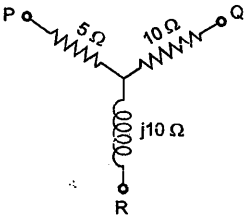
Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

12. A boiler at home is switched on to the ac mains supplying power at 230 V, 50 Hz. The frequency of instantaneous power consumed is
(a) 0 Hz (b) 50 Hz (c) 100 Hz (d) 150 Hz
[GATE E.E. 1996]

13. A series R-L-C circuit with R = 5 Ω, L = 1 henry and C = 1 farad is connected to voltage source $e(t) = 10 \sin t$. For such a circuit
(a) the supply voltage leads the current by 90°.
(b) the supply voltage and current are in phase.
(c) the supply voltage and current are out of phase by 180°.
(d) nothing can be said about phase relation.
[A.M.I.E. Elec. Science Winter 1993]

14. In the delta equivalent of the given star-connected circuit Z_{QR} is equal to

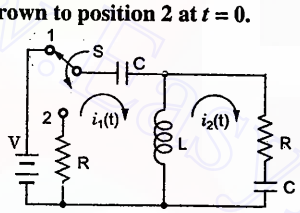


(a) 40 Ω (b) $(20 + j\,10)$ Ω
(c) $\left(10 + j\frac{10}{3}\right)\Omega$
(d) $(10 + j\,30)$ Ω
[U.P.S.C. I.E.S. E.E.-I, 1995]

15. Algebraic expression for Z transform of $x[n]$ is $X(z)$. What is the algebraic expression for Z transform of $e^{j\omega_0 n} x[n]$?
(a) $X(z - z_0)$ (b) $X(e^{-j\omega_0} z)$
(c) $X(e^{j\omega_0} z)$ (d) $X(z)\, e^{j\omega_0} z$
[U.P.S.C. I.E.S. E.T.E.-I, 2007]

The circuit for Q. 16 and Q. 17 is given. Assume that the switch S is in position 1 for a long time and thrown to position 2 at $t = 0$.

16. At $t = 0^+$, the current i_1 is
(a) $\frac{-V}{2R}$ (b) $\frac{-V}{R}$
(c) $\frac{-V}{4R}$ (d) zero
[GATE E.E. 2003]



17. $I_1(s)$ and $I_2(s)$ are the Laplace transforms of $i_1(t)$ and $i_2(t)$ respectively. The equations for the loop currents $I_1(s)$ and $I_2(s)$ for the circuit shown in the figure, after the switch is brought from position 1 to position 2 at $t = 0$, are

(a) $\begin{bmatrix} R + Ls + \frac{1}{Cs} & -Ls \\ -Ls & R + \frac{1}{Cs} \end{bmatrix} \begin{bmatrix} I_1(s) \\ I_2(s) \end{bmatrix} = \begin{bmatrix} \frac{V}{s} \\ 0 \end{bmatrix}$

(b) $\begin{bmatrix} R + Ls + \frac{1}{Cs} & -Ls \\ -Ls & R + \frac{1}{Cs} \end{bmatrix} \begin{bmatrix} I_1(s) \\ I_2(s) \end{bmatrix} = \begin{bmatrix} -\frac{V}{s} \\ 0 \end{bmatrix}$

(c) $\begin{bmatrix} R + Ls + \frac{1}{Cs} & -Ls \\ -Ls & R + Ls + \frac{1}{Cs} \end{bmatrix} \begin{bmatrix} I_1(s) \\ I_2(s) \end{bmatrix} = \begin{bmatrix} -\frac{V}{s} \\ 0 \end{bmatrix}$

(d) $\begin{bmatrix} R + Ls + \frac{1}{Cs} & -Ls \\ -Ls & R + Ls + \frac{1}{Cs} \end{bmatrix} \begin{bmatrix} I_1(s) \\ I_2(s) \end{bmatrix} = \begin{bmatrix} \frac{V}{s} \\ 0 \end{bmatrix}$

[GATE E.C.E. 2003]

18. A d c series motor is operating at rated speed with rated excitation. It has two resistances R_1 and R_2 connected across the field and the armature respectively. Speeds above the rated speed can be obtained by
(a) increasing R_1 only. (b) reducing R_2 only.
(c) reducing R_1 and increasing R_2.
(d) increasing R_1 and reducing R_2.

19. If the voltage applied across the armature of a dc motor is reduced by 5%, keeping the load current and field current unchanged, the speed of the motor will
(a) increase by about 5%. (b) reduce by about 5%.
(c) remain unaltered. (d) unpredictable.

20. A transformer has equivalent resistance R_{02} and reactance X_{02}. The regulation will be zero when pf is
(a) $\frac{R_{02}}{\sqrt{(R_{02})^2 + (X_{02})^2}}$ leading.
(b) $-\frac{X_{02}}{\sqrt{(R_{02})^2 + (X_{02})^2}}$ leading.
(c) $\frac{X_{02}}{\sqrt{(R_{02})^2 + (X_{02})^2}}$ leading.
(d) $\frac{R_{02}}{X_{02}}$ leading.

21. Silicon content in iron laminations is kept within 5% as it
(a) increases hysteresis loss.
(b) increases cost.
(c) makes the material brittle.
(d) reduces the curie point. [A.M.I.E. Sec B. Winter 1993]

22. A 3-phase transformer has its primary connected in delta and secondary in star. Secondary to primary turn-ratio per phase is 5. For a primary voltage of 400 V, the secondary voltage would be
(a) 2,000 V. (b) 80 V. (c) 3,464 V. (d) $80\sqrt{3}$ V.

23. In 36 slot, 4-pole, 3 ϕ alternator the winding pitch is 7. The electrical angle by which the winding is chorded is equal to
(a) 40°. (b) 30°. (c) 60°. (d) 15°.

24. A synchronous motor will deliver maximum power when
(a) load angle is equal to internal angle θ.
(b) input power factor is unity.
(c) load angle is 45°. (d) load angle is 0°.
[A.M.I.E. Sec B. Elec. Machines Winter 1996]

25. In a 3-phase slip-ring induction motor high starting torque is achieved by
(a) increasing supply voltage V.
(b) increasing supply frequency f.
(c) connecting a capacitor across the motor terminals.
(d) connecting a star-connected resistance across the slip-ring terminals of the motor.

26. Crawling of induction motor occurs due to
(a) harmonic synchronous torques.
(b) harmonic induction torques.
(c) vibration torques. (d) both (a) and (b).

27. Magnetically saturated ferrite
(a) interacts with electromagnetic waves.
(b) produces large hysteresis.
(c) produces low eddy currents.
(d) all of the above.

28. Which of the following pair (s) is/are correctly matched ?

Material	*Application*
1 Rochelle salt	Phonograph.
2 Barium titanate	Amplifier.
3 Quartz	Oscillator

Answers: **12.** (c), **13.** (b), **14.** (d), **15.** (b), **16.** (a), **17.** (c), **18.** (c), **19.** (b), **20.** (b), **21.** (c), **22.** (c), **23.** (a), **24.** (a), **25.** (d), **26.** (d), **27.** (a), **28.** (c),

Select the correct answer using the codes given below
(a) only 2 (b) 1 and 2 (c) 1 and 3 (d) 2 and 3
[U.P.S.C. I.E.S. E.E.-I, 1995]

29. In a dc machine "contraction coefficient" is used to take into account the reduction of
(a) air-gap area due to armature slots.
(b) iron losses in the teeth due to lower tooth density.
(c) armature mmf due to armature slots.
(d) torque due to ventilating ducts. [U.P.S.C. I.E.S. E.E.-II, 1993]

30. With increase in voltage, the window space factor of a transformer
(a) decreases. (b) increases.
(c) remains constant.
(d) decreases or increases depending upon whether it is a distribution or power transformer.
[A.M.I.E. Sec B Principles of Elec. Design Winter 1994]

31. Air gap of a polyphase induction motor is kept small to
(a) reduce the possibility of crawling.
(b) reduce the noise.
(c) reduce magnetizing current.
(d) obtain high starting torque.
[A.M.I.E. Sec B Principles of Elec. Design Winter 1994]

32. The safety of electrical appliances and wiring is ensured by
(a) insulation. (b) earthing.
(c) providing a fuse wire is the electric circuit.
(d) all of the above.

33. In a regenerative feed heating cycle,
(a) the optimum value of the fraction of steam extracted for feed water heating increases with the increase in Rankine cycle efficiency.
(b) the greatest economy is affected when steam is extracted from several places in different stages of the steam turbine.
(c) thermal efficiency is reduced.
(d) both (a) and (b).

34. Two generating plants feed a load centre through a transmission network. For maximum economy
(a) the incremental cost of power supplied at the load centre should be the same for both the plants.
(b) the incremental fuel cost should be the same for both the plants.
(c) the more efficient plant should share more load.
(d) none of the above.

35. A generating station has a maximum demand of 20 MW and a connected load of 40 MW. The generated units are 4.36×10^7 per annum. The demand factor is
(a) 2. (b) 2/3. (c) 1/2. (d) 1/3.
[A.M.I.E. Sec B. Power Systems, Winter 1998]

36. The surge impedance of 3-phase, 400 kV transmission line is 400 Ω. The surge impedance loading (SIL) is
(a) 400 MW (b) 100 MW
(c) 1600 MW (d) 200 MW
[U.P.S.C. I.E.S. E.E.-II, 2001]

37. The non-uniform distribution of voltage across the units in a string of suspension type insulators is due to
(a) unequal self-capacitance of the units.
(b) non-uniform distance of separation of the units from the tower body.
(c) the existence of stray capacitance between the metallic junctions of the units and the tower body.
(d) non-uniform distance between the cross-arms and the units. [U.P.S.C. I.E.S. E.E.-II, 1998]

38. The inductance of a single-phase two wire line is given by (D is the distance between conductors and r is the radius of conductor)
(a) $0.4 \log_e \frac{D}{r}$ mH/km. (b) $0.55 \log_e \frac{D}{r}$ mH/km.
(c) $0.4 \log_e \frac{r}{D}$ mH/km. (d) $0.55 \log_e \frac{r}{D}$ mH/km
[A.M.I.E. Sec B. Power Systems Winter 1998]

39. With bundled conductors
(a) the corona inception voltage increases.
(b) the corona inception voltage decreases.
(c) the corona inception voltage remains unaffected.
[A.M.I.E. Sec B. Winter 1993]

40. For bulk power transmission over long distance HVDC transmission is
(a) is economically and technically superior to ac transmission.
(b) not good alternative to ac transmission.
(c) not economically viable.
[A.M.I.E. Sec B. Power Systems Winter 1998]

41. The positive-sequence current for a L-L fault of a 2 kV system is 1,400 A, and corresponding current for a L-L-G fault is 2,220 A. The zero-sequence impedance of the system is
(a) 62.75 Ω. (b) 4.5275 Ω.
(c) 5.275 Ω. (d) 0.5275 Ω.
[U.P.S.C. I.E.S. Elec. Engineering II, 1999]

42. The rating of a circuit breaker is usually determined on the basis of ... fault.
(a) symmetrical (b) line to line
(c) single line to ground (d) double line to ground

43. The domains of power system where directional overcurrent relay is indispensable are
(a) in case of parallel feeder protection.
(b) in case of ring main feeder protection.
(c) both (a) and (b).
(d) none of the above. [A.M.I.E. Sec B. Summer 1998]

44. Time graded protection of a radial feeder can be achieved by using
(a) definite time relays. (b) inverse time relays.
(c) both definite and inverse time relays.
(d) none of the above. [A.M.I.E. Sec B. Summer 1999]

45. The light of fluorescent tube appears cooler than that from an incandescent lamp. This is due to the fact that
(a) the tube consumes less power.
(b) surface area of tube is larger than that of the incandescent lamp.
(c) tungsten is not used in the tube.
(d) none of the above.

46. A train weighing 120 tonne is to be driven up an incline of 2 per cent with an acceleration of 2 km phps. Neglecting rotational inertia and train resistance, the tractive force required is
(a) 263, 520 N. (b) 301, 870 N.
(c) 90, 210 N. (d) 69, 020 N.

47. The dc series motor is most suitable for traction services but more particularly for urban/suburban services because
(a) dc series motors are suitable for regenerative braking.
(b) dc series motors are capable of withstanding rapid fluctuations in supply voltage.
(c) dc series motors are capable of developing high torque at start.
(d) dc series motors are capable of withstanding temporary interruption of supply without undue rush of current.

Answers: **29.** (a), **30.** (a), **31.** (c), **32.** (d), **33.** (d), **34.** (a), **35.** (c), **36.** (a), **37.** (c), **38.** (a), **39.** (a), **40.** (a), **41.** (d), **42.** (a), **43.** (c), **44.** (c), **45.** (c), **46.** (c), **47.** (c),

Downloaded From : www.EasyEngineering.net

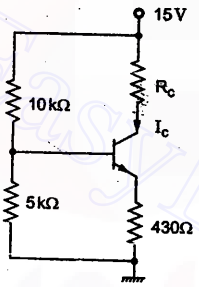
48. An electron in the conduction band
(a) is bound to its parent atom.
(b) has no charge.
(c) is located near the top of the crystal.
(d) has a higher energy than an electron in the valence band.
[A.M.I.E. Summer 1996]

49. With increasing temperature, the resistivity of an intrinsic semiconductor decreases. This is because, with the increase of temperature
(a) both the carrier concentration and mobility of carriers decrease.
(b) the carrier concentration increases butthe mobility of carriers decreases.
(c) the carrier concentration decreases but the mobility of carriers increases.
(d) the carrier concentration remains the same but the mobility of carriers decreases. [U.P.S.C. I.E.S. E.E.-I, 1993]

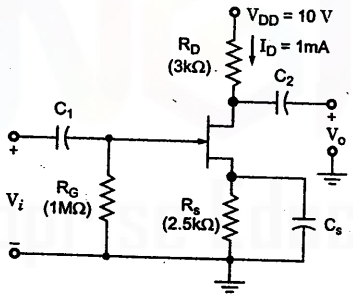
50. The Hall coefficient of a specimen of doped semiconductor is 3.06×10^{-4} $m^3 C^{-1}$ and the resistivity of the specimen is 8.93×10^{-3} Ω-m. The majority carrier mobility (in units of $m^2 V^{-1} s^{-1}$) will be
(a) 0.0078 (b) 0.035 (c) 0.151 (d) 0.350.
[U.P.S.C. I.E.S. E.E.-I, 1996]

51. For a BJT, early voltage V_A is 100 V. In common emitter configuration, quiescent V_{CE} is 10 V. What percentage change in quiescent I_C would occur, if early voltage V_A is made ∞ ?
(a) 10 % (b) 20 % (c) 5 % (d) 0 %
[U.P.S.C. I.E.S. E.T.E-I, 2008]

52. In the circuit of the figure, assume that the transistor is in the active region. It has a large β and its base-emitter voltage is 0.7 V. The value of I_c is
(a) Indeterminate since R_c is not given.
(b) 1 mA (c) 5 mA
(d) 10 mA [GATE E.C.E. 2000]



53. The voltage gain $A_v = \frac{v_o}{v_i}$ of the JFET amplifier shown in the figure is

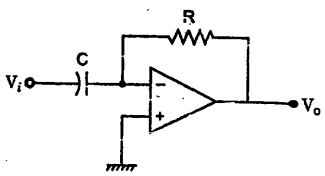


I_{DSS} = 10 mA $V_p = -5$ V
(Assume C_1, C_2 and C_s to be vary large)
(a) + 18 (b) − 18 (c) + 6 (d) − 6
[GATE E.C.E 2002]

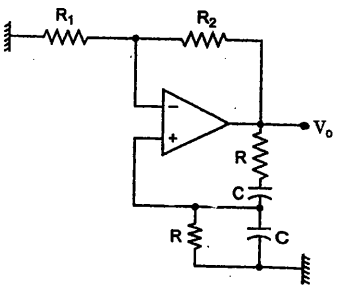
54. The input impedance (Z_i) and the output impedance (Z_o) of an ideal transconductance (voltage controlled current source) amplifier are
(a) $Z_i = 0, Z_o = 0$ (b) $Z_i = 0, Z_o = \infty$
(c) $Z_i = \infty, Z_o = 0$ (d) $Z_i = \infty, Z_o = \infty$
[GATE E.C.E. 2006]

55. In a class-B push-pull operation, the dc power drawn is 28 W. What is the power delivered by the amplifier at the ideal maximum efficiency of power conversion ?
(a) 28 W (b) 14 W (c) 22 W (d) 7 W
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

56. Assume that the op-amp of the figure is ideal. If v_i is a triangular wave, then v_o will be
(a) square wave.
(b) triangular wave.
(c) parabolic wave.
(d) sine wave.
[GATE E.C.E. 2000]



57. The configuration of the figure is a
(a) precision integrator.
(b) Hartley oscillator.
(c) Butterworth high pass filter.
(d) Wien-bridge oscillator.
[GATE E.C.E. 2000]



58. A single crystal rod is cut into thin slices, commonly known as
(a) glass rods. (b) preform.
(c) substrate. (d) wafers.
[A.M.I.E. Sec B. Solid State Physics and Semiconductor Devices Summer 2006]

59. An AM voltage singal $s(t)$, with a carrier frequency of 1.15 GHz has a complex envelope $g(t) = A_C[1 + m(t)]$, $A_C = 500$ V, and the modulation is a 1 kHz sinusoidal test tone described by

$$m(t) = 0.8 \sin(2\pi \times 10^3 t)$$

appears across a 50 Ω resistive load. What is the actual power dissipated in the load ?
(a) 165 kW (b) 82.5 kW (c) 3.3 kW (d) 6.6 kW
[U.P.S.C. I.E.S. E.E.-II, 2005]

60. Consider the following statements about analog communication and multiplexing:
1. Noise problem for analog communication has the greatest effect on TDM system.
2. Noise problem for analog communication has the least effect on SDM system.
Which of the statements given is/are correct?
(a) 1 only. (b) 2 only.
(c) Both 1 and 2. (d) Neither 1 nor 2.
[U.P.S.C. I.E.S. E.E.-II, 2008]

61. Consider a binary linear block code (6, 3) with a generator matrix of the form

$$G = \begin{bmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{bmatrix}$$

If a code word has been received from the channel as [101 111], what is the maximum likelihood decision for the transmitted code word?
(a) [101 111] (b) [100 111]
(c) [101 011] (d) [101 110]
[U.P.S.C. I.E.S. E.E.-II, 2007]

62. A fully controlled thyristor bridge drives a dc motor. The system is capable of
(a) motoring and braking in both directions.
(b) only motoring in both directions, no braking.
(c) motoring in forward direction and braking in forward direction.
(d) only motoring in forward direction, no braking.
[A.M.I.E. Sec B. Power Electronics Summer 2006]

Answers: **48.** (d), **49.** (b), **50.** (b), **51.** (d), **52.** (d), **53.** (d), **54.** (d), **55.** (c), **56.** (a), **57.** (d), **58.** (d), **59.** (c), **60.** (a), **61.** (b), **62.** (a),

Downloaded From : www.EasyEngineering.net

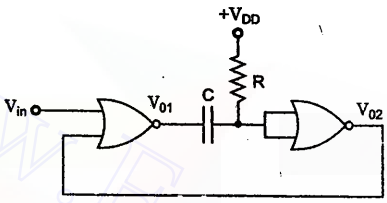
63. Consider the following semiconductor devices:
1. Triac. 2. Thyristor 3. Amplifying gate thyristor.
The correct sequence of these devices in increasing order of their *di/dt* capabilities is
(a) 1, 3 2. (b) 1, 2 3. (c) 3, 1, 2. (d) 3, 2, 1.
[U.P.S.C. I.E.S. E.E.-II, 1997]

64. Consider the following statements :
Switched mode power supplies are preferred over the continuous type, because they are
1. suitable for use in both ac and dc.
2. more efficient.
3. suitable for low-power circuits.
4. suitable for high-power circuits.
Of these statements.
(a) 1 and 2 are correct. (b) 1 and 3 are correct.
(c) 2 and 3 are correct. (d) 2 and 4 are correct.
[U.P.S.C. I.E.S. E.E.-II, 1997]

65. If X = 1 in the logic equation
$\left[X+Z\left\{\bar{Y}+\left(\bar{Z}+X\bar{Y}\right)\right\}\right]\left\{\bar{X}+\bar{Z}(X+Y)\right\}=1$, then
(a) $Y=Z$ (b) $Y=\bar{Z}$ (c) $Z=1$ (d) $Z=0$
[GATE E.C.E. 2009]

66. The given figure shows the circuit of which one of the following?



(a) Bistable multivibrator.
(b) Schmitt trigger.
(c) Monostable multivibrator.
(d) Astable multivibrator.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

67. A digital multiplexer can be used for which of the following?
1. Parallel to serial conversion.
2. Many-to-one switch.
3. To generate memory chip select.
4. For code conversion.
Select the correct answer using the code given below:
(a) 1, 3 and 4. (b) 2, 3 and 4.
(c) 1 and 2 only. (d) 2 and 3 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

68. A 1 ms pulse can be converted into a 10 ms pulse by using which one of the following?
(a) An astable multivibrator. (b) A monostable multivibrator.
(c) A bistable multivibrator. (d) A J-K flip-flop.
[U.P.S.C. I.E.S. E.T.E.-II, 2007]

69. In 8085 microprocessor whenever the POP H instruction is executed
(a) data bytes in the HL pair are stored in the stack.
(b) two data bytes at the top of the stack are transferred to the HL pair.
(c) two data bytes at the top of the stack are transferred to the PC.
(d) two data bytes from the HL registers that were previously stored on the stack are transferred back to the HL pair.
[U.P.S.C. I.E.S. E.E.-II, 1999]

70. Which one of the following is a correct statement in connection with commands of CMP and CPI?
(a) CMP takes less number of m/c cycles compared to CPI.
(b) CMP takes more number of m/c cycles compared to CPI.
(c) Both CMP and CPI take the same number of m/c cycles.
(d) CMP takes either less or the same number of m/c cycles as compared to CPI.
[U.P.S.C. I.E.S. E.E.-II, 1999]

71. Message switching in computer communication
(a) is a store and forward system.
(b) requires a dedicated path between transmitter and receiver.
(c) is used only for long messages.
(d) does not require a buffer at transmitter.
[U.P.S.C. I.E.S. E.E.-II, 1998]

72. For a second order instrument, the optimum range of ϵ (damping ratio), which gives good frequency response over a wide range of frequencies is
(a) 0.5 to 0.6. (b) 0.6 to 0.7.
(c) 0.7 to 0.8. (d) 0.8 to 1.0.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

73. Which of the following bridges is only used in an oscillator?
(a) Maxwell. (b) Schering. (b) Hay. (d) Wien.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

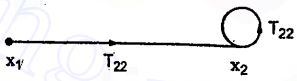
74. Which of the following transducers requires a high input impedance preamplifier for proper measurement?
(a) Thermocouple. (b Piezoelectric.
(c) Thermistor. (d) LVDT.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

75. Consider the following statements about ultrasonic flow-meters:
1. The measurement is insensitive to viscosity, pressure and temperature variations.
2. It has bidirectional measuring capability and can be used for any pipe size.
3. It has a relatively lower cost.
4. It has good accuracy, fast response and wide frequency range.
Which of the above statements is/are correct?
(a) 1 only. (b) 1 and 2 only.
(c) 1, 2 and 4. (d) 3 and 4 only.
[U.P.S.C. I.E.S. E.T.E.-II, 2009]

76. The projection of the vector $6\hat{a}_x+2\hat{a}_y-3\hat{a}_z$ along $3\hat{a}_x-4\hat{a}_y$ is
(a) 2 (b) $18\hat{a}_x-8\hat{a}_y$
(c) 10 (d) $21\hat{a}_x-28\hat{a}_y$.
[U.P.S.C. I.E.S. E.E.-I, 2000]

77. If a ramp input is applied to Type-2 system the steady-state error is
(a) positive constant (b) negative constant
(c) zero (d) positive infinity
[U.P.S.C. I.E.S. E.E.-I, 2002]

78. On eliminating the feedback loop in the system shown in the figure, it would lead to a simplification with a single edge of gain



(a) $\frac{T_{12}}{1+T_{22}}$ (b) $\frac{T_{22}}{1-T_{12}}$
(c) T_{12} (d) $\frac{T_{12}}{1-T_{22}}$
[U.P.S.C. I.E.S. E.E.-I, 1998]

79. If H (*x*) is the entropy of a source code, what is the n^{th} order extension of a discrete memory-less source [H (x^n)]?
(a) $[H(x)]^n$ (b) $H(x)\log_2 n$
(c) $\sqrt{n}H(x)$ (d) $nH(x)$
[U.P.S.C. I.E.S. E.E.-I, 2007]

80. For the system $x+ax+bx=0$, the equation for the phase-plane isocline of slope '*m*' is
(a) $m^2+am+b=0$ (b) $m=-ax-\frac{bx}{\dot{x}}$

Answers: **63.** (a), **64.** (c), **65.** (d), **66.** (c), **67.** (c), **68.** (b), **69.** (d), **70.** (c), **71.** (a), **72.** (a), **73.** (d), **74.** (b), **75.** (c), **76.** (a), **77.** (c), **78.** (d), **79.** (d), **80.** (b),

Downloaded From : www.EasyEngineering.net

Downloaded From : www.EasyEngineering.net

(c) $m = ax + \frac{bx}{\dot{x}}$ (d) $m^2 + \omega m + b = 0$

[U.P.S.C. I.E.S. E.E.-I, 2000]

81. A system with transfer function $G(s) = \frac{s}{(1+s)}$ is subjected to a sinusoidal input $r(t) = \sin \omega t$. In steady-state, the phase angle of the output relative to the input at $\omega = 0$ and $\omega = \infty$ will be respectively

(a) 0° and – 90°. (b) 0° and 0°.
(c) 90° and 0°. (d) 90° and – 90°.

[U.P.S.C. I.E.S. E.E.-II, 2000]

82. Consider the following statements regarding hold circuits for reconstruction of sampled signals:

1. Hold circuits are essentially low pass filters.
2. A first order hold circuit introduces less phase lag in comparison to zero hold circuit.
3. A zero order hold has a flat gain-frequency response over the frequency range of $0 \le \omega \le \frac{2\pi}{T}$, where T is the sampling period.

Which of these statements is/are correct?

(a) 3 alone. (b) 1 and 2. (c) 2 and 3. (d) 1 alone.

83. Consider the systems shown in Fig.-I and Fig.-II. If the forward path gain is reduced by 10% in each system, then the variation in C_1 and C_2 will be respectively

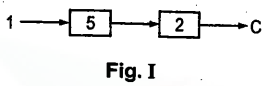


Fig. I

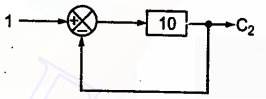

Fig. II

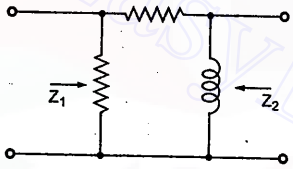
(a) 10 % and 10%.
(b) 2% and 10%.
(c) 5% and 1%.
(d) 10% and 1%. [U.P.S.C. I.E.S. E.E.-I, 1999]

84. For the circuit shown in the given figure, if the input impedance Z_1 at port 1 is given by

$$Z_1 = \frac{K_1(s+2)}{(s+5)}$$

then the input impedance Z_2 at port 2 will be



(a) $\frac{K_2(s+3)}{(s+5)}$. (b) $\frac{K_2(s+2)}{(s+3)}$.
(c) $\frac{K_2 s}{(s+5)}$. (d) $\frac{K_2 s}{(s+2)}$.

[U.P.S.C. I.E.S. E.E.-I, 1998]

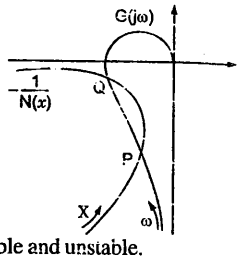
85. $A = \begin{bmatrix} 5 & 0 & 2 \\ 0 & 3 & 0 \\ 2 & 0 & 1 \end{bmatrix}$. The inverse of A is

(a) $\begin{bmatrix} 1 & 0 & -2 \\ 0 & \frac{1}{3} & 0 \\ -2 & 0 & 5 \end{bmatrix}$ (b) $\begin{bmatrix} 5 & 0 & 2 \\ 0 & -\frac{1}{3} & 0 \\ 2 & 0 & 1 \end{bmatrix}$

(c) $\begin{bmatrix} \frac{1}{5} & 0 & \frac{1}{2} \\ 0 & \frac{1}{3} & 0 \\ \frac{1}{2} & 0 & 1 \end{bmatrix}$ (d) $\begin{bmatrix} \frac{1}{5} & 0 & -\frac{1}{2} \\ 0 & \frac{1}{3} & 0 \\ -\frac{1}{2} & 0 & 1 \end{bmatrix}$

[GATE E.E. 1998]

86. For the determination of stability of a nonlinear control system by the Describing Function method, the plots of $G(j\omega)$ and $-\frac{1}{N(x)}$ are drawn as shown in the given figure for an input $x = X \sin \omega t$. The types of limit cycles at the points P and Q will be respectively

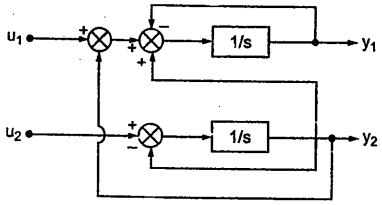


(a) stable and stable. (b) stable and unstable.
(c) unstable and stable. (d) unstable and unstable.

[U.P.S.C. I.E.S. E.E.-I, 2000]

87. The control system shown in the given figure is represented by the equation

$$\begin{bmatrix} y_1 \\ y_2 \end{bmatrix} = [\text{Matrix 'G'}] \begin{bmatrix} u_1 \\ u_2 \end{bmatrix}$$

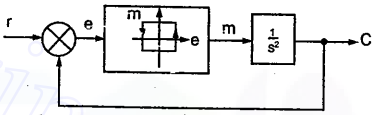


(a) $\begin{bmatrix} \frac{1}{s} & -\frac{1}{s^2} \\ 0 & \frac{1}{s} \end{bmatrix}$ (b) $\begin{bmatrix} \frac{1}{s} & \frac{1}{s^2} \\ 0 & -\frac{1}{s} \end{bmatrix}$

(c) $\begin{bmatrix} \frac{1}{(s+1)} & -\frac{1}{(s+1)^2} \\ 0 & \frac{1}{(s+1)} \end{bmatrix}$ (d) $\begin{bmatrix} \frac{1}{(s+1)} & \frac{1}{(s+1)^2} \\ 0 & -\frac{1}{(s+1)} \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 2000]

88. A closed-loop nonlinear system is shown in the figure.



The phase-plane plot in *e-ė* plane is :

(a) 
(b) 
(c) 
(d) 
[U.P.S.C. I.E.S. E.E.-I, 1998]

Use following codes for Questions from 89 to 92.

(a) Both A and R are true and R is a correct explanation of A.
(b) Both A and R are true but R is not a correct explanation of A.
(c) A is true but R is false.
(d) A is false but R is true.

89. (A) : For a lossy transmission line, the voltage standing wave ratio (VSWR) is higher near the load end than that near the source end.

Answers: **81.** (c), **82.** (d), **83.** (d), **84.** (c), **85.** (a), **86.** (c), **87.** (c), **88.** (d), **89.** (b),

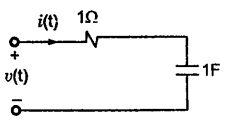
(R) : In the presence of losses, the propagation constant of the line becomes a complex quantity. [U.P.S.C. I.E.S. E.E.-I, 2005]

90. (A) : The best method of improving transient stability is by use of high speed circuit breakers.
(R) : The quicker the circuit breaker operates, the faster the fault is removed from the system and normal operating conditions are restored.

91. (A) : Entropy of a binary source is maximum if the probabilities of occurrence of both the events are equal.
(R) : The average amount of information per source symbol is called entropy for a memoryless source.
[U.P.S.C. I.E.S. E.T.E.-II, 2008]

92. (A) : The VTVM is a balanced bridge voltmeter.
(R) : TVM is the transistorised version of VTVM.
[U.P.S.C. I.E.S. E.E.-I, 1996]

93. Match List 1 [Input voltage $v(t)$ with List 2 [I(s), the Laplace transform of $i(t)$] for the given circuit and select the correct answer using the codes given below the lists:



List 1	List 2
A. Unit step	1. $\frac{s}{s+1}$
B. Unit ramp	2. $\frac{1}{s+1}$
C. Unit impulse	3. $\frac{s}{(s+1)^2}$
D. $\sin t$	4. $\frac{s}{s(s+1)}$

Codes:	A	B	C	D
(a)	2	4	1	3
(b)	3	1	4	2
(c)	2	1	4	3
(d)	3	4	1	2

[U.P.S.C. I.E.S. E.E.-I, 2000]

94. A system is represented by $\dddot{y} + 2\ddot{y} + 5\dot{y} + 6y = 5x$.
If state variables are $x_1 = y, x_2 = \dot{y}$ and $x_3 = \ddot{y}$, then the coefficient matrix 'A' will be

(a) $\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -6 & -5 & -2 \end{bmatrix}$ (b) $\begin{bmatrix} 0 & 1 & 0 \\ 0 & 0 & 1 \\ -2 & -5 & -6 \end{bmatrix}$

(c) $\begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ -6 & -5 & -2 \end{bmatrix}$ (d) $\begin{bmatrix} 0 & 0 & 1 \\ 0 & 1 & 0 \\ -2 & -5 & -6 \end{bmatrix}$

[U.P.S.C. I.E.S. E.E.-I, 1999]

95. Match List 1 with List 2 and select the correct answer using the code given under the lists:

List 1 (Communication Service)	List 2 (Bandwidth)
A. AM Broadcast	1. 10 kHz
B. Telephone	2. 4 kHz
C. Wideband FM	3. 200 kHz
D. TV	4. 7 MHz

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	3	4	1	2
(c)	1	4	3	2
(d)	3	2	1	4

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

96. Match List 1 with List 2 and select the correct answer using the code given below the lists:

List 1 (Diode)	List 2 (Common Application)
A. Tunnel diode.	1. Reading of film sound track.
B. PIN diode.	2. High frequency oscillator circuits.
C. Zener diode.	3. Very high frequency switching circuits.
D. Photodiode.	4. Reference voltage.

Codes:	A	B	C	D
(a)	4	3	2	1
(b)	2	1	4	3
(c)	4	1	2	3
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.T.E.-I, 2007]

97. Match List 1 with List 2 and select the correct answer using the code given below the lists:

List 1 (TTL Nos.)	List 2 (Significance)
A. 74 LS 00	1. Low power/low speed.
B. 74 H 00	2. High speed/high power.
C. 7400	3. Basic NAND Gate.
D. 74 L 00	4. Low power Schottky.

Codes:	A	B	C	D
(a)	4	2	3	1
(b)	3	1	4	2
(c)	4	1	3	2
(d)	3	2	4	1

[U.P.S.C. I.E.S. E.T.E.-II, 2006]

98. Match List 1 with List 2 and select the correct answer using the code given below the lists:

List 1 (Instruction of 8085)	List 2 (Function of Instruction)
A. RST 6.5	1. Highest priority of interrupts.
B. INTR	2. Vector interrupt.
C. TRAP	3. Interrupt request.
D. HLDA	4. Hold acknowledge.

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	1	2	4	3
(c)	2	3	1	4
(d)	2	3	4	1

[U.P.S.C. I.E.S. E.T.E.-II, 2007]

99. Match List 1 (Plot/diagram/chart) with List 2 (Characteristic) and select the correct answer using the codes given below the lists:

List 1	List 2
A. Constant M loci	1. Constant gain and phase shift loci of the closed-loop system.
B. Constant N loci	2. Plot of loop gain with variation of ω.
C. Nichol's chart	3. Circles of constant gain for closed-loop transfer function.
D. Nyquist plot	4. Circles of constant phase shift of closed-loop transfer function.

Codes:	A	B	C	D
(a)	3	4	2	1
(b)	3	4	1	2
(c)	4	3	2	1
(d)	4	3	1	2

[U.P.S.C. I.E.S. E.E.-I, 1998]

Answers: **90.** (a), **91.** (b), **92.** (d), **93.** (a), **94.** (a), **95.** (a), **96.** (d), **97.** (a), **98.** (c), **99.** (b),

100. Match List I (Components) with List 2 (Transfer functions) and select the correct answer using the codes given below the lists:

List 1	List 2
A. ac servomotor.	1. $\frac{K}{s(1+s\tau_m)}$
B. Field controlled dc servomotor.	2. $\frac{K}{s(1+s\tau_e)(1+s\tau_m)}$
C. Tachogenerator	3. Ks
D. Integrating gyro	4. $\frac{K}{1+s\tau}$

Codes:	A	B	C	D
(a)	1	2	3	4
(b)	1	2	4	3
(c)	2	1	3	4
(d)	2	1	4	3

[U.P.S.C. I.E.S. E.E.-I, 2000]

Identify whether the following statements are TRUE (T) or FALSE (F)?

101. A, B, C and D represent the transmission parameters of a two-port network. The network will be reciprocal if AD – BC = 0.

102. A dc series motor attains its maximum efficiency at a load considerably smaller than its rated load.

103. Hysteresis motors can pull-into step just about any load they can carry, regardless of the connected inertia of that load.

[A.M.I.E. Sec B Summer 1996]

104. The best electrical conductors are also the best heat conductors.

[A.M.I.E. Sec B Elec. Engineering Materials Winter, 1993]

105. Power plants having high capital cost and low operating costs are preferred for supplying peak loads.

106. Impulse insulation breakdown strength of the protected equipment must be greater than that of the protecting device.

107. Rheostatic control of 3-phase induction motors is used in light-locomotives and motor coaches where single economical speed is sufficient and energy consumption is of no importance.

108. Photodiodes are used under forward bias conditions.

109. In a transistor Hartley oscillator, inductive feedback is used.

110. To avoid the effect of stray magnetic fields in ac bridges magnetic screening can used.

Fill-in the blanks with appropriate word or words.

111. In case of a delta-connected load, if one of the resistors is removed, the power will become _____.

112. Two transformers A and B of equal ratings are connected in parallel. If the impedance of transformer A is more than that of B, transformer A will supply _____ load than that being supplied by B.

113. A large value of ampere-conductors would lead to _____ number of turns per phase.

114. Inside the earth pit, the earthing electrode should be placed _____.

115. For constant voltage transmission specially designed synchronous motors called the synchronous _____ are installed at the receiving end which maintains the voltage drop along the line constant.

116. Supply of an unbalanced voltage to a 3-phase, delta-connected induction motor can be detected using _____ relay.

(negative-sequence, zero-sequence)

[A.M.I.E. Sec B. Winter 1999]

117. The doping in a zener diode as compared with an ordinary general purpose junction diode is _____. [A.M.I.E. Summer 1996]

118. The register which stores the operand, executes an instruction with the help of other registers and memory is called the _____.

119. DC telemetry is called the _____ telemetry.

(land line / radio / frequency)

120. For a sampling period T, the relationship between Z and s transform variable is Z = _____.

Answers: **100.** (a), **101.** (F), **102.** (T), **103.** (T), **104.** (T), **105.** (F), **106.** (T), **107.** (T), **108.** (T), **109.** (T), **110.** (T).

ANSWERS

111. two-third	**112.** less	**113.** large	**114.** vertically	**115.** phase modifiers
116. negative-sequence	**117.** heavy	**118.** accumulator	**119.** land line	**120.** e^{sT}
